Even better for the pro-Trump world, Wade extended his criticism to the mainstream media too:

To my knowledge, no major newspaper or television network has yet provided readers with an in-depth news story of the lab escape scenario, such as the one you have just read, although some have run brief editorials or opinion pieces … What accounts for the media's apparent lack of curiosity?

The virologists' *omertà* is one reason. Science reporters, unlike political reporters, have little innate skepticism of their sources' motives; most see their role largely as purveying the wisdom of scientists to the unwashed masses. So when their sources won't help, these journalists are at a loss.

Another reason, perhaps, is the migration of much of the media toward the left of the political spectrum. Because President Trump said the virus had escaped from a Wuhan lab, editors gave the idea little credence. They joined the virologists in regarding lab escape as a dismissible conspiracy theory.

If there is any group of people more disliked by Trump supporters than Chinese Communists, it is the U.S. scientific community. For months, scientists had irritated Trump supporters by not falling in line with the pro-Trump argument that the coronavirus was much exaggerated and no big deal.

Anthony Fauci in particular has become a hate figure to the pro-Trump world and the Fox News network. It's weird, it's hard to explain, but it is an organizing fact of American politics: More than Biden, more than Vice President Kamala Harris, more than any Democrat in Congress other than Alexandria Ocasio-Cortez, Fauci has become the emblem and totem of everything that

Trumpists resent. Abuse. Name calling. Mob chants for his firing. Even thinly veiled calls for violence. All has been directed at Fauci. In the minds of the core Trump cadre, Fauci is the real culprit in Trump's defeat.

So when Fauci testified in the Senate a few days after Wade's article appeared, Senator Rand Paul made the most of it. "Dr. Fauci, do you still support … NIH funding of the lab in Wuhan?" Paul asked. Fauci denied that the National Institutes of Health supported so-called gain-of-function research in Wuhan, but that made no difference. Paul was relying on an authority more respected in Trump world than any scientist: the Fox News Tucker Carlson monologue of the night before.

Wade lays out a nearly insurmountably large amount of evidence that this virus originated at the Wuhan Institute of Virology in central China. It seems to make sense. This show and others have raised the possibility from the early days of the pandemic. But this piece all but proves it. At the time the outbreak began last fall, the Wuhan lab was conducting experiments on how to make bat viruses infectious to human beings. Those experiments were funded by American tax dollars. Those experiments, their funding, was approved and directed by Tony Fauci in Washington. By Tony Fauci. That is hard to believe, but it's true, and the piece lays it out.

Republicans in the House and Senate are now demanding formal investigations not only of the virus's origin, but of the American scientific community's role as well.

In many ways, what is happening is highly reminiscent of the anti-Communist battles of the late 1940s and early 1950s. In those days, the United States faced a dangerous external challenge from Soviet Communism. Isolationist Republicans had little interest in meeting that challenge: It would cost money and implied foreign commitments. They opposed the Marshall Plan, NATO, everything that really mattered. Instead, they used the foreign threat to justify launching a purge against an enemy within: domestic ideological opponents.

The United States is today in danger of repeating that sorry history. Pro-Trumpers want to use Chinese misconduct—real and imagined—as a weapon in a culture war here at home. They are not interested in weighing the evidence. They want payback for the political and cultural injuries inflicted on them by the scientists. They want Fauci to have time in the barrel.

What the rest of us should want is the truth.

While the Biden administration should defend U.S. scientists against partisan defamation, it has no reason to protect China against the truth, whatever that may be. In April, Biden's director of national intelligence testified to the Senate that the intelligence community remained open to the two possibilities that the virus "emerged naturally from human contact with infected animals or it was a laboratory accident." CIA Director William Burns concurred, adding that "the Chinese leadership has not been fully forthcoming or fully transparent." The only thing that is certain is that these leaders are starting to disbelieve the Chinese story that the virus originated in the Wuhan markets where live animals are sold.

By actively seeking the truth, the Biden administration will deny the Trump dead-enders the culture-war weapon they want. In the pursuit of the truth, the Biden administration can recruit as allies the scientists whom the Trumpists want to malign as enemies. Eighteen distinguished academics published an open letter in *Science* on May 14 describing both the species-jump theory and the lab-accident theory as equally "viable"—and urging an objective and impartial investigation.

More than scientific expertise may be required to reach the truth. The truth may depend less on analysis of the virus itself and more on intelligence from inside the Chinese government. Very possibly—and this theory is often heard from intelligence officials—the Chinese national authorities themselves do not know for certain how the virus originated. If there was a lah mistake, the people culpable in that mistake may be very frightened of their own government, and may have organized their own cover-up to protect themselves. One big reveal from the early phase of the coronavirus disaster is that local Chinese big shots can often effectively deceive and frustrate their own national government.

What we can know is this:

The people who supported this failed president should have no standing to accuse anybody else of fronting for China.

It was Trump who wasted crucial time in December 2019 and January 2020 by gullibly accepting Chinese assurances that all was okay. Trump had started a trade war, was losing it, and wanted a face-saving deal to goose the stock market in an election year. He praised the Chinese state and Xi Jinping at least 15 times in those decisive early days, according to a tally by *Politico.*

Trump supporters called on seniors to die for the economy. They mocked the masks that stopped the spread. They disparaged the vaccines that are bringing the pandemic to an end.

Trump's supporters have no interest in the truth about the virus's origin, whatever that truth ultimately proves to be. They care about attention-grabbing conflicts with fellow Americans, not about real-world problems. And if the Chinese state has more culpability for the pandemic than acknowledged to date, that is one hell of a real-world problem.

The Biden administration can defeat this squalid scheme to convert a real-world problem into a culture-war battlefield by acting fast and tough to take possession of the truth about the virus. If the current knowledge of the truth is ambiguous, it's okay to say that too—and to say it loud, say it clear, and say it often. The faster that problem is transferred from self-seeking outrage merchants to rational actors who can actually do something about it, the better for the United States and the world.

Subject:	Stories today re. FoIA'd grants, but not being widely amplified
From:	Peter Daszak <(b) (6) >
To:	David Morens <(b) (6) >;
CC:	Robert Kessler <(b) (6) >; Keusch, Jerry <(b) (6) Jeff Sturchio <(b) (6) >;
Attachments:	image006.jpg; image007.jpg; image008.jpg; image041.png; image042.gif; image043.jpg; image044.jpg; image045.jpg; image001.png; image002.png; image003.png; image004.png; image005.png; image013.png; image021.png; image022.png; image023.png; image024.png; image025.png; image026.png; image027.png; image028.png; image029.png; image030.png

The stories are sputtering forth slowly today but only in a few hard right outlets. The comments online are that this is largely a non-story and actually points to a very carefully designed study that considers the risks correctly.

Great quote from our spokesperson here – Robert Kessler, by the way: Asked about the grant materials, Robert Kessler, communications manager at EcoHealth Alliance, said, "We applied for grants to conduct research. The relevant agencies deemed that to be important research, and thus funded it. So I don't know that there's a whole lot to say."

https://theintercept.com/2021/09/06/new- details-emerge-about-coronavirus-research-at-chinese-lab/

Richard Ebright's trying to cause trouble on Twitter re. Dr. Fauci lying before congress – as is Josh Hawley and Rand Paul. I suspect it'll go nowhere fast.

By the way – on the Ebright issue – the definition of a P3CO-worthy expt is to "enhance virulence or transmission in people". If a virus has never been found in people, it's virulence or transmission cannot, by definition, be enhanced. Again – these are bat viruses, never found in people.

There are copycat stories in other journals, all based on this one.

This should go away if Rand Paul doesn't amplify it too much, so finger's cross on that.

Cheers,

Peter

NEW DETAILS EMERGE ABOUT CORONAVIRUS RESEARCH AT CHINESE LAB

More than 900 pages of materials related to US.-funded coronavirus research in China were released following a FOIA lawsuit by The Intercept.

Sharon Lerner, Mara Hvistendahl
September 6 2021, 9:06 p.m.

NEWLY RELEASED DOCUMENTS provide details of U.S.-funded research on several types of coronaviruses at the Wuhan Institute of Virology in China. The Intercept has obtained more than 900 pages of documents detailing the work of EcoHealth

Alliance, a U.S.-based health organization that used federal money to fund bat coronavirus research at the Chinese laboratory. The trove of documents includes two previously unpublished grant proposals that were funded by the National Institute of Allergy and Infectious Diseases, as well as project updates relating to EcoHealth Alliance's research, which has been scrutinized amid increased interest in the origins of the pandemic.

The documents were released in connection with ongoing Freedom of Information Act litigation by The Intercept against the National Institutes of Health. The Intercept is making the full documents available to the public.

"This is a road map to the high-risk research that could have led to the current pandemic," said Gary Ruskin, executive director of U.S. Right To Know, a group that has been investigating the origins of Covid-19.

One of the grants, titled "Understanding the Risk of Bat Coronavirus Emergence," outlines an ambitious effort led by EcoHealth Alliance President Peter Daszak to screen thousands of bat samples for novel coronaviruses. The research also involved screening people who work with live animals. The documents contain several critical details about the research in Wuhan, including the fact that key experimental work with humanized mice was conducted at a biosafety level 3 lab at Wuhan University Center for Animal Experiment — and not at the Wuhan Institute of Virology, as was previously assumed. The documents raise additional questions about the theory that the pandemic may have begun in a lab accident, an idea that Daszak has aggressively dismissed.

'mail

The bat coronavirus grant provided EcoHealth Alliance with a total of $3.1 million, including $599,000 that the Wuhan Institute of Virology used in part to identify and alter bat coronaviruses likely to infect humans. Even before the pandemic, many scientists were concerned about the potential dangers associated with such experiments. The grant proposal acknowledges some of those dangers: "Fieldwork involves the highest risk of exposure to SARS or other CoVs, while working in caves with high bat density overhead and the potential for fecal dust to be inhaled."

Alina Chan, a molecular biologist at the Broad Institute, said the documents show that EcoHealth Alliance has reason to take the lab-leak theory seriously. "In this proposal, they actually point out that they know how risky this work is. They keep talking about people potentially getting bitten — and they kept records of everyone who got bitten," Chan said. "Does EcoHealth have those records? And if not, how can they possibly rule out a research-related accident?"

According to Richard Ebright, a molecular biologist at Rutgers University, the documents contain critical information about the research done in Wuhan, including about the creation of novel viruses. "The viruses they constructed were tested for their ability to infect mice that were engineered to display human type receptors on their cell,"

Ebright wrote to The Intercept after reviewing the documents. Ebright also said the documents make it clear that two different types of novel coronaviruses were able to infect humanized mice. "While they were working on SARS-related coronavirus, they were carrying out a parallel project at the same time on MERS-related coronavirus," Ebright said, referring to the virus that causes Middle East Respiratory Syndrome.

Read Our Complete Coverage **The Coronavirus Crisis**

Asked about the grant materials, Robert Kessler, communications manager at EcoHealth Alliance, said, "We applied for grants to conduct research. The relevant agencies deemed that to be important research, and thus funded it. So I don't know that there's a whole lot to say."

The grant was initially awarded for a five-year period — from 2014 to 2019. Funding was renewed in 2019 but suspended by the Trump administration in April 2020.

The closest relative of SARS-CoV-2, which causes Covid-19, is a virus found in bats, making the animals a focal point for efforts to understand the origins of the pandemic. Exactly how the virus jumped to humans is the subject of heated debate. Many scientists believe that it was a natural spillover, meaning that the virus passed to humans in a setting such as a wet market or rural area where humans and animals are in close contact. Biosafety experts and internet sleuths who suspect a lab origin, meanwhile, have spent more than a year poring over publicly available information and obscure scientific publications looking for answers. In the past few months, leading scientists have also called for a deeper investigation of the pandemic's origins, as has President Joe Biden, who in May ordered the intelligence community to study the issue. On August 27, Biden announced that the intelligence inquiry was inconclusive.

Biden blamed China for failing to release critical data, but the U.S. government has also been slow to release information. The Intercept initially requested the proposals in September 2020.

"I wish that this document had been released in early 2020," said Chan, who has called for an investigation of the lab-leak origin theory. "It would have changed things massively, just to have all of the information in one place, immediately transparent, in a credible document that was submitted by EcoHealth Alliance."

The second grant, "Understanding Risk of Zoonotic Virus Emergence in Emerging Infectious Disease Hotspots of Southeast Asia," was awarded in August 2020 and extends through 2025. The proposal, written in 2019, often seems prescient, focusing on

scaling up and deploying resources in Asia in case of an outbreak of an "emergent infectious disease" and referring to Asia as "this hottest of the EID hotspots."

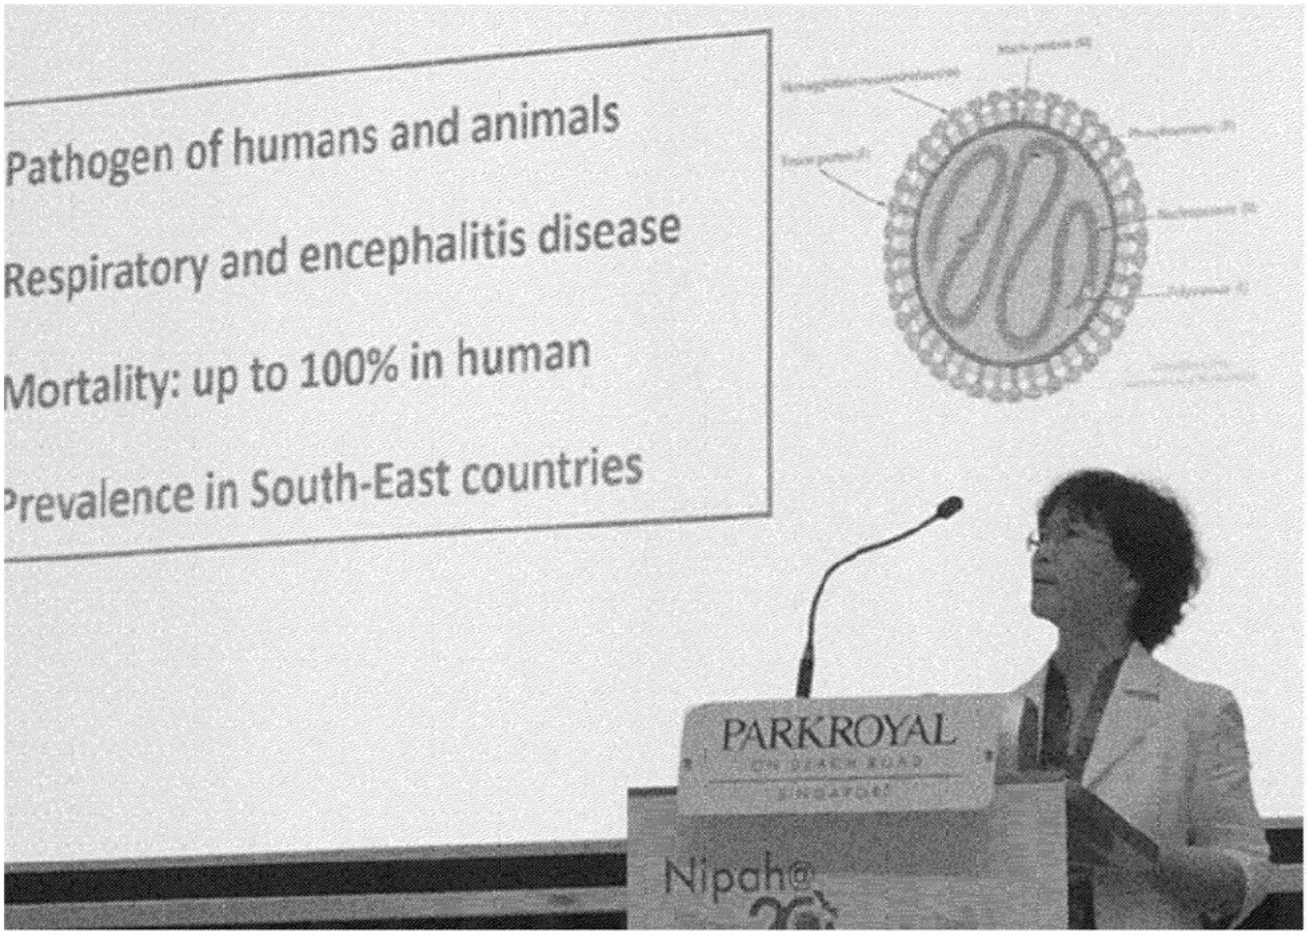
https://thenationalpulse.com/breaking/daszak- deletes-tweet-from-wuhan-fauci-conerence/

I deleted it after the lab leakers started their craziness because it has Zhengli's email address in it. The fact that I was at the conference is public knowledge and I regularly mention it to reporters – it was December 2019 just before the first cases of COVID were happening.



Cheers,

Peter

EcoHealth's Peter Daszak Deletes Tweet Revealing Wuhan Lab Researchers At Fauci-Funded Conference.

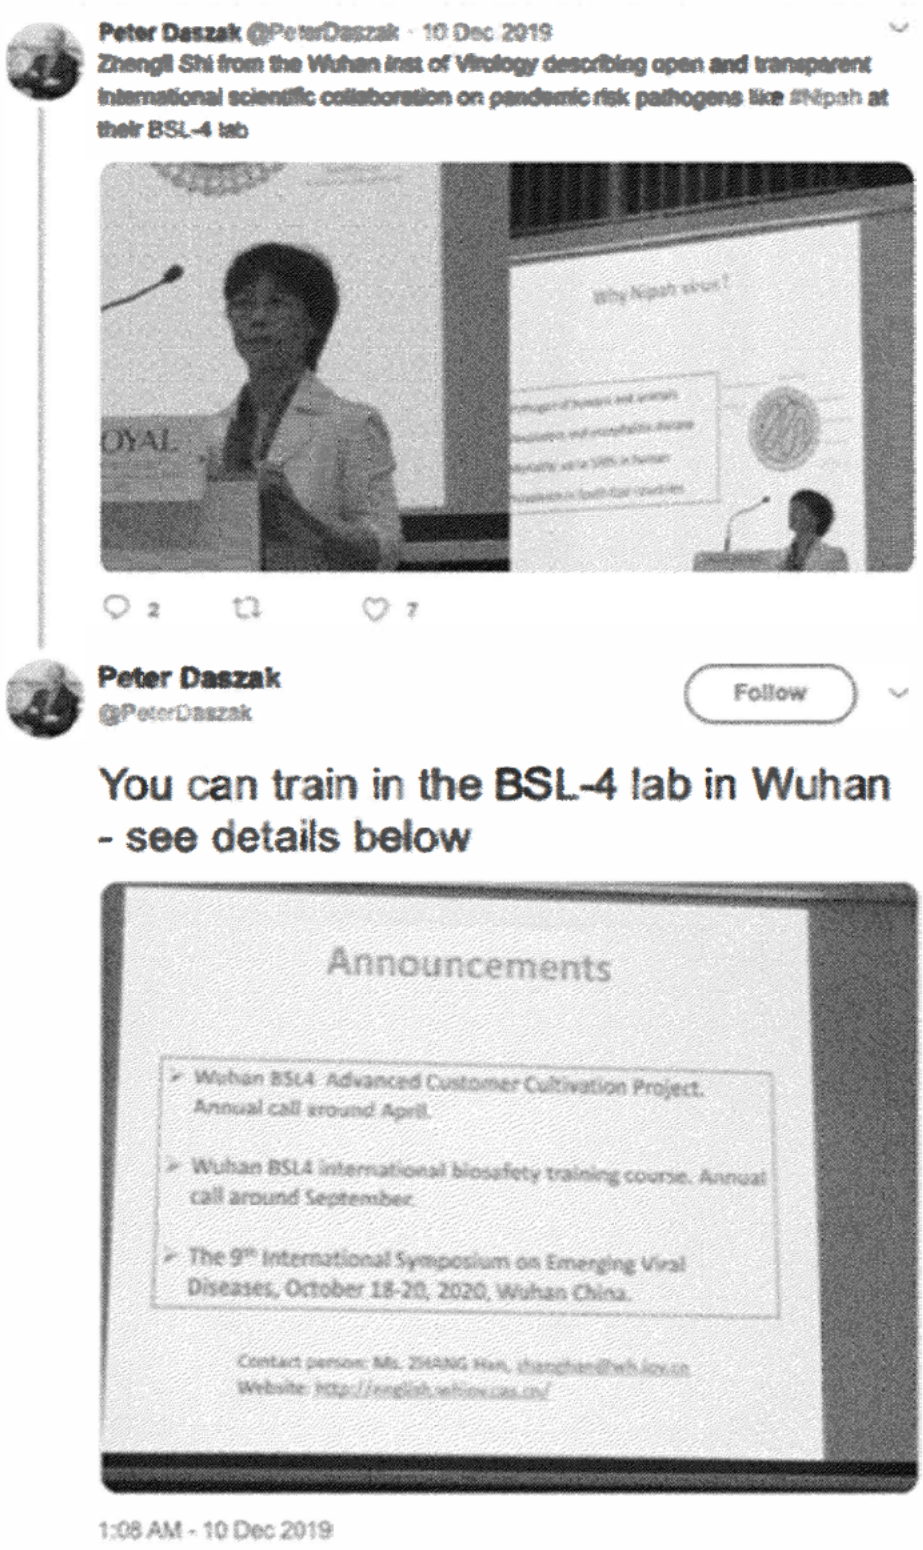
EcoHealth Alliance President Peter Daszak – the disgraced proponent of the COVID-19 "natural origins" theory and longtime collaborator of the Chinese Communist Party – deleted a tweet revealing his attendance at an event sponsored by Anthony Fauci's National Institute of Allergy and Infectious Diseases featuring Wuhan Institute of Virology researchers.

Posted on December 10th, 2019, just weeks before the Chinese government reported its first case of COVID-19, the tweet revealed Daszak's attendance at the Nipah Virus International Conference in Singapore.



"The two-day session was co-hosted by Duke-NUS Medical School (Duke-NUS) and the Coalition for Epidemic Preparedness Innovations (CEPI). Also listed as organizers are the World Health Organization and the National Institute

MORENS_SUBPOENA_013717
MORENS_NIH_025882
REL0000478632

of Allergy and Infectious Diseases," reports the site Some Bitch Told Me. CEPI was founded with a sizable investment from the Bill & Melinda Gates Foundation.

In the now-deleted tweet, Daszak details how Shi Zhengli, the Wuhan Institute of Virology's "bat lady," calls for "open and transparent international scientific collaboration on pandemic risk pathogens" at her lab's Biosafety Level 4 (BSL-4) facility. He follows up with a slide explaining how "you can train in the BSL-4 lab in Wuhan."

MORENS_NIH_025883
REL0000478632

NOW-DELETED TWEET.

Daszak's deletion of the tweet follows The National Pulse unearthing the scientist's extensive conflicts of interest with the Chinese Communist Party and its Wuhan Institute of Virology. These ties ultimately led to his recusal from the *Lancet* COVID-19 commission, where he used his position to

MORENS_SUBPOENA_013719
MORENS_NIH_025884
REL0000478632

discredit the “lab leak” theory and spread disinformation about the origins of the virus.

The unearthed post also follows Fauci, whose NIAID sponsored the event, denying affiliation with the Wuhan lab.

REL0000478632

In my view, this sort of stuff isn't going to get them the same level of interest that it did at the beginning of summer, so hopefully this will be another non-event, but let's see what drama they can dream up from it.

Peter:

This is excellent! I'm sorry to be slow in responding, but "officially" I have been on vacation and unable to read all emails coming my way without alerting my wife to my "non-vacation" behaviour. I am not en route home and have had the chance to read through this response.

What is so annoying here is that politicians have the easy option of targeting would-be scapegoats to uphold a political agenda and ignore science.

I hope the NAM will finally decide to follow the science and tell the politicians to go to hell.

Subject: FW: confidential: Response to letter from NAM April 11th 2022
Importance: High

EXTERNAL SENDER

Dear all,

Thank you very much for your support dealing with this awful situation. Below is my email to NAM with an attached letter responding to the allegations, and a dropbox file with 28 appendices supporting each of the points I make (feel free to click on the link and sift through if you've got a spare few hours!).

Having been lucky enough to get a scholarship to one of those schools in the UK where we had to stand when the teachers (who we had to call "masters") came in the room, this brings back some powerful memories of the way institutions can be manipulated to make the lives of the people they're supposed to serve totally bloody miserable.

I only hope the committee is able to see beyond the political narratives, and their desire to save the NAM from attack, and do the right thing by one of their members. If not, I'll get ready with my appeal, and continue this tedious journey…

Cheers,

Peter

Subject: RE: confidential: Response to letter from NAM April 11th 2022
Importance: High

Dear Dr. Fuentes-Afflick,

I want to thank you and the NAM for granting me the extra time to respond to the allegations from the three Republican members of the Congress. I am attaching the original letter to the NAM (attachment A), the focused allegations

MORENS_SUBPOENA_006811
MORENS_NIH_015815
REL0000478636

(attachment B), your letter to me informing me of the intent to open an investigation ("Letter to Member…."), and my response to your letter refuting these allegations ("Dr. Daszak, response to NAM letter of April 11th 2022").

As you can see, I have provided a detailed refutation of each of the allegations, along with documentary evidence to support each point. This consists of 28 appendices (many are quite short consisting of specific email chains or short documents). However, because of their overall size, I have placed them in a secure dropbox folder that is available for you to download and circulate among the committee by clicking on the following link:

https://www.dropbox.com/sh/io8q3ig64g0tkum/AACvnf8IlwXX86sfDXUOPIMaa?dl=0

As you stated below, I appreciate that this process is confidential, and I would ask that you take particular care to ensure that my letter and the appendices are carefully shared so as not to be circulated more widely than necessary – some of these appendices contain information that has never been released publicly before.

I will await the decision of the committee, the NAM Council and Dr. Dzau in due course, but in the meantime, please do not hesitate to reach out to me of my Chief-of-Staff, Dr. Aleksei Chmura (cc'd) for any further information or clarification

Sincerely,

Peter Daszak
President

Subject: confidential

Dr. Daszak,

Thank you for your note of April 22nd. I was traveling and apologize for my delayed response. I have reviewed your letter in detail and will respond to each point.

First, when the NAM receives any allegation of misconduct against a member, we have to follow an independent process that is outlined in the policy document you received. We have undertaken an initial evaluation by an assessment panel which eliminated many of the allegations but recommended a subset of the allegations to be further investigated by the conduct review committee. The list of allegations was shared with you.

MORENS_SUBPOENA_006812
MORENS_NIH_015816
REL0000478636

I accept your request for a deadline extension to June 12th. You may enlist the assistance of others and I encourage you to request that they honor the confidentiality of the process.

Point 1: To date, the NAM has not conducted its own investigation of the allegations. We have identified a subset of materials for further investigation which were referenced in the April 11, 2022 letter.

Point 2: I apologize for not providing information about the conflicts evaluation. We conducted a thorough evaluation of the conflicts of the assessment panel and conduct review committee members and none were identified.

Point 3: We identified selected references from the list provided in the original letter with the allegations and added one reference that is publicly available on the NIAID's website. These materials and any response you provide are the only materials that the Conduct Review Committee will consider.

Point 4: I should have asked if you have the results of an external investigation related to the allegations under consideration. If you have any such results, please share them.

Point 5: You are correct that our policy does not include a provision to meet with the conduct review committee and I cannot offer you this option. I invite you to submit additional materials if you believe they are relevant.

I want to assure you, personally, that the confidentiality requirement and following our process are my top priorities. I have discussed this with all individuals involved and have not shared information with anyone other than the assessment panel and conduct review committee members. My communication with the representatives of those who wrote the original letter was to confirm receipt of the materials and explain that we would be following our conduct review process.

I would be happy to connect with you, by phone or Zoom, to discuss.

Best,
Elena Fuentes-Afflick, MD, MPH

Subject: Reporter inquiries re. the confidential NAM process of dealing with alleged code of conduct violations

Dear Victor, Elena and Kim,

I was very concerned to have received three separate press inquiries today regarding a story in *Fox News* (https://www.foxnews.com/politics/house- republicans-ecohealth-alliance-concealed-data). I am not planning to respond to these questions.

As you can see in the *Fox News* article, yet another partisan political letter has been made public with unsubstantiated and clearly politically motivated allegations against our organization and myself. In the article, an aide to Representative McMorris Rodgers states that "*After receiving our letter, NAM notified us they had opened an internal review of Daszak's behavior, per our request…We believe this letter about EcoHealth's potential false statements and fraud is relevant to the ongoing investigation the NAM is conducting into Peter Daszak, so we have sent NAM a copy of this letter as well.*"

In your letters to me, and by phone, you reassured me repeatedly that the process of deciding whether to investigate these allegations was confidential on the NAM side, and you urged me to also treat correspondence with NAM on this issue as confidential, which I have. However, it appears that this is not the case, in that NAM has informed the Republican staff of intent to review my 'behavior' and that this has now been made public, as I indicated could happen in my letter to you last week, April 22, 2022.

It seems rather evident that the letters you have received are part of an ongoing and systematic political campaign to destroy EcoHealth Alliance's reputation and my own, with the ultimate target of undermining the NIH, Dr. Fauci, and the Biden White House. They are hyper-partisan and disingenuous in their goals, in that the letters and the fact they are simultaneously made public on *Fox News* and *Twitter*, are clearly designed to push a false narrative. EcoHealth Alliance has repeatedly and publicly refuted such allegations in our responses to NIH that have since been made public (e.g. https://www.wsj.com/articles/coronavirus- study-of-bats-in-china-met-nih-grant-requirements-ecohealth-says-11635441406) and in carefully given interviews with the press (e.g. https://www.science.org/content/article/we- ve-done-nothing-wrong-ecohealth-leader-fights-charges-his-research-helped-spark-covid-19 and https://theintercept.com/2022/03/11/covid- nih-ecohealth-peter-daszak-interview/).

Given the developments today, I urge you to reconsider your decision to investigate these allegations, which have nothing to do with my adherence to the rules of conduct of NAM members, and to respond to the Republican accusers to state that they do not rise to the level whereby an investigation is warranted. I believe this is justified by the one-sided political nature of the attacks, the lack of prima facie evidence for the allegations, and the fact that your communications have already been made public in defiance of the confidentiality of the matter that NAM and EcoHealth Alliance have maintained. I'm very concerned that this public witch hunt will be damaging not just for myself and our organization, which has consistently produced cutting edge research on emerging diseases that has been fundamental to a series of NAM publications, but that it will also be damaging to NAM and the Academies in general. If you do not stand up to these politicized attacks at this point, they will surely continue and drag in other members of the Academies who have been publicly criticized and accused by the same politicians for the last two years, and who are being continually attacked by various fringe groups espousing conjectural hypotheses about the origins of SARS-CoV-2, in spite of the increasing scientific evidence supporting the spillover from bats through an intermediary host to humans.

This active political interference with stewardship of science, the integrity of science, and the pursuit of knowledge by scientists, goes well beyond EcoHealth Alliance and threatens the integrity of the entire U.S. scientific enterprise. It is no different except in volume than the incontrovertible political interference by Donald Trump in the scientific enterprise at NIH in April 2020, which prompted you to issue a public statement about the separation of politics from science in response. Your words and those of Marcia McNutt ring even more true at this point: *"Any efforts to discredit the best science and scientists threaten the health and welfare of us all"* (https://www.nationalacademies.org/news/2020/09/nas- and-nam-presidents-alarmed-by-political-interference-in-science-amid-pandemic). EcoHealth Alliance, myself, the NIH, Tony Fauci, NAM and you are in the cross-hairs now because NIH failed to protect science and scientists from Trump's overtly political, and sadly successful, effort to close down research that was politically inconvenient. I worry that this is just the beginning of the goal of this anti-science agenda, and for that reason it demands brave, bold, and decisive action.

Yours sincerely,

Peter

Disappointing your editor doesn't get it yet.

All off-the-record, but please talk to your editor about how hard we argued with the China side re. whether live mammals were being sold or not. The fact that we couldn't state categorically in the WHO report that live mammals of species known to host SARSr-CoVs were present in the market was used by the lab leak contingent to ridicule the evidence we did find – frozen ferret-badger & rabbit carcasses left behind after the cleanout. Anyone with half a brain could see what was going on here, but having that paper as evidence would have built a much stronger case in my opinion.

Also mention to your editors that the truth will out – there are papers coming down the pipeline that add weight to a bat-int.host-human pathway and zero for the lab leak BS. This article will be one of the few right now that gets on the right side of history – surely that matters?

Cheers,

Peter

Thanks, David.
I just got off a video conf call with the current editor in NY (the one asking all the latest questions). He's very nice and I feel like he gets its. He thinks it's a fascinating story.
Problem we have in journalism is that there are some people who aren't interested in actual journalism and telling stories; they want to climb to

MORENS_SUBPOENA_013153
MORENS_NIH_024960
REL0000478639

the top and manage people. I rejected the latter route 10 years ago, but am so grateful that I still get to meet so many remarkable people, visit cool places and see all aspects of humanity.
A difficulty working for a NY-based organization is that it's assumed that all the best people are in NYC, so being in Melbourne (where I need to be to be close to my kids in Adelaide), is that folks consider Australia a backwater and, by association, I mustn't be all that important/valuable. But my new role as "global biosecurity czar" is helping somewhat. Ahhhhh... Office politics!

Jason, all I can say is that it must be harder to be a journalist than a scientist…. I had no idea someone at your level would get pushed back.

Usually i get from one to 4 reviewer responses to a ms. and three of those are out to lunch. Occasionally i get a reviewer who really understands the work: half of those are helpful, the other half are trashers.

Maybe it's like being in the government where i am: there is endless push back, but the push-backers are brainless idiots who don't know what they are talking about.

Do you ever get to a point where the editors leave you alone on the science? Or do they all think they are science geniuses? d

External Sender. Be aware of links, attachments and requests.

Hi guys, in case you have nothing better to read over the weekend, this is some of the dialog I am having with editors in the U.S. Essentially, my response to questions from editor #6.
I thought I could claim victory when it looked like the story could be published this morning, but the editor of Businessweek objected and thinks he can make it better with another revision and an ETA of Tuesday. Sigh.
Jason

> Hi.
> Thanks for the feedback and the questions, which I have tried to answer in detail.
> It's often easier to have a conversation over Nexi or the phone to explain nuanced information, or details that are clear to me, but might not be to someone coming at this fresh, but that's tricky with the time difference.
> When you look back at what's happened here, it seems that in trying to deflect blame for the pandemic, which became increasingly vicious as the cataclysmic nature of the Covid-19 pandemic unfolded around March-April 2020, China tried to conceal a very obvious, very plausible source of the pandemic: it's flourishing wildlife trade (worth about $90 billion in 2016).
> It was an obvious cause of the pandemic because an almost identical scenario triggered an international outbreak caused by a very similar coronavirus (SARS) in 2003-04.
> But in attempting to cover up the wildlife trade, and making like there were never any wild animals being sold in Wuhan's wet markets, things began to backfire on China; questions were raised about the nearby lab studying these coronaviruses. The more geopolitical, heated and vicious the arguments and accusations became, the less cooperative China became. In response, the more intent/adamant some groups have become in their belief that China is covering up a lab-leak. It's become a vicious circle. If China isn't coming clean on the wild animals, what else is it trying to hide?? China's defensiveness means we may never get the cooperation needed to find the answers. If China had been honest and transparent about the wild animals in

MORENS_SUBPOENA_013155
MORENS_NIH_024962
REL0000478639

the wet markets, it might not be in this mess now.

Anyway, here are my response to your queries in green.

By the way, I wonder if the current headline:
Delayed Paper Gives Credence to Wuhan Market Covid Origin Story
doesn't convey much more than what we had 2 months earlier when we reported Xiao's findings: China Markets Sold Mink, Civets, Stoking Natural Origins Theory
Perhaps Obscured China Paper Scuppered Chance to Trace Covid Origins
would hits "China", "Covid" and "Origins" in a way that won't alienate people who already believe it was a lab-leak

<><><><>

According to the report, minks, civets, raccoon dogs and other mammals known to harbor coronaviruses were sold in plain sight for years in shops across the city, including the now infamous Huanan wet market, to which many of the earliest Covid cases were traced. The evidence collected over 30 months by **Xiao Xiao** a I'D NAME HIM HERE [[i don't know that naming a researcher no one has ever heard of adds much]] researcher working at a lab affiliated with China's Ministry of Education was hastily drafted into a manuscript and submitted to a scientific journal [Joel, we cannot name the first journal they delivered it to because the authors decline to give us the name, saying it may affect their future chances of being published] in February 2020, just weeks before the outbreak was declared a pandemic.

<><><><>

While the study received wide attention when it was eventually released by a different publisher [Publisher (Springer Nature) and publication (Scientific Reports) are different. Might add confusion DO YOU WANT TO ADD NAME HERE?], its long and torturous journey to publication gave **Chinese officials an opportunity to weave alternative narratives in which the virus may have come from abroad, even from a U.S. Army biological research facility**. [the stuff in bold is not contested and we go on to show how that happened, documenting with links when available]I TWEAKED WORDING HERE BUT THIS STILL ISN'T QUITE RIGHT. IF THE REPORT HAD BEEN PUBLISHED EARLIER CHINESE OFFICIALS COULD STILL HAVE DONE WHAT THEY DID—THEY COULD HAVE JUST SAID THE REPORT WAS SHODDY, OR WHATEVER, AND THEY ALSO COULD HAVE JUST IGNORED IT. I disagree. The evidence that Xiao et al provide was meticulously documented and supported by photographs that would have been

difficult/impossible for China to dismiss (as older published photos and media reports had been). What's more, Newman understands that Xiao collected blood-sucking ticks from the wild animals he studiously cataloged. His frozen tick samples could be tested for blood/antibodies/virus, which could be extremely helpful in identifying infected species PRIOR to December 2019. The WHO team knew nothing of this, so couldn't have asked China for this research or any results, had they actually done the research. The delay in the publication of Xiao's paper delayed the evidence that there were live animals sold in the Huanan market. The WHO researchers couldn't have asked about tests on wildlife that ostensibly were never there. Likewise, Chinese authorities couldn't have done the tests on animals that didn't exist. The problem is that in January and February 2020, it was widely assumed the animals HAD been there and that the necessary tests and tracing of animals (the sampling of animals on farms they were raised on, testing of farm workers, animal hunters, transporters and traders **had all been done** by researchers in China -- the very things that ultimately led to the discovery of the origins of SARS and of MERS viruses. **None of these things were done** (or at least, there is nothing publicly available to show that they were done) **because the animals "weren't there"**. Now that we all know they were there, China as lost considerable face. The issue has become so political than there is much less/?no willingness to cooperate and conduct the additional research that the WHO-led team recommended. Ideally, Xiao 's ticks should be studied, but it's doubtful that will now happen (I wouldn't be surprised if he's been ordered to incinerate them!) Hope this is clear.

<><><><><>

An international team of experts convened by the WHO traveled to Wuhan earlier this year to seek answers—a trip that might have yielded different results if the scientists had known about the work of Xiao Xiao, a virologist whose roles straddled epidemiology and animal research at the government-funded Key Laboratory of Southwest China Wildlife Resources Conservation and at Hubei University of Traditional Chinese Medicine.‘MIGHT HAVE YIELDED DIFFERENT RESULTS’ SEEMS HIGHLY SPECULATIVE. WHAT RESULTS DID IT YIELD? I’D CUT THIS GRAF
As mentioned above, the WHO-convened team of researchers was told by market authorities, vendors and regular market visitors that there were no live animals sold in the Huanan market. That undermined completely the premise that the Huanan market was the kind of place where live animals from different species are stacked in cages, with urine and fecal material drips from one cage to the one below it, where there are splatters of blood and guts from

animals, and lots of potential for the spread of diseases from one species to another (including Homo sapiens). Instead, the market (and one other one known to have been selling live wild animals in 2019) was presented as selling only frozen wild animals and aquatic species and things unlikely to be the source of SARS-CoV-2. The WHO researchers were told there were frozen ferret badgers and other wildlife found in freezers. Some of the carcasses actually came from Yunnan, the province where the closest coronavirus related to SARS-CoV-2 was found in bats -- thus establishing a potential route from Yunnan to Wuhan in wildlife. That was actually important. When the researchers showed their Chinese counterparts photos of caged raccoon dogs taken in the Huanan market by Prof. Edward Holmes five or six years earlier, they were told by Chinese scientists that the photos may have been faked, and that the market had ceased selling such live animals anyway. The WHO researchers saw no evidence (empty cages, animal pelts, etc) to dispute what the Chinese scientists told them, although they did smell "animals" -- but were told they were smelling rotten meat, sewage etc. Three people associated with the WHO-led mission told me that they didn't believe the information they were given by anyone associated with the market. But since there was no evidence to the contrary, they were unable to push the Chinese scientists further on this. T**he fact that the mission concluded that frozen, not live wild animals were sold in the market undermined the thesis that Covid resulted from an animal spillover**. And the absence of strong evidence pointing to a spill over from wild animals to humans made the lab-leak theory look, in relative terms, more plausible.

<><><><><><>

Six months and two revisions later, the journal’s publishers rejected the paper. “They did not think it would have widespread appeal,” says Newman, who declined to name the publication [do you want us to say why he won’t name it? I don't think it's necessary. There's no upside for scientists to make a publisher look bad (most journals are published by a handful of publishers)] “It caused us, especially our Chinese co-authors, concern that these data would not be taken seriously.”

<><><><><><>

The manuscript underwent a third revision to include data on China’s pangolin trade networks (an earlier study, later contested, had implicated pangolins in the virus’s spread to humans)WHO ASKED THAT THIS INFO BE INCLUDED? (I did, because we're trying to explain here why WHO missed the significance of Xiao's evidence. The WHO was slammed

by other papers being submitted PLUS Xiao's paper had a weird title. That title seemed relevant to the authors back in January-February 2020, when pangolins were considered a possible SARS-CoV-2-spreading culprit. But in October 2020, pangolins were off the hook, so the title would have seem irrelevant/unimportant at first glance at WHO). It was then sent to the online journal *Scientific Reports.*

<><><><><><>

The China-based researchers had reason to be cautious. In February 2020, the China Center for Disease Control (CCDC lets not use "CCDC". It's not commonly used like the U.S. "CDC" is, and it's going to force readers to go back and figure out what the "CCDC" is) prohibited scientists working on Covid-relate

<><><><><><><><>

~~CCDC~~ Disease detectives arriving from Beijing (think this makes it clear that these are China's disease "feds" arriving) on the first day of 2020 ordered environmental samples to be collected from drains and other surfaces at the market. Some 585 specimens were tested, of which 33 turned out to be positive for SARS-CoV-2. “All current evidence points to wild animals sold illegally,” China CDC Director George Gao and colleagues wrote in the agency’s weekly bulletin in late January. All but two of the positive specimens came from a cavernous and poorly-ventilated section of the market’s western wing, where many shops sold animals.

<><><><><><><><><>

~~The information void kindled a raging political debate that’s already caused a trade war between China and Australia, as nations~~ demand to know ~~how Covid emerged.~~ Australia in April 2020 called for a global inquiry into the origins of the pandemic, including China’s handling of the initial outbreak. Days later, then-U.S. Secretary of State Mike Pompeo used part of his Earth Day message to call on China to close its wet markets to “reduce risks to human health inside and outside of China.”

Based on a discussion today with someone with knowledge of the WHO-led mission to Wuhan in Jan-Feb 2021, a significant catalyst for China's defensiveness is the emergence of **claims for reparations** that extended from the finger-pointing at China's wet markets. These surfaced in April 2020, and have continued as recently as June 2021 (when Trump pushed for it again at a rally in the Midwest)

SO IS THIS THE POINT AT WHICH CHINA, WHICH SEEMINGLY ACCEPTED THE WET MARKET HYPOTHESIS, BEGAN TRYING TO CREATE A DIFFERENT NARRATIVE? (I think it was incremental. I believe China was embarrassed that its citizens were still buying wild animals in wet markets to eat -- a well-known hazard for zoonotic disease transmission that China tried unsuccessfully to outlaw almost 20 years ago. But that embarrassment/humiliation morphed into rigid denial and obfuscation when governments began openly blaming the Chinese Communist Party and agitating for China to pay reparations for the pandemic. See these clips:

- USA Today: Blame the Chinese Communist Party for the coronavirus crisis: Coronavirus crisis proves communism is still a grave threat to the entire world. If Beijing had just been honest, the pandemic could be preventable. April 5, 2020

In response, Geng Shuang, a spokesman for China's Foreign Ministry, denied "wildlife wet markets" existed in the country. Government researchersCAN WE BE MORE SPECIFIC? Twenty-two researchers from mostly nationally-funded laboratories (I think it's the Chinese equivalent of the NIH in the U.S.) and institutes attached to the Chinese Academy of Sciences) now dismiss the market hypothesis completely. "SARS-CoV-2 could not have possibly evolved in an animal market in a big city and even less likely in a laboratory," they wrote in a paper released last month ahead of publicationWHERE/WHEN WILL IT BE PUBLISHED? It was released as a "pre-print" on a Chinese academic repository ahead of publication that appears to be managed/owned by the Chinese Academy of Sciences. Papers are usually released in pre-print form before they have been accepted for publication or peer-reviewed as a way of expediting public access to the information. In this case, there is no information to suggest if, where or when the paper will be published.

<><><><><><><><><>

A more recent paperBY WHOM? (China CDC's Gao and eight other scientists mostly from the Chinese of Academy of Sciences' institutes) contends that the virus may have been imported from multiple locations worldwide, including parts of Europe where mink are raised in areas inhabited also by horseshoe bats known to harbor coronaviruses. "The official narrative changed not because the evidence changed," says Robert Garry, a professor of microbiology and immunology at Tulane University's School of Medicine in New Orleans "A spillover from a wet market was what caused SARS, and, embarrassingly for China, those wet markets were never shut down." Garry is the co-author of one of the earliest papers on the origins of Covid but wasn't involved in the research on Wuhan's markets.

<><><><><><><><><>

I DON'T REALLY UNDERSTAND WHAT POINT THIS GRAF IS TRYING TO MAKE. This is intended to demonstrate the kind of gaslighting that has occurred. Some of the WHO-led researchers are veterinarians and zoologists -- they know what animals smell like, and could smell their lingering presence a year later, but were told essentially that it

was impossible that they were smelling animals because **there "were no live animals there"**.) The researchers noted a mixed smell of animals and disinfectant in some areas of the market, but they were told by the market's manager that they were probably smelling the lingering stench of rotten meat and sewage, according to a joint WHO-China report. [should we add "according to Laing Wannian etc here? Liang Wannian was the leader of the Chinese research team collaborating jointly with the WHO-led research team. The source for the above description are in the annexes to the official joint WHO-China report released at the end of March 2021.]

<><><><><><><>

Earlier the same day, the international research team visited Wuhan's larger Baishazhou market, where Xiao had regularly surveyed two sellers of live wild animals. Yet the group was told only frozen food, ingredients, and kitchenware were on offer there. Liang Wannian, an epidemiologist who led the Chinese experts collaborating with the WHO-convened team, says his group had no knowledge of Xiao's data either. [if the above information on what the delegation saw all comes from this same source, maybe we should include his name higher up (The source for the description of what the origins researchers saw on Jan. 31, 2021, comes from the official 120-page joint WHO-China report and its 193-page annexes, not from Liang. Since we are essentially accusing China of concealing the information that Xiao documented, we asked Liang at a press conference in late July 2021 when the Chinese team first knew about Xiao's findings -- that the Huanan market and three others in Wuhan were selling live animals permissive to SARS-CoV-2 infection -- and what research China has done subsequently as a follow-up on this information? Liang gave a very long-winded response in Chinese in which he said essentially "we didn't have that information in January-February 2021 when the research team was in Wuhan". I think it's important we keep this to demonstrate that we have tried to ascertain what China knew/has done and have given the Chinese researchers the opportunity to respond. In addition, I have emailed China CDC Director George Gao at least twice and not received any response.]

<><><><><><><><>

Among the earliest clusters of infections recorded in Wuhan, one involved three Covid cases among staff working at a stall in Huanan. One of the employees, a 32-year-old who fell ill on Dec. 19, traded goods back and forth between the Huanan and Baishazhou markets.
WHERE DOES THIS FACT COME FROM? NOT THE REPORT, RIGHT?

WHEN DID IT FIRST BECOME KNOWN? This information was from the joint WHO-China report released in March 2021, however, the WHO-led researchers went to the Baishazhou market more as a demonstration by the China team of what a perfectly functioning large food market looks like. The WHO-led team was oblivious to Xiao's research that showed there were at least two stalls in Baishazhou that had been selling live wild animals for human consuption. So this detail and its significance was lost on the WHO researchers at the time.)

<><><><><><><>

A confirmed case linking two markets that sold wild animals is “very intriguing,”says Stephen Goldstein, a research associate in evolutionary virology at the University of Utah in Salt Lake City. But tracing any contact the employee might have had with infected wildlife is impossible now that the animals are long gone.WOULD TIMELY PUBLICATION OF THE REPORT HAVE CHANGED THIS? It's unlikely that Xiao et al's paper would have been *published* soon after It was drafted in February 2020, but it could have been *released* as a pre-print ahead of publication and peer-review that same month. That would have **confirmed** what almost everyone had suspected: that there **was** a flourishing wildlife trade in Wuhan that provides a plausible pathway by which coronavirus-infected wildlife from Yunnan and beyond could have introduced the virus to the city, sparking the Covid outbreak. It's also possible that swift recognition of these potential wild-animal vectors could have allowed scientists to test them for the virus and for antibodies against the virus while they were still alive (perhaps not the ones from Huanan, but wildlife in the three other Wuhan markets). Because of the statements the Chinese authorities had been making in January and February that strongly supported the animal spill over theory, it was assumed that this research was being done. Of course, the pandemic was raging then, so it would have been challenging. But, because of the denial by Chinese researchers that wild animals were being sold in Wuhan wet markets before the pandemic, there was never that level of follow up. At least, if there was, it was never made public.)

<><><><><><><>

“It seems to me, at a minimum, that local or regional authorities kept that informationWHAT INFORMATION? (that Wuhan had a flourishing live wild animal business going on in its wet markets before the pandemic) quiet deliberately,” Goldstein says. “It’s incredible to me that people theorize about one type of cover-up, but an obvious cover-up is staring them right in the face.”

Hilarious – love the NEJM 'article'. By the way, we're funded a little bit by Reckitt Benckiser, the makers of Lysol and Dettol. We've been getting funds from them since before the pandemic, but when this took off, they had to actually respond to DJT's inane ramblings:

https://www.wsj.com/articles/lysol-maker-warns-against-internal-use-of-disinfectants-after-trump-ponders-treatment-options-11587746107

Also, they actually tested lysol against SARS-CoV-2 and it works, so they now use it in their ads. We helped them get samples, and edited the paper – me and Jon Epstein are co-authors on a paper coming out soon.

Cheers,

Peter

Just reading about Kamala Harris' role in the Biden White House. If only it was possible to reach her that could make a difference in this being heard in the administration. Not only is this an issue of scientific integrity, which they should believe in, but it has very pragmatic relevance to the way we are going to be seen internationally with respect to WHO and the global community affected by COVID, which should be a priority for this administration, and our ability to play a role in mitigating future threats and that it wholly dependent on whether we are supporting crazy stuff or using science diplomacy (in this case it is Peter and his entre in China and at WIV) to become

involved.

The crap coming from the State Department and "intelligence" (sometimes hard to use the term for some of the people involved) must be tamped down. Pompeo isn't there anymore; haven't they heard?

Finally the attached is to provide a smile today – one a day is a really good thing – although you may already have seen it and have had your allotted smile. I learned that the 5 authors are the control group for this paper.

Jerry, i am not sure what the next step should be. You are better at thinking these things through snd have higher placed contacts. There may be no slam dunk, but every little bit of push back may have value. A short letter to the editor can't hurt and these are screened by a different staff which looks for balance. A gentle prod that the emperor's new clothes are threadbare has a chance of getting heard. D

> So what's the rebuttal? The Washington Post won't be interested in denigrating their own editorial board opinion pieces. Its interesting that the guy in charge of the editorial board, Fred Hiatt, is the son of a former Dean of Harvard School of Public Health, Howard Hiatt (now 95 years old). This made me think about connecting with former IOM President Harvey Feinberg (who succeeded Howard Hiatt at HSPH) and figuring out some way to respond publicly to the WaPo stuff. Harvey chose not to support the letter I organized to the NASEM presidents, or to sign on to the Op-Ed in The Hill, but that probably doesn't capture his views or concerns, which I believe are rather to the left.

I think there needs to be some response which won't be buried by the attention now devoted to the stimulus package, voting rights, Andrew Cuomo, filibuster and getting vaccine out to people and in their arms, to the exclusion of most everything else. I'm wondering if there is some way to stimulate the editorial team at Science, Jon Cohen, Meredith Wadman, also Kai Kupferschmidt to write something about the follow up from NIH to Peter, the threats, the security, the WHO team and the fact he is the only American to be selected by WHO and the only one who has personal connections to Wuhan to be able to have real conversations about what happened. I'm willing to reach out to prod them along. 60 minutes would be another given the program they did last year, and the interest in the WHO report which will greatly increase when its published and the yahoos begin to denigrate its value.

David, what do you think might be a next step (note I sent this to your gmail account so if you respond to all it will stay just among us friends and colleagues). I'm willing to get on it.

Wuhan lab at heart of COVID outbreak may get three more years of US funding

By Post Editorial Board
February 21, 2021 | 5:37pm | Updated
Enlarge Image
<image004.jpg>
The Wuhan Institute of Virology in Wuhan, China. Photo by HECTOR RETAMAL/AFP via Getty Images
The Wuhan Institute of Virology remains the most likely source of the coronavirus pandemic, yet it is set to receive US taxpayer dollars for the next three years. Worse, the cash will fund more animal research.
The National Institutes of Health told the Daily Caller that the Wuhan lab has an active Foreign Assurance file that authorizes it for US funding until 2024. When the virus first broke out, the Wuhan Institute had reportedly been testing coronaviruses in bats with $600,000 of US funding routed via the nonprofit EcoHealth Alliance.
The NIH terminated that EcoHealth grant, with the promise to restore it if an independent investigation cleared the Wuhan Institute of involvement in the outbreak. Now a World Health Organization delegation tasked with investigating the lab has preliminarily concluded that a leak was "extremely unlikely," which may let the contract resume. Never mind that the head of the WHO and the US State Department remain unwilling to rule out that possibility.
Here's where it gets really swampy: Not only did the WHO delegation fail to do its own investigation, merely accepting reports from China's government, the WHO team's only American member happens to be the EcoHealth Alliance's president, Peter Daszak — who demands that Washington unequivocally accept the delegation's findings. (This also tells you how pathetic the whole WHO investigation was.)
Anthony Bellotti, who heads nonpartisan watchdog group White Coat Waste Project, called for EcoHealth to be stripped of funding and asked Congress to finally conduct a real investigation into how the pandemic really started.
If this grant goes ahead, you'll know the Biden administration is committed to restoring Washington business-as-usual in all its disgusting ingloriousness.

Subject: Re: COVID-19 Commission: Need approval of minor edits after first peer review

Yes Jeff, we discussed this at length and we agreed to send this out for peer review - with the understanding that the manuscript would be modified pending the comments. Now that a referee agrees with my assessment, this needs to be addressed in a forthright manner. My recommendation is that you accept the referee's criticism by stating that at least one of the Commissioners agrees and the language in the document has been modified accordingly. That's the only honest answer I can think of. It will also protect the entire LC from future backlash from the virology community.

One way to go is to add a sentence, that there was not consensus in your statement giving equal weight to zoonotic spillover vs lab leak GOF research and at least one of the Commissioners feels that body of scientific evidence overwhelmingly supports the former. This is a simple statement of truth and one that would give our document greater intellectual heft.

Thank you! Peter

Dear Peter,

We have already discussed this at length and agreed long ago not to state relative probabilities.

Our report is balanced, measured, and circumspect. I will revise the sentence to reflect that we had a session with top scientists and that as Chair I consulted extensively on the topic (after the chronic lying by Daszak and duplicity of other TF members).

> Response: Thank you for this feedback. The Chair conducted extensive consultations on this issue with independent experts and the Commission hosted a session with a group of international experts who advised us clearly and cogently that it is not possible nor prudent to place estimates of feasibility or likelihood on either scenario, so we have left the manuscript as it is without implying either scenario is more likely. Both scenarios should be taken seriously.

Sadly, you didn't attend the session because you told me late that you simply had too much work to do. Moreover, I invited Mike Worobey just as you requested, and he also cancelled without a single word of explanation before or after!

As my co-authored PNAS article explains, I believe that NIH and EHA have behaved very badly in this matter, opposing transparency at every step.

Jeff

>
> *2. Pages 25-28. The current manuscript implies that these 2 hypotheses have a 50:50 relationship. In my opinion, both natural spillover and lab escape hypotheses are feasible. But the current evidences do not support that they have equal likelihood. Several evidences suggest that SARS-CoV-2 is a product of natural virus recombinations. I entirely agree that SARS-CoV-2 can be THEORETICALLY generated in a lab. But there is hardly any direct evidence to show such work has been conducted. There is no solid evidence to show that was lab accidents or lab escape event in Wuhan.*
>
> Response: Thank you for this feedback. We conducted meetings with a group of international experts on this subject, who informed us that it is not possible nor prudent to place estimates of feasibility or likelihood on either scenario, so we

MORENS_SUBPOENA_007156
MORENS_NIH_016308
REL0000478645

have left the manuscript as it is without implying either scenario is more likely. Both scenarios should be taken seriously.

This is not a 50:50 situation by any means, in fact the outrage from the community of virologists after Jeff's recent PNAS paper on the subject should be a wakeup call to the dangers of citing false equivalency.

Also, Jeff's response is not true. We did not conduct meetings with international experts, he organized a single meeting with unqualified scientists from other fields. Therefore, this language must be altered to both accommodate the referee and reflect the reality that the lab generated hypothesis remains viable but unlikely.

Many thanks, Peter

Yes, this is difficult. But let us view-it as a process, and not despalr at every twist and turn.

There will be many twists and turns, but they do not predict the outcome. The outcome is that the important scientific work that needs to be done, will be done. And the questions that need to be answered will be answered. And in the history books, your place is already assured

That said, the challenge is how to keep from despairing until we get to the finish line…

I had a very long phone chat with Tony tonight. He called because he is getting nervous about scheduled testimony before Congress a few weeks from now, and wNts to be reassured on multiple technical points, also asking that i help him do a "murder session", an internal run through in which surrogates attack him as if they were Republican nut jobs, and he practices how to respond

In that discussion he asked me to reassure him it was not a man made virus, that Bob Redfield was in lala land re his recent statements, and i also relayed to him, in some detail, our phone discussion today in which i told him that you had convinced me that broad viral sequencing across the 5-6 countries would yield the virus origin, and i told him i pressed you on that, that you convinced me, and that therefore it was critical the work go forward.

Admittedly, he is more concerned with his own being squeezed than with the fate if your work, but also realize that at the end if the day he is Always going to support what the science says.

On another subject, don't forget to send me your thoughts on at least 5 or so top research things that need to be done to get to the bottom of not only viral origin but also prevention/ control of future pandemic emergences

> You've got it exactly right Jerry. I've had a tough day – trying to hang on to a funder this afternoon, then trying to talk sense to a former board member who said I've brought ecohealth into the crosshairs. I told him our work did that, not me, but he says I came out too strong on the 'debate' from the beginning. So frustrating, not to mention this is no debate, these are two hypotheses with very imbalanced weights of evidence, in fact one has zero evidence. He wasn't listening – just buys into the idea that China was probably 'up to something'.

Cheers,

Peter

There is always the clash between special knowledge and expertise versus conflicts of interest because of personal bias, at least in the minds (such as they are) of some who see the world differently. Our only recourse is to declare our potential for a true biased conflict of interest to be open and truthful and to insist, like a juror, that we can review evidence and reach conclusions based on the evidence obtained and presented. Otherwise there is no reason to become trained and expert in any area of science. As in the past just claim special knowledge and expertise – or the not very distant past like Trumps claim to know more than everybody else when he propped people with COVID ingest or be injected with bleach to kill the virus (it can't grow in a dead person killed by bleach) – and skip the years and the costs of education and training.

Really good to see this– the 2nd sentence in particular is extremely valuable:

"However, misinformation, unsubstantiated claims, and personal attacks on scientists surrounding the different theories of how the virus emerged are unacceptable, and are sowing public confusion and risk undermining the public's trust in science and scientists, including those still leading efforts to bring the pandemic under control."

The comment about "minimizing conflicts of interest" and implying that natural origin and lableak are just two scenarios worth investigating, is of less use – the WHO mission is the only viable game in town to do this work, and I've been accused of having 'egregious' conflicts and this was pointed to in the Science letter that David Relman coordinated. Can't

MORENS_SUBPOENA_020134
MORENS_NIH_040658
REL0000478646

help this undermines my role in the work. It also undermines the WHO work, which clearly indicated that one of these scenarios was far more likely. Given the paper in Nature on live wildlife trade in Wuhan this week, and the paper in Cell on another close virus from bats in China, it seems one is clearly more worth our concern than the other – that's how science works, is it not – hypothesis, data, thesis (conclusion)…?

Let Scientific Evidence Determine Origin of SARS-CoV-2, Urge Presidents of the National Academies

Statement | June 15, 2021

The origin of SARS-CoV-2, the virus that causes COVID-19, and the circumstances of the first cases of human infection, remain unknown. Science is our best tool to ascertain, or to understand to the extent possible, the origins of SARS-CoV-2 and COVID-19, which could help prevent future pandemics. However, misinformation, unsubstantiated claims, and personal attacks on scientists surrounding the different theories of how the virus emerged are unacceptable, and are sowing public confusion and risk undermining the public's trust in science and scientists, including those still leading efforts to bring the pandemic under control.

We urge that investigations into the origins of SARS-CoV-2 and COVID-19 be guided by scientific principles, including reliance on verifiable data, reproducibility, objectivity, transparency, peer review, international collaboration, minimizing conflicts of interest, findings based on evidence, and clarity regarding uncertainties. In the case of SARS-CoV-2, there are multiple scenarios that could, in principle, explain its origin with varying degrees of plausibility based on our current understanding. These scenarios range from natural zoonotic spillover (when a virus spreads from non-human animals to humans) to those that are associated with laboratory work. Scientists need to be able to evaluate all of these scenarios, and all viable hypotheses, with credible data. Data accessibility, transparency, and full cooperation from China, of course, will be essential for a proper and thorough investigation.

Although much still needs to be done to stop the pandemic, particularly in developing nations, science has made remarkable headway, especially through the rapid development of effective vaccines. The same scientific robustness, rigor, and cooperation should be applied to examining important questions about how the pandemic began.

The more the merrier as we say in the UK!

I think our goal should be to really get a lot of support from all segments of society. We definitely should avoid the claim that we are just being elitists.

EXTERNAL SENDER

Would engaging with the AAAS Committee on Scientific Freedom and Responsibility be useful? Here's some information on the CSFR from the AAAS website:

Committee on Scientific Freedom and Responsibility

The Committee on Scientific Freedom and Responsibility (CSFR) was established in 1976 by AAAS. The Committee Charter is as follows:

The Council recognizes that the CSFR, as a standing committee of the AAAS, plays a significant as well as potentially controversial role for the Association. The increasing complexity of the interactions among science, technology, and the public interest raise new issues and problems concerning the human rights, freedom of scientific inquiry, and professional responsibilities of scientists and engineers. The Association affirms at the outset that scientific freedom is grounded in basic human rights and implies special responsibilities to extend and disseminate knowledge for the good of humanity. With these perspectives in mind, and within the resources allocated by the Board of Directors, the Committee on Scientific Freedom and Responsibility is charged with the following duties on behalf of the Association:

To formulate and recommend principles and procedures to guide the Association in a continuing review of issues that affect scientific freedom and scientific responsibility, and to search for means that will effectively bring these issues to the attention of both scientists and others.

To monitor whether the actions and policies of the government of the United States, the governments of other nations, and of private organizations circumscribe or restrict the freedom of scientists or their ability to carry out their responsibilities.

To collect information on restrictions of scientific freedom and of the ability of scientists to carry out their responsibilities, and to make such information available to scientists, scientific societies, and others who may be interested in taking action to counter these restrictions.

To encourage and assist the AAAS, its affiliates, and other scientific groups to develop statements of principles governing professional conduct, and to establish policies, procedures,

and educational activities designed to encourage scientists to accept their professional responsibilities both with regard to safeguarding the integrity of science and with regard to the application of science in the promotion of human rights and general welfare.

To encourage and assist the AAAS and its affiliates to develop policies and procedures to protect scientists against infringements of scientific freedom; to collect information about the procedures of affiliated societies for dealing with documented allegations of such infringements; to facilitate communication among the societies with a view to strengthening of these procedures; and, in exceptional circumstances and within the criteria developed by the Committee, to conduct an analytic review of cases where the ramifications are deemed to be especially significant for the scientific community at large.

To report annually to the Association, through the Council–and, as appropriate, to other scientific and technological communities and to the general public–the activities of the Committee and its general assessment of significant developments during the year that affect scientific freedom and scientific responsibility and that call for examination, discussion and possible action.

As part of the attempt to fulfill its mandate, the CSFR in 1977 established a Science and Human Rights Subcommittee, specifically to address issues of human rights as they occur in relation to all these duties.

Adopted by the Committee for Scientific Freedom and Responsibility February 9, 1996.

Adopted by the AAAS Council on February 16, 1997.

LeBron was not great on the vaccine issue, he refused to rebuke Kyrie Irving, citing "freedom of choice". We need a strong NIH Director, and more forceful statements from the National Academies. I speak with Holden pretty regularly who gets it and is concerned. When I pick up my Purple Heart AAAS Scientific Freedom Medal on March 5, he'll be there and hopefully we can strategize then. So far only AAAS and to some extent AMA and AAMC seem interested or worried.

Many thanks Rich!

Hi:

I have spoken with several people about the idea of a campaign to protect science and most seem on board with the idea, but a little short on ways to implement it in a way that might get wide public acceptance.

I spoke with Keith Yamamoto at some length. He is extremely supportive. He did have some insights about the NIH Directorship. He said that Biden had taken over the selection personally and no-one else seemed to be involved. His view and mine is that that means it is dead for now. He had been talking with Harold Varmus and Bob Horvitz, both of whom are very concerned about the Republican attacks on science. I will be talking with both of them tomorrow afternoon.

I spoke with John Deutsch (ex-President of MIT) and he is supportive, but has no clear ideas of how to proceed. He did say that we should talk with Holden Thorp (as we had discussed) and get AAAS involved. I had contacted Holden previously and he and I have a talk scheduled for next week.

Some of the more interesting suggestions that have emerged are that we should try to garner support from individuals and organizations that are not viewed by the general public, or politicians, as belong to the "elite" segment of society. I am thinking that someone like LeBron James could be an excellent spokesperson if we can reach him and his views are pro-science. He seems like a decent person and so maybe he is Pro-science. There are others who fit that category such as other sports stars and even some Hollywood people. I believe George Clooney would be favorable and maybe Harrison Ford, whom I met many years ago.

Subject: Notes from our call
Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress

Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.

MORENS_SUBPOENA_018822
MORENS_NIH_038306
REL0000478651

- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
    - AAAS
    - AIDS Vaccine Advocacy Coalition
    - American Public Health Association (Georges Benjamin)
    - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
    - Association of Public & Land-Grant Universities
    - Georgia Global Health Alliance
    - Bay Area Global Health Alliance
    - Consortium of Universities for Global Health
    - COVID Collaborative
    - Global Health Council
    - Global Health Technologies Coalition
    - Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
    - International AIDS Vaccine Initiative
    - Nobel Laureates Campaigns
    - Pandemic Action Network
    - PATH
    - Research!America – Reach back out – Jerry will
    - Union of Concerned Scientists
    - Washington Global Health Alliance
    - 156 virologists letter
    - NAM
    - NAS
    - NL Campaigns (to be kept informed of progress by Rich)
    - CUGH
    - The pandemic action coalition
    - FASEB
    - Global Health technologies coalition
    - APLU (KHG has connection)
    - Wellcome Trust (Paul Schreier is the interim head).
    - Dr. Tony Fauci
    - Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
    - OSTP
    - ASV – Anne Moscona (President-Elect)

Cheers,

Peter

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee

(HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.
I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?
Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists. What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.
The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.
The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.
All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine

aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media

Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?
Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.
Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?
Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.
It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.
After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.
As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science

aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism*, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far

right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has

MORENS_SUBPOENA_018832
MORENS_NIH_038316
REL0000478651

clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter,

and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.
NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious attack. They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.

The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.

"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.

Sponsor Message

He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.

Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.

"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message

"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.

He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

MORENS_SUBPOENA_018841
MORENS_NIH_038325
REL0000478651

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Jerry

Subject: Re: Tweet by Miner Flux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

MORENS_SUBPOENA_018847
MORENS_NIH_038331
REL0000478651

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Hi:

I have spoken with several people about the idea of a campaign to protect science and most seem on board with the idea, but a little short on ways to implement it in a way that might get wide public acceptance.

I spoke with Keith Yamamoto at some length. He is extremely supportive. He did have some insights about the NIH Directorship. He said that Biden had taken over the selection personally and no-one else seemed to be involved. His view and mine is that that means it is dead for now. He had been talking with Harold Varmus and Bob Horvitz, both of whom are very concerned about the Republican attacks on science. I will be talking with both of them tomorrow afternoon.

I spoke with John Deutsch (ex-President of MIT) and he is supportive, but has no clear ideas of how to proceed. He did say that we should talk with Holden Thorp (as we had discussed) and get AAAS involved. I had contacted Holden previously and he and I have a talk scheduled for next week.

Some of the more interesting suggestions that have emerged are that we should try to garner support from individuals and organizations that are not viewed by the general public, or politicians, as belong to the "elite" segment of society. I am thinking that someone like LeBron James could be an excellent spokesperson if we can reach him and his views are pro-science. He seems like a decent person and so maybe he is Pro-science. There are others who fit that category such as other sports stars and even some Hollywood people. I believe George Clooney would be favorable and maybe Harrison Ford, whom I met many years ago.

Jeffrey Sturchio(b) (6) Aleksei Chmura (b) (6)
Subject: Notes
Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress
Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack

- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
  - AAAS
  - AIDS Vaccine Advocacy Coalition
  - American Public Health Association (Georges Benjamin)
  - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
  - Association of Public & Land-Grant Universities
  - Georgia Global Health Alliance
  - Bay Area Global Health Alliance
  - Consortium of Universities for Global Health
  - COVID Collaborative
  - Global Health Council
  - Global Health Technologies Coalition
  - Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
  - International AIDS Vaccine Initiative
  - Nobel Laureates Campaigns
  - Pandemic Action Network
  - PATH
  - Research!America – Reach back out – Jerry will
  - Union of Concerned Scientists
  - Washington Global Health Alliance
  - 156 virologists letter
  - NAM
  - NAS
  - NL Campaigns (to be kept informed of progress by Rich)
  - CUGH
  - The pandemic action coalition
  - FASEB
  - Global Health technologies coalition
  - APLU (KHG has connection)
  - Wellcome Trust (Paul Schreier is the interim head).
  - Dr. Tony Fauci
  - Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
  - OSTP
  - ASV – Anne Moscona (President-Elect)

Cheers,

Peter

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

MORENS_SUBPOENA_017761
MORENS_NIH_036365
REL0000478656

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines,

MORENS_SUBPOENA_017762
MORENS_NIH_036366
REL0000478656

hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad,* and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.
Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.
Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?
Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.
Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?
Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?
Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.
Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?
Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee]

money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.

After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading

MORENS_SUBPOENA_017765
MORENS_NIH_036369
REL0000478656

these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism,* you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or

MORENS_SUBPOENA_017766
MORENS_NIH_036370
REL0000478656

hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?" And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a

MORENS_SUBPOENA_017767
MORENS_NIH_036371
REL0000478656

COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious

MORENS_SUBPOENA_017774
MORENS_NIH_036378
REL0000478656

attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route, " says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the

MORENS_SUBPOENA_017775
MORENS_NIH_036379
REL0000478656

lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.
That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.
"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.
If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work." But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it."
He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things

MORENS_SUBPOENA_017776
MORENS_NIH_036380
REL0000478656

go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

Subject: RE: Tweet by MinerFlux on Twitter

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Jerry

Subject: Re: Tweet by MinerFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good

friend th (b) (6) rom (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

I don't think Jeff Sachs did a thoughtful reflection on what sort of damage he might end up doing by supporting the lab leak narrative and pointing the finger at US scientists. He's now dragged US science into the line of attack from China, Russia, and the US right wingers, all over again…

It's been a relatively quiet few weeks in the press for us at EHA, but I noticed some increased harassment by email etc last night. I've now found out that Tucker Carlson on Fox News decided to do a 'retrospective' on the lab leak narrative and demand investigation of US scientists including me and EcoHealth. The video's below – pretty miserable attack full of errors, innuendo and outright lies…of course… and with video of me and naming me as a person who likely started the pandemic.

https://www.youtube.com/watch?v=1MJrUew2Kyg

If you don't want to watch it (and it's extremely irritating) – just have a look at the comments on the website and you'll see where all this is going – with over a million views in one day, that's a million hard right US citizens putting US scientists on their hit lists for harrassment and worse…

Russia Jumps on Wild Claims COVID Was Created in U.S. Lab

By Ed Browne On 7/6/22 at 10:51 AM EDT

A Russian government official has demanded that Washington be "held accountable" for the COVID-19 pandemic after a pair of university professors said U.S. research organizations had more to answer for.

Since the early days of the pandemic in 2020 there has been much discussion over how SARS-CoV-2, the virus that causes COVID, came into existence.

World Health Organization (WHO) researchers sent to Wuhan, China, to investigate the first known outbreak concluded that although more research was needed, a natural spillover to humans from animals was the most likely outcome and considered a lab leak scenario to be "extremely unlikely."

At the time the lab leak scenario was perhaps more of a fringe idea and one that carried with it an air of conspiracy theory. Since then, calls for investigation into the origins of COVID, including a lab leak, have come from the U.S. president himself and the possibility has not been written off, though it's sparked animosity between scientists who disagree on the likelihood of the theory as well as between countries who are keen to offload blame.

Proponents of the lab leak theory argue that it is no coincidence that some labs—notably those in Wuhan—had been working on engineering coronaviruses in the years prior to the pandemic.

In May, two Columbia University professors published an opinion article in the U.S. journal *Proceedings of the National Academy of Sciences* (PNAS) in which they argue that animal spillover and a "research-related incident" are "the two main hypotheses" regarding the origin of COVID and that "there is much important information that can be gleaned from U.S.-based research institutions, information not yet made available for independent, transparent, and scientific scrutiny."

[redacted], an economics professor, and Neil Harrison, a professor of anesthesiology and pharmacology, went on to state that "much of the work on SARS-like coronaviruses performed in Wuhan [before the pandemic] was part of an active and highly collaborative U.S.–China scientific research program funded by the U.S. government" and that "it is still not clear whether the U.S. intelligence community (IC) investigated these U.S.-supported and U.S.-based activities. If it did, it has yet to make any of its findings available to the U.S. scientific community for independent and transparent analysis and assessment."

More recently, Sachs went further. Speaking in a discussion at the Gate Center research group in Madrid last month, Sachs said: "I'm pretty convinced it came out of a U.S. lab of biotechnology, not out of nature after two years of intensive work on this. So it's a blunder, in my view, of biotech, not an accident of a natural spillover.

"We don't know for sure, I should be absolutely clear, but there's enough evidence that it should be looked into and it's not being investigated," he said, without elaborating on the nature or substance of said evidence.

However, responding to a *Newsweek* request for comment, Sachs provided some additional insight into his thinking.

"The basic point is the US-backed and US-funded research in the US and partners in China was to perform the very kind of experiments that may have produced SARS-CoV-2," he wrote in an email.

"Indeed, in my view, that is the most likely inference from various pieces of evidence. SARS-CoV-2 is a SARS-like CoV (coronavirus) that has a Furin Cleavage Site (FCS). The US team backed by NIH was intent on introducing an FCS into a large number of previously unreported SARS-CoVs.

"My personal best guess is that SARS-CoV-2 was thereby created and that it accidentally escaped from a laboratory, perhaps the Wuhan Institute of Virology, or perhaps elsewhere.

MORENS_SUBPOENA_008186
MORENS_NIH_017974
REL0000478658

"NIH has yet not told us what it knew when. The ongoing NIH secrecy and indeed misdirection is a huge and ongoing problem," he concluded.

However, as the U.S. Intelligence Council has previously noted, and past research has suggested, instances have been observed in which furin cleavage sites—a part of SARS-CoV-2 that enhances infection—have been identified in naturally-occurring coronaviruses in the past, and that a coronavirus that was 96.2 percent identical to SARS-CoV-2 was discovered in a bat in 2013.

While the research into and debate around this particular aspect of SARS-CoV-2 continues, it is neither a definitive indicator of lab origins of the virus, nor is it a new piece of information in the conversation about Covid origins, as some outlets and commentators have purported.

It is also worth noting that Sachs' own credibility and links to China, where he holds an advisory role at Beijing' Tsinghua University, have been questioned in the light of his efforts to find the origins of the virus, with some conservative outlets branding him "China's apologist in chief."

And regardless of his genuine or purported affiliations, it is worth emphasizing that Sachs' primary expertise lie in the fields of economics and policy, rather than virology.

Newsweek has contacted the U.S. Department of State for comment.

Shortly after videos of Sachs' comments spread online, Vyacheslav Volodin, Chairman of the State Duma in Russia, pounced on the claim to criticize the U.S. and demand compensation.

In a Telegram post on Wednesday this week, Volodin wrote, translated from Russian: "Millions of sick and dead people, the global economic crisis, a drop in people's living standards are the consequences of COVID-19 for which Washington needs to be held accountable.

"To all states affected by the pandemic, the United States is obliged to compensate for the losses incurred."

It should be noted that Russian officials and outlets have been spreading debunked claims and propaganda about supposed U.S. "biolabs" in Ukraine since invading its neighboring country.

It's also not the first time that COVID origins accusations have been levelled at Washington. China, which itself has been a target of such accusations, has in turn pushed its own theories.

Several times last year, Chinese foreign ministry spokesperson Zhao Lijian suggested that the Fort Detrick military base in the U.S. should be investigated as part of the WHO's COVID investigations. China's state-owned *Global Times* newspaper has also made similar claims.

Update 07/07/22, 5:16 a.m. ET: This article was updated with comment from Jeffrey Sachs.

Importance: High

Dear all – can we set up a call maybe next week to talk about building a Coalition to protect science.

Alison – could you look at availability for the week beginning Feb 27th or March 6th for us all…

I've also attached a revised version of the Coalition concept note. Jeff re-wrote this following our call and we also reached out to a political consultant to get his input on how this would be perceived from both Dems and moderate Republicans. I added a few comments using track changes. Please feel free to add to this also.

Cheers,

Peter

Viral spread: Peter Hotez on the increase of anti-science aggression

on social media

By Sara Goudarzi | January 30, 2023

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site.

MORENS_SUBPOENA_019600
MORENS_NIH_039194
REL0000478663

Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far

right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?

Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.

Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?

Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.

After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent

anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism,* you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine

ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it,

MORENS_SUBPOENA_019605
MORENS_NIH_039199
REL0000478663

because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to pushback against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

Virologists defend their science as officials eye more oversight of risky experiments

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident

MORENS_SUBPOENA_019612
MORENS_NIH_039206
REL0000478663

or malicious attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

MORENS_SUBPOENA_019613
MORENS_NIH_039207
REL0000478663

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

MORENS_SUBPOENA_019614
MORENS_NIH_039208
REL0000478663

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

MORENS_SUBPOENA_019615
MORENS_NIH_039209
REL0000478663

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by MinerFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. This opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position

MORENS_SUBPOENA_019619
MORENS_NIH_039213
REL0000478663

That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him-and w of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Thanks David – I also had a good conversation with Dennis Carroll who's been through a bunch of these (USAID is a big target).

We're enthusiastically complying and will give them exactly what they ask for (no more). We're confident that the worst they'll find is that we filed out subcontract details late (already known by NIAID, and now fully compliant). The Stevens Amendment stuff that Jodi Ernst accused us of is pretty much garbage – we list our funders frequently and fully. I already checked a few weeks back on some of the filings from WIV – they gave us very good accounting of expenditures, so we don't expect any issues to be found of any significance.

Please let others know at NIAID that we're complying and are confident no surprises will be forthcoming!

POLITICO-Harvard poll: Most Americans believe Covid leaked from lab

Opinion on the lab leak scenario, once seen as a fringe theory, has shifted dramatically.

By ALICE MIRANDA OLLSTEIN
07/09/2021 06:00 AM EDT

Most Americans now believe that the coronavirus leaked from a laboratory in China, according to a new POLITICO-Harvard poll that found a dramatic shift in public perception of Covid-19's origins over the last year.

U.S. adults were almost twice as likely to say the virus was the result of a lab leak in China than human contact with an infected animal, which many scientists believe is the most likely scenario. The poll's findings show what was once a fringe belief held mainly among some on the political right has become accepted by most Republicans, as well as most Democrats, amid heightened scrutiny of the lab leak theory.

In March 2020, a Pew Research Center poll found 29 percent of Americans believed the virus was made in a Chinese lab and released either accidentally or intentionally. The new survey shows 52 percent believe the virus came out of a lab, including 59 percent of Republicans and 52 percent of Democrats, while 28 percent said it was from an infected animal.

MORENS_SUBPOENA_020902
MORENS_NIH_041667
REL0000478665

The absence of a large partisan gap on the issue is particularly striking, said Bob Blendon, a professor of health policy and political analysis at the Harvard T.H. Chan School of Public Health who designed the poll.

"Usually, our polls find a big split between Republicans and Democrats, so this is unique," he said. "More conservative media have been carrying the 'lab leak' issue, and it's been a Trump talking point from the beginning, so we expected people who lean Democratic would say either 'It's not true' or 'I don't know.' But the belief is bipartisan."

Blendon said Democrats likely became more receptive to the idea after President Joe Biden's recent order that intelligence agencies investigate the virus' origin and comments from Anthony Fauci, the White House chief medical officer, that it's worth digging into. Fauci and other scientists have cautioned the answer may never be known definitively.

"That the president thought there was enough evidence to ask intelligence agencies to put together a report sends a signal to Democrats that there might be something there," Blendon said.

Democratic lawmakers have also faced pressure to look more closely at the lab leak scenario, though they worry Republicans will stoke uncertainty about the virus origin for political gain. Several congressional committees have launched inquiries, and the House Science Committee plans to hold its first hearing on the issue next week.

The POLITICO-Harvard poll, which will be released next week, also found there's a high level of public interest in investigating Covid-19's origin, with almost two-thirds of Democrats and Republicans calling the issue "extremely" or "very" important. The finding also surprised Blendon, who said the public isn't typically invested in such a scientific inquiry.

The broad attention on the issue underscores the stakes for the Biden administration's upcoming report on the virus origin, due in August. Even if the report concludes the virus came from nature, it could be hard to move public opinion, lawmakers and researchers like Blendon have noted.

The poll surveyed 1,009 adults from June 22-27. The margin of error was plus or minus 3.8 percentage points.

Any help or suggestions are welcome. Cc'ing in Jeff Sturchio and Robert Kessler so they can follow this.

Rich, David – Jeff Sturchio is working with EcoHealth Alliance to help manage any statements we make at all right now. We're being as minimalist as possible, trying to avoid press, but clearly people are out to find a villain, and are pointing directly at our work, EcoHealth and me as a target.

Cheers,

Peter

Just mortified by this.

https://www.thetimes.co.uk/article/the- rise-and-fall-of-british-virus-hunter-peter-daszak-05q8brpz7

The rise and fall of British virus hunter Peter Daszak

The scientist who led opposition to the claim that Covid leaked from a Wuhan lab is engulfed in controversy after it was revealed his charity had funded the institute at the centre of the row

Peter Daszak became the face of the WHO mission to find the origins of the coronavirus

On January 18, Peter Daszak, born and raised in the mill and mining town of Dukinfield, near Manchester, awoke to a winter's dawn in central China, 5,500 miles away. "Sunrise in Wuhan — my early morning view on day 4 of quarantine — beautiful," he tweeted, with a photograph of skyscrapers against a hazy orange sky.

His presence there in a delegation from the World Health Organisation (WHO) on a mission of global significance showed a remarkable rise for the 55-year-old parasitologist with a PhD from the University of East London.

Ostensibly he was visiting the city to find the truth about where the coronavirus pandemic began before it swept across the world — killing nearly four million people. Five months later, however, the trip to Wuhan has placed Daszak at the centre of a growing web of controversy. The wry Mancunian humour that singled him out from fellow scientists of international renown has dried up.

"When you see him on the television now, he's not the funny northerner," said one old friend and colleague. "There's so much nastiness and vitriol out there, this must have been a challenging time for him."

Daszak faces questions about a crucial conflict of interest in four interlocking aspects of his professional life: his role on the WHO-led mission to Wuhan; his relationship with the

MORENS_SUBPOENA_020678
MORENS_NIH_041389
REL0000478678

Wuhan virologist Shi Zhengli, known as the "bat woman"; his presidency of a federally funded American charity that gave money to her laboratory; and his chairmanship of a commission investigating the pandemic's possible origins for The Lancet medical journal.

The Lancet commission, supported by the United Nations sustainable development solutions network, is looking, among other things, at the explosive question of whether the virus escaped accidentally from Shi's Wuhan Institute of Virology (WIV), which Daszak — like China — has consistently denied.

Critics ask how Daszak can objectively investigate something he has such fixed views about, in a lab his charity has funded. The WIV appears to have received almost $600,000 of a $3.7 million grant awarded to Daszak's EcoHealth Alliance in 2014 by the US Department for Health and Human Services for the purposes of "understanding the risk of bat coronavirus emergence".

Last week The Lancet acknowledged the conflict of interest by announcing that Daszak had recused himself from its commission. It said that in future "technical work will be conducted by independent experts who were not themselves directly involved in US-China research activities that are under scrutiny".

It was a heavy blow, and not the first time Daszak's impartiality has been in question. He strongly attacked the lab leak theory before, during and after the WHO mission, which concluded that it was "extremely unlikely". In an episode of the US TV show *60 Minutes* in March, he faced a grilling about his "conflict of interest". And in April a US congressional committee requested evidence from EcoHealth Alliance about its funding.

SPONSORED

Yet little is known about the figure in the middle of this maelstrom. How did the boy from Manchester become the president of a charity bankrolled by the Pentagon and America's National Institutes of Health (NIH), the face of the WHO mission, the Wuhan lab's biggest cheerleader and now one of the most controversial characters in the pandemic saga?

Daszak lives in New York state's wealthy Rockland county, 30 miles northwest of Manhattan. Seven years ago he and his wife Janet bought a sprawling house in two acres for

MORENS_SUBPOENA_020679
MORENS_NIH_041390
REL0000478678

$665,000. In 2019 he was paid $354,065 by EcoHealth Alliance, based in Manhattan.

It is a world away from Dukinfield, where Daszak's Anglo-Welsh mother and Ukrainian father Bohdan raised their family. One son, John, a year younger than Peter, became a tenor with the English National Opera. But Peter Daszak's passions lay elsewhere: his childhood dreams were of becoming a "zoologist in the Amazon", he told the podcast *This Week In Virology* in 2019. "I think that once you get hooked on research and finding new things out, there's something that plays to a fundamental need to discover in the human psyche."

Daszak started off with a BSc in zoology at the University of Bangor in Wales — a teacher recalls that he was "really bright" — before his PhD and postdoctoral research. At Kingston University one project proved to be a springboard. With a colleague, Andrew Cunningham, he discovered the cause of a mass die-off of frogs from Australia to Panama, unexplained for a decade. Daszak suggested that the fungus responsible was linked to the wildlife trade in bullfrogs, sold as pets or food. This was the first step in a career focused on the interaction between humans, nature and viruses.

He moved to America with his wife, an immunologist, when she got a job in Georgia. His frog fame followed him, and over the next few years his research on emerging infectious disease gained attention, partly due to outbreaks of several rare and deadly diseases in humans, including Nipah virus, ebola and Sars.

In 2001 he joined the Wildlife Trust, a small, privately funded charity that would later become EcoHealth Alliance. Throughout the ensuing decade, Daszak was adept at promoting his projects. In an interview on America's National Public Radio in 2004 he compared his frog research to a Monty Python sketch: "John Cleese goes into the pet shop and says, 'Yeah, this parrot's dead.' 'Well, actually, sir, it's just resting.' And they just looked like frogs that were resting, who were perfectly OK, but dead."

In an episode of the TV programme *60 Minutes* the same year, clad in head-to-toe khaki on a boat speeding towards the remote Malaysian island of Pulau Tioman, Daszak was referred to as a "virus hunter" off to search for bats suspected of harbouring the Nipah virus. He says: "Almost 75% of the emerging diseases in humans actually come from wildlife ... or domestic animals," he warns. "We are looking for the next HIV, the next Sars." This nascent area of

scientific study, now known as conservation medicine, shaped the next 16 years of Daszak's career.

By 2010 Daszak was busily fund- raising for the newly reconfigured EcoHealth Alliance. Millions of dollars worth of grants rolled in: 87.6 per cent of it from US government sources in 2019, including the NIH and the Pentagon.

According to one prominent scientist, who asked not to be named, Daszak did not have a laboratory of his own, nor was he performing his own research, as most grant recipients did. What he did have, however, was a network of partnerships with other laboratories, including Shi's WIV.

With Shi, Daszak helped to co-ordinate visits to remote mines in China to look for bat coronaviruses to study in the lab in the hope of getting ahead of natural spillovers into local populations. Then in late 2019 the pandemic erupted in Wuhan.

When President Donald Trump first suggested in January 2020 that the virus had leaked from Shi's lab, Daszak was quick to leverage connections and lobby colleagues to push the counternarrative that it came directly from animals.

In February 2020, he organised an open letter in The Lancet with 26 scientists, condemning "conspiracy theories suggesting that Covid-19 does not have a natural origin". He also wrote an article in The Guardian in June last year under the headline: "Ignore the conspiracy theories: scientists know Covid-19 wasn't created in a lab".

When it was suggested to him by *60 Minutes* in March that, as a member of the WHO mission, he had technically been investigating his own colleagues at the Wuhan lab, Daszak said: "I'm on the WHO team for a reason ... and if you're going to work in China on coronaviruses and try and understand their origins you should involve the people who know the most about that, and for better or for worse I do."

Last week in an update on The Lancet site, Daszak wrote that his organisation collaborated with a range of universities and governmental health and environmental science organisations in China. He said that neither the EcoHealth Alliance nor he personally received funding from the Chinese government.

MORENS_SUBPOENA_020681
MORENS_NIH_041392
REL0000478678

Despite Daszak's best efforts, President Joe Biden lent credence to the lab-leak theory when he approved a full investigation into it last month.

Suddenly Daszak's vehement attacks on the hypothesis appeared to some to be less about the science and more about a serious conflict of interest — one that a growing number seem unwilling to ignore any longer.

Cheers,

Peter

Jeffrey Sturchio (b) (6) ; Aleksei Chmura <(b) (6) >
Subject: Notes from our call
Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress

Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
  - AAAS
  - AIDS Vaccine Advocacy Coalition
  - American Public Health Association (Georges Benjamin)
  - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent

Kester)

- Association of Public & Land-Grant Universities
- Georgia Global Health Alliance
- Bay Area Global Health Alliance
- Consortium of Universities for Global Health
- COVID Collaborative
- Global Health Council
- Global Health Technologies Coalition
- Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
- International AIDS Vaccine Initiative
- Nobel Laureates Campaigns
- Pandemic Action Network
- PATH
- Research!America – Reach back out – Jerry will
- Union of Concerned Scientists
- Washington Global Health Alliance
- 156 virologists letter
- NAM
- NAS
- NL Campaigns (to be kept informed of progress by Rich)
- CUGH
- The pandemic action coalition
- FASEB
- Global Health technologies coalition
- APLU (KHG has connection)
- Wellcome Trust (Paul Schreier is the interim head).
- Dr. Tony Fauci
- Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
- OSTP
- ASV – Anne Moscona (President-Elect)

Cheers,

Peter

Subject: Concept note and Agenda for our discussion today at 1pm Eastern US time

Dear All,

I'm looking forward to our discussion today at 1pm. Attached is a concept note that Jeff Sturchio drafted to frame some ideas around what we might try to do.

I've also attached a rough agenda for us.

Here are the details of the zoom call, and I look forward to speaking with you all later on:

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

REL0000478686

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the

COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad,* and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the

MORENS_SUBPOENA_018132
MORENS_NIH_037069
REL0000478686

partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?

Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.

Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus

say the flu or MMR vaccines?

Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.

After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden

administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism*, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience

misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came upwith somewhat colonial name!!???

In all seriousness, while it's good for virologists to pushback against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

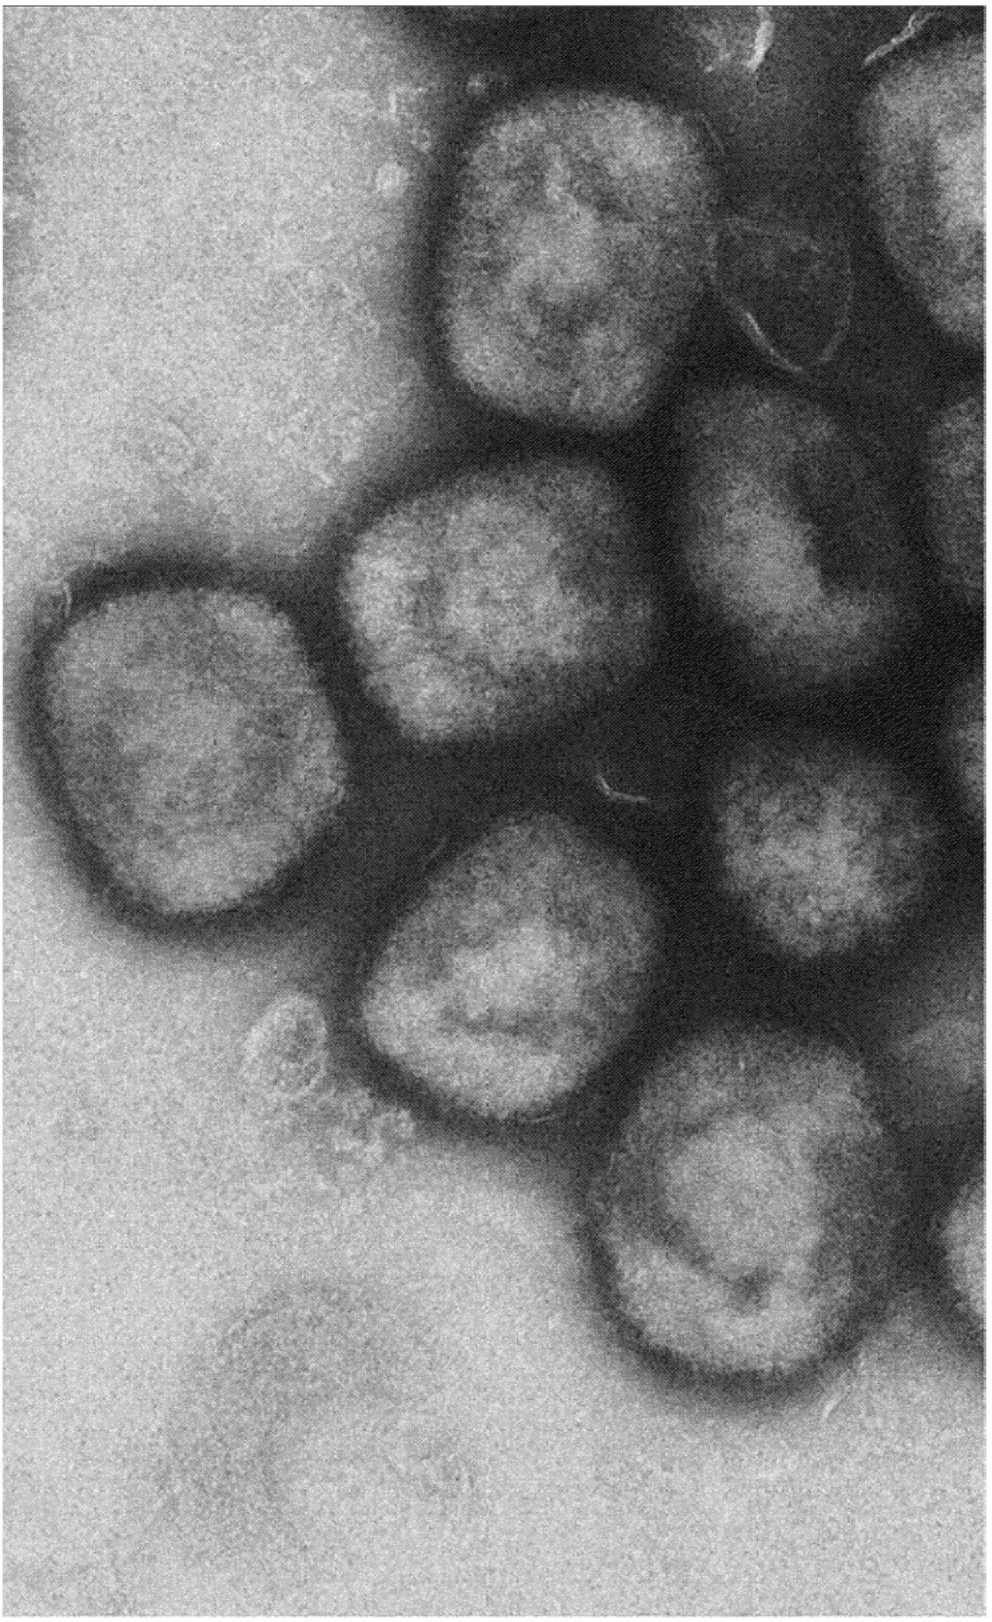
EXTERNAL SENDER

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…



BTW – saw your name on the Scientists for Science website Jerry!

POLICY-ISH

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident

MORENS_SUBPOENA_018143
MORENS_NIH_037080
REL0000478686

or malicious attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

MORENS_SUBPOENA_018144
MORENS_NIH_037081
REL0000478686

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

MORENS_SUBPOENA_018145
MORENS_NIH_037082
REL0000478686

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

MORENS_SUBPOENA_018146
MORENS_NIH_037083
REL0000478686

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by Miner Flux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position

MORENS_SUBPOENA_018150
MORENS_NIH_037087
REL0000478686

That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him-and of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

> It's been a while since we all connected, and after a hectic build up to the holidays (I was on 3, multi-week trips to Southeast Asia between Sept and Dec), I wanted to get back in touch with you and let you know what's happening. As you know, we received a letter from Reps. Comer and Jordan mid-December demanding documents and on-the-record interviews as part of their 'investigations' they're planning into COVID origins. The White House received similar letters demanding docs and interviews with the HHS Secretary, multiple people from NIH (incl. David Morens) and others. They pushed back because the Republicans weren't even in power, and we've now heard from the staffers that they're getting ready to send new letters over to us all. None of us are sure how actively or rapidly they'll get to their COVID investigation, or if this will involve public hearings. They've got a lot of other issues, and a priority to target Hunter Biden's laptop, as well as new issues like the debt ceiling and classified documents. However, we do expect that they will get to it eventually, and that the Republicans in the House will be aggressively targeting EcoHealth Alliance (and probably other organizations) with efforts to defund us.
>
> This all adds to a growing anti-science movement that Peter Hotez has been highlighting in articles and online recently around COVID origins, the mask mandates, vaccine mandates and other anti-vaxx and 'anti-expert' type attacks. The Republicans will want to turn up the heat to keep all of this in the press so it helps them in

their attacks on Biden, Fauci etc. It's pure politics, but has a real threat of damage to us, and to the research we all value. At the very least, we expect to see substantial efforts to legislate against so-called gain-of-function work, and as of yet, zero pushback from the scientific community writ large – the societies, academies, universities. The media are jumping in. Everyone wants to write an article about COVID origin and given the aggression on social media, these are being amplified rapidly and getting into the public eye. Just in the last couple of days:

The COVID lab-leak hypothesis: what scientists do and don't know

Nature examines arguments that the coronavirus SARS-CoV-2 escaped from a lab in China, and the science behind them.

- Amy Maxmen &
- Smriti Mallapaty

The Wuhan Institute of Virology has carried out research on coronaviruses for years because these pathogens are endemic to the region where it's located.Credit: Kyodo News via Getty

Debate over the idea that the SARS-CoV-2 coronavirus emerged from a laboratory has escalated over the past few weeks, coinciding with the annual World Health Assembly, at which the World Health Organization (WHO) and officials from nearly 200 countries discussed the COVID-19 pandemic. After last year's assembly, the WHO agreed to sponsor the first phase of an investigation into the pandemic's origins, which took place in China in early 2021.

Most scientists say SARS-CoV-2 probably has a natural origin, and was transmitted from an animal to humans. However, a lab leak has not been ruled out, and many are calling for a deeper investigation into the hypothesis that the virus emerged from the Wuhan Institute of Virology (WIV), located in the Chinese city where the first COVID-19 cases were reported. On 26 May, US President Joe Biden tasked the US Intelligence Community to join efforts to find SARS-CoV-2's origins, whatever they might be, and report back in 90 days.

Divisive COVID ‘lab leak’ debate prompts dire warnings from researchers

Australia, the European Union and Japan have also called for a robust investigation into SARS-CoV-2’s origins in China. The WHO has yet to reveal the next phase of its investigation. But China has asked that the probe examine other countries. Such reticence, and the fact that China has withheld information in the past, has fuelled suspicions of a ‘lab leak’. For instance, Chinese government officials suppressed crucial public-health data at the start of the COVID-19 pandemic, and during the 2002–04 severe acute respiratory syndrome (SARS) epidemic, according to high-level reports[1,2].

At the assembly, Mike Ryan, director of health emergencies at the WHO, asked for less politicization of calls for an origin investigation, which have, in many ways, devolved into accusations. “Over the last number of days, we have seen more and more and more discourse in the media, with terribly little actual news, or evidence, or new material,” said Ryan. “This is disturbing.”

Nature looks at the key arguments that support a lab leak, and the extent to which research has answers.

There’s not yet any substantial evidence for a lab leak. Why are scientists still considering it?

Scientists don’t have enough evidence about the origins of SARS-CoV-2 to rule out the lab-leak hypothesis, or to prove the alternative — that the virus has a natural origin. Many infectious-disease researchers agree that the most probable scenario is that the virus evolved naturally and spread from a bat either directly to a person or through an intermediate animal. Most emerging infectious diseases begin with a spillover from nature, as was seen with HIV, influenza epidemics, Ebola outbreaks and the coronaviruses that caused the SARS epidemic beginning in 2002 and the Middle East respiratory syndrome (MERS) outbreak beginning in 2012.

Scientists found SARS-CoV-2's closest known relative, RATG13, in a horseshoe bat.Credit: Shutterstock

Researchers have some leads that support a natural origin. Bats are known carriers of coronaviruses, and scientists have determined that the genome of SARS-CoV-2 is most similar to that of RATG13, a coronavirus that was first found in a horseshoe bat (*Rhinolophus affinis*) in the southern Chinese province of Yunnan in 2013[3]. But RATG13's genome is only 96% identical to SARS-CoV-2's, suggesting that a closer relative of the virus — the one passed to humans — remains unknown.

Still, the possibility remains that SARS-CoV-2 escaped from a lab. Although lab leaks have never caused an epidemic, they have resulted in small outbreaks involving well-documented viruses. A relevant example happened in 2004, when two researchers were independently infected by the virus that causes SARS at a virology lab in Beijing that studied the disease. They spread the infection to seven others before the outbreak was contained.

What are the key arguments for a lab leak?

In theory, COVID-19 could have come from a lab in a few ways. Researchers might have collected SARS-CoV-2 from an animal and maintained it in their lab to study, or they might have created it by engineering coronavirus genomes. In these scenarios, a person in the lab might have then been accidentally or deliberately infected by the virus, and then spread it to others — sparking the pandemic. There is currently no clear evidence to back these scenarios, but they aren't impossible.

People have made a number of arguments for a lab origin for SARS-CoV-2 that are currently conjecture.

The biggest mystery: what it will take to trace the coronavirus source

One holds that it's suspicious that, almost a year and a half into the pandemic, SARS-CoV-2's closest relative still hasn't been found in an animal. Another suggests it is no coincidence that COVID-19 was first detected in Wuhan, where a top lab studying coronaviruses, the WIV, is located.

Some lab-leak proponents contend that the virus contains unusual features and genetic sequences signalling that it was engineered by humans. And some say that SARS-CoV-2 spreads among people so readily that it must have been created with that intention. Another argument suggests that SARS-CoV-2 might have derived from coronaviruses found in an unused mine where WIV researchers collected samples from bats between 2012 and 2015.

So what do infectious disease researchers and evolutionary biologists say about these arguments?

Is it suspicious that no animal has been identified as transmitting the virus to humans?

Outbreak-origin investigations often take years, and some culprits remain unknown. It took 14 years to nail down the origin of the SARS epidemic, which began with a virus in bats that spread to humans, most likely through civets. To date, a complete Ebola virus has never been isolated from an animal in the region where the world's largest outbreak occurred between 2013 and 2016.

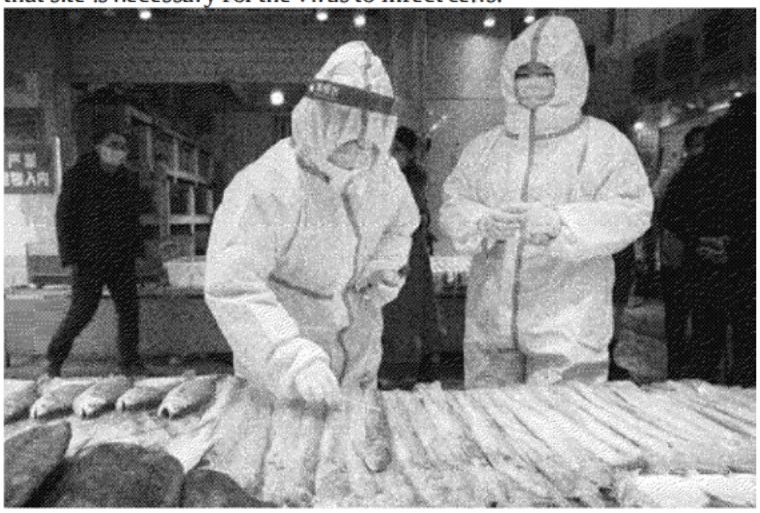
Origin investigations are complicated because outbreaks among animals that aren't the main hosts of a particular virus, such as civets in the case of SARS, are often sporadic. Researchers must find the right animal before it dies or clears the infection. And, even if the animal tests positive, viruses found in saliva, faeces or blood are often degraded, making it difficult to sequence the pathogen's whole genome.

WHO report into COVID pandemic origins zeroes in on animal markets, not labs

Scientists have made some progress since the pandemic began, however. For example, a report, posted to the preprint server

bioRxiv on 27 May, suggests that RmYN02, a coronavirus in bats in southern China, might be more closely related to SARS-CoV-2 than RATG13 is[4].

As for finding an intermediate host animal, researchers in China have tested more than 80,000 wild and domesticated animals; none have been positive for SARS-CoV-2. But this number is a tiny fraction of the animals in the country. To narrow the search down, researchers say, more strategic testing is needed to isolate animals that are most susceptible to infection and those that come in close contact with people. They also suggest using antibody tests to identify animals that have previously been infected with the virus.



Is it suspicious that the WIV is in Wuhan?

Virology labs tend to specialize in the viruses around them, says Vincent Munster, a virologist at the Rocky Mountain Laboratories, a division of the National Institutes of Health, in Hamilton, Montana. The WIV specializes in coronaviruses because many have been found in and around China. Munster names other labs that focus on endemic viral diseases: influenza labs in Asia, haemorrhagic fever labs in Africa and dengue-fever labs in Latin America, for example. “Nine out of ten times, when there’s a new outbreak, you’ll find a lab that will be working on these kinds of viruses nearby,” says Munster.

Researchers note that a coronavirus outbreak in Wuhan isn’t surprising, because it’s a city of 11 million people in a broader region where coronaviruses have been found. It contains an airport, train stations and markets selling goods and wildlife transported there from around the region[5] — meaning a virus could enter the city and spread rapidly.

Does the virus have features that suggest it was created in a lab?

Several researchers have looked into whether features of SARS-CoV-2 signal that it was bioengineered. One of the first teams to do so, led by Kristian Andersen, a virologist at Scripps Research in La Jolla, California, determined that this was “improbable” for a few reasons, including a lack of signatures of genetic manipulation[6]. Since then, others have asked whether the virus’s furin cleavage site— a feature that helps it enter cells — is evidence of engineering, because SARS-CoV-2 has these sites but its closest relatives don’t. The furin cleavage site is important because it's in the virus's spike protein, and cleavage of the protein at that site is necessary for the virus to infect cells.

After the WHO report: what’s next in the search for COVID’s origins

But many other coronaviruses have furin cleavage sites, such as coronaviruses that cause colds[7]. Because viruses containing the site are scattered across the coronavirus family tree, rather than confined to a group of closely related viruses, Stephen Goldstein, a virologist at the University of Utah in Salt Lake City, says the site probably evolved multiple times because it provides an evolutionary advantage. Convergent evolution — the process by which organisms that aren’t closely related independently evolve similar traits as a result of adapting to similar environments — is incredibly common.

Another feature of SARS-CoV-2 that has drawn attention is a combination of nucleotides that underlie a segment of the furin cleavage site: CGG (these encode the amino acid arginine). A *Medium* article that speculates on a lab origin for SARS-CoV-2 quotes David Baltimore, a Nobel laureate and professor emeritus at the California Institute of Technology in Pasadena, as saying that viruses don’t usually have that particular code for arginine, but humans often do — a “smoking gun”, hinting that researchers might have tampered with SARS-CoV-2’s genome.

Andersen says that Baltimore was incorrect about that detail, however. In SARS-CoV-2, about 3% of the nucleotides encoding arginine are CGG, he says. And he points out that around 5% of those encoding arginine in the virus that caused the original SARS epidemic are CGG, too. In an e-mail to *Nature*, Baltimore says Andersen could be correct that evolution produced SARS-CoV-2, but adds that “there are other possibilities and they need careful consideration, which is all I meant to be saying”.

Is it true that SARS-CoV-2 must have been engineered, because it's

MORENS_SUBPOENA_020195
MORENS_NIH_040719
REL0000478692

perfect for causing a pandemic?

Many scientists say no. Just because the virus spreads among humans doesn't mean it was designed to do so. It also flourishes among mink and infects a host of carnivorous mammals. And it wasn't optimally transmissible among humans for the better part of last year. Rather, new, more efficient variants have evolved around the world. To name one example, the highly transmissible variant of SARS-CoV-2 first reported in India (B.1.617.2, or Delta) has mutations in the nucleotides encoding its furin cleavage site that appear to make the virus better at infecting cells[8].

"This was not some supremely adapted pathogen," says Joel Wertheim, a molecular epidemiologist at the University of California San Diego.

Did researchers collect SARS-CoV-2 from a mine?

Researchers from the WIV collected hundreds of samples from bats roosting in a mine between 2012 and 2015, after several miners working there had gotten sick with an unknown respiratory disease. (Last year, researchers reported that blood samples taken from the miners tested negative for antibodies against SARS-CoV-2, meaning that the sickness was probably not COVID-19[9].) Back at the lab, WIV researchers detected nearly 300 coronaviruses in the bat samples, but they were only able to get whole or partial genomic sequences from less than a dozen , and none of those that were reported were SARS-CoV-2[9,10]. During the WHO-led origins probe earlier this year, WIV researchers told investigators that they cultured only three coronaviruses at the lab, and none were closely related to SARS-CoV-2.

'Major stones unturned': COVID origin search must continue after WHO report, say scientists

Although the investigators didn't sift through freezers at the WIV to confirm this information, the low number of genomes and cultures doesn't surprise virologists. Munster says it's exceedingly difficult to extract intact coronaviruses from bat samples. Virus levels tend to be low in the animals, and viruses are often degraded in faeces, saliva and droplets of blood. Additionally, when researchers want to study or genetically alter viruses, they need to keep them (or synthetic mimics of them) alive, by finding the appropriate live animal cells for the viruses to inhabit in the lab, which can be a challenge.

So, for SARS-CoV-2 to have come from this mine in China, WIV researchers would have had to overcome some serious technical challenges — and they would have kept the information secret for a number of years and misled investigators on the WHO-led mission, scientists point out. There's no evidence of this, but it can't be ruled out.

What's next for lab-leak investigations?

Biden asked the US Intelligence Community to report back to him in 90 days. Perhaps this investigation will shed light on undisclosed US intel reported by *The Wall Street Journal* suggesting that three staff members at the WIV were sick in November 2019, before the first cases of COVID-19 were reported in China. The article claims that US officials have different opinions on the quality of that intel. And researchers at the WIV have maintained that staff at the institute tested negative for antibodies that would indicate SARS-CoV-2 infection prior to January 2020.

Last week, Anthony Fauci, Biden's chief medical adviser, asked Chinese officials to release the hospital records of WIV staff members. Others have asked for blood samples from WIV staff members, and access to WIV bat and virus samples, laboratory notebooks and hard drives. But it's unclear what such asks will yield because China has not conceded to demands for a full lab investigation. A spokesperson for the Ministry of Foreign Affairs of the People's Republic of China, Zhao Lijian, said that US labs should instead be investigated, and that some people in the United States "don't care about facts or truth and have zero

MORENS_SUBPOENA_020196
MORENS_NIH_040720
REL0000478692

interest in a serious science-based study of origins".
As Biden's investigation commences and the WHO considers the next phase in its origin study, pandemic experts are bracing themselves for a long road ahead. "We want an answer," says Jason Kindrachuk, a virologist at the University of Manitoba in Winnipeg, Canada. "But we may have to keep piecing bits of evidence together as weeks and months and years move forward."

I thought the SARS-CoV-2 virus that emerged in Wuhan wasn't capable of infecting mice that weren't genetically engineered to express human ACE2? This paper, with its emphasis of meteorological factors, seems dodgy to me. But it's good to see research on the origins from researchers in China getting out, albeit it in an obscure journal.

Clearly these viruses are commonplace in SE Asia. And I don't just think that bats and pangolins will be the only animals with SC2-like viruses. Virus ecology does not work like that. But this is not the same as determining the events that happened in Wuhan. To me, China still looks like the most likely source.
>
> Third, I'm pretty certain that groups in China are sitting on more SC2-like viruses. If you sample bats you find them. It is striking to me that CCDC have published so little on this yet have supposedly sampled so many animals. That doesn't add up. Never discount the politics.

Subject: Re: Study from 2007 shows SARS-infected civets on farms in Hubei

nPeter, as i am perennially swamped with work that has nothing to do with COVID issues of importance, i am always catching up on reading the important stuff

Just now i poured a martini and-read word for word your "A strategy..." paper with first author Sánchez. Also Kevin and Lin-fa were coauthors. Wow!!

This is dynamite and also beautifully written. I mean, Hemingway, Conrad, Nin, couldn't have written it better. Beautiful job and so important.

I think you need to promote this work, and emphasize that the conclusions are far reaching and a sort of call to arms.

Let us all keep pushing, and keep our eyes on the prize of getting to the bottom of it all

Jon Cohen was in touch with me last week as he was trying to reach Peter without success. I said it was understandable given the attacks. He got back to me and said let him know when Peter D can talk. I would be happy to get back to Jon Cohen, but Peter H, if you want to contact Jon bring me into it as would represent two different task forces and I would be happy to talk to him about what's going on with the Commission. I don't think it is the time now for Peter to be directly involved in such conversations, and Robert and Jeff Sturchio can comment on that as necessary.

https://www.thetimes.co.uk/article/the- rise-and-fall-of-british-virus-hunter-peter-daszak-05q8brpz7

The rise and fall of British virus hunter Peter Daszak

The scientist who led opposition to the claim that Covid leaked from a Wuhan lab is engulfed in controversy after it was revealed his charity had funded the institute at the centre of the row

Peter Daszak became the face of the WHO mission to find the origins of the coronavirus

On January 18, Peter Daszak, born and raised in the mil land mining town of Dukinfield, near Manchester, awoke to a winter's dawn in central China, 5,500 miles away. "Sunrise in Wuhan — my early morning view on day 4 of quarantine — beautiful," he tweeted, with a photograph of skyscrapers against a hazy orange sky.

His presence there in a delegation from the World Health Organisation (WHO) on a mission of global significance showed a remarkable rise for the 55-year-old parasitologist with a PhD from the University of East London.

Ostensibly he was visiting the city to find the truth about where the coronavirus pandemic began before it swept across the world — killing nearly four million people. Five months later, however,

MORENS_SUBPOENA_020713
MORENS_NIH_041427
REL0000478707

the trip to Wuhan has placed Daszak at the centre of a growing web of controversy. The wry Mancunian humour that singled him out from fellow scientists of international renown has dried up.

"When you see him on the television now, he's not the funny northerner," said one old friend and colleague. "There's so much nastiness and vitriol out there, this must have been a challenging time for him."

Daszak faces questions about a crucial conflict of interest in four interlocking aspects of his professional life: his role on the WHO-led mission to Wuhan; his relationship with the Wuhan virologist Shi Zhengli, known as the "bat woman"; his presidency of a federally funded American charity that gave money to her laboratory; and his chairmanship of a commission investigating the pandemic's possible origins for The Lancet medical journal.

The Lancet commission, supported by the United Nations sustainable development solutions network, is looking, among other things, at the explosive question of whether the virus escaped accidentally from Shi's Wuhan Institute of Virology (WIV), which Daszak — like China — has consistently denied.

Critics ask how Daszak can objectively investigate something he has such fixed views about, in a lab his charity has funded. The WIV appears to have received almost $600,000 of a $3.7 million grant awarded to Daszak's EcoHealth Alliance in 2014 by the US Department for Health and Human Services for the purposes of "understanding the risk of bat coronavirus emergence".

Last week The Lancet acknowledged the conflict of interest by announcing that Daszak had recused himself from its commission. It said that in future "technical work will be conducted by independent experts who were not themselves directly involved in US-China research activities that are under scrutiny".

It was a heavy blow, and not the first time Daszak's impartiality has been in question. He strongly attacked the lab leak theory before, during and after the WHO mission, which concluded that it was "extremely unlikely". In an episode of the US TV show *60 Minutes* in March, he faced a grilling about his "conflict of interest". And in April a US congressional committee requested evidence from EcoHealth Alliance about its funding.

MORENS_SUBPOENA_020714
MORENS_NIH_041428
REL0000478707

Yet little is known about the figure in the middle of this maelstrom. How did the boy from Manchester become the president of a charity bankrolled by the Pentagon and America's National Institutes of Health (NIH), the face of the WHO mission, the Wuhan lab's biggest cheerleader and now one of the most controversial characters in the pandemic saga?

Daszak lives in New York state's wealthy Rockland county, 30 miles northwest of Manhattan. Seven years ago he and his wife Janet bought a sprawling house in two acres for $665,000. In 2019 he was paid $354,065 by EcoHealth Alliance, based in Manhattan.

It is a world away from Dukinfield, where Daszak's Anglo-Welsh mother and Ukrainian father Bohdan raised their family. One son, John, a year younger than Peter, became a tenor with the English National Opera. But Peter Daszak's passions lay elsewhere: his childhood dreams were of becoming a "zoologist in the Amazon", he told the podcast *This Week In Virology* in 2019. "I think that once you get hooked on research and finding new things out, there's something that plays to a fundamental need to discover in the human psyche."

Daszak started off with a BSc in zoology at the University of Bangor in Wales — a teacher recalls that he was "really bright" — before his PhD and postdoctoral research. At Kingston University one project proved to be a springboard. With a colleague, Andrew Cunningham, he discovered the cause of a mass die-off of frogs from Australia to Panama, unexplained for a decade. Daszak suggested that the fungus responsible was linked to the wildlife trade in bullfrogs, sold as pets or food. This was the first step in a career focused on the interaction between humans, nature and viruses.

He moved to America with his wife, an immunologist, when she got a job in Georgia. His frog fame followed him, and over the next few years his research on emerging infectious disease gained attention, partly due to outbreaks of several rare and deadly diseases in humans, including Nipah virus, ebola and Sars.

In 2001 he joined the Wildlife Trust, a small, privately funded charity that would later become EcoHealth Alliance. Throughout the ensuing decade, Daszak was adept at promoting his projects. In an interview on America's National Public Radio in 2004 he compared his frog research to a Monty Python sketch: "John Cleese goes into the pet shop and says, 'Yeah, this parrot's dead.'

MORENS_SUBPOENA_020715
MORENS_NIH_041429
REL0000478707

'Well, actually, sir, it's just resting.' And they just looked like frogs that were resting, who were perfectly OK, but dead."

In an episode of the TV programme *60 Minutes* the same year, clad in head-to-toe khaki on a boat speeding towards the remote Malaysian island of Pulau Tioman, Daszak was referred to as a "virus hunter" off to search for bats suspected of harbouring the Nipah virus. He says: "Almost 75% of the emerging diseases in humans actually come from wildlife ... or domestic animals," he warns. "We are looking for the next HIV, the next Sars." This nascent area of scientific study, now known as conservation medicine, shaped the next 16 years of Daszak's career.

By 2010 Daszak was busily fund-raising for the newly reconfigured EcoHealth Alliance. Millions of dollars worth of grants rolled in: 87.6 per cent of it from US government sources in 2019, including the NIH and the Pentagon.

According to one prominent scientist, who asked not to be named, Daszak did not have a laboratory of his own, nor was he performing his own research, as most grant recipients did. What he did have, however, was a network of partnerships with other laboratories, including Shi's WIV.

With Shi, Daszak helped to co-ordinate visits to remote mines in China to look for bat coronaviruses to study in the lab in the hope of getting ahead of natural spillovers into local populations. Then in late 2019 the pandemic erupted in Wuhan.

When President Donald Trump first suggested in January 2020 that the virus had leaked from Shi's lab, Daszak was quick to leverage connections and lobby colleagues to push the counternarrative that it came directly from animals.

In February 2020, he organised an open letter in The Lancet with 26 scientists, condemning "conspiracy theories suggesting that Covid-19 does not have a natural origin". He also wrote an article in The Guardian in June last year under the headline: "Ignore the conspiracy theories: scientists know Covid-19 wasn't created in a lab".

When it was suggested to him by *60 Minutes* in March that, as a member of the WHO mission, he had technically been investigating his own colleagues at the Wuhan lab, Daszak said: "I'm on the WHO team for a reason ... and if you're going to work in China on coronaviruses and try and

MORENS_SUBPOENA_020716
MORENS_NIH_041430
REL0000478707

understand their origins you should involve the people who know the most about that, and for better or for worse I do."

Last week in an update on The Lancet site, Daszak wrote that his organisation collaborated with a range of universities and governmental health and environmental science organisations in China. He said that neither the EcoHealth Alliance nor he personally received funding from the Chinese government.

Despite Daszak's best efforts, President Joe Biden lent credence to the lab-leak theory when he approved a full investigation into it last month.

Suddenly Daszak's vehement attacks on the hypothesis appeared to some to be less about the science and more about a serious conflict of interest — one that a growing number seem unwilling to ignore any longer.

Cheers,

Peter

Peter: I agree with you – this is unacceptable. You've already agreed to recuse yourself from the task force on origins. And Sachs's suggestion that you step down as a Commissioner is inconsistent with his statement that your "considerable expertise and experience [on] the important issues of One Health and the ecology of emerging infectious diseases" is valuable for the Commission's deliberations – this is an argument for your remaining on the Commission.

Is he freelancing here, or have the editors of *The Lancet* endorsed this unilateral move? I think it's worth raising that question with the editors – this seems to me a highly unusual situation, given the way they normally run *Lancet* Commissions.

Also, I don't see why you should agree to something now, rather than have an opportunity to discuss this with your fellow Commissioners. (For one thing, Professor Sachs himself lacks the scientific credentials to make these decisions unilaterally – he's an economist, not a virologist. He should be relying on the input of Commissioners with appropriate expertise.) Peter Hotez, as another Commissioner, may want to add his viewpoint on this question. I'm sure there are others among the Commissioners who will object both to Sachs's high-handed methods and to the impression this gives that the *Lancet* Commission is aligning its deliberations with an extreme position in US politics, rather than the scientific objectivity and consensus that should govern its methods and findings.

As ever,
Jeff

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

From: Jeffrey Sachs <(b) (6) u>
Sent: Sunday, June 27, 2021 2:24 PM
To: Peter Daszak <(b) (6) >
Cc: Ozge Karadag (b) (6) >; Bagenal, Jessamy (ELS-LOW) <(b) (6) >; Yanis Ben Amor (b) (6) edu>
Subject: Continued work on the task force

Dear Peter,

I would like to pursue a way forward in which you would continue as a member of the task force to provide expertise and inputs on the One Health approach to pandemics, while you would step away from being a commissioner and would recuse yourself from the task force's work on the question of origins of SARS-CoV-2. Hume similarly would recuse himself from any work on the origins question. I will appoint a new acting chair or co-chairs of the task force following consultations with the task force.

I am proposing this two-track approach so that the controversies and issues surrounding your work do not envelope the Commission's work and its final report, while at the same time enabling you to contribute your considerable expertise and experience to the important issues of One Health and the ecology of emerging infectious diseases.

I hope that you find this approach to be satisfactory and reasonable under the circumstances. It is my deeply considered view on how to achieve several important objectives going forward.

I will move forward expeditiously on these issues one way or another, so I would deeply appreciate your timely response.

With best wishes,

Jeff

Subject: Re: House Energy and Commerce Republicans are now demanding documents/testimony from EcoHealth and NIH

My 2 talking points

Remember, the work of the EcoHealth Alliance is what is helping to keep America safe in first identifying the fourth major coronavirus pandemic in this Century. I'm predicting number 4 will be out before the end of this decade. We must support EcoHealth Alliance.

Remember, it was Marjorie Taylor Green and her colleagues on the House Freedom Caucus and their antivaccine rhetoric that caused thousands of Americans in conservative states in the South, especially in my state of Texas, to shun vaccines and lose their lives. They killed Americans before and now they want to further endanger the US population by shutting down our warning systems for the 4th pandemic will that will surely come

EXTERNAL SENDER

Just to let you all know that, as predicted, we've received our first exhaustive request for documents, information and testimony. 41 questions from the House Energy & Commerce Committee Republicans. Many of them have already been answered over and over again, and many of the documents have been repeatedly FoIA'd, but of course, this isn't about getting to the truth about anything – it's about creating a 'show' for the hard right voters to watch EcoHealth squirm.

They wrote to us by email and simultaneously made the letter public of course. They've also written to NIH asking them 47 questions all about EcoHealth's terrible behavior. David – they're after your emails too…Here's the link, and I've attached the letters to us and NIH to save you the downloading time…

REL0000478709

https://energycommerce.house.gov/posts/chairs- rodgers-griffith-and-guthrie-launch-e-and-c-s-118th-congress-covid-19-origins-investigation

Most outrageously, in their preamble they comment that our work in China funded by NIH provided "no scientific work product produced for the American taxpayers who helped finance these efforts, and no useful information to support pandemic preparedness efforts."

Actually, in the first 5 years of the R01 funding, we published 18 papers, including 2 in *Nature* and 1 in *Cell*. It was so productive that our renewal proposal was scored within the top 3% of grants.

Cheers,

Peter

MORENS_SUBPOENA_016723
MORENS_NIH_034871
REL0000478709

Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation &
- NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress

Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
  - AAAS
  - AIDS Vaccine Advocacy Coalition
  - American Public Health Association (Georges Benjamin)
  - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
  - Association of Public & Land-Grant Universities
  - Georgia Global Health Alliance
  - Bay Area Global Health Alliance
  - Consortium of Universities for Global Health
  - COVID Collaborative

MORENS_SUBPOENA_016724
MORENS_NIH_034872
REL0000478709

- Global Health Council
- Global Health Technologies Coalition
- Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
- International AIDS Vaccine Initiative
- Nobel Laureates Campaigns
- Pandemic Action Network
- PATH
- Research!America – Reach back out – Jerry will
- Union of Concerned Scientists
- Washington Global Health Alliance
- 156 virologists letter
- NAM
- NAS
- NL Campaigns (to be kept informed of progress by Rich)
- CUGH
- The pandemic action coalition
- FASEB
- Global Health technologies coalition
- APLU (KHG has connection)
- Wellcome Trust (Paul Schreier is the interim head).
- Dr. Tony Fauci
- Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
- OSTP
- ASV – Anne Moscona (President-Elect)

Cheers,

Peter

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

MORENS_SUBPOENA_016729
MORENS_NIH_034877
REL0000478709

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the

COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad,* and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the

MORENS_SUBPOENA_016731
MORENS_NIH_034879
REL0000478709

partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?

Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.

Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus

MORENS_SUBPOENA_016732
MORENS_NIH_034880
REL0000478709

say the flu or MMR vaccines?

Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.

After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden

MORENS_SUBPOENA_016733
MORENS_NIH_034881
REL0000478709

administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism*, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience

MORENS_SUBPOENA_016734
MORENS_NIH_034882
REL0000478709

misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

I forgot about that Rich. But I'm assuming it wasn't you that came upwith somewhat colonial name!!???

In all seriousness, while it's good for virologists to pushback against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

MORENS_SUBPOENA_016741
MORENS_NIH_034889
REL0000478709

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident

MORENS_SUBPOENA_016742
MORENS_NIH_034890
REL0000478709

or malicious attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

MORENS_SUBPOENA_016743
MORENS_NIH_034891
REL0000478709

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to meritthat kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,"' says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

MORENS_SUBPOENA_016744
MORENS_NIH_034892
REL0000478709

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

MORENS_SUBPOENA_016745
MORENS_NIH_034893
REL0000478709

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by Miner Flux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position

MORENS_SUBPOENA_016749
MORENS_NIH_034897
REL0000478709

That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend th (b) (6) from (b) (6) Peter H, you may know him- and of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

I don't know if these will get traction, but it's extremely stressful…

First, another attempt by Republican member of the house Guy Reschenthaler to defund EcoHealth Alliance
https://www.nationalreview.com/news/house- republican-introduces-bill-to-ban-federal-funding-for-ecohealth-alliance/

Second, an effort to set up a new Inspector General for NIH from Senator Marshall
https://www.washingtontimes.com/news/2023/jan/25/senators- move-create-inspector-general-probe-nih-f/

I'm hoping it's just grandstanding at the moment, but this attests to our need to defend science right now. They're starting with us, but their goals are all types of 'risky research' as they define it…

Cheers,

Peter

Subject: Re: Tweet by MinerFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) (b) (6) from (b) (6) - Peter H, you may know him - and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

I think it's also a problem doing this search without an NIH Director installed. NIAID is one of the biggest NIH Institutes. A real gap in White House leadership not filling the NIH post 14 months after Francis left. So dysfunctional things as described below start to happen. There is no adult supervision at NIH

This *Vanity Fair* article is full of hyperventilation about the dire consequences of the cover-up they've unearthed – but most of the purported evidence they present is circumstantial, and none of it offers anything new about the actual origins of COVID-19. They continue to flog the dead horse of the DARPA proposal that allegedly introduced a furin cleavage site into bat coronaviruses to enhance their infectivity – although this proposal was never funded and the research never conducted.

And today I see this in Vanity Fair. I admit I have just skimmed and not read it yet. I will ask my China scholar niece what she thinks about the analysis of CCCP speak argument and report back if she has time to read and respond.

Jerry, as i have said earlier, great idea. The PNAS document is powerful in many different ways and should be considered the definitive expert "take" on the situation. Let's see how the crazies react to it, I have faith in fair scientific analysis. d

Thanks David,

I responded to Bruce Lee (the perfect name for a truth ninja warrior such as he) including a pdf of the PNAS paper at his City University email which was easy to obtain to a) congratulate him, and b) ultimately ask him if we can respond to his article in depth via an introduction to the editorial staff as I am tired of sending pointed well evidenced Op-Eds or editorials or opinions over the transom and then being ignored with a standard no thanks reply. Or if necessary via a letter to the editor. Let's see if he responds. I'm thinking the Task Force, all or some, might respond – actually maybe just the American members because of the uniquely American nature of this sort of rank political nonsense. I'm hoping Lee will reply.

Has anybody seen any comment from Burr regarding the outrageous attack on Nancy Pelosi's home, and the sole occupant at the time, her 82 year old husband Paul? I haven't and to me that is just the exclamation point on the assessment that his report is political and timed before the election, aside from the mile wide holes in the argument, so well-articulated by Bruce Lee.

Sen. Richard Burr (R-N.C.), seen here on August 6, 2022 in Washington, DC., and his office came out ... [+]

Getty Images

These days anytime any politician makes any claims about Covid-19, you've got to wonder whether it's more about politics than real science. After all, throughout the pandemic, politics has infiltrated Covid-19 decision-making like botox in a reality TV star. So when the office of Senator Richard Burr (R-N.C.) dropped "An Analysis of the Origins of the COVID-19 Pandemic Interim Report," just two weeks before the midterm election, you've gotta wonder whether this report was more about politics than actually determining what really happened.

After all, in the report, Burr did indicate that last Summer he and Senator Patty Murray (D-Washington) "announced a bipartisan Health, Education, Labor and Pensions (HELP) Committee oversight effort into the origins of SARS-CoV-2, the virus that caused the COVID-19 pandemic as part of our effort to address pandemic preparedness and response programs." *Dictionary.com* defines bipartisan as "representing, characterized by, or including members from two parties or factions," and not "screw it, why don't I just issue a report myself?" It's also interesting why such a interim report would be issued so quickly now before it's been properly vetted by the scientific community. Why the rush? And why wasn't there more of a heads up to everyone that this would be on its way? Was this designed to be a Halloween scare? Or maybe just maybe the midterm elections had something to do with it?

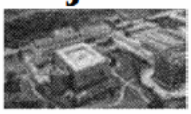
Plus, this interim report drew some pretty strong conclusions that usually would require a lot more supporting scientific evidence than the report actually provided. What's a strong conclusion? How about, "Based on the analysis of the publicly available information, it appears reasonable to conclude that the Covid-19 pandemic was, more likely than not, the result of a research-related incident." Yeah, that statement certainly has drawn headlines and attention on social media. The phrase "more likely than not" sounds fairly definitive. For example, if you were to tell your significant other that "based on analysis of publicly available information, it appears reasonable to conclude that you are more likely than not a cheater," you had better more likely than not provide enough specific concrete evidence to justify such a claim. Otherwise all of your possessions including your butt would more likely than not end up on the street. Similarly, this report seemed to be claiming that the evidence is already strong enough to conclude that a lab leak started the Covid-19 pandemic. But what evidence did the report then provide? Well, here's a hint. It rhymes with "Not a troll bot." Yes, not a whole lot.

Did any real scientists develop, vet, and support the findings of this Interim Report?

Let's take a look at what some real scientists who have real expertise in this area said on Twitter

MORENS_SUBPOENA_003130
MORENS_NIH_009657
REL0000478716

about this report. Spoiler alert: some expletives more likely than not emerged. For example, Kristian G. Andersen, PhD, a Professor of Immunology and Microbiology at Scripps Research, used the phrase "Flood the zone with bull [bleep]" when referring to what's going on with this report:
And Peter Hotez, MD, PhD, Dean of the National School of Tropical Medicine, wrote, "My view: a total load of antiscience [bleep]," in the following tweet:
To adapt the words from that song in the movie *Bring It On*, Burr, it's cold in here— with here being real scientists' reaction to the report. Bull-bleep and antiscience bleep weren't exactly words of endorsement. Hotez also provided some real scientific papers describing how the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) may have jumped from other animals to humans and the evidence supporting such a natural jump:
Speaking of real scientists. Were any real scientists involved in developing and reviewing Burr's interim report? Well, the cover of the report bore the names Minority Oversight Staff, Senate Committee on Health Education, Labor and Pensions, which was a fancy way of saying that it was compiled by the office of Burr. The report didn't really list any other authors or contributors other than Burr. So, assuming that Burr himself didn't compile and write everything like a high schooler doing a book report, it's unclear who actually did the research and writing for this report. The report didn't really clearly delineate what process was used to assemble and review the available evidence, who determined what should and shouldn't considered, or how the report was vetted either.



What counterarguments did this Interim Report provide against evidence that the SARS-CoV-2 had jumped from other animals?

That being said did the report at least provide some strong arguments to support its conclusions? Well, the first of the four sections attempted to offer some kind of counter to the existing evidence of a natural animal original of the SARS-CoV-2 without even mentioning that evidence. That was sort of the "I'm going to ignore what you have said and provide only my side of the story" tactic. This section basically presented six arguments that were weak at best. The first two arguments were essentially the same: that the intermediate host animal species—meaning the intermediate between bats and humans—for SARS-CoV-2 hasn't yet been found. That argument would hold water about as well as a fish net thong.
It's been only about three years since the Covid-19 pandemic first broke. Science rarely can move that quickly, especially when Congress isn't providing nearly enough funding to support the needed studies. It can be challenging to find such a intermediate animal host species. It's not as if you can post a message on Twitter or Facebook saying, "hey all animals, come by and get tested for SARS-CoV-2 or some virus similar to it" or "hey, did you host this virus before passing it along to us humans? Come one, you can tell us." Plus, scientists around the world have been kind of busy with something called, you know, the Covid-19 pandemic. So unless Burr and his Senate colleagues want to provide much more support and funding to help find the intermediate host species, "you haven't found it yet," really isn't a very strong argument.
The third argument provided was that the "SARS-CoV-2's high binding affinity for human ACE2 receptors suggests that it is possible for it to directly infect humans without needing a period of adaptation in an intermediate host." In other words, the virus took to humans so well, it couldn't have jumped from other animals. That's a bit like saying, "hey, that velour track suit fits you so well that it was probably tailored specifically for you." Such an argument doesn't pass much muster because it wasn't clear what the virus was doing before the start of 2020. Weaker versions of the virus could have very well been spreading between other animals and humans long before late 2019 and early 2020. The world didn't have much of a surveillance system in place to really track what every possible viral threat was doing before 2020. It still doesn't have such a system.
The section's fourth argument was that Wuhan, China, seemed to be the only place where the virus may have jumped from non-humans to humans. The claim was that if the virus had jumped from other animals to humans, why didn't such jumps occur elsewhere as well. Again, all of this assumes that the world already had great global surveillance systems in place that could readily determine exactly where and how everyone had gotten infected with the SARS-CoV-2. Yeah try doing that when there's been well over 630 million Covid-19 cases around the world so far. And that's not even counting those folks who never ended up getting tested.
The fifth argument was similar to the fourth, claiming that "After the unidentified source transmitted SARS-CoV-2 to humans, it stopped transmitting SARS-CoV-2." Again, this has never been established. With so many cases emerging every day, it's difficult to say who caught the virus

from where. The Covid-19 pandemic is not the same situation as the 2002-2004 SARS and the 2013 avian influenza A (H7N9) outbreaks where there were a lot fewer cases so that infections and transmission chains were a lot easier to track.

The sixth argument was that "The low genetic diversity of the earliest SARS-CoV-2 samples suggests that the COVID-19 pandemic is most likely the result of a single successful spillover of SARS-CoV-2." That's not exactly true. Plus, once again, the lack of a comprehensive surveillance system means that cases may have been missed early on in 2020 and before that time. Moreover, even if the pandemic had started with a single spillover event, how exactly would that prove that it was lab-leak rather than a natural spillover event that triggered the whole pandemic? All of these arguments didn't seem to be that scientific, which raises the question again, what specific scientists contributed to this interim report.

Did the Wuhan Institute of Virology actually have major safety concerns as the Interim Report claimed?

This aerial view shows the P4 laboratory (L) on the campus of the Wuhan Institute of Virology in ... [+]

AFP via Getty Images

The second section of the report tried to paint a picture of the Wuhan Institute of Virology (WIV) as a place with numerous safety concerns and incidents. It did include brief descriptions of events and items that you probably normally wouldn't find at your home, assuming that you don't regularly sleep and shower at a Biosafety Level (BSL) 3 or 4 laboratory. So all of these could have sounded ominous and scary to the general public or anyone else who doesn't conduct virology experiments on regular basis.

So, assuming that Burr and his staff aren't running enzyme linked immunosorbent assays in their Congressional offices, wouldn't it have been better to ask a real laboratory scientist who regularly works with viruses to put together that section? Angela Rasmussen, PhD, a virologist at the Vaccine and Infectious Disease Organization at the University of Saskatchewan in Canada, would qualify as such an expert. So let's turn to Rasmussen's tweet thread about this section of the Burr report:

As you can see, Rasmussen's tweet stated that the report "claims to show evidence of multiple biocontainment breaches. That sounds very bad! But how reliable is this evidence?" Her tweet thread went on to review each thing listed in this section of Burr's report and explain how much of it seemed pretty normal for such a lab to her:

For example, Rasmussen explained how procuring a vaporized hydrogen peroxide system to disinfect air coming from the lab and renovating the HVAC system were not evidence of biosafety failures but instead business-as-usual:

A little later in the tweet thread, Rasmussen concluded, "No evidence of a breach or biosafety failure, but lots of evidence that they were operating a containment lab in a pretty standard way, with one exception: WIV was more innovative than many others and patented some of the bespoke systems they developed," as you can see here:

Rasmussen went on to assess what was written in the report about the working conditions, training, and management at WIV and determined that "No evidence of a biocontainment breach or a biosafety failure, other than lab leak fan fiction invented by people with no clue about how biosafety actually works reading documents that reflect the daily considerations & challenges of operating a containment lab," at the conclusion of her tweet thread:

Remember you can make anything sound scary when describing it in a certain way to people not familiar with the situation. Imagine relating the details of a high school football practice to someone who has never ever seen football. You could talk about high speed collisions, violence, things getting intercepted, jock straps, and people slapping each other on their butts in a manner that could prompt someone to say, "what the bleep is going on? Call the authorities."

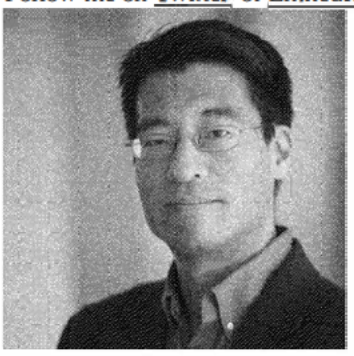
Is it relevant that China developed Covid-19 vaccines faster than the U.S. did with Operation Warp Speed?

The third section presented a rather weird argument. It pointed out that teams in China were able to develop and start administering Covid-19 vaccines faster than Operation Warp Speed could in the

MORENS_SUBPOENA_003132
MORENS_NIH_009659
REL0000478716

U.S. The section tried to suggest that the only way the teams in China were able to move more quickly was if they had access to genomic sequences of the SARS-CoV-2 much earlier.

Hmm, that sounds a little like the "they beat us, therefore, they must have cheated" argument. While Operation Warp Speed did result in Covid-19 vaccines at the end of 2020, it was by no means a perfectly run operation. For example, it July 2020, Jon Cohen wrote for *Science* magazine an article entitled "Operation Warp Speed's opaque choices of Covid-19 vaccines draw Senate scrutiny." And in December 2020, I covered for *Forbes* a range of supply chain and distribution missteps made by Operation Warp Speed. In general, the word well-oiled machine didn't seem to apply the Trump Administration's response to the Covid-19 pandemic in 2020. Moreover, it's not clear what shortcuts the teams from China may have taken in order to get Covid-19 vaccines out there sooner. For example, did they do the same about of human testing as Pfizer-BioNTech and Moderna did before rolling out vaccines to the general public.



One thing's clear. The government of China wasn't as open and transparent to the rest of the world as they could have and probably should have been about the SARS-CoV-2 outbreak in late 2019 and early 2020. The first reports of this "mysterious pneumonia" emerged late in December 2019 and very early in January 2020, as I reported for *Forbes* on January 3, 2020. The government of China likely knew more about the virus and its deadly nature at the time. If that were indeed the case, then China's government chose poorly and should have been more forthcoming to get help from the international community. It is very fair to criticize China's government for withholding information and not being more cooperative. But again all of this does not necessarily mean that the Covid-19 pandemic started with a lab leak.

Did the development and release of the Interim Report follow a scientific process?

All in all, this so-called "Analysis of the Origins of the COVID-19 Pandemic Interim Report" didn't seem to follow many of the steps and criteria needed for a truly scientific report. It didn't even fulfill basic criteria such as clearly describing the methods employed or identifying the people who did the analyses and wrote the report. Whenever you don't transparently describe how you chose what evidence to consider and not consider, you've gotta wonder how much cherry-picking happened. While cherry-picking may be great when you are making a pie, selectively choosing what evidence to follow and not follow is just not appropriate scientifically.

If Congress really wants to shed more light on the actual origins of the Covid-19 pandemic, it would commission and fund a panel of real and most importantly independent scientific experts to compile the report. At the same time, Congress members would then stay clear of this panel to avoid the perception that they are applying any political pressure to see a particular outcome. The U.S. has been leading the world in Covid-19 cases and deaths throughout the pandemic in big part of its failure to consistently follow science and instead defer to politics. And in the end, while politics may cover up to a degree what the virus does, only real science will be able to work against the SARS-CoV-2 and any future viral threats.

Yes – I do know the journalist Peter Aldhous. I've found him to be persistent and generally balanced, but not averse to doing the usual journalistic strategy of always getting both sides of an issue and giving them appearance of equal weight. He did this in an article on the WHO mission's report last spring, but now this seems to be more balanced than some:
https://www.buzzfeednews.com/article/peteraldhous/who- covid-origins-china-report-lab-accident

He did an earlier piece after Trump canceled our grant which tried to explain what the work was:
https://www.buzzfeednews.com/article/peteraldhous/wuhan- lab-coronavirus-trump

I heard from him last week (email below). He says now that he's investigating what the political motivations were for the initial cancelation of our grant, which he believes were in-part driven by the awful pressure group White Coat Waste (he's correct). He might also be looking into their involvement in the attacks on Tony re. the alleged 'beagles with leishmaniasis'. Here's an email I got from him a few days ago:

From: Peter Aldhou(b) (6)
Sent: Monday, April 11, 2022 9:28 PM
To: Peter Daszak (b) (6)
Subject: Could we set up a conversation this week?

Dear Peter,

I hope all is well. I am now working on a piece based in part of the materials we've received from our FOIA to NIH surrounding the cancellation of your grant and subsequent developments.

My focus is a little different from previous coverage. I'm looking at the role of the animal group White Coat Waste in the events that led up to the cancellation of your grant and the subsequent "lab leak" and "gain-of-function" controversies, WCW's links to prominent Republican politicians, its subsequent involvement in attacks on Tony Fauci, and its current activities, which include (questionable) claims about research funded by NIH in Russia. There are some clear parallels this campaign and the way in which the group targeted your grant.

The piece will also discuss the big shift in the tone of internal NIH discussion of your grant before and after WCW's claims were published in the Daily Mail and elsewhere and pressure began to be exerted through WCW 's links with politicians including Matt Gaetz and Marco Rubio. And it will go over NIH's missteps in the termination of your grant as the agency bent under this pressure.

I'd like to your input on the key developments as they affected the EcoHealth Alliance. I noticed that you've been quoted some of the stuff we discussed previously off the record, including in this piece in Science.

Can we set up a time for this? I'm due to file a draft early next week, so if we can speak in the next couple of days, I'd be very grateful.

Thanks,

Peter

Finishing off my sentence…

The real clarity will come when people are allowed back into China to actually do some research. The more lab leak discussion, the less chance of that happening…..That's straight from the WHA yesterday where apparently the Chinese delegate stated that "In the view of China, our role in the COVID-19 origins investigation is now over"

Cheers,

Peter

I sure do agree with the last complete sentence in Peters note. That's what I would hope to get across to the reporter tomorrow. I'll stay away from the science I sort of understand but not the granularity where all of the important insights reside. One of my mentors (not Donald Rumsfeld) always said "know what you know" as applied to clinical medicine. The implication was to also know what you don't know because that's what you need to add to the I know bucket.

Jerry

I was just talking about that statement with a couple of our Board members. My view is this is Biden's way of punting it down the road for 90 days, hoping the hype dies down, and hoping something shifts the narrative. He looks like he's doing something, while everyone knows that the US intelligence agencies are unlikely to get any more clarity in the meantime.

The real clarity will come when people are allowed back into China to actually do some research. The more lab leak discussion, the less chance of that happening. That's a direct

President Biden announced Wednesday he has asked the U.S. intelligence community to "redouble their efforts" to investigate the origins of the coronavirus and provide a report within 90 days that "could bring us closer to a definitive conclusion."

Why it matters: The debate over the origins of COVID-19 has been reinvigorated in recent days by previously undisclosed U.S. intelligence, first reported by the Wall Street Journal, that three researchers at the Wuhan Institute of Virology fell ill enough to be hospitalized in November 2019.

The state of play: Biden said in a statement that the U.S. intelligence community had "coalesced around two likely scenarios" for the origins of the virus — one, that it emerged from human contact with an infected and animal, and two, that it was the result of an accidental laboratory leak.

- A joint team from the World Health Organization and China issued an inconclusive report in March that described the so-called lab-leak theory as "extremely unlikely."
- But the report has been criticized by the U.S. and WHO leadership for its methodology and lack of transparency from the Chinese government, and top U.S. officials have called for a new investigation.

What they're saying: Biden said the U.S. intelligence community's current position is that "while two elements in the IC leans toward the former scenario and one leans more toward the latter – each with low or moderate confidence – the majority of elements do not believe there is sufficient information to assess one to be more likely than the other."

- "I have now asked the Intelligence Community to redouble their efforts to collect and analyze information that could bring us closer to a definitive conclusion, and to report back to me in 90 days," Biden said in a statement.
- "As part of that report, I have asked for areas of further inquiry that may be required, including specific questions for China. I have also asked that this effort include work by our National Labs and other agencies of our government to augment the Intelligence Community's efforts. And I have asked the Intelligence Community to keep Congress fully apprised of its work."

Our thought bubble: Whether COVID-19 ultimately originated in an animal or in a lab, the bulk of the evidence is in China, which limits what the U.S. can find out. But Biden's statement underscores the fact that this debate will not end any time soon, and that the U.S. could ramp up pressure on China to cooperate.

Go deeper: The COVID lab-leak theory goes mainstream

Yes – exactly. It's harmless when he's just writing interesting summaries of outbreaks, but he's repeatedly supported the lab leak hypothesis and was an 'early adopter' of that when he commented about how suspicious he was of China's outbreak investigation, leading to a piece in NY Times in early summer 2020 that didn't really help anyone get closer to the truth, but raised his profile, I guess…

I didnt want to say so, but that's an apt description, or as we would say "gad fly"…. Without any expertise in anything, he flies off to every epidemic anywhere in the world, and then starts opining on it. Quite an expensive out of pocket but gig, but no one here in town takes him seriously. He's kind of like a little kid, always trying to get a seat at the grownups table…. d

I know him quite well. He's what we'd call in England a 'busy-body'. It's crazy to turn every single paper and event into an attack on China – just because one group was doing studies at a university with the goal of analyzing welfare and ethics at wildlife markets does not mean the China team involved in the WHO mission knew about it.

If China was trying to cover up this, why did they let this group publish a paper on it in Scientific Reviews!

Not until June 2021 does China report Wuhan wet markets sold palm civets, racoon dogs and mink from 2017-2019: Where are the SARS-CoV-2 results?

By IDSA Contributor on July 14, 2021.

By Daniel R. Lucey MD, MPH, FIDSA

Last month a paper titled "Animal sales from Wuhan wet markets immediately prior to the COVID-19 pandemic" by Xiao et al., in *Nature Scientific Reports* listed 18 mammalian species sold May 2017 -November 2019 in Wuhan wet markets (Table 1). These mammalian species included masked palm civets (*Paguma larvata*) and racoon dogs (*Nyctereutes procyonoides*), species linked with SARS-CoV-1 in 2003 and known to be susceptible to SARS-CoV-2. Mink (*neovision vison*) were also sold, and the authors state these mink: … originated from fur farms — noting that SARS-CoV-2 has been reported in mink farms in Europe and North America." (paragraph 3 of the Discussion section).

Notably, Figure 2 shows photos of **caged live mammals in the Huanan seafood market** including a racoon dog, amur hedgehogs, Chinese bamboo rat, marmots and hog badger.

In sharp contrast, the WHO-China joint team report from their work in Wuhan Jan. 14-Feb. 10, 2021 and posted March 30, 2021 (p. 98): "Although there is photographic evidence in a published paper that live mammals were sold at the Huanan market in the past (2014) (36) (date confirmed by author in statement Annex F) and unverified media reports in 2020, **no verified reports of live mammals being sold around 2019 were found.**" (my bolding added for emphasis and contrast with Figure 2 of the paper by Xiao et al. above).

Xiao et al., also state in the next to last paragraph of the Discussion section: "Furthermore, the WHO reports that market authorities claimed all live and frozen animals sold in the Huanan market were acquired from farms officially licensed for breeding and quarantine, as such no illegal wildlife trade was identified. In reality, however, because China has no regulatory authority regulating animal trading conducted by small-scale vendors or individuals it is impossible to make this determination".

Specific information regarding racoon dogs is provided by Xiao et al:

"Racoon dog fur farming is legal in China; however, due to a drop in fur prices, racoon dogs are now frequently sold off in live animal markets, augmented by wild-caught animals." (3rd paragraph of the Discussion section).

Xiao et al. state that no pangolins or bats were found in the Wuhan markets.

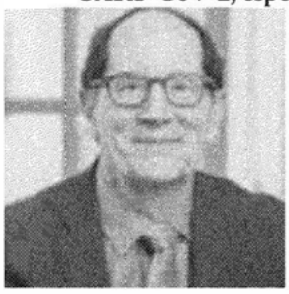
Memorably, Xiao X. (X.X.) et al. explained how these data were acquired:

"Serendipitously, prior to the COVID-19 outbreak, over the period May 2017-November 2019, we were conducting

MORENS_SUBPOENA_013246
MORENS_NIH_025053
REL0000478731

unrelated routine monthly surveys of all 17 wet market shops selling live wild animals for food and pets across Wuhan City (surveys were conducted by X.X.). This was intended to identify the source of the tick-borne (no human-to-human transmission) Severe Fever with Thrombocytopenia (SFTS), following an outbreak in Hubei province in 2009-2010 . . . these shops selling live, often wild, animals included two at Baishazhou market . . . seven at Huanan seafood market . . . four at Dijiao outdoor pet market . . .and four at Qiyimen live animal market . . .". (1st paragraph of Materials and Methods section).

"As an objective observer unconnected to law enforcement X.X. was granted unique and complete access to trading practices. On each visit, vendors were asked what species they had sold over the preceding month and in what numbers, along with the prices. . .and origin of these goods (wild caught or captive bred/farmed). Additionally . . . the number of individuals available for sale at the time of each visit was noted, and animals were checked for gunshot wounds . . ." (2nd paragraph of Materials and Methods section).



Even more people than the five co-authors (from China, Canada, and UK), and the multiple market vendors, were well aware of this study and its findings of live mammalian species in Wuhan wet markets, including the Huanan seafood market because:

"All protocols in the market survey were reviewed and approved by the Ethics Committee of Hubei University of Chinese Medicine (no 20161111). All vendors provided written informed consent to participate in these surveys, and all protocols were performed with relevant guidelines and regulations". (4th paragraph of the Materials and Methods).

[redacted] two of the many key questions [redacted] publication are:

- **Will the WHO Director General, Dr. Tedros, determine from China why the WHO international team in Wuhan Jan-Feb 2021 was not informed of these important data,** especially with regard to the live masked palm civets, racoon dogs, and mink being sold in Wuhan wet markets May 2017 until November 2019 "immediately prior to the COVID-19 pandemic"**?**

- Will Dr. Tedros determine from China what became of these 18 live mammalian species in Wuhan wet markets in December 2019-January 2020 **and what were the results of (so far undisclosed) testing of these animals for SARS-CoV-2, especially the masked palm civets, the raccoon dogs, and the mink?**

Dr. Daniel Lucey

Daniel Lucey, M.D. MPH, FIDSA, FACP, *is a Clinical Professor of Medicine at Dartmouth Geisel School of Medicine, Infectious Disease adjunct Professor at Georgetown Medical Center, senior scholar at Georgetown Law, Anthropology Research Associate at the Smithsonian Museum of Natural History and a member of the Infectious Diseases Society of America Global Health Committee. He served as a volunteer to outbreaks overseas including hands-on Ebola patient care in Sierra Leone and Liberia (Doctors without Borders) 2014, MERS 2013, SARS 2003, as well as HIV, H5N1, Zika, yellow Fever, and pneumonic plague 2017 (with WHO/USAID/CDC). Since Jan. 6, 2020 he has contributed more than 100 posts to Science Speaks on COVID-19 and traveled to China in February 2020. He initially proposed, then fundraised and helped design the content for 2018-2022 Smithsonian Exhibition on Epidemics due to zoonotic viruses. From 1982-1988 he trained at University of California San Francisco and Harvard and was an attending physician at the NIH (NIAID) in the 1990s while in the U.S. Public Health Service.*

Thank you Jerry, it was so great seeing you and everyone! Did you get a chance to see John David, that was nice as well.

I thought the evening was a great show of support for Peter Daszak and the EcoHealth Alliance, especially from the Board. I think that was probably the best part of the gala, the unbridled enthusiasm for the mission, it was nice to see.

The meeting at the RF in the afternoon was impactful and meaningful. I think we have

some momentum to move forward on a coalition. So let's meet next week by zoom.

Warmest regards, Peter

The Coming Tidal Wave of Right Wing Covid Lawsuits

Lawyers have found a way to cash in on outrage over mask mandates and vaccines.

Kiera Butler10 hours ago

In late March, I watched as some 300 lawyers, doctors, and activists assembled in the aggressively beige conference wing of the Midtown Atlanta Hilton for the inaugural Covid Litigation Conference. A promotional flier promised that the event would "provide attendees with the resources they need to begin taking on Covid cases for the first time or to expand the range of Covid claims that they currently handle." An unsuspecting lawyer could have been forgiven for expecting tips on how to help clients who had been disabled by Covid that they caught at their factory jobs, for instance, or those whose medical bills their insurance refused to pay.

But those kinds of cases were entirely absent from the agenda. Rather, the topic was a very particular kind of litigation: How best to advance the movement that organizers called "medical freedom." In other words, how to sue the people who created and enforced public health measures like vaccine and mask requirements, policies against Covid misinformation, and treatment protocols for hospitalized Covid patients.

The conference organizers wore t-shirts emblazoned with the slogan "Misinformation Superspreader." Steve Kirsch, a Silicon Valley entrepreneur, philanthropist, and a main organizer of the event, told me that the slogan was a cheeky reference to what he saw as the unfair labeling of anti-vaccine activists as peddlers of misinformation. "We said, 'Okay if that's what they're calling us," he explained, "let's kind of make fun of it." Indeed, many of the attendees seemed to see themselves as underdogs, scrapping against government and pharmaceutical behemoths.

What those underdogs didn't mention during the sessions, though, is their friends in high places: specifically, federal judges who seem to be sympathetic to their aversion to pandemic policies. Pointing to some of the victories that medical freedom lawyers have enjoyed in US District courts, Dorit Reiss, a public health lawyer and law professor at the University of California College of the Law, noted, "They're having some success in the federal system in front of Trump-appointed judges, and they're very much forum shopping right now." Adam Winkler, a constitutional law scholar at the University of California-Los Angeles, agreed. "The courts have issued a lot of what were once thought to be outlandish kinds of rulings with regard to any number of issues like abortion and affirmative action," he said. "I'd expect that encourages people to bind hope to the prospects of lawsuits that they would otherwise seem certain to lose."

When I arrived, I didn't think I'd get past the Misinformation Superspreaders and make it into the ballroom where the event was taking place. The media liaison for the conference, Trevor FitzGibbon, asked me if I was there to write about disinformation, and he seemed to balk at my affirmative answer. When I said I worked for *Mother Jones*, he noticeably brightened. He had come up in the PR business working for prominent progressive candidates and groups, he explained, including Barack Obama, MoveOn, and Planned Parenthood, which I took to mean that he considered us to be politically kindred spirits. And then he let me into the ballroom.

Once inside, I watched as one indignant panelist after another enumerated their grievances. At the Hospital Negligence Panel, doctors who refused to deviate from

MORENS_SUBPOENA_005395
MORENS_NIH_013459
REL0000478733

CDC protocol to treat Covid patients with unproven drugs like the antiparasitic medication ivermectin and antimalarial hydroxychloroquine were the targets of rage. The Education Mandates session featured the mother of a California teenager who had defied her school's mask requirement, showing up at school without a mask for weeks on end in 2021, and standing outside the school for hours every day after she was kicked out. The panelists batted around ideas: Could the refusal to wear a mask be considered free speech? Could putting a kid in detention for not wearing a mask count as false imprisonment?

In his speech, Kirsch, the conference organizer, told the story of how, at the beginning of the pandemic, he had invested $1 million of his own money toward studying existing drugs as potential Covid treatments. Somewhere along the way, he became convinced that the Covid vaccines were dangerous. Last year, he founded the Vaccine Safety Research Foundation, whose goal, according to its website, is "to advance COVID-19 vaccine safety through scientific research, public education, and advocacy, and to support the vaccine injured." After his speech, Kirsch told me that he sees litigation as a way to force the federal government agencies to release data that he believes they're concealing about the dangers of the Covid vaccines. He said he is sure that "the only reason that we're not allowed to see any of the data is because it's bad."

Many of the other speakers seemed to share Kirsch's belief that the public isn't seeing the whole picture of Covid. In a constitutional law panel, Robert Barnes, an attorney who previously represented both Kenosha shooter Kyle Rittenhouse and Sandy Hook conspiracy theorist Alex Jones, said, "Pfizer makes the Mexican drug cartels look like a street corner dealer by comparison." To hold the public health crowd accountable, he implored the lawyers at the ballroom tables to "knock down the doors of every court we can."

But not just any court. Medical freedom activists have already started enjoying some successes in front of conservative judges. At the local level, several have sided with plaintiffs who've sued hospitals for refusing to give patients ivermectin. But it's been on the federal level, with Trump-appointed judges, where they've enjoyed some of their most significant successes. In 2021, Texas Attorney General Ken Paxton sued the Biden administration over a proposed policy that would have required Covid vaccinations for all Head Start employees. In March 2023, Judge James Wesley Hendrix of the Northern District of Texas, a Trump appointee, struck down the proposed policy. In January 2022, a group of government workers sued the Biden Administration over the president's vaccination requirements for all federal employees; in 2022, Judge Jeffrey Vincent Brown, whom Trump appointed in 2019, ruled in their favor. That ruling was briefly overturned, but in 2023, the 5th US Circuit Court of Appeals in New Orleans upheld it; the opinion was written by Trump appointee Judge Andrew Oldham.

In August 2022, a group of physicians sued the Biden Administration over its efforts to hold social media companies accountable for platforming physicians who spread misinformation about Covid. The plaintiffs, two of whom created the 2020 Great Barrington Declaration to oppose pandemic protections, accused the federal government of violating their First Amendment rights. "The US government used its vast power over social media and big tech to censor legitimate scientific and policy discussion about Covid during the pandemic," Jay Bhattacharya wrote in a statement. That case is still ongoing, but in March, Trump-appointed judge Terry Doughty, in the Western District of Louisiana, denied a motion to dismiss it.

"The US government used its vast power over social media and big tech to censor legitimate scientific and policy discussion about Covid during the pandemic."

There is more to come. Several of the conference speakers have embarked on a Covid litigation bonanza of late. Mark Meuser, a member of the Future Litigation and Censorship panels, boasts on his website that he "has been involved in 22 lawsuits brought against [California Governor Gavin] Newsom for his unconstitutional usurpation of power as a result of COVID-19." In the exhibition area, I visited the booth of Children's Health Defense, the anti-vaccine organization helmed by the new presidential hopeful Robert F. Kennedy, Jr., who announced his bid to replace Joe Biden in April. A flier that highlighted some of the dozens of lawsuits that the group

had recently filed reveals its eagerness to sue the government, at both local and federal levels. It's suing California over a law that prohibits doctors from spreading misinformation; the *Washington Post* and other news outlets over their efforts to stop the spread of misinformation; and the CDC for access to reports of "unusual or unexpected patterns of adverse events reporting that can signal safety problems with a vaccine." Sen. Elizabeth Warren (D-Mass.) is getting sued for calling for a review of the Amazon algorithms that allegedly promoted anti-vaccine books, and Facebook parent company Meta is being sued for "collusion with the US government to censor CHD social media content." Add to the long list of defendants Rutgers University for its vaccine mandate for students and staff.

Law professor Reiss is dubious about the prospects for some of those lawsuits, especially those in which individuals sue a private company for censorship. The First Amendment, she noted, also protects "the freedom of private companies like Twitter and YouTube to kick them off." Nor was the idea of students suing universities, a winning strategy. "You don't have the right to go to a specific university," she said. "And if you don't like the university policies, universities are on pretty solid grounds denying you admission."

Yet she noted that some of the victories the medical freedom movement has racked up so far could pave the way for future legislation that would last long beyond the Covid era—and possibly transform established public health practices. In fact, that's already happening: Several panelists suggested making vaccination status a protected class like race or sex—which means that it would be illegal to discriminate against someone on the basis of whether or not they had received immunizations. In 2021, Montana became the first state to pass such a law. In February of this year, Idaho followed suit. Employers there who require vaccination against Covid can now be fined $1,000 per violation. A similar bill in Florida is currently under consideration.

Another potential opening for medical freedom advocates, Reiss said, is a broader interpretation of laws about religious exemptions to vaccine mandates, which most states allow. With the current Supreme Court's expansion of what is included within the definition of freedom of religion, she worried they may include religious objections to vaccines. "If they go there, it will make it a lot harder to prevent the abuse of religious exemption," she said. On April 18, a few weeks after I spoke to Reiss, a US district judge ruled that Mississippi must change its current policy to allow religious exemptions for vaccine mandates. (The judge, Halil Suleyman Ozerden, had been nominated by Trump in 2019 to serve on the 5th Circuit Court of Appeals, but key Republicans questioned his conservative bona fides and he was never confirmed.)

With all this coming litigation, some of the conference sponsors saw a business opportunity. While the speakers inside the ballroom railed against big pharma and the CDC, just outside, representatives from law-firm-adjacent companies handed out business cards. Zena Obebe, the CEO of Hill Redaction Services, told me, "We wanted to get in front of those litigation lawyers and say, 'Hey, you can use us for the medical records.'" She expects to see many more Covid-related cases soon, explaining, "There's a huge influx that's coming down the pipeline."

Though Covid was the official topic of the conference, many of the people I talked to made detours into other subjects. Their involvement in the medical freedom movement, they said, had caused the scales to fall from their eyes. Kirsch, the conference organizer, explained that before the pandemic, he had never been skeptical of routine childhood vaccinations, but over the past few years, he has come to believe they cause autism (a theory that has been extensively discredited but one cherished by RFK, Jr. whose campaign, Kirsch says, he looks forward to supporting). So fervent is his newfound aversion to immunizations, he told me, that he now believes "nobody should ever" even vaccinate their pets.

For FitzGibbon, the comms guy, his involvement with the medical freedom movement has led to a more thorough disenchantment with his progressive roots. In 2020, during the height of the pandemic, he had become acutely ill with Covid, but two different hospitals sent him home. Only when a doctor-client put in a good word for him did he get admitted to an ICU, where he received monoclonal antibodies—an effective though underutilized treatment—which he credits with saving his life.

In the months that followed, he became skeptical of what he saw as the single-minded focus on Covid vaccines and what he considered to be the suppression of treatments like the one he received, as well as more scientifically dubious drugs like ivermectin and hydroxychloroquine. "All you saw in the US media was vaccine, vaccine, vaccine," he said. "Any other mentions of these alternative treatments were blacklisted." He now believes not only that the Covid vaccines are bioweapons, but also that the Democratic party has lost its way—he saw it even before Covid in Democrats' soft stance on domestic surveillance under Obama, and now he sees it in foreign policy, too. In a pivot I frankly did not see coming, he said, "I do not recognize this administration or this party when it comes to the war in Ukraine," especially since he claims that Russia had good reason to invade the country because of its problem with Nazis (ostensibly a reference to Russian President Vladimir Putin's shakv-at-best justification for his invasion).

It's possible, though, that something unrelated to politics deepened his disenchantment with progressives: In 2015, his PR firm closed abruptly after several female former employees accused him of sexual assault and harassment; he spoke to me on the condition that I note that the US Attorney declined to file any criminal charges, and a woman who had accused him of rape publicly retracted her allegations and apologized as part of a settlement in 2019.

Both Kirsch and FitzGibbon complained that progressive groups with whom they both were previously allied would no longer return their calls—about Covid or anything else. Aggrieved, they were determined to press on in what they saw as a countercultural but righteous crusade—a sentiment echoed by many of the speakers. Their alienation and what they consider to be oppression only further energizes them and their cause. In a heartfelt speech in the ballroom, Sujata Gibson, a New York-based lawyer and activist who recently won a lawsuit that led to New York overturning its vaccine mandate for healthcare workers, compared current medical freedom activism to the Indian struggle for independence, Nelson Mandela's campaign against apartheid in South Africa, and the American civil rights movement. "Part of what we have to do as lawyers when we're in these tyrannical moments in history—and this one is quite extreme—is we have to hold the line in the courts," she said. "I've been lucky enough to see time after time how David and Goliath battles can be won."

Subject: Fw: More harrassment from Michael Lauer Today!!
From: (b) (6) <(b) (6)
To: David Morens <(b) (6)

Speaking of Michael Lauer – interesting and telling side bar with him re. the WIV lab notebooks. Remember, NIH terminated our grant, then reinitiated it with an instant suspension, pending a series of conditions be met – including getting a vial of virus from China etc.

In Jan 2022, while the grant was still suspended, they wrote to us and asked us to supply the lab notebooks and raw data from WIV, and if we didn't have them, to request them from WIV we explained we didn't have them, and passed on their letter to WIV, who never responded (of course!). WIV was then debarred by HHS, in part because when NIH directly asked for the lab notebooks via a UPS letter, the letter didn't even make it past the gate and was marked 'return to sender'!

Now the SSCP has demanded all correspondence from EHA with WIV whereby we tried to get their lab notebooks. There is only one email where we forward the demand from NIH. Cue Michael Lauer, who has seen the SSCP letter to EHA and now demands we share everything with NIH also, given "ongoing concerns over EcoHealth Alliance's compliance". Truly outrageous, however we took the high road and shared the email.

Of course Michael Lauer hasn't stopped at that, he now wants to provide (I believe) a foiable trail of emails that show how dogged he is in pursuit of the nefarious EcoHealth Alliance, and how negligent we are. Today, we got the following email from him, demanding all sorts of answers to questions about a grant that was terminated, and about an organization that is debarred. If this isn't overreach, I don't know what is. I believe he realizes that the Intel agencies can't even get this information, but wants to show that EcoHealth has likely continued to work with WIV, but hasn't done its patriotic duty in demanding their lab notebooks.. Of course, at the same time, NIH is fully aware that we're aiming to publish work from our prior award in China, and get hold of critical genomic information that WIV has generated from 15,000 NIH samples in their freezers. Talk about being stuck between a rock and a hard place…

Here's the brunt of Lauer's email:

By the way – we just received a response from Michael Lauer re. the lab notebooks. We voluntarily shared the email from us to WIV that the SSCP has asked for, that shows we forwarded NIH's demand for us to get WIV's notebooks. As is typical for Lauer, rather than say 'thanks' and move on, he's come back with further questions and demands, written in the style of a suspicious NKVD operative under Stalin. He knows these will be foiad at some point, and has written them in a way that once again implies we're either hiding information or didn't' fully comply with their request 2 yrs ago. They're also designed to make a point – if we are still communicating with WIV (which we have to if we're going to publish papers from our prior work), why aren't we demanding the notebooks? This, even though NIH has specifically told us no work in China, and HHS has debarred them from federal funding. It's a massive overreach from NIH and more like the sort of work a CIA operative would do…

Dear Dr. Chmura,

Thank you for your response. We have some follow-up questions:

- When you (EHA) received no response from WIV, did you follow-up with WIV to confirm receipt of the email, or did you otherwise follow-up with them after not hearing back?
- Did you communicate with or attempt to communicate with WIV after NIH sent a follow-up letter in January 2022 (3rd attachment)?
- Did you ever explicitly request that WIV send the lab notebooks and electronic files to you? All we see is that you forwarded the NIH email to WIV and stated, "I will write to NIH and explain that I've forwarded it to WIV, because I don't have that information."
- Were there any other EHA communications with WIV during the period of November 15, 2021, and February 1, 2022?

Sincerely,
Michael S Lauer, MD

Cheers,

Peter

k of the LA Times

I did put him on to Lauer and the Thousand Talents purge, including Lauers glee over the number of US and Chinese scientists caught in the web. I also notedand the shock Collins and Tabak exhibited when the ACD members read their statement and how quickly they ended the day one meeting after that. He has now seen the transcript and asked Lauer and Tabak to comment on it but of course no real response on that either.

I met my former fellow Claire Panosian Donavan for breakfast this morning. She just interviewed Peter Hotez for ASTMH which will be published soon in the journal. She said Phil Rosenthal would be very positive if some of us wrote an updated perspectives piece although I know that takes to time to write well and credibly. Claire suggested we be in touch with Don McNeil who recently left The NY Times due to rather flimsy racist allegations to talk about the current situation as he might have some ideas about how to get attention to our perspective. She offered to introduce me if that would be helpful. We should consider it as a group or I could just do it myself.

I must say I am looking forward to what Michael Hiltzik puts out after the hearing because there may some really wacky stuff coming out of some of the committee members.

Jerry

EXTERNAL SENDER

Hi all, I Just had a good call with Michael Hiltzik, mainly off the record, but I gave him some quotes at the end along the lines of "It seems that NIH's actions are continuing the de facto blocking of our funding via administrative overreach.." or something less eloquent. He will allow me to check quotes. I also gave him the go ahead to excerpts from the emails and even publish the whole emails that detail the onerous oversight that NIH have been using to block our work, should he wish to. These have already been FoIA'd and are likely to be public very soon in any case.

He told me he will probably wait until after the hearing to see what happens there that can add to his story, but It does seem that he will be doing a story that directly critiques NIH's actions against EcoHealth, and that he believes are part of them trying to rationalize their initial termination under Collins, which I reminded him, our legal team contend was an illegal move. He asked for comment from Tabak and Lauer, and they responded with a single line along the lines "because this is the subject of ongoing compliance oversight, we cannot comment" or similar.

I spoke to Michael Hiltzik about what seems to be a sort of Troika at NIH – Francis Collins, Lawrence Tabak and Michael Lauer. Collins and then Tabak clearly have given the go-ahead on a number of issues to Lauer to do what he can with EcoHealth in a way that benefits NIH and avoids harassment from congress. This seems to mirror what Lauer has done with some Chinese American scientists who were accused of illicit financial activities, never shown to have committed any, but lost their jobs or privileges once Lauer called their Deans (see story in *Science* https://www.science.org/content/article/pall- suspicion-nihs-secretive-china-initiative-destroyed-scores-academic-careers).

He mentioned he had a good conversation with you also Jerry…

RE: Security concerns re. upcoming Public Hearing

Thanks for the kind words Jerry.

Talking with Michael Hiltzik at 1pm and will be ready to fill him in on some of this, and point him to the Troika at the top of NIH (Collins, Tabak, Lauer) who's weak-willed kow-towing to the former president began all this with the termination of my grant 4 years and 2 days ago (not that I'm counting!!)…

I'll avoid the phrase "four more years" at this point, because I really think we do have another 4 years of crap to wade through…

Cheers,

Peter

It is absolutely awful Peter. But I expect your bravery in the face of adversity, and your insistence on clarity and truth, as David and Tony will echo it as well, will remain strong and in the end be the authentic and true of the fictional story they are trying to manufacture.

Dear all,

Just letting you know some of the damage that these political attacks on science have. As soon as the SSCP announced my hearing a few weeks ago, I noticed a significant increase in online death threats, both the number and severity of the threats. On Tuesday this week I received a death threat by mail at my house, and while I was in DC yesterday for a mock hearing, the local police received a notice that someone had killed a scientist and had his wife tied up in the basement at my house. It was a fake call but we ended up with 4 police cars, and detectives searching the house, and staying for the afternoon. We're expecting more of this and are tightening up security for the next couple of weeks at my house and in the office. We also have security lined up in DC where there is a real chance for harassment because they know I have to enter the building that morning. It's also a public building and people will be in the corridors as I enter the room.

In the meantime the SSCP seem happy to gin up their base with a Twitter 'countdown' to my hearing date, just like the buildup to the next season of "Game of Thrones" (below). This time they didn't use the popcorn icon – meaning 'bring your popcorn for this fun show' – as they did on previous countdowns to testimony. I wonder if that's because Peter Hotez called them out repeatedly?

Anyway – it looks like we're in for a rough couple of weeks. Sometime today or over the weekend, the SSCP tells us they'll release a (no doubt damning) report about EcoHealth Alliance, as well as

the transcripion from my 9.5 hours interview I did with them in November. That will keep the Right wing press busy and get their supporters frothing at the mouth up to Wednesday..

Subject: Details and a link to my upcoming Public Hearing
Importance: High

Dear colleagues,

Sadly we're getting close to my upcoming public hearing with the SSCP. There are some details and a link below that you can use to watch it live on the day:
https://uspolitics.einnews.com/pr_news/706672646/hearing- advisory-ecohealth-alliance-president-dr-peter-daszak-to-testify-on-may-1

Hearing Advisory: EcoHealth Alliance President Dr. Peter Daszak to Testify on May 1

WASHINGTON — On May 1, 2024 at 10:00am ET, the Select Subcommittee on the Coronavirus Pandemic will hold a hearing titled, "A Hearing with the President of EcoHealth Alliance, Dr. Peter Daszak." This hearing will examine EcoHealth Alliance's (EcoHealth) use of U.S. taxpayer dollars to fund dangerous gain-of-function research at the Wuhan Institute of Virology as well as hold Dr. Daszak publicly accountable for any and all discrepancies between his closed-door transcribed interview and available evidence. Prior to Dr. Daszak's public testimony, the Select Subcommittee will release the full transcript from Dr. Daszak's transcribed interview and publish a detailed report about EcoHealth's impact on the origins of COVID-19.

Read more about Dr. Daszak's upcoming hearing here.

WHAT: Hearing titled "A Hearing with the President of EcoHealth Alliance, Dr. Peter Daszak"

DATE: Wednesday, May 1, 2024

TIME: 10:00AM ET

LOCATION: 2154 Rayburn House Office Building

WITNESS:

Dr. Peter Daszak

President

EcoHealth Alliance, Inc.

WATCH: The hearing will be open to the public and press and will be livestreamed online at

https://oversight.house.gov/hearing/a-hearing-with-the-president-of-ecohealth-alliance-dr-peter-daszak/.

RSVP: Media must be congressionally credentialed and RSVP by Tuesday, May 1 at 5:00 PM ET.

###

By the way – Allegations that me sending information to David Morens is somehow corrupt are outrageous. Tony Fauci was busy working with the White House COVID taskforce at the time, trying to halt the worse pandemic since the 1918 influenza outbreak. I would have happy emailed him directly, but pretty sure he wasn't checking each of his 50,000 emails a day!

Subject: Today's news...

Had a very successful EcoHealth Alliance benefit last night – sorry some of you couldn't be there.

Michael Mann was our main honoree, and he was great! We raised well above our expectation – all critical to keeping us afloat given the increased pressure we're under right now.

Speaking of which – here's the latest attempt from the SSCP to smear David Morens, EcoHealth Alliance and others as being involved in a 'cover up'

https://nypost.com/2024/04/19/us-news/ex-fauci-adviser-shared-confidential-nih-info-with-ecohealth-about-covid-biosafety-levels-docs/

Basically, they've found an email from me to David, Jerry others when the allegations that EcoHealth expts were conducted at an insufficient BSL level first came out. Tony Fauci was interviewed and said that he would look into it. I sent David M. a review I'd done of the BSL rules for Bat CoVs in various countries, which clearly show that we were operating at the correct biosafety levels.

d Email release today has relevance to NIH and Michael Lauer issues
Importance: High

Good to talk with you yesterday Michael. We got more negative press yesterday, this time related to emails that allegedly show coverups and inappropriate behavior among scientists. The Republicans released only the subject line and addresses etc. (https://oversight.house.gov/release/wenstrup- reveals-emails-from-whistleblower-alleging-additional-attempts-by-fauci-advisor-to-subvert-transparency-about-covid-19-origins/), leading to BS stories in the usual right wing press. We released the full text of the emails today:

https://www.ecohealthalliance.org/2024/04/ecohealth- alliance-releases-emails-that-are-the-subject-of-false-allegations-in-the-press

These are all from me to senior NIAID staffmember David Morens and former NIH Center Director Jerry Keusch, trying to make sense of the termination of our grant by Trump, and to find a way to get it reinstated. In the end NIH did reinstate the grant (May 2023). One of the chains shows emails that refer to the pressure from Michael Lauer, and the fact NIH instructed me not to talk with our program officer (Erik Stemmy) and direct all communications to Grants Management (Emily Linde). That was another highly unusual move from NIH and is part of the pattern that I was talking with you about.

Here is that particular set of emails:
https://www.ecohealthalliance.org/wp-content/uploads/2024/04/Emails- 01.pdf

Peter,

Let's set up a time to talk next week (Wednesday or later best for me). On first glance, it strikes me that I'm glad I'm not in the grants-application business, because the bureaucratic behavior here seems incomprehensible, at least to a layman.

What's the overarching theme in their relations with you? Is it pressure from the lab-leak crowd, the FOIAing from Tobias, which as far as I can tell has yielded nothing of any substance? A spillover from the Trump era?

I read the Science piece, which was thorough in detailing what was done to the Chinese researchers but silent on what provoked it....what was the question I was left with--Why did NIH do all this?

MH

On Sat, Apr 6, 2024 at 12:03 PM Peter Daszak <
(b) (6) > wrote:

> Hi Michael, I'm just contacting you off the record in case you or others are interested in reporting on what's going on at NIH with respect to EHA's grants. We were trying to deal with this privately, without it becoming public, but we found out last week that some of our recent correspondence with Emily Erbelding asking for her help is in a batch of FoIA's emails that will be released to Jimmy Tobias in the next couple of weeks. Tobias is in the habit of simply dumping these on the internet, so we wanted to get these to a bona fide reporter before that happens.
>
> As you probably know, our organization has been funded by NIAID for around 20 years, conducting successful research on emerging diseases, and working closely with communities, scientists and governments in emerging disease hotspot countries to try to reduce the risk of disease emergence. Prior to the termination of our R01 grant in April 2020 that would have had the Wuhan Institute of Virology as a subrecipient, we had never had any issues with NIH or NIAID, and had been lauded by program officers for our cutting edge research into viral

emergence, and the many papers in Science, Nature, NEJM and others based on NIH funding.

After the termination of our grant, the HHS OIG was called in to audit our work and NIH's oversight. They reported back after an 18 month audit with recommendations for both us, and for NIH, most of which were minor and easily addressed. We rapidly complied and NIH's DFAS group confirmed that all audit findings were resolved. However, we continued to receive further actions from the Office of the Director (Michael Lauer, who *Science* wrote about re. NIH's actions on grantees with China connections https://www.science.org/content/article/pall- suspicion-nihs-secretive-china-initiative-destroyed-scores-academic-careers), and the NIH group that manages oversight (OPERA) directly under Michael Lauer. In April 2023, Michelle Bulls from Opera and Emily Linde from NIAID placed 4 Specific Award Conditions (SACs) on our grants. At the time, Michael Lauer had contacted Tufts University who oversaw our IACUC approvals to conduct wildlife sampling because EHA doesn't have an animal facility. This led to Tufts canceling our interinstitutional agreement. The only way for us to proceed was to request an Animal Welfare Assurance from OLAW (based at NIH), but this was denied because of these SACs. One of the SACs stated that all of our subcontracts must be reviewed and revised by NIH reviews. We worked extremely hard to rapidly respond (often within days) to every single request, despite many of them being contradictory or having no material impact on the contracts. In the original letter NIH set a deadline of September 2023 to resolve the SACs, which due to repeated delays by NIH grants management staff in responding to us, continued further requests and shifting of the goalposts means we still do not have resolution. Furthermore, grants management are now suggesting that we are beyond the period of work and our subcontractees won't be able to be reimbursed. Additionally, during the past 12 months, NIH has only reimbursed EcoHealth for around $50K of the now nearly $2 million we are expecting and have expended.

As you can imagine, this puts us in a very difficult position, with institutions like UNC and Uniformed Services University likely to be outraged that their funding is threatened, and with us unable to do our work fully – work that has been reviewed, scored well, and is critical to pandemic prevention. We've tried every possible avenue to get a fair and reasonable rapid resolution. We've informed Emily Erbelding of these issues (hence the FoIA'd email), and Program staff at NIAID remain supportive of our work, but we still have

MORENS_NIH_044665
REL0000478735

no resolution. Every time we try to seek a meeting or resolution, we get a hard response from NIH that we're out of compliance and they set further deadlines and further minor issues for us to fix. Right now I believe we're probably in greater compliance with NIH rules and just about any other institution in the US, given the level of scrutiny we've gone through. I've attached some of the many recent letters between NIH OPERA, NIAID Grants managements and EcoHealth Alliance to give you an indication of the levels of detailed work that we've gone through to try and resolve these issues.

We don't know the reasons why this is happening – all our subcontracts prior to April 2023 covered every single requirement in NIH's grants management guidance, subrecipients had to sign that they would adhere to these. The stonewalling, and shifting of goalposts by NIH is linked to emails that they send us stating that we're 'delinquent' or 'out of compliance', or that they're 'concerned' etc. and seem to us designed ready to be FoIA'd (which they are being) or to be used when NIH has to show Congressional Republicans that EcoHealth is being treated in the way they are calling for. Meanwhile, important findings can't be reported, including a novel SARS-CoV-2 related virus able to bind well to human ACE2 that we have found in one of our country sites, but are now unable to publish because our subrecipient is concerned they don't yet have an approved contract. This is hurting our ability to conduct pandemic prevention work, and the US's ability to be informed about public health threats that could emerge and threaten our citizens.

If you want to report on this, I'm happy to talk on-the-record on some issues, and there are others who are aware of these problems that I can put you in touch with, including at NIH and senior people from outside.

Cheers,

Peter

So let's get this straight: Fauci is the GoF-father ordering NIAID grantees to cook up SARSr-CoV bioweapons in violation of international law using insertional mutagenesis to sprinkle in his favorite bioweapon ingredient: suboptimal polybasic cleavage sites at the S1/S2 junction.

1

EXTERNAL SENDER

I love that idea Rich.

Truth is, our lawyers told us early on that the actions NIH took are likely illegal. They've looked at all prior cases of NIH terminated grants, suspending grants and appeals against them. There are precedents for winning these cases, e.g. Planned Parenthood and others. The only catch is that suing NIH would mean litigation that drags on for a few years, discovery actions that would demand all sorts of private correspondence, and ultimately a jury that might by now be contaminated with the lab leak narrative. They advised us that the best option is to push privately for the grant to be renegotiated, which I suppose is where we are now.

All of this is of course exacerbated by the other actions and attacks that add to a general narrative that EcoHealth must have been up to no good – this includes the NAM investigation that we're still waiting to hear about, and the OIG audit. There's also a lawsuit against us that we've tried not to talk publicly about, but it's real and we have to defend against it. A lawyer in Long Island who's sued EHA, myself and even my wife for a huge sum for causing COVID-19 that then infected him etc.

EXTERNAL SENDER

Thanks Rich - I've got to look at the positives in all of this and just carry on fighting, if only for my own health reasons. It's been a really horrible couple of years and I've found that the constant harassment can really get you down – it's been shocking to me how much of struggle this is with many days spent despairing over my own personal future and the future of EcoHealth. It's been tough on my family as well, and the other staff at EHA.

I'm determined not to give up though and will be going through all the options carefully. The other glimmer of hope is that any 'renegotiation' will be with NIAID staff, so I'll reach out to them ASAP. I think that if most of the funding is planned for the US, with just one subcontract to China, for a group that works on epidemiology, that might work. The other strategy would be to see if a shift to another country would work. I'm mindful that NIH (Lauer et al.) would be delighted if we just handed in the towel, and will probably be looking for excuses to consider our alternative plans out of scope.

On this issue of who is 'the pits' and who isn't at NIH, I think the list begins with Francis Collins, who committed the original sin of terminating our grant when he could have simply resisted. Second is his lackey Lauer who took it

MORENS_SUBPOENA_011103
MORENS_NIH_021849
REL0000478736

to another level of bumbling errors, illegal actions, and aggressive brinksmanship, but there are others also. Lawrence Tabak (now acting Director NIH) publicly stated that we were out of compliance and really threw us under the bus, and there are a group of legal advisors and Congressional staffers at the Office of the Director who have actively worked to publicly undermine us, sometimes with clear glee and delight.

For example, in one of the FoIA'd emails that Peter Aldhous at Buzzfeed unearthed, he spotted Michael Lauer sending details of our animal experiment oversight, which they then used to tighten the screw on us very publicly and unfairly. Lauer used the subject Header "A Gift" when he sent this to his legal and Congressional relations colleagues at NIH. That sort of gloating is pretty disgusting, and won't be forgotten by me. Peter Aldhous also dug up clear evidence that NIH requested an OIG audit as part of their efforts to tighten the screws on us, and get them off the hook. We're just negotiating the final results of that audit – a huge timesink that's been going on over a year now, has looked at grants to EHA over the last 8 years, and has only found $77,000 of mis-coded financial errors (including a $19 overpayment to a contractor, with $7 indirect costs; and a single $5 alcoholic beverage at a hotel mistakenly coded to our grant). Great use of taxpayer money and time and the total of these mis-coded finances is less than 1% of the grants they reviewed, and less than 0.01% of our budget over that period. Of course, when the report goes public in a few weeks, it'll be used by Republicans to demand we're de-funded and closed down (again).

Ironically, in the emails (below), Michael Lauer cc's Michelle Bulls, who's listed in his correspondence yesterday as the person we have to write to if we want to appeal their decision. Pretty sure she's not an objective overseer at this point.

Here's the article: https://www.buzzfeednews.com/article/peteraldhous/white- coat-waste-anthony-fauci-nih-ecohealth-alliance-lab

And here's the section (and you can click on the links to see the FoIA'd emails):

A heavily redacted series of emails from May 2021 centers on the July 2016 letter from the NIAID that had given EcoHealth permission to resume the chimera work. Accepting a suggestion made by Daszak himself, it stated that if any of the chimeric viruses showed unexpectedly rapid growth, he would "immediately stop all experiments with these viruses" and provide NIAID officials with information about the unexpected outcomes. Shortly after receiving the letter, Lauer sent it on to a senior attorney with the Department of Health and Human Services, assigned to the NIH, changing the subject line on the email thread to "Gift ."

Daszak's problem was that the NIH determined that an experiment described in annual progress reports for the grant indicated that one of these viruses had made mice engineered to carry the human receptor targeted by SARS-like viruses sicker than expected and showed signs of rapid growth. "EcoHealth failed to report this finding right away," NIH deputy director Tabak later wrote in an October 2021 letter to James Comer, the ranking Republican member on the House of Representatives Committee on Oversight and Reform.

None of this amounts to a smoking gun linking EcoHealth and the Wuhan institute to the origins of COVID, as the viruses involved were very different to SARS-CoV-2. And in a letter to Lauer and Tabak after the latter's communication with Comer, Daszak contested the conclusion that the experiment did show rapid viral growth and argued that EcoHealth had complied with its reporting requirements.

But it gave Lauer evidence that he was looking for. EcoHealth is now under audit from the Office of Inspector General for the Department of Health and Human Services, an independent watchdog that monitors fraud, waste, and other problems, as part of a review of the NIH and "selected grantees" initiated on June 11, 2021. Documents received by BuzzFeed News through its FOIA lawsuit, including a timeline of events put together by Lauer dated June 13, 2021, indicate that the suggestion for an OIG audit of EcoHealth came from the NIH, just days after Lauer sent his "Gift" email.

The NIH declined to discuss Lauer's email and timeline, saying in a statement: "NIH doesn't comment on internal deliberation of grant awards."

It's good that they're publicly stating we've cooperated with NIH – this is related to their continued series of letters about our other grants – making us jump through all sorts of hoops just to continue our work. At the same time, they're clearly trying to show the aggressive Republicans in Congress that NIH is going to crack down on miscreants such as us. Apparently, for at least the next 3 years we'll have to double up our reporting requirements, have no automatic carry over of unspent funds, and have to conduct 6 monthly onsite assessments of subcontractees. We've not been told all that yet by NIH, but no doubt there'll be another letter from Lauer on its way soon.

Cheers,

Peter

Here's the latest from NIH – as usual we received a Friday afternoon pdf letter from Michael Lauer that's full of legalistic language (attached). And as also 'usual', Lauer only sent this the same day he informed Republicans on an oversight committee, and either him or the Republicans then instantly made it public. There's already an article in the Washington Examiner about it (below)

They're basically terminating our subcontract to WIV because we were unable to get the lab notebooks they demanded (no surprise there, given the politics). They're also offering us the chance to renegotiate the grant. Sounds great, but by now of course the chances of any institution in China wanting to work with an organization targeted in this way are pretty slim. There's also the buried proviso that we have to arrange for 6-monthly inspections of our subcontractee's labs.

If we don't want to renegotiate, we have to bilaterally terminate.

After 2 and a half years of pressure from NIH, we're now back to where we were in April of 2020, when NIH informed us to suspend all work with WIV, but that we could carry on with the grant. This was then followed a few days later with full termination, then suspension with conditions, then more conditions, now this. Pretty depressing, awful, and utterly unnecessary.

Not sure what we'll do, hut my gut feeling is we should continue and try to find a way forwards with other groups in China. It'll be a hard path, considering WIV are the premier bat virus group in China and our preferred partners, and the politics has made all of this completely toxic. But it's the honorable path, as a scientist, and I think we

MORENS_SUBPOENA_011106
MORENS_NIH_021852
REL0000478736

should at least try.

Here's the Washington Examiner article: https://www.washingtonexaminer.com/policy/healthcare/nih- ends-subaward-wuhan-lab-stonewalling

WUHAN LAB

NIH ends subaward to Wuhan lab after continued stonewalling

by Jerry Dunleavy, Justice Department Reporter |
August 19, 2022 08:21 PM

Ad ends in 9s

The National Institutes of Health announced it was finally cutting off a subaward to the Wuhan Institute of Virology after it continued to refuse to hand over key information about the coronavirus research it conducted with U.S. tax dollars.

NIH Deputy Director Michael Lauer made the revelation in a letter Friday to House Oversight Committee Republicans, in which he said the Wuhan lab had refused to turn over lab notebooks and electronic files connected to its research funded through an NIH subaward given to it by the U.S.-based EcoHealth Alliance.

But Lauer indicated the NIH may continue funding EcoHealth's controversial bat coronavirus research despite the group's documented noncompliance issues, its close links to the Wuhan virology institute, and its history of funneling hundreds of thousands of U.S. tax dollars to the Chinese lab.

"NIH … identified one non-compliance under the ... award that cannot be remedied with specific award conditions," Lauer said Friday. "NIH has requested on two occasions that EHA [EcoHealth Alliance] provide NIH the laboratory notebooks and original electronic files from the research conducted at the WIV [Wuhan Institute of Virology]. To date, WIV has not provided these records."

Lauer added: "Today, NIH informed EHA that since WIV is unable to fulfill its duties for the subaward grant under R01AI110964, the WIV subaward is terminated for failure to meet award terms and conditions requiring provision of records to NIH upon request."

MORENS_SUBPOENA_011107
MORENS_NIH_021853
REL0000478736

FBI INVESTIGATED NIH AWARD TO ECOHEALTH AND WUHAN LAB

The Office of the Director of National Intelligence released an assessment in 2021 stating that one U.S. intelligence agency assessed with "moderate confidence" that COVID-19 most likely emerged from the Chinese government lab in Wuhan, while four U.S. spy agencies and the National Intelligence Council believe with "low confidence" COVID-19 most likely has a natural origin.

The NIH's Lauer also said Friday that the National Institute of Allergy and Infectious Diseases, which has been led by Dr. Anthony Fauci for decades, "will begin to engage with EHA to renegotiate the specific aims and objectives of the R01 grant without the involvement of WIV … in light of the cooperation from EHA and the substantial subsequent improvements in administrative processes that EHA demonstrated."

Rep. James Comer (R-KY), the ranking member on House Oversight, hammered the NIH over this. "Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum," Comer said Friday. "It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract. EcoHealth conducted gain of function research on bat coronaviruses in Wuhan, knew about the Chinese Communist Party's coverup, and failed to inform the U.S. government."

Comer added: "EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money."

The NIH had awarded EcoHealth with a grant dubbed "R01AI110964" years ago, and EcoHealth then doled out three research subawards, including one to the Wuhan lab.

"The research approved under this grant sought to understand how bat coronaviruses evolve naturally in the environment to become more transmissible to the human population," the NIH said Friday in defending the award. "This type of research is a critical part of pandemic preparedness."

The grant to EcoHealth was suspended by the NIH in June 2020 due to "grant administrative non-compliance concerns." EcoHealth was reprimanded by the NIH in October when the agency found that the organization delayed revealing that a U.S.-funded experiment conducted with the Wuhan lab determined that mice with implanted human cells became sicker with an engineered version of bat coronavirus. The NIH found more EcoHealth violations in January.

Republicans say the findings showed EcoHealth was funding risky gain-of-function research in China.

EcoHealth leader Peter Daszak was a longtime collaborator with the Wuhan lab who steered hundreds of thousands of dollars in NIH funding to the Chinese lab and was also a key World Health Organization-China joint study team member in early 2021.

Daszak dismissed the lab leak hypothesis in March 2021 when he admitted he took Wuhan lab workers at their word. Meeting minutes from discussions between lab scientists in Wuhan and the WHO-China COVID-19 origins joint study team reveal lab leak concerns were referred to as "myths" and "conspiracy theories."

An advisory group assembled by the WHO said in June that the lab leak hypothesis needed further study.

The NIH said Friday that the prior problems it had identified with EcoHealth's handling of its coronavirus grant included "inadequate oversight in monitoring the activities of its subawardees, failure to report subawards to the General Services Administration's Federal Subaward Reporting System, and errors in indirect rate charges."

But Lauer nevertheless said EcoHealth might again soon start receiving U.S. tax funding for its bat coronavirus experiments — just without the Wuhan lab's continued involvement.

The NIH had been run until recently by Dr. Francis Collins, while Fauci still leads NIAID. Scientists consulting with the U.S. government early in the pandemic believed COVID-19 originating from a lab in Wuhan was possible or even likely, but emails show Fauci and Collins worked behind the scenes to shut the hypothesis down.

We used distribution data from bats known to host SARSr-CoVs, human population data, and serological testing results to estimate that a median of ~66,000 people are infected by bat-origin SARSr-CoVs in South and Southeast Asia each year. Obviously, this suggests spillovers are a daily occurrence in the region and would make any possibility of a lab leak pale into insignificance, given that 1) only a few dozen people work in labs or in the field on these viruses, 2) they all wear PPE as opposed to villagers hunting bats etc.
>
> Note that the analysis doesn't take into account people working in the wildlife trade because data are so patchy, but we do know that 14 million people worked in the wildlife trade in China alone before the outbreak, so that means human infections are probably even more common.

Bizarre indeed, but this is how they do it – tangential links from you to your former postdoc to Zhengli to me, followed by accusations that you're linked to research which they (wrongly) claim is GoF, all used to try to undermine your appropriate pushback against all these other attacks.

It's exactly what the Union of Concerned Scientists called the 'disinformation playbook' that was used by big tobacco and anti-climate change activists (successfully I might add).

I'll also report that the paper you cofunded with EcoHealth Alliance dealt with rWIV1-SHC014S, a chimeric virus shown to be very dangerous to mice with human airway cells, which biosafety experts consider to be gain of function, and which is already under GOP congressional investigators' microscope. Were you aware of this? Should you have disclosed this to your followers on Twitter and The Lancet Commission?

Please clarify if this is incorrect.

Thank you,
Emily

I can help with evidence Jerry. The goal here should not be further reporting to pitch EcoHealth against NIH. The goal should be a deeper understanding of essentially a corrupt action by NIH (illegally terminating a grant 'for convenience') and then 2 years of trying to pin the blame for this malfeasance on a non-profit that has led to substantial harm.

Cheers,

Peter

Hi Peter,

First, and I already told Peter, my note to NAM members last night has had a few direct responses to me indicating it was received and people are already writing to Victor Dzau about it, providing membership input that the attack from the republicans is political and not an indication of misconduct. That's important.

MORENS_SUBPOENA_015211
MORENS_NIH_031691
REL0000478742

The LA Times said no yesterday, in part because they didn't have the evidence to corroborate the charges I make, and because "the conflict between Peter Daszak and NIH over the past year could be a good subject for news reporting". I wanted to move the focus above the specifics of Peter and EcoHealth to the level of Francis Collins and his inability to defend the integrity of science and his spreading of misinformation. So I wrote back with my willingness to share the "evidence" and the need to get this out now before Collins leaves at the end of the year.

I am preparing to send it to the Boston Globe if I don't hear back in the next couple of hours.

Jerry

Hi Peter,
I have written to the list serve of NAM members who signed on to my letter to the NASEM Presidents in 2020 to speak out about political interference in the peer review process at NIH, many of whom also signed the Op-Ed I published with Rick Klausner and Ken Olden in The Hill. I included the republic E+C committee members letter to Victor Dzau, discussed the flaws and the bias, and asked them to write in support of you and EHA.

I am still fighting the battle over the Op-Ed about Collins and NIH.

Importance: High

Follow the email chain below for the latest from NAM on my 'accusations'.

As well as them refusing to give me a copy of the regulations and procedures, I've just received emails suddenly 'rescheduling' or canceling my NAM and NASEM committee calls this week.

I have zero faith in this process at the moment. Every time I email this person and cc. Aleksei, she responds without the cc. She's told me not to share any of this information, yet won't share any details about the rules and regulations. At the same time my reputation is on the line again, and in the hands of a small number of unknown people who clearly want to keep things quiet so that NAM doesn't come under attack.

Thanks very much for the prompt reply.

I look forward to hearing from you once the Assessment Committee has determined the next steps. I sincerely hope this will not become a full-blown review by the Conduct Review Committee – these accusations are part of a political campaign that is designed to undermine and discredit scientists to push a political agenda.

Cheers,

Peter

Dr. Daszak,

Thank you for the follow-up note.

The process is outlined in an internal document that is not part of the members' materials posted on the website nor available in another location.

I can share with you that the first process is a review by the President, Home Secretary, and Membership Director. Following a preliminary review, the NAM's Assessment Panel is convened to review the materials. The Assessment Panel is charged with reviewing the allegations, determining whether supplemental materials are needed, and making a recommendation whether to convene the Conduct Review Committee.

I am in the midst of scheduling a meeting of the Assessment Panel; we all understand the issue of time-sensitivity. I will do my best to operate in the most expeditious manner possible.

Best,

Elena Fuentes-Afflick

Dear Elena,

MORENS_SUBPOENA_015215
MORENS_NIH_031695
REL0000478742

Thank you for your email re. confidentiality. Unfortunately, as is typical with these political attacks, the Republican members of the House E&C Committee have not kept this confidential. In fact, they posted the letter in full on their website as soon as they sent it to you. Their goal by making these easily refuted accusations public, like their previous attacks, is to undermine the science on COVID origins, and to smear scientists publicly so as to discredit us.

Again, I am asking again for you to send me the written processes and rules for how accusations of misconduct against members are to be dealt with. It seems unfair that these accusations are now public so colleagues can see them, but as a NAM member I don't have clear guidelines on what I am and am not allowed to do or say, on who exactly will be making a decision on these awful allegations, nor on how long this will hang over me. As I mentioned to you in my last email, I searched long and hard on the website and was unable to find details specific to the process and procedures, even on the NAM member-protected pages.

I understand none of us wants to be in the position of having to deal with this, but I am simply trying to clear my name and reputation as rapidly as possible.

Cheers,

Peter

Subject: RE: follow-up

Thank you for the call today Elena. I've cc'd our Chief-of-Staff, Dr. Aleksei Chmura, who also joined us. I appreciate your explanation and will do my best to adhere to the policies of the NAM as we go through this process.

My only hope is that the review can be as rapid as possible. Our organization has been the focus of a horrific series of political attacks from the hard right wing as part of their political goals regarding Dr. Fauci, NIH and ultimately the Biden administration. These tie up resources and staff answering pages upon pages of false accusations, all carefully worded to give the impression of a thoughtful and sincere inquiry.

Again, I want to reassure you that none of the accusations from Republicans on the House E&C Committee have the slightest bearing in fact. We have acted honorably and with the highest scientific integrity throughout the pandemic, and simply want to be allowed to continue our work without constant, politically-motivated harassment.

sincerely,

Peter

Some good news..

Just letting you all know that our paper in *Nature Communications* will go live tomorrow at 11am: Sánchez *et al.* "*A strategy to assess spillover risk of bat SARS-related coronaviruses in Southeast Asia*". We used distribution data from bats known to host SARSr-CoVs, human population data, and serological testing results to estimate that a median of ~66,000 people are infected by bat-origin SARSr-CoVs in South and Southeast Asia each year. Obviously, this suggests spillovers are a daily occurrence in the region and would make any possibility of a lab leak pale into insignificance, given that 1) only a few dozen people work in labs or in the field on these viruses, 2) they all wear PPE as opposed to villagers hunting bats etc.

Note that the analysis doesn't take into account people working in the wildlife trade because data are so patchy, but we do know that 14 million people worked in the wildlife trade in China alone before the outbreak, so that means human infections are probably even more common.

I've attached the proofs here, and a press release, as well as an editorial I've published in our journal *EcoHealth* published by Springer. We also know that a story will appear in orrow about this. tomorrow about this.

Cheers,

Peter

Bizarre indeed, but this is how they do it – tangential links from you to your former postdoc to Zhengli to me, followed by accusations that you're linked to research which they (wrongly) claim is GoF, all used to try to undermine your appropriate pushback against all these other attacks.

It's exactly what the Union of Concerned Scientists called the 'disinformation playbook' that was used by big tobacco and anti-climate change activists (successfully I might add).

*****CAUTION:*** This email is not from a BCM Source. Only click links or open attachments you know are safe.**

I'll also report that the paper you cofunded with EcoHealth Alliance dealt with rWIV1-SHC014S, a chimeric virus shown to be very dangerous to mice with human airway cells, which biosafety experts consider to be gain of function, and which is already under GOP congressional investigators' microscope. Were you aware of this? Should you have disclosed this to your followers on Twitter and The Lancet Commission?

Please clarify if this is incorrect.

Thank you,
Emily

Intelligence on Sick Staff at Wuhan Lab Fuels Debate On Covid-19 Origin

Report says researchers went to hospital in November 2019, shortly before confirmed outbreak; Adds to calls for probe of whether virus escaped lab

MORENS_SUBPOENA_019716
MORENS_NIH_039333
REL0000478748

A World Health Organization-led team investigating the origins of the Covid-19 pandemic visited the Wuhan Institute of Virology on Feb. 3.

By Michael R. Gordon, Warren P. Strobel and Drew Hinshaw
May 23, 2021 2:57 pm ET

WASHINGTON—Three researchers from China's Wuhan Institute of Virology became sick enough in November 2019 that they sought hospital care, according to a previously undisclosed U.S. intelligence report that could add weight to growing calls for a fuller probe of whether the Covid-19 virus may have escaped from the laboratory.

The details of the reporting go beyond a State Department fact sheet, issued during the final days of the Trump administration, which said that several researchers at the lab, a center for the study of coronaviruses and other pathogens, became sick in autumn 2019 "with symptoms consistent with both Covid-19 and common seasonal illness."

The disclosure of the number of researchers, the timing of their illnesses and their hospital visits come on the eve of a meeting of the World Health Organization's decision-making body, which is expected to discuss the next phase of an investigation into Covid-19's origins.

Current and former officials familiar with the intelligence about the lab researchers expressed differing views about the strength of the supporting evidence for the assessment. One person said that it was provided by an international partner and was potentially significant but still in need of further investigation and additional corroboration.

Another person described the intelligence as stronger. "The information that we had coming from the various sources was of exquisite quality. It was very precise. What it didn't tell you was exactly why they got sick," he said, referring to the researchers.

November 2019 is roughly when many epidemiologists and virologists believe SARS-CoV-2, the virus behind the pandemic, first began circulating around the central Chinese city of Wuhan, where Beijing says that the first confirmed case was a man who fell ill on Dec. 8, 2019.

The Wuhan Institute hasn't shared raw data, safety logs and lab records on its extensive work with coronaviruses in bats, which many consider the most likely source of the virus.

China has repeatedly denied that the virus escaped from one of its labs. On Sunday, China's foreign ministry cited a WHO-led team's conclusion, after a visit to the Wuhan Institute of Virology, or WIV, in February, that a lab leak was extremely unlikely. "The U.S. continues to hype the lab leak theory," the foreign ministry said in response to a request for comment by The Wall Street Journal. "Is it actually concerned about tracing the source or trying to divert attention?"

The Biden administration declined to comment on the intelligence but said that all technically credible theories on the origin of the pandemic should be investigated by the WHO and international experts.

"We continue to have serious questions about the earliest days of the Covid-19 pandemic, including its origins within the People's Republic of China," said a spokeswoman for the National Security Council.

Covid-19's Origins

- WHO Report Into Covid-19 Origins Leaves Key Questions Unanswered (March 29)
- WHO Team Expert Expects Covid-19's Origins Will Be Found 'Within A Few Years' (March 10)

"We're not going to make pronouncements that prejudge an ongoing WHO study into the source of SARS-CoV-2," the spokeswoman said. "As a matter of policy we never comment on intelligence issues."

Beijing has also asserted that the virus could have originated outside China, including at a lab at the Fort Detrick military base in Maryland, and called for the WHO to investigate early Covid outbreaks in other countries.

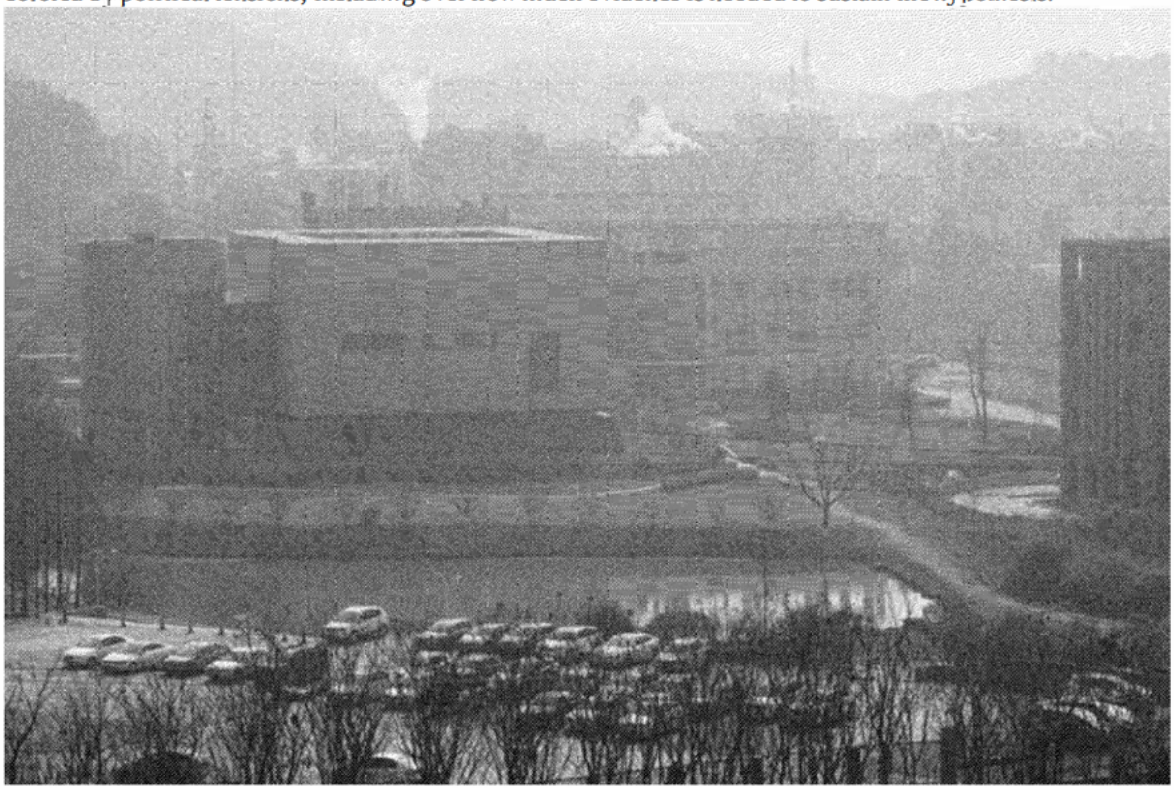
Most scientists say they have seen nothing to corroborate the idea that the virus came from a U.S. military lab, and the White House has said there are no credible reasons to investigate it.

China's National Health Commission and the WIV didn't respond to requests for comment. Shi Zhengli, the top bat coronavirus expert at WIV, has said the virus didn't leak from her laboratories. She told the WHO-led team that traveled to Wuhan earlier this year to investigate the origins of the virus that all staff had tested negative for Covid-19 antibodies and there had been no turnover of staff on the coronavirus team.

Marion Koopmans, a Dutch virologist on that team told NBC News in March that some WIV staff did fall sick in the autumn of 2019, but she attributed that to regular, seasonal sickness.

"There were occasional illnesses because that's normal. There was nothing that stood out," she said. "Maybe one or two. It's certainly not a big, big thing."

It isn't unusual for people in China to go straight to the hospital when they fall sick, either because they get better care there or lack access to a general practitioner. Covid-19 and the flu, while very different illnesses, share some of the same symptoms, such as fever, aches and a cough. Still, it could be significant if members of the same team working with coronaviruses went to hospital with similar symptoms shortly before the pandemic was first identified.



David Asher, a former U.S. official who led a State Department task force on the origins of the virus for then-Secretary of State Mike Pompeo, told a Hudson Institute seminar in March that he doubted that the lab researchers became sick because of the ordinary flu.

"I'm very doubtful that three people in highly protected circumstances in a level three laboratory working on coronaviruses would all get sick with influenza that put them in the hospital or in severe conditions all in the same week, and it didn't have anything to do with the coronavirus," he said, adding that the researchers' illness may represent "the first known cluster" of Covid-19 cases.

Long characterized by skeptics as a conspiracy theory, the hypothesis that the pandemic could have begun with a lab accident has attracted more interest from scientists who have complained about the lack of transparency by Chinese authorities or conclusive proof for the alternate hypothesis: that the virus was contracted by humans from a bat or other infected animal outside a lab.

Many proponents of the lab hypothesis say that a virus that was carried by an infected bat might have been brought to the lab so that researchers could work on potential vaccines—only to escape.

While the lab hypothesis is being taken more seriously, including by Biden administration officials, the debate is still colored by political tensions, including over how much evidence is needed to sustain the hypothesis.

The State Department fact sheet issued during the Trump administration, which drew on classified intelligence, said that the "U.S. government has reason to believe that several researchers inside the WIV became sick in autumn 2019, before the first identified case of the outbreak, with symptoms consistent with both Covid-19 and seasonal illnesses."

The Jan. 15 fact sheet added that this fact "raises questions about the credibility" of Dr. Shi and criticized Beijing for its "deceit and disinformation" while acknowledging that the U.S. government hasn't determined exactly how the pandemic began.

The Biden administration hasn't disputed any of the assertions in the fact sheet, which current and former officials say was vetted by U.S. intelligence agencies. The fact sheet also covered research activities at the WIV, its alleged cooperation on some projects with the Chinese military and accidents at other Chinese labs.

But one Biden administration official said that by highlighting data that pointed to the lab leak hypothesis, Trump administration officials had sought "to put spin on the ball." Several U.S. officials described the intelligence as "circumstantial," worthy of further exploration but not conclusive on its own.

MORENS_SUBPOENA_019719
MORENS_NIH_039336
REL0000478748

Asked about the Jan. 15 statement, State Department spokesman Ned Price said: "A fact sheet issued by the previous administration on January 15 did not draw any conclusions regarding the origins of the coronavirus. Rather, it focused on the lack of transparency surrounding the origins."

Though the first known case was Dec. 8, several analyses of the virus's rate of mutation concluded that it likely began spreading several weeks earlier.

The WHO-led team that visited Wuhan concluded in a joint report with Chinese experts in March that the virus most likely spread from bats to humans via another animal, and that a laboratory leak was "extremely unlikely."

However, team members said they didn't view raw data or original lab, safety and other records. On the same day the report came out, WHO chief Tedros Adhanom Ghebreyesus said the team hadn't adequately examined the lab leak hypothesis, and called for a fuller probe of the idea.

The U.S., European Union and several other governments have also called for a more transparent investigation of Covid-19's origins, without explicitly demanding a lab probe. They have called in particular for better access to data and samples from potential early Covid-19 cases.

Members of the WHO-led team said Chinese counterparts had identified 92 potential Covid-19 cases among some 76,000 people who fell sick between October and early December 2019, but turned down requests to share raw data on the larger group. That data would help the WHO-led team understand why China sought to only test those 92 people for antibodies.

Team members also said they asked for access to a Wuhan blood bank to test samples from before December 2019 for antibodies. Chinese authorities declined at first, citing privacy concerns, then agreed, but have yet to provide that access, team members say.

Subject: Washington Post cites Democrats with more negative comments about EcoHealth
Importance: High

https://www.washingtonpost.com/politics/2024/05/16/covid- origins-spotlight-feds-cut-funding-virus-hunters/

It's written as if "The Fix is in" – they've (SSCP, HHS, Democrats in general) decided that Michael Lauer's, Tabak's and the Republicans allegations are just true, and therefore we're out of business. We never did, yet, get chance to respond – certainly not

at my public hearing.

The EcoHealth saga continues

What did the deputy director of the **National Institutes of Health** know, and when did he know it? Top NIH official **Lawrence Tabak** is set to face off this morning with the House panel probing the coronavirus response. Expect lawmakers to focus on the agency's oversight and funding of **EcoHealth Alliance**, a nonprofit organization that worked with the Wuhan Institute of Virology before the pandemic.

EcoHealth was thrown back into the spotlight Wednesday, after the Department of Health and Human Services said it was suspending funding to the organization and moving to debar the New York-based nonprofit from receiving additional funds, citing evidence EcoHealth had failed to monitor and report on risky virus experiments in China.

EcoHealth has said it is appealing the decision, but the news was hailed on Capitol Hill. Both Republicans and Democrats had called on HHS to review the organization's funding and its NIH grants; GOP leaders have gone further and called for a criminal probe.

"Our investigation into EcoHealth and Dr. Daszak's actions is not over," Rep. **Brad Wenstrup** (R-Ohio), who chairs the **House Select Subcommittee on the Coronavirus Pandemic**, plans to say to Tabak today, in remarks shared with The Health 202. "This issue has highlighted broader concerns with the NIH — especially that it is up to the grantee to oversee themselves. That is a recipe for waste, fraud, abuse and deception."

Years of questions

EcoHealth has been at the center of questions about **SARS-CoV-2**'s origins since the pandemic's earliest days, given the organization's ties to Wuhan, China — the epicenter of the outbreak — and its work to research and experiment with coronaviruses. Then-President **Donald Trump** publicly said his administration was looking into EcoHealth's work, and Tabak was among the officials in April 2020 who moved to abruptly halt NIH funding to the organization. (It was later restored.)

The House coronavirus panel also recently grilled **Peter Daszak**, EcoHealth's president, on his conflicting statements and outstanding questions, including why his organization waited nearly two years to submit a required report about the results of its research and activities leading up to the pandemic.

EcoHealth has repeatedly denied accusations that it played any role in the pandemic, and its defenders have said it's been wrongly scapegoated. There's no existing evidence EcoHealth, the Wuhan Institute of Virology or another organization had SARS-CoV-2 in its possession before the pandemic.

Federal and congressional officials also cautioned that the HHS decision to cut funding to EcoHealth shouldn't be interpreted as a smoking gun about the virus's origins or a possible lab leak. Officials on Wednesday told me the theory that the pandemic began naturally — when a virus spread from animals to humans — continues to be favored by several government agencies and many scientists.

But at minimum, federal officials had grown increasingly uneasy about EcoHealth's work and safeguards, they said. "HHS wanted to be out of the EcoHealth business," one official told me.

What Tabak will be pushed on today

Republicans' line of attack was previewed in a letter to NIH last week, in which Wenstrup laid out Daszak's claims and compared them with other officials' statements under oath.

"The Select Subcommittee is eager to uncover the true sequence of events and has identified multiple occasions where Dr. Daszak directly contradicts NIH's or NIAID's assertions," Wenstrup wrote.

Republicans have hinted that they could refer Daszak to the **Justice Department** on perjury grounds.

Expect GOP lawmakers to probe Tabak's conversations with **Anthony S. Fauci**, his longtime colleague

MORENS_NIH_049981
REL0000478749

at NIH and the center of persistent Republican attacks over his pandemic recommendations, his agency's funding of EcoHealth and other issues. Fauci, who retired from government at the end of 2022, is set to testify in front of the panel in June.

Democrats, meanwhile, have tried to draw a line between what they characterized as bad actions by EcoHealth and Daszak, and the more sweeping charge that the organization helped spark the pandemic.

"While the Select Subcommittee's probe has uncovered efforts by Dr. Peter Daszak to mislead his funders at the National Institutes of Health and the **National Institute of Allergy and Infectious Diseases**, it has not substantiated any allegations that federal grant funding for EcoHealth Alliance created the COVID-19 pandemic," Rep. **Raul Ruiz** (D-Calif.), the top Democrat on the House coronavirus panel, plans to say in remarks today previewed with The Health 202.

The EcoHealth saga continues

Lawrence Tabak, principal deputy director of the National Institutes of Health, is returning to Capitol Hill today. (Jabin Botsford/The Washington Post)

What did the deputy director of the **National Institutes of Health** know, and when did he know it?

Top NIH official **Lawrence Tabak** is set to face off this morning with the House panel probing the coronavirus response. Expect lawmakers to focus on the agency's oversight and funding of **EcoHealth Alliance**, a nonprofit organization that worked with the Wuhan Institute of Virology before the pandemic.

'We've done nothing wrong.' EcoHealth leader fights charges that his research helped spark COVID-19

● JON COHEN

NEWS

17 NOV 2021

Federal officials today suspended federal funding for the EcoHealth Alliance, possibly dealing a mortal blow to a U.S. research nonprofit that has been under fire since early in the COVID-19 pandemic. The group has been the focus of concerns that SARS-CoV-2 may have emerged from bat virus research funded by the U.S. National Institutes of Health (NIH) and conducted by EcoHealth's collaborators in Wuhan, China.

In a letter to the New York City organization, an official for the Department of Health and Human Services (HHS), NIH's parent agency, informed the group it is suspended from federal funding programs and that the department is proposing to formally debar—or ban—the organization from receiving funding. Grants from NIH and other U.S agencies provide the bulk of its budget, which was about $14 million in 2022.

EcoHealth said in a statement it "is disappointed by HHS'[s] decision today and we will be contesting the proposed debarment. We disagree strongly with the decision and will present evidence to refute each of these allegations and to show that NIH's continued support of EcoHealth Alliance is in the public interest."

The move comes 2 weeks after a bipartisan House of Representatives panel grilled EcoHealth President Peter Daszak about allegations the group had violated NIH grant rules. Members of the House's Select Subcommittee on the Coronavirus Pandemic cited missteps such as the group filing a late progress report on its bat virus studies and highlighted allegations that EcoHealth misrepresented the risks of experiments conducted by its collaborators at the Wuhan Institute of Virology (WIV).

The announcement also comes 1 day before a top NIH official is scheduled to testify before the same panel. Representative Brad Wenstrup (R–OH), chair of the subcommittee, called HHS's actions "a victory for the U.S. taxpayer, but also for American national security and the safety of citizens worldwide." The panel's ranking member, Representative Raul Ruiz (D–CA), also praised HHS's action. While noting Democrats on the panel do not believe EcoHealth helped create the pandemic, he pointed to EcoHealth's "failure" to "meet the utmost standards of transparency and accountability to the American public."

The suspension involves EcoHealth's management of a grant to study bat coronaviruses with WIV, which received a small subaward. In April 2020, then-President Donald Trump pressured NIH to ax the grant after some conservative politicians and commentators alleged that SARS-CoV-2 could have leaked from WIV. That move sparked condemnation by scores of scientists who defended EcoHealth's actions and history of pandemic prevention research. HHS reinstated the grant a few months later but immediately suspended it. Last year it was restarted without WIV, which failed to respond to NIH's requests for lab notebooks related to the work.

Meanwhile, documents obtained through public records requests by *The Intercept* raised numerous questions about EcoHealth's oversight of the work. For example, they found that WIV had filed a 2019 progress report more than 2 years late. Critics also suggested experiments at the lab creating hybrid bat

viruses qualified as dangerous "gain-of-function" (GOF) research that should have received high-level scrutiny from HHS. EcoHealth noted it consulted on the work with NIH, which found the experiments did not meet its definition for risky GOF studies.

At last month's hearing, both Democrats and Republicans hammered Daszak and EcoHealth for allegedly mismanaging grants and making misleading statements about the work at WIV. NIH had told the committee last fall that a forensic audit found no evidence to support EcoHealth's claims that it was unable to file the 2019 progress report because it was locked out of NIH's grants system.

In an 11-page memo, HHS suspension and debarment official Henrietta Katrina Brisbon echoes the select committee's concerns, including questions about whether EcoHealth should have reported an experiment finding unexpected growth in mice of a chimeric virus distantly related to SARS-CoV-2. "I have determined that the immediate suspension of EHA [EcoHealth Alliance] is necessary to protect the public interest and due to a cause of so serious or compelling a nature that it affects EHA's present responsibility," the memo states.

It is relatively rare for HHS to debar an NIH grantee. Debarments typically last about 3 years, but agencies have the option of lengthening or shortening the penalty.

For years, EcoHealth has led research aimed at identifying viruses found in the wild that could pose a threat to humans. That work has produced hundreds of publications over the past 2 decades, including papers in high-profile journals such as *Science* and *Nature*. The group has a total of three active NIH grants totaling $2.6 million in fiscal year 2023 to study the risks that animal viruses will jump to humans in Southeast Asia and how Nipah virus moves from bats to people in Bangladesh. It also has large awards from the Department of Defense and other U.S. agencies.

Lawrence Gostin, an expert on global health law at Georgetown University, says that although EcoHealth has 30 days to contest the suspension, he expects any such effort will fail.

"All in all, this has an unpleasant political smell behind it," Gostin says, adding that he believes the move reflects "a political campaign to dissuade scientific cooperation with China."

Virologist Stuart Neil of King's College London says the alleged grant offenses are not "crimes, nor are they evidence of misuse of public money." He calls the HHS action "performative political nonsense carried through by the cowardice of the ranking Democrat members [on] the select committee."

Peter Hotez, a vaccine researcher at Baylor College of Medicine, adds that "EcoHealth Alliance is one of the few organizations we have to track the emergence of new and dangerous virus pathogens. If they disappear, our national security suffers."

But critics of EcoHealth applauded the decision. More details may come out at tomorrow's hearing, where NIH Principal Deputy Director Lawrence Tabak will answer questions about EcoHealth and NIH's grants process.

With reporting by Meredith Wadman.

Cheers,

Peter

Excellent summary - I'd add an intelligence community report despite some of the most biased news coverage I've ever seen. Reading the report it's clear that the Ic including the top committee also leans heavily to natural - zip zero nada evidence for lab leak - all that's left for lab leakers is thd Relman Special - that wiv had sc2 in a freezer and didn't know they had it - some lab person got infected and touched of transmission chains in multiple wet markets

Yes – saw that paper Jason – really interesting

I looked through the paper and it's yet another game changer. So far, in the last few weeks/months, we've got the following new evidence supporting emergence via bat-to-intermediate host-to-human origin for COVID-19 (I've probably missed something):

- Multiple new, SARS-CoV-2 related CoVs in SE Asia (Cambodia, Thailand, Japan, China etc.). I know of other work in review describing other related viruses in SE Asia also. We're also finding further novel SARS-CoV-2 related bat viruses in Malaysia, Thailand.
- New evidence that live animals of the type that carry CoVs were present in the Wuhan markets (including Huanan).
- Evidence from other bat SARSr-CoVs that mutations occur where there FCS is found (eg. RmYN02) https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7211627/
- a rat alpha-CoV with an FCS in wildlife farms, hotels and train stations in S. China, showing that FCS insertions are more common in nature than previously thought. https://journals.asm.org/doi/epdf/10.1128/JVI.01173-21
- Epidemiological analysis of early cases supporting early origin close to Huanan market, not WIV https://www.cell.com/cell/fulltext/S0092-8674(21)00991-0
- Phylogenetic analyses suggesting there may have been multiple introductions into the human population, supporting presence of a virus circulating in animals rather than a lab leak (@virology paper)
- Our work showing a very large interface for bat SARSr-CoV spillover in a v. densly population region, and potential for large numbers of missing cases each year https://www.medrxiv.org/content/10.1101/2021.09.09.21263359v1
- This paper showing ACE2 binding for bat SARS-CoV-2 related CoVs. https://www.researchsquare.com/article/rs-871965/v1

On the lab leak side, we have convoluted accusations based on interpretations of intent about how Chinese scientists submitted genomes, wrote the papers, or how me and other scientists had collaborations with Chinese scientists. But, as far as new evidence goes, I could only find this:

- None

Of course, the momentum on the lab leak side will continue, with books by Sharri Markison, Alina Chan/Matt Ridley, Op

MORENS_SUBPOENA_022918
MORENS_NIH_043931
REL0000478757

Eds that criticize scientists, 70+ FoIAs by one organization alone, many other FoIAs on their way, 900 pages of FoIA'd grants and reports from EHA/NIAID showing zero evidence of lab leak.

This rate of research even in a pandemic is remarkable and suggests that we'll pretty quickly have such overwhelming evidence for the 'natural' origins that most people will move on from the lab leak.

(Off-the-record) However, the damage they leave behind is already horrific and will be worse by the time they decide to find another issue to focus on.

Cheers,

Peter

Almost identical SARS-CoV-2 RBD in several bat sarbecoviruses! This is as close as you can get for a natural RBD origin!

Also, the paper concluded that SARS-CoV-2 genome fragments are found in different sarbecoviruses, very similar to the PloS Path paper for SARS-CoV-1.

All we need is to find a sarbecovirus with a furin cleavage site and no more debate on the natural origin of SARS-CoV-2!

Just stumbled across it reading the discussion of another paper honestly. It's been cited since - there are certainly people who remembered it but I did not know of it and clearly had not penetrated the public origins discussion.

for my ranting in places, but I'm disgusted on many levels that he's willing to throw EcoHealth under the bus like this. The article has errors or hyped up comments in just about every paragraph. It's also extremely cynical that on one day he removes me from the Commission because of my 'competing interests', then writes a piece on it and sells it to a media outlet. He's a regular monthly contributor to the place this was published, which means he has to come up with material each month and this month is was our organization that helped make him his $1000-2000. Of course, I can't be sure how much he gets paid, but an op ed in the times or guardian is $500 and these monthly deals pay better – my former boss had a similar one.

Subject: Relentless - Another letter today from Republicans to NIH, OIG & NAM accusing EcoHealth of 'potential fraud' etc.
From: Peter Daszak <(b) (6) >
To: Hotez, Peter Jay <(b) (6)
CC: Jeff Sturchio <(b) (6) Keusch, Gerald T <(b) (6) Roberts, Rich <(b) (6) David Morens <(b) (6)
Attachments: 4.25.22-Letter-to-Dr.-Lawrence-Tabak from House E&C republicans.pdf

Today the Republicans on the House Energy and Commerce Committee are making a series of allegations about the motives behind our reporting to NIH – the timing of our reports and their content – including accusing us of 'potential fraud'.
The story is here https://www.foxnews.com/politics/house- republicans-ecohealth-alliance-concealed-data.

One important point in the article is that they are publicly stating now that NAM are investigating me: "After receiving our letter, NAM notified us they had opened an internal review of Daszak's behavior, per our request," an Energy and Commerce committee aide told Fox News Digital. "We believe this letter about EcoHealth's potential false statements and fraud is relevant to the ongoing investigation the NAM is conducting into Peter Daszak, so we have sent NAM a copy of this letter as well."

Of course, the allegations in this 17 page letter (attached) are essentially a re-hashing of earlier attacks, most of them spurious, easily explained by the process of doing science, and based on false allegations of motives coupled with a heavy dose of innuendo and hearsay. Some of the allegations are verging on the bizarre – e.g. a whole paragraph on the cropping of a figure in one report whereby the word 'dead' from 'dead point' is partially cut out. Of course, they don't accuse us of lying and fraud, just comment that "it appears the word "dead" was taken out to conceal the deaths from the peer reviewers, which raises scientific and ethical concerns."

The letter is attached – it's from just the Republicans on the committee to the NIH, the HHS OIG, and the National Academy of Medicine.

Cheers,

Peter

The GAO was asked by the Biden administration to look into political interference in science by the white house under Trump. They interviewed me repeatedly last year and this year about the termination of our R01 grant.

https://www.gao.gov/products/gao- 22-104613

This is the first report from them on the topic. It's massively disappointing, of course, because it just comes up with broad recommendations on what agencies should do to protect themselves against political interference. However, if you read the email below, this is the first of two reports, and the second one should hopefully go into more detail about the NIH actions on EcoHealth's grant.

Subject: New GAO Report on Scientific Integrity at HHS

Dear Peter,

Thank you for participating in our report on scientific integrity at HHS. Our completed report can be accessed here. Please feel free to share it with your network and colleagues. We plan to issue an additional report that will examine the key characteristics that can insulate agencies from political interference, and how, if at all, the selected HHS agencies have experienced potential political interference while carrying out their missions.

Thank you again for your time and providing information on this important topic.

Sincerely,

Rob Marek

Just to let you all know that, as predicted, we've received our first exhaustive request for documents, information and testimony. 41 questions from the House Energy & Commerce Committee Republicans. Many of them have already been answered over and over again, and many of the documents have been repeatedly FoIA'd, but of course, this isn't about getting to the truth about anything – it's about creating a 'show' for the hard right voters to watch EcoHealth squirm.

They wrote to us by email and simultaneously made the letter public of course. They've also written to NIH asking them 47 questions all about EcoHealth's terrible behavior. David – they're after your emails too…Here's the link, and I've attached the letters to us and NIH to save you the downloading time…

Most outrageously, in their preamble they comment that our work in China funded by NIH provided "no scientific work product produced for the American taxpayers who helped finance these efforts, and no useful information to support pandemic preparedness efforts."

Actually, in the first 5 years of the R01 funding, we published 18 papers, including 2 in *Nature* and 1 in *Cell*. It was so productive that our renewal proposal was scored within the top 3% of grants.

Cheers,

Peter

REL0000478764

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23

Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:

- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation &
- NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:

- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress

Peter Hotez will talk with:

- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps

- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
  - AAAS
  - AIDS Vaccine Advocacy Coalition
  - American Public Health Association (Georges Benjamin)
  - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
  - Association of Public & Land-Grant Universities
  - Georgia Global Health Alliance
  - Bay Area Global Health Alliance
  - Consortium of Universities for Global Health
  - COVID Collaborative
  - Global Health Council
  - Global Health Technologies Coalition
  - Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
  - International AIDS Vaccine Initiative
  - Nobel Laureates Campaigns
  - Pandemic Action Network
  - PATH
  - Research!America – Reach back out – Jerry will
  - Union of Concerned Scientists
  - Washington Global Health Alliance
  - 156 virologists letter

MORENS_SUBPOENA_016530
MORENS_NIH_034668
REL0000478764

- NAM
- NAS
- NL Campaigns (to be kept informed of progress by Rich)
- CUGH
- The pandemic action coalition
- FASEB
- Global Health technologies coalition
- APLU (KHG has connection)
- Wellcome Trust (Paul Schreier is the interim head).
- Dr. Tony Fauci
- Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
- OSTP
- ASV – Anne Moscona (President-Elect)

Cheers,

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated

MORENS_SUBPOENA_016534
MORENS_NIH_034672
REL0000478764

and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put

MORENS_SUBPOENA_016535
MORENS_NIH_034673
REL0000478764

out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?

Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.

Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?

Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My

MORENS_SUBPOENA_016536
MORENS_NIH_034674
REL0000478764

forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.
After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.
As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.
Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.
Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.
Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?
Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.
The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.
To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.
Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.
Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of*

Totalitarianism, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

MORENS_SUBPOENA_016538
MORENS_NIH_034676
REL0000478764

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then

MORENS_SUBPOENA_016539
MORENS_NIH_034677

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

POLICY-ISH

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.
NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that

MORENS_SUBPOENA_016544
MORENS_NIH_034682
REL0000478764

would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.

Sponsor Message

He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.

Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.

"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message

"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.

He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to

MORENS_SUBPOENA_016545
MORENS_NIH_034683
REL0000478764

broaden its work and to evaluate the regulations more comprehensively.
If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."
But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message
Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tw x on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications,

MORENS_SUBPOENA_016550
MORENS_NIH_034688
REL0000478764

if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Subject: Re: Tony Fauci's testimony today

Jerry, I talk to such reporters frequently, usually on background or off the record. I am willing to do that with any reporter you suggest, and may also be able to speak on the record. Yesterday I taped a follow up podcast, fully approved by NIH some months ago (I did the podcast 6+ months ago and so didn't have to go through censorship for this follow up). In any case, I was very up front with her about this NOT being a lab virus and the danger of shutting down important research. I wasn't very diplomatic, although I will have editing rights before this airs. Time to take the gloves off.

I have spent the last two days ready over 50 manuscripts relating to SARS-CoV-2 origins, including the many complicated papers on phylogenetics of bat and pangolin viruses. This is in preparation from putting pen to paper soon... I have been more and more intrigued by the possibility that the virus is a near descendant of a recombinant bat virus with an imported RBD from a pangolin virus. I spoke with Eddie about that 2-3 weeks ago and he seemed to pooh pooh it, in part because the AA identity was not fully matched by nucleotide identity. But it seemed to me that if the recombination happened some time ago, that might allow for codon optimization. Our phylogeneticist here in the pathogenesis lab has been on vacation, but when he returns I will ask him to drop his flu work long enough to take a look at all these CoV papers. The repeated and growing finding of pangolin viruses from different areas at different times having CoVs with similar - almost identical to SARS-CoV-2 - RBD sequences has to be a clue to something. But pangolins are solitary animals and presumably have no way of interacting with and infecting each other over long distances, unless perhaps they are chronically infected and serve as a reservoir.... Very mysterious.

Peter, question for you: has it been settled about these early case discrepanacies where the Wuhan cases didn't match up with the sequences? Also, does this impact on Eddie's recent great publication and the maps of early cases?

TY, D

the politics and the misinformation about the origins controversy. I was talking to them off the record but I decided they were legitimately exploring the issues and would likely be a voice of reason if they were given the necessary space to build their case and it was eventually shown.

I mentioned Peter Hotez to them, among some others, and while I mentioned Peter D as well I also said you were under constant attack and it might well be better to allow others to take up the fight on your behalf. GOF and the Goffers were part of the chat. I have agreed to be interviewed on the record and potentially to do a video session as they were potentially interested in using some of that as part of the report. Rich, I didn't specifically mention your name, but if you would be willing to speak with them I can do that when I next connect.

Subject: Tony Fauci's testimony today
Importance: High

I'm delighted to see Tony Fauci fighting to let everyone understand clear line between what is gain-of-function (work EcoHealth does NOT do), and what is not Gain of function (work EcoHealth did do with Wuhan).

It's a shame it will generate publicity, but he did this so well today that I'm hoping it might help get rid of the willful misinformation the Republicans are engaging in…

Here's a news piece on it https://thehill.com/policy/healthcare/563874- fauci-paul-doesnt-know-what-hes-talking-about-and-i-want-to-say-that , and there's some pretty exciting video to watch.

David – please pass this information on to Tony and Clifford if you possibly can,

The WHO DG, Dr. Tedros set up a 6am Monday morning meeting with the current WHO Origins team – the international experts who went to Wuhan to work with our China counterparts on COVID origins. He announced they'd be disbanding the team, setting up a separate structure and moving to a system whereby a new team will be formed to do Phase 2 of the work in China. The stated goal is to follow member state's wishes and improve transparency in the way the origins team is selected. Sadly it will reduce transparency because there will now be a 'behind closed doors' decision from the member states on who of the nominees are put forward to WHO, then another 'behind closed doors' decision from WHO on who is selected, with, we've been told, the DG of WHO having final say.

From my point of view it's a real problem because given the political pressure from the Right wing, it might prevent my future involvement in this work. This means my 17 years + of collaboration with the very people in China who we need to work with, will not be part of Phase 2 work – including designing the animal testing protocols that are my key expertise. Disbanding the current team will also significantly delay the work and this threatens to undermine our capacity to do the trace-back, as antibodies wane among wildlife farmers in rural China who we've proposed should be interviewed and tested in Phase 2, for example. The current team has a good working relationship with the China side and has made significant progress over the last few months, meeting weekly as an international expert group and working with our Chinese counterparts to update the WHO report, include new data and get phase 2 Terms of Reference thrashed out. We'd reached the beginnings of consensus on this.

It will also be seen as an implicitly political move on behalf of WHO, and one that projects a perception of undermining the hard work we did to produce buckets of new data in the WHO report. The rest of the team are very angry about the way we've been repeatedly undermined by politics, and we're working on a communications strategy right now.

David, I'm not sure who is the US representative for WHO Covid origins negotiations. It was publicly announced that Tony would represent the US at WHO, but it may be a State Dept or other HHS person. I think it's important that Tony and perhaps Clifford know what's happening.

Cheers,

Peter

Dear all,

Just wanted to let you know that I found out my name was on a 'kill list' posted on the Right wing anonymous internet site 4Chan. Someone posted the names of 6 virologists, including myself, and encouraged people who have had enough and were ready to commit suicide, to take go out and murder this group first. Even more horrific, they named my wife (b) (6) (b) (6)) and my eldest daughter, posting her name and University name also.

I'm traveling in (b) (6) with (b) (6) this week, but have already contacted the FBI and both daughter's universities, but as you can imagine this is pretty awful, though sadly not unexpected.

I expect this will get worse after the mid-terms, when the truly heinous folks on the Right start the launch of their McCarthyesque witch hunts against scientists re. covid origins, vaccines, masks etc.

Cheers,

Peter

Rich: Your summary of my summary is right on point – that was exactly the vibe of Sachs's comments during the webinar. He let Ebright and Kopp spell out the crazier aspects of the lab leakers' viewpoint. Chan was more balanced than I expected her to be (although her summary clearly had a thumb on the scale).
Best regards,
Jeff

Subject: RE: Jeff Sachs moderated a Lancet Commission webinar on COVID-19 origins this morning

Jeff:

Great summary, but nothing really new as all the presenters had well-known views. My only comment is that Sachs recently seems to be a little less adamant that it was a lab leak and just now relies on innuendo.

Subject: Jeff Sachs moderated a Lancet Commission webinar on COVID-19 origins this morning
Importance: High

EXTERNAL SENDER

All: I listened in this morning on the webinar on COVID-19 origins that Jeff Sachs moderated under the auspices of the Sustainable Development Solutions Network (SDSN). I wasn't able to stay until the end of the Q&A, but I did hear the three main presentations. Sachs said that he plans to post the recording of the session (on SDSN?). This was the first of three planned webinars – the second (on global health financing) will take place on November 22, the third (on health system strengthening) on December 8.

Sachs served as moderator. His introduction was fairly mundane. His basic premise was that there are two "absolutely viable" hypotheses for the origin of COVID-19 – either zoonotic or due to a lab leak. (Note that the language he uses – "absolutely viable" – obscures the fact that the evidence differs significantly for each of the two hypotheses. But this was a bias that ran through all of the presentations.) He then argued that we need to follow both lines of inquiry equally, to have a proper understanding of both possibilities. He alluded to the bimodal distribution of most discussion of these questions – with "mainstream media" coming down on natural origins, and "alternate media" arguing for laboratory origins (including in this Senator Burr's Senate Minority Report). He then turned to two "leading scientists" and a "leading reporter" for further perspectives.

The speakers were Alina Chan (Broad Institute), Richard Ebright (Rutgers University) and Emily Kopp (US Right to Know) – no great surprises there.

Alina Chan's main argument was that there is not enough evidence to decide which hypothesis is true, and that all the evidence is circumstantial. She did say that there is no argument over the fact that the pandemic originated in

spillover from bats – just a difference of opinion on how and where this happened.

She presented a set of factors that would explain the chain of causation for each of the two hypotheses:

Natural origins
- Earliest cases handled live animals?
- Were there infected animals in markets or farms?
- Were there animal variants of the virus?
- Was there antibody evidence of infected animals or traders (not presenting with pneumonia)?
- Was there a strong wildlife conduit between known bat reservoirs and the outbreak site?

She then claimed that none of these have been established for SARS-CoV-2, and thus we can't say that natural origins hypothesis is true.

Lab leak
- WIV was the HQ for virus hunting program targeting both animals and humans
- WIV found and developed SARS-CoV-2-like viruses by 2013
- WIV did advanced work with virus isolates and "seamless clones"
- Live virus work was done in BSL2 and BSL3 environments, which could not contain airborne viruses
- WIV and collaborators were planning to insert furin cleavage sites in different viruses (she referred to a "pipeline" of risky research and made a big deal of the rejected DARPA proposal, for which the research was never done)

Her conclusion: evidence is not definitive for either hypothesis, but these aspects of research at the WIV were "very concerning" and thus we need to investigate both conclusions.

Richard Ebright was then asked what should be done about improving the oversight of research in this area from the perspective of biosafety, biosecurity, and biorisk management. He concurred with Sachs and Chan that the available data do not enable a choice between the two hypotheses of COVID-19 origin. But regardless of where one stood on this question, the research by EcoHealth Alliance, WIV, and their collaborators – according to Ebright – used inadequate biosafety protocols and lacked transparency. Again, according to him, this points to, but does not prove, a research spillover as the origin of COVID-19.

I've attached a screen shot of the slide he shared that lays out his bill of complaint. As you can see, he's fixated on the work that WIV and EHA did from 2016-2019, arguing that, while this doesn't prove laboratory origins, it "exceeds

the standard of probable cause" and provides "ample basis to initiate investigation and ample basis to improve oversight." (Like Chan, he also made much of EHA's rejected DARPA proposal, trying to use it as a "smoking gun" for malign intent by EHA and WIV, despite the fact that this research was never done!)

He spent most of his time, however, outlining a basis for and recommendations for improved research regulation and oversight in biosafety, biosecurity, and bio risk management.

Sachs and Ebright had an exchange about the recent news of the creation of a variant of COVID-19 that appeared to be more virulent than Omicron, without the "knowledge or approval of NIH." This was evidence for both of them of the need for enhanced oversight.

Emily Kopp, an investigative journalist with US Right to Know, then made a breathless presentation about her attempts to bring the truth about COVID-19 origins to light through FOIAs and dogged persistence. The gravamen of her complaint is that much of the relevant research has been underwritten by NIH, DOD, and USAID with taxpayer funds, and conducted in the US (at EHA, University of North Carolina, University of Texas, and UC Davis), yet she and her colleagues have had to file dozens of FOIA requests and lawsuits to get access to what they consider to be relevant information.

She reviewed five categories of evidence:

1. EHA progress reports to the NIH: She noted that the Intercept is going after 31 EHA NIH proposals and over 1000 other documents not yet released. They also plan to go after EHA Board members and collaborators at the U of Maryland and UC Davis.

2. USAID databases from PREDICT.

3. NIH bioinformatics databases for sequence data from WIV: She was quite exercised about the "apathy" of NIH at not going through archived sequences to provide the information that USRTK wants.

4. The Baric Lab at UNC: She said as yet there are few clues to planned work on genetic engineering techniques here.

5. Department of Defense: Again, she railed about the lack of transparency about the rejected EHA DARPA proposal, which she claimed DARPA tried to conceal. She also mentioned data from PREEMPT.

She then claimed that the public can't trust the credibility and integrity of the

NIH on these matters, since they tried to obscure the existence of relevant data – and event tried to obscure the involvement of other scientists in the discussion of COVID-19 origins in the conversations that led to the *Nature Medicine* correspondence in 2020 (I lost her here – the discussion became very "inside baseball"). She concluded with a plea that the public deserves more clarity about the pandemic's early days.

Sachs then threw her a softball about the *Nature Medicine* correspondence, inviting her to tell the listeners how it appeared that NIH was trying to obscure who came up with the zoonotic origins theory (and then didn't credit those authors on the publication). She then said that the virologists who were on this correspondence have continued "to be aggressive about natural origins and to marginalize other theories" – asking (rhetorically) if they have shown integrity.

Sachs then said that all of this information had to be pried out of the NIH and the USG, rather than being offered transparently. He showed how the NIAID had redacted most of the 300-page COVID strategic plan of April 2020, and also made a point of saying that Robert Redfield had wanted to attend today's webinar but couldn't, noting that he believes a lab leak is more likely – and that he was shut down by NIH when he tried to call for further investigation. Sachs then teased that there may be new revelations that the WIV and US scientists were implicated in evidence that COVID-19 emerged in China before December 2019. (This latter evidence-free speculation seems to refer to Mike Pompeo's evidence-free contention that the USG had evidence of this – but that evidence has never materialized.)

Sachs then reiterated his contention that both hypotheses need further investigation – and that the relevant information may be in the US, not China. We need an independent, rigorous, transparent scientific investigation. (Despite this language, I think you can sense from my summary of the webinar that Sachs is actually shading the argument toward his belief that COVID-19 had a laboratory origin.)

I wasn't able to stay on for the Q&A, but we should be able to review the rest of the session when Sachs posts the recording.

Hope this is helpful.

As ever,
Jeff

Virologist who tried to discredit the lab leak theory was once a 'partner' to EcoHealth Alliance

Print Email Share Tweet

Posted on July 1, 2022 by Emily Kopp

Columbia University virologist Ian Lipkin has coauthored several articles with EcoHealth Alliance since 2011. (Photo credit: kris krüg)

A virologist who coauthored a paper marginalizing the lab leak theory did not disclose his ties to the research group at the center of it.

Director of Columbia University's Center for Infection and Immunity Ian Lipkin has often worked with EcoHealth Alliance, a U.S.-based collaborator of the Wuhan Institute of Virology, the group confirmed in an email.

EcoHealth Alliance listed Lipkin as a "partner" from 2012 to 2014, an archived version of the group's website shows. Lipkin has coauthored at least ten scientific papers with EcoHealth researchers from 2011 to 2021, EcoHealth Alliance President Peter Daszak said in an email. These publications include a paper about novel coronaviruses EcoHealth and its partners sampled around the world.

EcoHealth Alliance hunts for novel viruses in wildlife and funds research at the Wuhan Institute of Virology.

Lipkin did not disclose his partnership with EcoHealth in "The proximal origin of SARS-CoV-2," a highly influential paper that states that COVID-19 arose from nature.

A central premise of that paper: COVID-19 is too dissimilar from viruses commonly employed in experiments to have spilled out of a lab.

"It is improbable that SARS-CoV-2 emerged through laboratory manipulation of a related SARS-CoV-like coronavirus," the paper states. "The genetic data irrefutably show that SARS-CoV-2 is not derived from any previously used virus backbone."

But Lipkin did not disclose his connection to a nonprofit that uncovers new and novel viruses. Some of those viruses were likely studied at its partnering lab in Wuhan, which housed one of the world's largest collection of bat coronaviruses.

Lipkin did not return several requests for comment.

At 5.7 million views, the *Nature Medicine* article may be one of the most widely read scientific papers in history — though the piece is formally a "correspondence."

David Relman, a Stanford University microbiologist and emerging infectious diseases expert for the National Academies, said conflicts of interest are especially troublesome when writing on high profile issues.

"For any major, controversial issue, I believe that all of us have an even greater responsibility to reveal those conflicts upfront—and let others have an opportunity to judge what effect those conflicts might have had," said Relman.

Relman also called into question the logic of the paper's premise. The Wuhan Institute of Virology may have simply been experimenting with unfamiliar viruses. The disappearance of the lab's coronavirus sequence database in 2019 and the lab's history of gain-of-function experiments also weaken the claims of Lipkin and his coauthors, Relman said.

"The Proximal Origins paper is flawed in its assumptions, logic and the soundness of its conclusions. I was very surprised that it passed review at *Nature Medicine*," he said.

Columbia University Center for Sustainable Development Director Jeffrey Sachs — chair of The Lancet COVID-19 Commission — said the citation the authors used to prop up the paper's premise deserves more scrutiny.

"The Proximal Origins paper has no credibility," Sachs wrote in an email. "The paper's central claim — that SARS-CoV-2 is not related to viruses previously reported in laboratory research — ~~offers as proof a foot~~note to a 2014 paper!"

"It ludicrously claims to debunk a 2019 lab emergence using a 2014 paper," he continued. "The paper offers no real evidence whatsoever against the possible lab origin of the virus, even though it claimed to do so."

Lipkin himself has since acknowledged the possibility that the Wuhan Institute of Virology

was experimenting with unknown viruses, contradicting the popular paper he coauthored.

"If they've got hundreds of bat samples that are coming in, and some of them aren't characterized, how would they know whether this virus was or wasn't in this lab? They wouldn't," Lipkin said in an interview with the Washington Post last year.

But Lipkin has not disclosed his work with EcoHealth to reporters.

Nature Medicine, the journal that published the paper, defines a "competing interest" requiring disclosure as including "personal or professional relations with organizations and individuals" — paid or unpaid. A spokesperson for parent company Springer Nature did not respond to a request for comment by press time.

Lipkin's connection to a group at the center of lab leak suspicions is the latest revelation to cast doubt on the correspondence.

Significant questions remain. It's still unclear how the authors dispelled their own private concerns that the virus had been engineered within a couple of days.

For example, Lipkin privately voiced concerns to his coauthors about a "nightmare of circumstantial evidence" pointing to the Wuhan Institute of Virology, Vanity Fair reported.

It's also unknown to what extent leaders of the National Institutes of Health, which funded the EcoHealth Alliance, may have shaped the paper.

Grant reports that led a reporter to the defunct link showing Lipkin's partnership with EcoHealth Alliance were obtained through a Freedom of Information Act request to the U.S. Agency for International Development.

Maybe we should pick one and provide the background information Peter is putting together. The trouble with The New Yorker or the Atlantic is that it will take weeks for them to get something published and what is necessary now is to have the news journalists point out the written record to the contrary for claims like those the committee is making. Hiltzik is good at that. He has the attention of Ruiz's PR guy who is distressed Michael did not soften the criticism in his piece today. I think that has just made Michael more determined to tell it like it is and reveal the perfidy of Ruiz, his colleagues, HHS, and ultimately up to the White House.

By the way, I have found Michael Specter at The New Yorker to be a direct, scientifically driven, hard driving writer. I have dealt with him in the past and could try to interest him in following up. What say?

On May 17, 2024, at 3:19 PM, Keusch, Gerald <(b) (6) wrote:

Regarding Tabak's comments on GoF, this is what the text below shows.

Rep. Lesko: "Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?"

Dr. Tabak: "It depends on your definition of gain-of-function research. If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

So it is not what he said but how the SSCP spun it. That's a weakness that should be exploited in the press. It is deliberately spinning information into disinformation and that is both lying and dangerous. We need to point it out, find other examples where it is easy to refute what they are saying about Peter, EHA, and David, and make sure others will amplify that and delegitimize the committee. I'm going to point out that one to Hiltzik and Kaiser.

Press ReleasePublished: May 17, 2024

Hearing Wrap Up: NIH Refutes EcoHealth's Testimony, Tabak Reveals Federal Grant Procedures in Need of Serious Reform

WASHINGTON — The Select Subcommittee on the Coronavirus Pandemic held a hearing titled "Overseeing the Overseers: A Hearing with NIH Deputy Director Lawrence Tabak" to examine the National Institutes of Health's (NIH) process for funding and overseeing scientific research as well as investigate

NIH's relationship with EcoHealth Alliance, Inc. (EcoHealth). Members pressed former Acting NIH Director and current Principal Deputy Director, Dr. Lawrence Tabak, to explain numerous inconsistencies between the public and private testimonies of NIH employees and EcoHealth President, Dr. Peter Daszak. Dr. Tabak offered substantial evidence that Dr. Daszak purposefully misled both the NIH and the Select Subcommittee about EcoHealth's efforts to comply with grant procedures. In a

MORENS_NIH_045183
REL0000478785

shocking admission that directly contradicts Dr. Fauci's previous statements, Dr. Tabak testified that the NIH was funding gain-of-function research in Wuhan, China through a grant to EcoHealth. Members highlighted the dangers of continuing to fund gain-of-function research in foreign laboratories where NIH cannot ensure proper biosafety measures are implemented. Both Dr. Tabak and Select Subcommittee Members agreed that, in "hindsight," the NIH could have done more to protect the

MORENS_NIH_045184
REL0000478785

American taxpayer from EcoHealth.

Key Hearing Takeaways

- NIH Deputy Director and former Acting NIH Director, Dr. Lawrence Tabak, acknowledged that NIH funded gain-of-function research in Wuhan, China.
- Dr. Lawrence Tabak repeatedly refuted EcoHealth Alliance President Dr. Peter Daszak's public and private testimonies. It is now clear that Dr. Daszak misled both the Select Subcommittee and the NIH on numerous occasions.
- Serious shortcomings and failures in the NIH's grant awarding and grant oversight procedures enabled EcoHealth to facilitate gain-of-function research in Wuhan, China. These NIH deficiencies were exploited by Dr. Daszak and his team in an effort to avoid oversight and maintain funding.
- The U.S. Department of Health and Human Services' (HHS) decision to immediately suspend funding and commence debarment proceedings against EcoHealth is backed by substantial evidence and necessary to protect America's national security. The Select Subcommittee also recommends that HHS immediately begin debarment proceedings against Dr. Peter Daszak personally.
- The NIH often lacks the necessary subject matter and scientific expertise to ensure U.S. taxpayer funds are spent and overseen safely. Dr. Tabak testified to these gaps in NIH's system today, and former NIH Director Dr. Francis Collins recounted similar problems during his transcribed interview found here.
- The Select Subcommittee's investigation into EcoHealth's impropriety is far from over. Chairman Wenstrup appreciates Dr. Tabak's honesty today and intends to use his testimony to hold EcoHealth accountable for its facilitation of gain-of-function research and its blatant contempt for the American taxpayer.

Member Highlights

Select Subcommittee on the Coronavirus Pandemic Chairman Brad Wenstrup (R-Ohio), D.P.M, pressed Dr. Tabak to address Dr. Daszak's testimony that EcoHealth was "locked out" of the NIH's grant

MORENS_NIH_045185
REL0000478785

reporting system. NIH conducted an internal forensic audit which proves EcoHealth was, in fact, not “locked out” from submitting its required NIH grant research update report on time. Notably, EcoHealth finally submitted its report nearly two years after the required deadline. According to the facts gathered by NIH, Dr. Daszak’s sworn testimony appears to be false.
<image001.png>

Chairman Wenstrup: “*EcoHealth, like every*

MORENS_NIH_045186
REL0000478785

other NIAID grantee, was required to submit a five-year progress report, as you know. This report was submitted nearly two years late. Dr. Daszak testified that EcoHealth had tried to submit the report on time but was locked out of the NIH system. Dr. Lauer testified that a forensic audit was conducted, and no such system error was detected. Is NIH now willing to share the findings of this forensic audit with the Select Subcommittee?"

Dr. Tabak: "*We certainly will work together*

MORENS_NIH_045187
REL0000478785

with you to obtain things that you require, sir."

Chairman Wenstrup: "*Does the audit indicate that EcoHealth could have submitted their report on time?*"

Dr. Tabak: "*That's what our audit indicates, yes.*"

Chairman Wenstrup: "*When EcoHealth eventually submitted its year-five report, Dr. Daszak testified it took 11 days to unlock the NIH system. Is this true?*"

Dr. Tabak: "*We have no evidence of that.*"

...

Dr. Tabak: "*All I can say to you is that our system did not lock them out*

MORENS_NIH_045188
REL0000478785

and there was no impediment for them to provide that report on time."

Committee on Oversight and Accountability Chairman James Comer (R-Ky.) questioned Dr. Tabak about the employment status of alleged federal records violator and top advisor to Dr. Anthony Fauci — Dr. David Morens — who was placed on administrative leave after the Select Subcommittee uncovered incriminating information. Dr. Morens used his personal email(s) to hide conversations about the origins of COVID-19 and undermine

MORENS_NIH_045189
REL0000478785

the operations of the NIH. <image002.png >

Chairman Comer: "*What is Dr. Morens's current employment status?*"
Dr. Tabak: "*He is an employee of NIH.*"
Chairman Comer: "*Well, I think you see where my lines of questioning were leading. We have some serious concerns. We have fought in this Select Subcommittee, the Oversight committee, on obtaining information. And here you have an admission of deleting information, going to great lengths to not be transparent, in an apparent*

MORENS_NIH_045190
REL0000478785

cover-up of something that I think we would agree, in a bipartisan manner, is one of the most serious issues that our country has ever faced, the COVID 19 pandemic."

Rep. Debbie Lesko (R-Ariz.) elicited an admission from Dr. Tabak that the NIH funded gain-of-function research at the WIV through a grant to EcoHealth. This directly contradicts Dr. Fauci's U.S. Senate testimony in 2021 in which he claimed the NIH "has not ever and does not now fund gain-of-function

MORENS_NIH_045191
REL0000478785

research in the Wuhan Institute of Virology." This type of research is known to be dangerous and even former NIH Director Francis Collins and Dr. Fauci were willing to admit that there are risks associated with this experimentation.
<image003.png >

Rep. Lesko: "*Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?* "

Dr. Tabak: "*It depends on your definition of gain-of-function research.*

MORENS_NIH_045192
REL0000478785

If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

Rep. Rich McCormick (R-Ga.), M.D., proved that EcoHealth violated the terms of its NIH grant when it failed to produce "laboratory notebooks" with information about the WIV's gain-of-function research. On May 1, Dr. Daszak falsely

MORENS_NIH_045193
REL0000478785

testified that he was not required to produce these notebooks as a condition of his grant.
<image004.png>

Rep. McCormick: "*When the National Institutes of Health requested the notebooks from EcoHealth, was EcoHealth required to produce them under its grant terms?*"
Dr. Tabak: "*Yes, they were.*"
Rep. McCormick: "*When NIH requested notebooks from EcoHealth should EcoHealth have been able to access them or already have access to*

MORENS_NIH_045194
REL0000478785

them?"
Dr. Tabak:
"That's correct."
Rep. McCormick:
"Did EcoHealth ever produce the requested notebooks?"
Dr. Tabak:
"They have not."
Rep. McCormick:
"Dr. Daszak testified two weeks ago that he was not required to produce the lab notebooks. Would NIH disagree with that testimony?"
Dr. Tabak:
"Yes, we disagree with that testimony."
Rep. McCormick:
"The testimony here today clarifies the inconsistency between Dr. Daszak's testimony and the

MORENS_NIH_045195
REL0000478785

testimony of numerous NIH officials and NIAID officials, also, including yourself. Dr. Daszak continues to thwart congressional oversight through semantics and outright dishonesty, quite frankly. He has routinely failed to produce pertinent documents and made countless misleading statements to the Select Subcommittee right here."

Rep. Mariannette Miller-Meeks (R-Iowa), M.D., uncovered serious shortcomings in NIH's grant awarding and grant oversight procedures. Dr. Tabak testified

MORENS_NIH_045196
REL0000478785

that he would never again support a grant to EcoHealth Alliance to fund gain-of-function research in Wuhan and believes the NIH relied too heavily on Dr. Daszak attestations.

.

<image005.png>

Rep. Miller-Meeks: "*As I mentioned, the Understanding the Risk of Bat Coronavirus Emergence Grant was an almost $4 million grant that partially went to the Wuhan Institute of Virology and the Wuhan University of Public Health. Do you believe this grant*

MORENS_NIH_045197
REL0000478785

was an effective use of taxpayer dollars, and would you support issuing the same grant today?"

Dr. Tabak: "*Well, with the benefit of what we know today, no, of course not.*"

Rep. Miller-Meeks: "*There is great concern with Dr. Daszak interaction with NIH and NIAID pertaining to the one log growth term of the award. The NIH relied on Dr. Daszak to monitor and report virus growth after being a month late on his annual reporting requirements, which were outlined in the grant.*

Dr. Tabak, looking back, did the NIH rely too much on Dr. Daszak's self-reporting information?"

Dr. Tabak: "*Again, with the benefit of hindsight, we did because we never received the information.*"

Rep. Miller-Meeks: "*Well, as an ophthalmologist, hindsight is always 20/20.*"

Rep. Nicole Malliotakis (R-N.Y.) revealed NIH's honest viewpoint regarding its funding of EcoHealth's risky research at the WIV. Dr. Tabak testified that NIH believed it

MORENS_NIH_045199
REL0000478785

was not funding any dangerous research prior to or during the COVID-19 pandemic.
<image006.png>

Rep. Malliotakis: *"We also know that at least 20 more EcoHealth research projects received funding since March of 2020, and they are conducting research Nipah, zoonotic viruses, bat coronaviruses, MERS. They are doing a lot of this research, mostly actually in third world countries. Subpar safety conditions. How do you ensure that our federal dollars are not going to do risky*

MORENS_NIH_045200
REL0000478785

experiments in countries where there are subpar safety regulations? And do you believe that should be a criteria that is put forth to ensure that the money doesn't?"
Dr. Tabak: *"Well, again, once we established special conditions for award on EcoHealth Alliance, we have monitored them very carefully with regard to expenditure and with regard to their various administrative processes. There was never a concern with the danger, if you will, of the experiments that NIH approved*

MORENS_NIH_045201
REL0000478785

for EcoHealth Alliance to with under subaward with WIV."

Hi Peter,

We haven't spoken for a year or two since I was covering vaccine misinformation. Anyway, I'm being put back on the origins of COVID beat ahead of the Fauci hearing next month. I've been loosely following the twists and turns with EcoHealth and NIH and all the rest, but I'm needing to get a little more caught up.

Would you be up for a quick background conversation?
Best,
Geoff

Subject: Confidential: WHO DG Circular Letter to Member States - Origins of SARS-CoV-2
From: Peter Daszak <(b) (6)
To: David Morens <(b) (6) Keusch, Gerald T(b) (6) ; (b) (6) peter hotez <(b) (6)
Attachments: C.L.28.2021 (Origins of SARS-CoV-2).pdf

David – please pass this information on to Tony and Clifford if you possibly can,

The WHO DG, Dr. Tedros set up a 6am Monday morning meeting with the current WHO Origins team – the international experts who went to Wuhan to work with our China counterparts on COVID origins. He announced they'd be disbanding the team, setting up a separate structure and moving to a system whereby a new team will be formed to do Phase 2 of the work in China. The stated goal is to follow member state's wishes and improve transparency in the way the origins team is selected. Sadly it will reduce transparency because there will now be a 'behind closed doors' decision from the member states on who of the nominees are put forward to WHO, then another 'behind closed doors' decision from WHO on who is selected, with, we've been told, the DG of WHO having final say.

From my point of view it's a real problem because given the political pressure from the Right wing, it might prevent my future involvement in this work. This means my 17 years + of collaboration with the very people in China who we need to work with, will not be part of Phase 2 work – including designing the animal testing protocols that are my key expertise. Disbanding the current team will also significantly delay the work and this threatens to undermine our capacity to do the trace-back, as antibodies wane among wildlife farmers in rural China who we've proposed should be interviewed and tested in Phase 2, for example. The current team has a good working relationship with the China side and has made significant progress over the last few months, meeting weekly as an international expert group and working with our Chinese counterparts to update the WHO report, include new data and get phase 2 Terms of Reference thrashed out. We'd reached the beginnings of consensus on this.

It will also be seen as an implicitly political move on behalf of WHO, and one that projects a perception of undermining the hard work we did to produce buckets of new data in the WHO report. The rest of the team are very angry about the way we've been repeatedly undermined by politics, and we're working on a communications strategy right now.

David, I'm not sure who is the US representative for WHO Covid origins negotiations. It was publicly announced that Tony would represent the US at WHO, but it may be a State Dept or other HHS person. I think it's important that Tony and perhaps Clifford know what's happening.

Cheers,

Peter

EXTERNAL SENDER

Rich: Couldn't agree more that we need a different descriptor than "gain-of-function," particularly since this term has now become so politically loaded. If you and Harold can come up with a better descriptor, an op-ed by the two of you making the case for a different way of understanding this genre of research – with a different term – would be an excellent resource for bringing clarity and rationality to the debates around what is currently known as GOF.

As ever,
Jeff

Subject: Re: The new NIH Director nomination

EXTERNAL SENDER

Rich, yes, I know Monica and we have talked several times about the NCI and NIH jobs. But I don't expect to be involved in her preparation for the hearing on her nomination as NIH Director. That is usually organized by the legislative offices in the NIH Office of the Director and by the legislative team at DHHS. I am sure that she will get briefed about the EHA grant and it is likely that NIAID will be asked to provide background material.

The document you sent has a lot of detailed information that she might want to read but it would best be delivered to her via NIAID; in addition, the source of the document (presumably EHA itself) should be apparent. EHA might simply provide that to NIAID's current leadership and I expect that they've done that already.

Best,

HV

PS Can't we find a better, more restricted way to label experiments that enhance pathogenicity or transmissibility of infectious agents than "gain of function"? Even DURC (dual use research of concern) is better than that. I've been doing GoF research for decades, enhancing cell growth by enhancing the function of proto-oncogenes!

You probably know Monica Bertagnolli and I am wondering if you will be contacting her prior to the Senate Hearing?

MORENS_SUBPOENA_005136
MORENS_NIH_013039
REL0000478802

I ask because in light of the recent events related to EcoHealth Alliance she is likely to be questioned about their funding and the relationship to the COVID lab-leak hypothesis. I had let you know that their grant had been re-instated (2 1/2 years after we asked for it!), but I don't see that will stop some awkward questions for her.

If you do get the chance to chat you might mention some of the possible responses to questions that are covered in the attached.

If you will not be speaking with her, perhaps you could suggest someone else I might contact about this matter.

Hope all is well with you.

It's relentless.

This is from an editorial board member of Wall Street Journal – asks "Couldn't someone have put Mr. Daszak's on mouth quarantine for a month".

https://www.wsj.com/articles/wuhan- lab-theory-a-dark-cloud-on-china-11615332235

I'm sure this guy's tough as nails when he's writing from the comfort of his home, but that sort of comment is beyond rude and I just hope I don't bump into him at some meeting sometime in the future. I guess the truth is that for the WSJ to be doing ad hominem attacks means that our work is making some sort of impact, but really this is just another call to ban the work we're doing, close down the labs, cut the collaboration all in the name of saving us from a future lab-release pandemic. He rapidly dismisses environmental encroachment as the cause – which is a shame really because that's what we'd need to stop to reduce the chances of the next big one…

Cheers,

Peter

Subject: Jerry's letter to Victor Dzau

Re. your letter below, Jerry, and the comment to Victor that the news is now public re. the NAM investigation – in my inbox this morning are requests from journalists from the Washington Examiner, Bloomberg Law, and Epoch Times. They want me to comment on the allegations from McMorris Rodgers, and the letter last week requesting the HHS secretary to investigate EcoHealth for unethical behavior and get us debarred from federal funding.

Does Victor really want the NAM to be a party to this anti-science political witchhunt? Because that's exactly what's happening right now.

Cheers,

Peter

I sent the note below to Victor, now that the internal investigation at NAM is in the public domain.
Rich, it is time to mobilize the Nobel laureates. This is going too far and there must be pressure, all the pressure possible from the

scientific community, and applied to Victor and NAM to stop it now.

Subject: Investigation of Peter Daszak

Dear Victor,

I am surprised to see the Republican members of the House Energy and Commerce Committee providing information to Fox News about supposedly confidential procedures at NAM. They of course are repeating the baseless accusations we discussed previously, but there is the uncomfortable reality that when lies are repeated time after time people begin to believe them. But now this is in the public domain. NAM no longer has the luxury of working through this in protected space. You are in the spotlight, and like it or not you and the Academy are being dragged into this dreadful episode in the history of science.

I would hope NAM has the courage to stop this in its tracks by issuing a brief memo to them saying the initial investigation has revealed no violation by Peter Daszak of the code of conduct and their request is denied. Period. The stakes are high, certainly for Peter and his career and his organization which has generated so much critical science for the past 20 years. But beyond Peter it is the very integrity of science and the stewardship of science and separation of politics away from science that is so threatened by these accusations.

I am convinced there will be an uproar at NAM if there is any adverse judgement passed on Peter and his integrity. Please stop it in its tracks while you can.

Jerry

EcoHealth Alliance Statement Concerning SSCP Comments as Reported by Fox News

April 6, 2024 – EcoHealth Alliance shares the interest of members of the Select Subcommittee on the Coronavirus Pandemic (SSCP) reported in a Fox News article on Thursday (https://www.foxnews.com/politics/covid- origins-ecohealth-alliance-president-testify-publicly-congress-next-month) in ensuring that reporting requirements on Federal grants are met so that grantee organizations are held accountable to the American people. This is precisely why EHA has cooperated fully with all inquiries into our use of Federal funds to carry out our mission to reduce the threat of future outbreaks, and prevent future pandemics.

We note that the HHS Office of the Inspector General (OIG), in its audit of EHA's and NIH's grant oversight and compliance, did not find significant issues and summarized its findings as follows: "EcoHealth had steps in place to conduct risk assessments of its subrecipients, and also had standardized checklists to document routine monitoring of its subrecipients." The NIH's Division of Financial Advisory Services subsequently informed EHA that all of the findings of the HHS OIG audit have now been resolved, indicating that EHA is fully in compliance. We look forward to the hearing on May 1, when we will have an opportunity to clarify misunderstandings about EHA's reporting on its Federal grants.

David: Too true – you're right about this tendency to provide equal time/balance. It's aggravated by reporters depending on sources who are not experts in the science. Most of the VF article is predicated on the conclusions of a junior staffer who claims to have unique insights into the thinking of Chinese officials simply because he can read Chinese. It still isn't clear just what level of scientific understanding Kadlec's team working for the Senate minority brought to this report.

I look forward to readng it carefully, as it seems to cover a lot of territory

I have done 2-3 interviews in the past with this writer, on background or off the record, and she has come across to me as trying to get to the truth. Yet, like many others, she is into this "false equivalency" mode, not realizing that some of her sources are non-expert bloviators, highly biased, or both. , and this suggesting that their comments are worth airing to achieve balance. If writers like these were interviewing a battered women, they would give equal time to the batterer. d

Thanks David,

I responded to Bruce Lee (the perfect name for a truth ninja warrior such as he) including a pdf of the PNAS paper at his City University email which was easy to obtain to a) congratulate him, and b) ultimately ask him if we can respond to his article in depth via an introduction to the editorial staff as I am tired of sending pointed well evidenced Op-Eds or editorials or opinions over the transom and then being ignored with a standard no thanks reply. Or if necessary via a letter to the editor. Let's see if he responds. I'm thinking the Task Force, all or some, might respond – actually maybe just the American members because of the uniquely American nature of this sort of rank political nonsense. I'm hoping Lee will reply.

Has anybody seen any comment from Burr regarding the outrageous attack on Nancy Pelosi's home, and the sole occupant at the time, her 82 year old husband Paul? I haven't and to me that is just the exclamation point on the assessment that his report is political and timed before the election, aside from the mile wide holes in the argument, so well-articulated by Bruce Lee.

Sen. Richard Burr (R-N.C.), seen here on August 6, 2022 in Washington, DC., and his office came out ... [+]

Getty Images

These days anytime any politician makes any claims about Covid-19, you've got to wonder whether it's more about politics than real science. After all, throughout the pandemic, politics has infiltrated Covid-19 decision-making like botox in a reality TV star. So when the office of Senator Richard Burr (R-N.C.) dropped "An Analysis of the Origins of the COVID-19 Pandemic Interim Report," just two weeks before the midterm election, you've gotta wonder whether this report was more about politics than actually determining what really happened.

After all, in the report, Burr did indicate that last Summer he and Senator Patty Murray (D-Washington) "announced a bipartisan Health, Education, Labor and Pensions (HELP) Committee oversight effort into the origins of SARS-CoV-2, the virus that caused the COVID-19 pandemic as part of our effort to address pandemic preparedness and response programs." *Dictionary.com* defines bipartisan as "representing, characterized by, or including members from two parties or factions," and not "screw it, why don't I just issue a report myself?" It's also interesting why such a interim report would be issued so quickly now before it's been properly vetted by the scientific community. Why the rush? And why wasn't there more of a heads up to everyone that this would be on its way? Was this designed to be a Halloween scare? Or maybe just maybe the midterm elections had something to do with it?

Plus, this interim report drew some pretty strong conclusions that usually would require a lot more supporting scientific evidence than the report actually provided. What's a strong conclusion? How about, "Based on the analysis of the publicly available information, it appears reasonable to conclude that the Covid-19 pandemic was, more likely than not, the result of a research-related incident." Yeah, that statement certainly has drawn headlines and attention on social media. The phrase "more likely than not" sounds fairly definitive. For example, if you were to tell your significant other that "based on analysis of publicly available information, it appears reasonable to conclude that you are more likely than not a cheater," you had better more likely than not provide enough specific concrete evidence to justify such a claim. Otherwise all of your possessions including your butt would more likely than not end up on the street. Similarly, this report seemed to be claiming that the evidence is already strong enough to conclude that a lab leak started the Covid-19 pandemic. But what evidence did the report then provide? Well, here's a hint. It rhymes with "Not a troll bot." Yes, not a whole lot.

Did any real scientists develop, vet, and support the findings of this Interim Report?

Let's take a look at what some real scientists who have real expertise in this area said on Twitter about this report. Spoiler alert: some expletives more likely than not emerged. For example, Kristian G. Andersen, PhD, a Professor of Immunology and Microbiology at Scripps Research, used the phrase "Flood the zone with bull [bleep]" when referring to what's going on with this report:

And Peter Hotez, MD, PhD, Dean of the National School of Tropical Medicine, wrote, "My view: a total load of antiscience [bleep]," in the following tweet:

To adapt the words from that song in the movie *Bring It On*, Burr, it's cold in here—with here being real scientists' reaction to the report. Bull-bleep and antiscience bleep weren't exactly words of endorsement. Hotez also provided some real scientific papers describing how the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) may have jumped from other animals to humans and the evidence supporting such a natural jump:

Speaking of real scientists. Were any real scientists involved in developing and reviewing Burr's interim report? Well, the cover of the report bore the names Minority Oversight Staff, Senate Committee on Health Education, Labor and Pensions, which was a fancy way of saying that it was compiled by the office of Burr. The report didn't really list any other authors or contributors other than Burr. So, assuming that Burr himself didn't compile and write everything like a high schooler doing a book report, it's unclear who actually did the research and writing for this report. The report didn't really clearly delineate what process was used to assemble and review the available evidence, who determined what should and shouldn't considered, or how the report was vetted either.

What counterarguments did this Interim Report provide against evidence that the SARS-CoV-2 had jumped from other animals?

That being said did the report at least provide some strong arguments to support its conclusions? Well, the first of the four sections attempted to offer some kind of counter to the existing evidence of a natural animal original of the SARS-CoV-2 without even mentioning that evidence. That was sort of the "I'm going to ignore what you have said and provide only my side of the story" tactic. This section basically presented six arguments that were weak at best. The first two arguments were essentially the same: that the intermediate host animal species—meaning the intermediate between bats and humans—for SARS-CoV-2 hasn't yet been found. That argument would hold water about as well as a fish net thong.

It's been only about three years since the Covid-19 pandemic first broke. Science rarely can move that quickly, especially when Congress isn't providing nearly enough funding to support the needed studies. It can be challenging to find such a intermediate animal host species. It's not as if you can post a message on Twitter or Facebook saying, "hey all animals, come by and get tested for SARS-CoV-2 or some virus similar to it" or "hey, did you host this virus before passing it along to us humans? Come one, you can tell us." Plus, scientists around the world have been kind of busy with something called, you know, the Covid-19 pandemic. So unless Burr and his Senate colleagues want to provide much more support and funding to help find the intermediate host species, "you haven't found it yet," really isn't a very strong argument.

The third argument provided was that the "SARS-CoV-2's high binding affinity for human ACE2 receptors suggests that it is possible for it to directly infect humans without needing a period of adaptation in an intermediate host." In other words, the virus took to humans so well, it couldn't have jumped from other animals. That's a bit like saying, "hey, that velour track suit fits you so well that it was probably tailored specifically for you." Such an argument doesn't pass much muster because it wasn't clear what the virus was doing before the start of 2020. Weaker versions of the virus could have very well been spreading between other animals and humans long before late 2019 and early 2020. The world didn't have much of a surveillance system in place to really track what every possible viral threat was doing before 2020. It still doesn't have such a system.

The section's fourth argument was that Wuhan, China, seemed to be the only place where the virus may have jumped from non-humans to humans. The claim was that if the virus had jumped from other animals to humans, why didn't such jumps occur elsewhere as well. Again, all of this assumes that the world already had great global surveillance systems in place that could readily determine exactly where and how everyone had gotten infected with

the SARS-CoV-2. Yeah try doing that when there's been well over 630 million Covid-19 cases around the world so far. And that's not even counting those folks who never ended up getting tested.

The fifth argument was similar to the fourth, claiming that "After the unidentified source transmitted SARS-CoV-2 to humans, it stopped transmitting SARS-CoV-2." Again, this has never been established. With so many cases emerging every day, it's difficult to say who caught the virus from where. The Covid-19 pandemic is not the same situation as the 2002-2004 SARS and the 2013 avian influenza A (H7N9) outbreaks where there were a lot fewer cases so that infections and transmission chains were a lot easier to track.

The sixth argument was that "The low genetic diversity of the earliest SARS-CoV-2 samples suggests that the COVID-19 pandemic is most likely the result of a single successful spillover of SARS-CoV-2." That's not exactly true. Plus, once again, the lack of a comprehensive surveillance system means that cases may have been missed early on in 2020 and before that time. Moreover, even if the pandemic had started with a single spillover event, how exactly would that prove that it was lab-leak rather than a natural spillover event that triggered the whole pandemic? All of these arguments didn't seem to be that scientific, which raises the question again, what specific scientists contributed to this interim report.

Did the Wuhan Institute of Virology actually have major safety concerns as the Interim Report claimed?

This aerial view shows the P4 laboratory (L) on the campus of the Wuhan Institute of Virology in ...[+]

AFP via Getty Images

The second section of the report tried to paint a picture of the Wuhan Institute of Virology (WIV) as a place with numerous safety concerns and incidents. It did include brief descriptions of events and items that you probably normally wouldn't find at your home, assuming that you don't regularly sleep and shower at a Biosafety Level (BSL) 3 or 4 laboratory. So all of these could have sounded ominous and scary to the general public or anyone else who doesn't conduct virology experiments on regular basis.

So, assuming that Burr and his staff aren't running enzyme linked immunosorbent assays in their Congressional offices, wouldn't it have been better to ask a real laboratory scientist who regularly works with viruses to put together that section? Angela Rasmussen, PhD, a virologist at the Vaccine and Infectious Disease Organization at the University of Saskatchewan in Canada, would qualify as such an expert. So let's turn to Rasmussen's tweet thread about this section of the Burr report:

As you can see, Rasmussen's tweet stated that the report "claims to show evidence of multiple biocontainment breaches. That sounds very bad! But how reliable is this evidence?" Her tweet thread went on to review each thing listed in this section of Burr's report and explain how much of it seemed pretty normal for such a lab to her:

For example, Rasmussen explained how procuring a vaporized hydrogen peroxide system to disinfect air coming from the lab and renovating the HVAC system were not evidence of biosafety failures but instead business-as-usual:

A little later in the tweet thread, Rasmussen concluded, "No evidence of a breach or biosafety failure, but lots of evidence that they were operating a containment lab in a pretty standard way, with one exception: WIV was more innovative than many others and patented some of the bespoke systems they developed," as you can see here:

Rasmussen went on to assess what was written in the report about the working conditions, training, and management at WIV and determined that "No evidence of a biocontainment breach or a biosafety failure, other than lab leak fan fiction invented by people with no clue about how biosafety actually works reading documents that reflect the daily considerations & challenges of operating a containment lab," at the conclusion of her tweet thread:

Remember you can make anything sound scary when describing it in a certain way to people not familiar with the situation. Imagine relating the details of a high school football practice

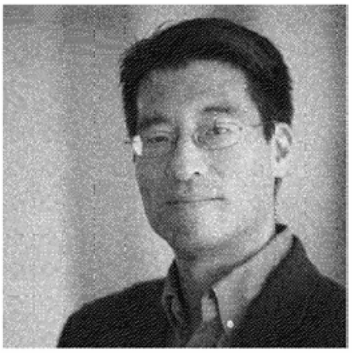
to someone who has never ever seen football. You could talk about high speed collisions, violence, things getting intercepted, jock straps, and people slapping each other on their butts in a manner that could prompt someone to say, "what the bleep is going on? Call the authorities."

Is it relevant that China developed Covid-19 vaccines faster than the U.S. did with Operation Warp Speed?

The third section presented a rather weird argument. It pointed out that teams in China were able to develop and start administering Covid-19 vaccines faster than Operation Warp Speed could in the U.S. The section tried to suggest that the only way the teams in China were able to move more quickly was if they had access to genomic sequences of the SARS-CoV-2 much earlier.

Hmm, that sounds a little like the "they beat us, therefore, they must have cheated" argument. While Operation Warp Speed did result in Covid-19 vaccines at the end of 2020, it was by no means a perfectly run operation. For example, it July 2020, Jon Cohen wrote for *Science* magazine an article entitled "Operation Warp Speed's opaque choices of Covid-19 vaccines draw Senate scrutiny." And in December 2020, I covered for *Forbes* a range of supply chain and distribution missteps made by Operation Warp Speed. In general, the word well-oiled machine didn't seem to apply the Trump Administration's response to the Covid-19 pandemic in 2020. Moreover, it's not clear what shortcuts the teams from China may have taken in order to get Covid-19 vaccines out there sooner. For example, did they do the same about of human testing as Pfizer-BioNTech and Moderna did before rolling out vaccines to the general public.

One thing's clear. The government of China wasn't as open and transparent to the rest of the world as they could have and probably should have been about the SARS-CoV-2 outbreak in late 2019 and early 2020. The first reports of this "mysterious pneumonia" emerged late in December 2019 and very early in January 2020, as I reported for *Forbes* on January 3, 2020. The government of China likely knew more about the virus and its deadly nature at the time. If that were indeed the case, then China's government chose poorly and should have been more forthcoming to get help from the international community. It is very fair to criticize China's government for withholding information and not being more cooperative. But again all of this does not necessarily mean that the Covid-19 pandemic started with a lab leak.



Did the development and release of the Interim Report follow a scientific process?

All in all, this so-called "Analysis of the Origins of the COVID-19 Pandemic Interim Report" didn't seem to follow many of the steps and criteria needed for a truly scientific report. It didn't even fulfill basic criteria such as clearly describing the methods employed or identifying the people who did the analyses and wrote the report. Whenever you don't transparently describe how you chose what evidence to consider and not consider, you've gotta wonder how much cherry-picking happened. While cherry-picking may be great when you are making a pie, selectively choosing what evidence to follow and not follow is just not appropriate scientifically.

If Congress really wants to shed more light on the actual origins of the Covid-19 pandemic, it would commission and fund a panel of real and most importantly independent scientific experts to compile the report. At the same time, Congress members would then stay clear of this panel to avoid the perception that they are applying any political pressure to see a particular outcome. The U.S. has been leading the world in Covid-19 cases and deaths throughout the pandemic in big part of its failure to consistently follow science and instead defer to politics. And in the end, while politics may cover up to a degree what the virus does, only real science will be able to work against the SARS-CoV-2 and any future viral threats.

I don't know if this has been shared with us all yet, but a preprint on this issue came out a few months ago and is now published in Nature Communications Biology.

As you can read, it clearly indicates that the ability of SARSr-CoVs to undertake furin cleavage is something that is clearly achievable in nature – in this case in European bat SARSr-CoVs, with just one nucleotide mutation. Normally, this would close the door on all lab leak suppositions around the FCS of SARS-CoV-2, but we're not in a normal world, and with loud voices like Jeff Sachs spuriously claiming the opposite, the confusion will continue in the public's mind…..

Abstract

The furin cleavage site (FCS) in SARS-CoV-2 is unique within the *Severe acute respiratory syndrome–related coronavirus* (*SrC*) species. We re-assessed diverse *SrC* from European horseshoe bats and analyzed the spike-encoding genomic region harboring the FCS in SARS-CoV-2. We reveal molecular features in *SrC* such as purine richness and RNA secondary structures that resemble those required for FCS acquisition in avian influenza viruses. We discuss the potential acquisition of FCS through molecular mechanisms such as nucleotide substitution, insertion, or recombination, and show that a single nucleotide exchange in two European bat-associated *SrC* may suffice to enable furin cleavage. Furthermore, we show that FCS occurrence is variable in bat- and rodent-borne counterparts of human coronaviruses. Our results suggest that furin cleavage sites can be acquired in *SrC* via conserved molecular mechanisms known in other reservoir-bound RNA viruses and thus support a natural origin of SARS-CoV-2.

Peter:

Thanks. On the whole, I thought the piece was quite well done. I think we all know that coverups, especially in China, are never as simple as one might think. I certainly appreciate your clarifications. For me the take home message is that one has to be very careful in taking Chinese scientists or government officials at their word. Most are very intimidated by the higher-ups.

EXTERNAL SENDER

Yes – saw that piece. There are some truths in it and some exaggerations. On cover-ups in China. From what I've gleaned, the coverups were not as simplistic as they suggest – i.e. that China acted a single entity in not letting the world know how serious COVID was – it's more subtle than that:

- the local CDC (Wuhan) didn't inform the Federal CDC (China CDC) early enough about the outbreak and their suspicions of it being SARS-like. This seems to be a case of city and provincial bureaucrats not wanting to be punished by higher ups – probably cost a few days in closing down transmission at the market.
- The market workers covered up the live animal trade in the Huanan Seafood Market instead of having them tested, and finding out the source farms where the outbreak likely happened. This was then covered up by every sector of govt in China, and is denied to this day, despite there being solid, published evidence of it.
- There clearly was a delay in reporting the sequence in early Jan, but I think that was a case of individual labs competing for a Nature paper – prob cost a couple of days in getting that information out globally. We don't know how long that

would have continued, but the sequence was already in press on Jan 11th when it was released by one group via GISAID, so probably would have been released by the journal a few days later.

- Re. human to human transmission, China was open about intra-family transmission, and the WHO and most of us strongly suspected human-to-human transmission very early on – in fact I publicly stated in early Jan when there were suddenly 40+ cases from the Huanan Market, that this is either human-to-human transmission or repeated exposure to an infected animal source. We knew the market was cleaned out so the latter was unlikely. Marion Koopmans also believed this and said this publicly. It was a dynamic, difficult outbreak situation and no one had such certainty, but the evidence was already there.

The most important mistakes were then our lack of preparation between Jan and March – we could see the virus spread to Thailand (early Jan), then Iran, then Italy, then Austria/rest of Europe. We saw the horrors of the Seattle nursing homes, and our White House just tried to wish it away – we all know the rest – that same magical thinking led us into the 'Opening by Easter weekend' comments in 2020, then summer surge, the opening just before the Delta wave, anti-maskers, anti-vaxxers and the whole sorry mess we've been through.

Then the current big mistake – I'm glad she points out that we continued to fail in getting sufficient vaccines out to the rest of the world, and the consequences of that for continued waves of infection…

Cheers,

Peter

EXTERNAL SENDER

Dear all (cc'ing Dennis Carroll who I spoke with at the weekend),

Not sure if you've already seen this, but after multiple harassing, innuendo-filled articles in this journal *The Intercept*, we decided to respond to them and try to explain that all of the minutiae they have been reporting on for the last few months are not evidence of corrupt science that led to a pandemic, but just the opposite – they're part of the normal process of doing science to help prevent pandemics.

The result is an interview they published last week that is a bit combative, but at least helps explain to those who are bothered, that all of the allegations these guys have been pushing can be easily addressed, albeit that the answers are 1) boring, and 2) not the narrative that they want.

David – you'll be interested in the bit where I explain that the NIH Office of the Director has been cruelly holding us over a barrel to deflect from their political and erroneous decision to defund us.

Here's the link: https://theintercept.com/2022/03/11/covid- nih-ecohealth-peter-daszak-interview/

And here's the story pasted in the email:

PETER DASZAK ANSWERS CRITICS AND DEFENDS CORONAVIRUS RESEARCH

MORENS_SUBPOENA_005838
MORENS_NIH_014396
REL0000478831

“Scientists disagree over an issue where there’s no definitive proof,” said the EcoHealth Alliance president on the origins of the Covid-19 pandemic.

Sharon Lerner, Mara Hvistendahl
March 11 2022, 9:50 a.m.

SINCE THE EARLY days of the Covid-19 pandemic, Peter Daszak has been at the center of a heated, and at times vicious, debate over the origins of the SARS-CoV-2 virus. The parasitologist helms the New York-based nonprofit EcoHealth Alliance, a wildlife conservation organization that aims to understand and prevent infectious diseases; the organization has received more than $118 million in grants and contracts from U.S. agencies, much of which Daszak distributes to labs around the world. Starting in 2005, he worked closely with Shi Zhengli of the Wuhan Institute of Virology, who was a key partner on a 2014 National Institutes of Health grant to research bat coronaviruses in China. The Intercept has published over 2,500 pages of documents and communications from the grant following a Freedom of Information lawsuit — information that has transformed public understanding of the research conducted under the grant.

Those documents have shown that in its efforts to head off and prepare for a pandemic, EcoHealth Alliance oversaw an experiment in which researchers intentionally made coronaviruses more pathogenic and transmissible. One grant report contained evidence that the research group also did an experiment with infectious clones of MERS, another deadly virus. While none of the experiments described in the grant materials released so far could have sparked the current pandemic, the documents raise serious questions about biosafety and oversight at NIH. Early in the grant, research on certain coronaviruses was subject to a U.S. government ban, but notes on communications between NIH staffers and EcoHealth Alliance obtained by The Intercept showed that the federal agency allowed Daszak to take the lead in shaping a plan to evade that moratorium.

Meanwhile, a grant proposal published by the internet research group DRASTIC last September showed that in 2018 EcoHealth Alliance applied for funding from the Defense Advanced Research Projects Agency, or DARPA, to look for novel furin cleavage sites in bat coronaviruses. According to the proposal, which was not funded, EcoHealth planned to insert furin cleavage sites into the spikes of SARS-related viruses — an idea that drew attention because scientists had already noted that such a site is unique in the subclass of viruses to which SARS-CoV-2 belongs.

The Intercept repeatedly sought comment from EcoHealth Alliance on these revelations. EcoHealth initially responded. In September 2021, a spokesperson denied that the organization had conducted the research on the deadly MERS virus that was described in the NIH proposal. After documents obtained via FOIA later showed that such research had in fact been done, Daszak stated that the spokesperson had been misinformed. EcoHealth Alliance then stopped responding to The Intercept's questions. In late February, Daszak replied to email inquiries and offered to talk. He spoke with us on March 1. In a wide-ranging interview conducted over Zoom, he addressed questions that have swirled around EcoHealth Alliance for the past two years, defended his organization against what he characterized as unjust accusations, and railed against the questioning he has faced from congressional Republicans, the NIH, and news organizations, including The Intercept.

This interview has been edited for length and clarity.

Responding to the Outbreak

We're curious when you first heard about the outbreak in Wuhan.

If you look at my Twitter account, you'll see a tweet on New Year's Eve of 2019 —

But before the tweet, what was the moment when you first learned about it?

It was a couple of days before that. We heard from our contacts in China that something was going on, that there were cases of a disease in Wuhan. I think it was December 30. We looked on Chinese social media and found the rumors about it there. But we heard from many scientists in China.

Many of the virologists and other scientists we speak to say that we don't have enough information to determine whether Covid-19 emerged from natural spillover or as a result of research. Do you agree with that?

Do I agree that it's possible that Covid-19 emerged through a lab leak? Of course. It's been widely reported that we shut down discussion on that. But in the WHO report, which I was part of — and in fact I led the animal environmental side for the WHO side — we state that it's extremely unlikely. We don't state that it's impossible it came from the lab. Of course it's possible.

One of the many reasons that the origin of Covid-19 became such a sensitive and divisive issue was the sense, based on your communications about the Lancet letter, that you orchestrated a response among scientists and then made an effort to distance yourself from that effort. Do you want to say anything about that episode?

MORENS_SUBPOENA_005840
MORENS_NIH_014398
REL0000478831

You said, “One of the reasons why this has become so divisive is because of the Lancet thing.” You could say that about many things. It’s because we didn’t release the DARPA proposal. It’s because we didn’t release our emails. It’s because, early on, we said very strongly that this came from nature, and that this lab leak stuff is preposterous. The real reason this has become so divisive is because it’s being used politically. That’s it.

Scientists disagree over an issue where there’s no definitive proof. And for this issue, there’s no definitive proof. And there may never be. But what we do know is the weight of evidence points strongly to emergence from farmed wildlife in China.

Since the WHO report even, there are something like 12 scientific papers that have been published or put up online from good scientists pointing towards that origin. And I’ve looked at every single document that’s come out of the folks who are trying to show it came out of the lab, and there is no evidence yet for that. It’s all about implied motives, databases that were taken offline, people that aren’t on a website, or innuendo around something. Any one of those things can be explained by the normal process of doing science.

Controversial Research

Did EcoHealth Alliance or the Wuhan Institute of Virology, through its partnership with EcoHealth Alliance, ever insert a furin cleavage site into a bat

MORENS_SUBPOENA_005842
MORENS_NIH_014400
REL0000478831

coronavirus genetic sequence?

Of course we did not do that. I really don't understand how that could be a question at this point it's beyond the pale. That's not in our plans and it's not any of our reports, so of course we didn't do that.

But isn't it the case that you submitted a grant proposal to DARPA to do so?

We did submit a proposal to DARPA. I've not checked through the one that's online that it's the correct document. What I do know is it was widely reported that DARPA rejected that because there were concerns about safety issues. That is absolutely untrue. The document that allegedly is DARPA's response, their review of our proposal, I've never seen that before. It was never sent to us. I don't know if it's real.

DARPA had a process by which people who didn't get funded could do an interview with them to find out why they didn't get funded. So I did that. Never once did they mention any concerns or issues around safety; never once did they mention gain-of-function. The reason they told us it was rejected was because the amount we asked for was too much for them. They couldn't afford it. They actually encouraged us to resubmit in different ways. We then had protracted conversations with them about funding specific parts of it. They liked the proposal.

Was any of the work described in that proposal completed prior to its submission? We were told by multiple sources that when you submit a grant, that at least some of the work would have been done.

When you write a grant proposal and propose to do a new line of research, which is what we did, we would not be doing that research before we submit the proposal. That's not how it works.

When we asked if you had ever inserted a furin cleavage site to a coronavirus, you responded with outrage. But that is what was described in the DARPA proposal.

No. What you said is, did we insert a furin cleavage site? And what I said was, of course not! If we had done that work with the Wuhan Institute of Virology, it would have been published by now. It would have been made public in our reports to the NIH. The DARPA proposal was not funded. Therefore, the work was not done. Simple.

But you acknowledge that you proposed to DARPA to insert a furin cleavage site?

I refute that that was the goal of the DARPA proposal. The idea was not to insert a furin cleavage site in a virus to see what happens. That's not what was proposed. The proposal was to look for those polybasic cleavage sites in nature because we knew that that was the potential to make a virus more able to infect people and move from person to person.

If we found mutations around that polybasic cleavage site that looked like it could be evolvable, the idea was then that Ralph Baric's lab at UNC would do some work to see how evolvable that site was. So that work never happened. The proposal was not funded.

Did you find any of these cleavage sites in naturally occurring viruses that you collected?

The proposal was not funded so we didn't do that work. We've not found polybasic cleavage sites. However, they are in many coronaviruses from bats. Papers from Europe show mutations around that cleavage site that suggest strongly that that furin cleavage site could evolve very easily in nature. I'm sure there are viruses out there with it. I'm convinced that it could have easily evolved during the first stages of the pandemic, as the virus got from bats, perhaps into an intermediate host in a wildlife farm, or into people.

Did you resubmit the proposal?

We had conversations with them over many months about bits they would like to fund or they wanted to fund. We did not get funded. We did not do the work.

So you didn't think the DARPA proposal was relevant to the investigation into the origin of the pandemic?

A proposal that was not funded and work that was never done is not relevant to the origins of Covid. Of course not!

When asked if you had done this work with the furin cleavage site, you said no.

For the furin cleavage site, you should really ask Ralph Baric. He wrote that section of the DARPA grant.

So you're saying that that would be a good question for Ralph Baric, whether he has done any of these insertions?

I don't know what Ralph Baric has done. But I doubt that he would go ahead and do that work without the funding.

Some virologists were dismayed to see the insertion of furin cleavage sites in this proposal.

I don't know why anyone would be dismayed at that because furin cleavage sites were first researched in influenza viruses. And it's well known that that's something you should look for if you're interested in virulence factors. Second, there's actually a published paper from way before our proposal was submitted, way before the pandemic, where a group actually inserted a furin cleavage site into SARS-CoV-1. So we were right to look for that. And I think the proposal stands as a valid and actually quite predictive

effort to understand the risk of viruses. You've got to look at the big picture of why we do this research. We're not doing it as a sort of academic interest, "what would happen if you put a cleavage site there?" No. This work is done to say: What viruses are there out there in the wild that have the potential to emerge in people? And can we do something to stop them? Develop vaccines, develop therapies, stop people making contact with those animals.

Your grant, "Understanding the Risk of Bat Coronavirus Emergence," included an experiment using humanized mice. Were other humanized mouse experiments conducted by you and/or WIV?

Not by us, no.

What about by WIV?

Well, you need to talk to WIV about what else they were doing. We were doing one line of work with them.

Were you aware of any?

No, of course. I'd tell you if I was aware.

Were there viruses from elsewhere in Southeast Asia that were sent to the WIV?

No. This is a commonly put about story that's simply not true. WIV did not receive viruses from all around the world.

How many actual viruses do they have?

WIV does not have the biggest collection of viruses from bats in the world. There's 20,000 bat samples, something like that, tiny fecal pellets from bats.

Right now I don't know exactly how many bat coronaviruses are in culture and freezers at the WIV. But from our work, I know that out of the SARS-related coronavirus, they were only ever able to culture a handful. I think three cultures. It's not easy to do.

In November 2019, you tweeted that you had identified over 50 novel SARS-related coronaviruses, including some that cause SARS-like signs in mice and didn't respond to monoclonal antibodies.

Yes.

What are these 50 viruses? And are they public?

This is a complex thing that's been widely misinterpreted. It's actually quite simple. What we had were hundreds of genetic sequences of coronaviruses from bats. We

published them in that paper. They're not all new viruses. As we went through the sequence data and analyzed it, we refined what you might call a new virus versus a known virus. That's all. It's scientists refining and analyzing.

One ongoing point of contention between you and NIH is about lab notebooks and the communications around experiments.

NIH has made a bunch of requests that are completely reasonable, that we've dealt with very quickly and sent them the information that they required. And in many cases, NIH had the information already. What's happening here is you've got an office of the director that's dealing directly with us and completely cutting out the program staff who've got all the data they need. NIH has also asked us for a number of things which to any balanced and independent reviewer are impossible for us to supply.

Clearly in coming up with Year 4 and 5 progress reports, EcoHealth Alliance had information and draft reports on these humanized mouse experiments. Did you share those with NIH?

Of course not. You don't share draft reports. You share the final report.

Here's what happens, it's a very standard procedure: We are subcontracting to a lab in China to do some work. Every year we have to file a report to NIH to tell them what we've done for the year, how we've spent the money, and whether we've achieved the goals of the grant. So, we contact our subcontractees and we say, "Send us the information. Let us know what successes you've had this year and whether you've had problems and issues. Put it all in a report and send it to us." And then we use that to produce a report for NIH. That's why there are some editing issues around that. We move them around a bit, and we send a final report. A draft report is just a worse written version of the final report. There's no special information that's got intelligence value or anything.

Then why not share them?

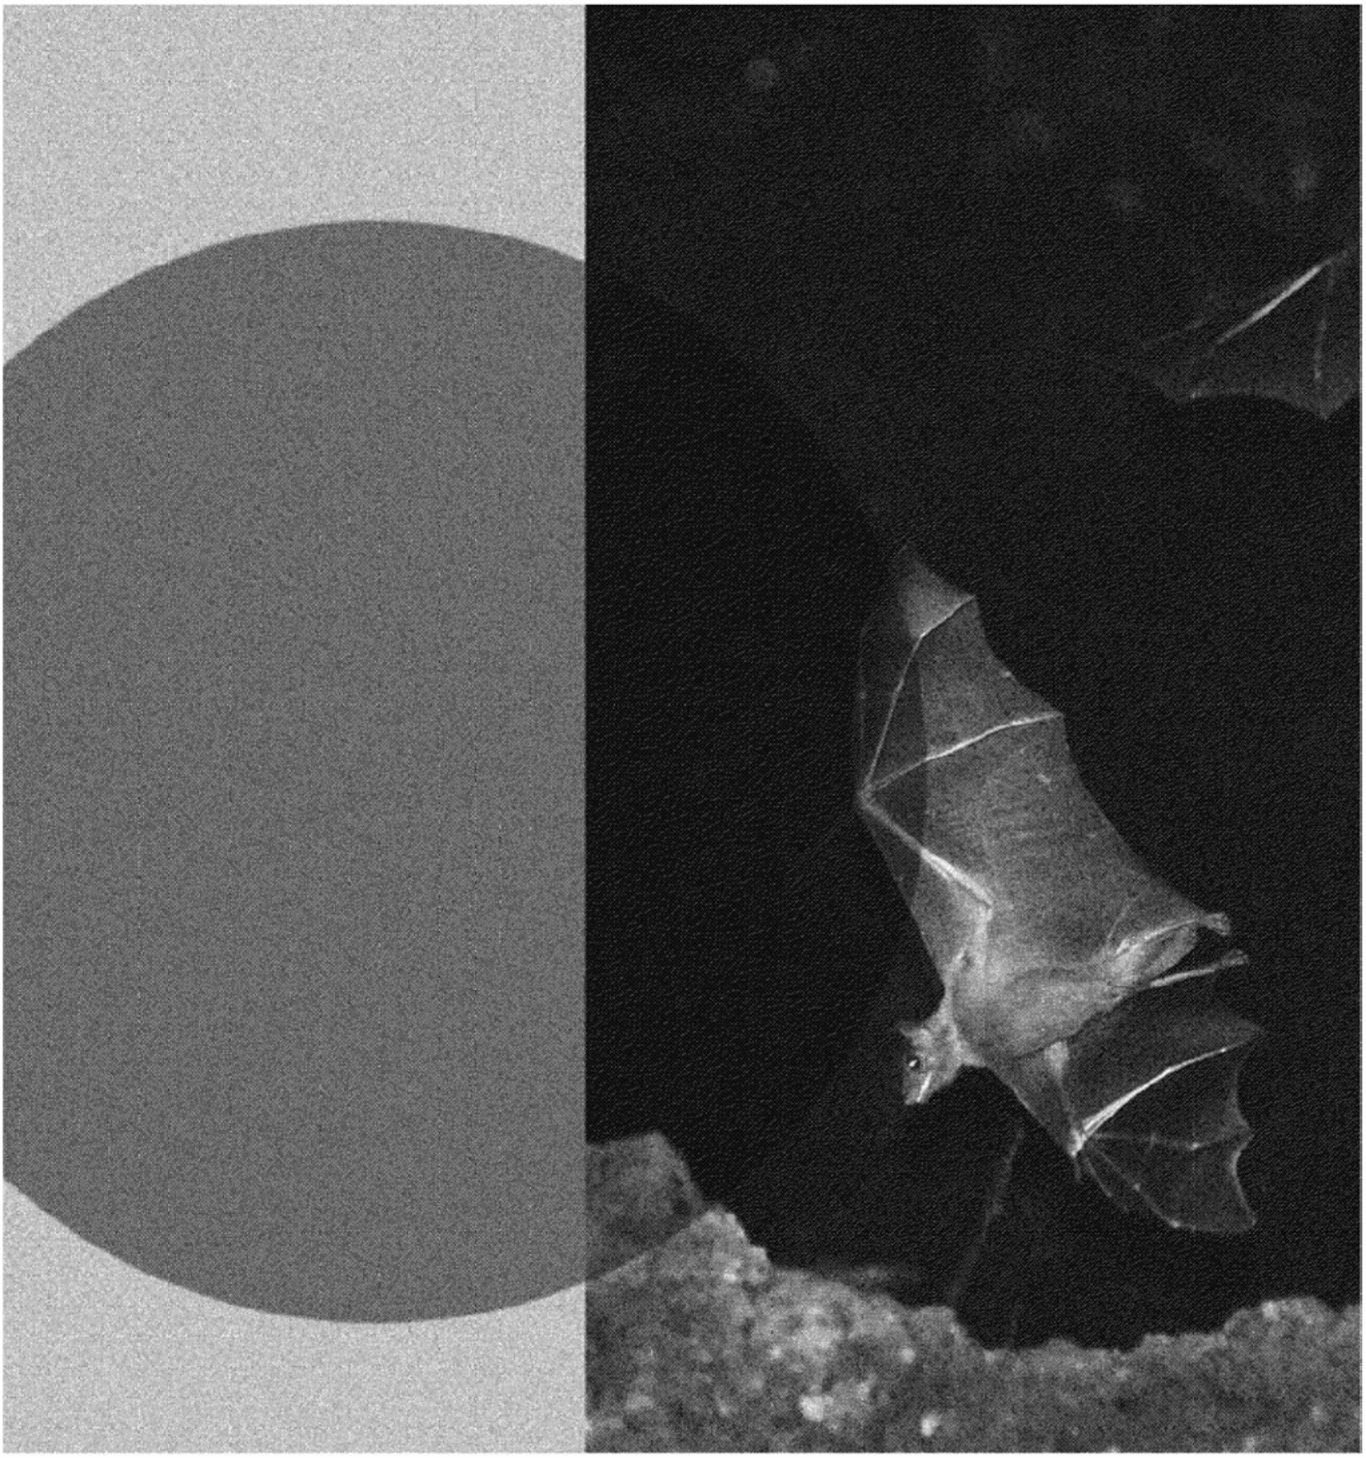
We've not been asked for a draft report by anybody.

You've been colleagues with Shi Zhengli, the Chinese bat coronavirus expert who directs the Center for Emerging Infectious Diseases at the Wuhan Institute of Virology, since 2005?

Yes.

So is it the kind of relationship where you would be generally aware of all the work that she was involved in? Can you say a little bit about what your level of awareness of other stuff she was doing?

We were aware of most of the stuff she was doing. Of course. These people weren't hiding anything from us. They are scientists.



I've sat through dozens of meetings with people from Wuhan Institute of Virology, where they talk openly about unpublished work. And, by the way, RaTG13 was one of the sequences in a paper published in I think 2015. So they weren't hiding anything from us.

Early on, after she learned about the outbreak, Shi said she was worried that somehow a virus might have leaked from her lab. A lot of people we speak to — virologists who do this kind of work — are the ones who seem most in touch with that possibility, that this stuff happens.

Very specifically, it happens when you have cultures of viruses in flasks, and you're then doing experiments with high concentrations of virus. It rarely happens if ever from an animal sample, especially a saliva sample from a bat. What Shi Zhengli was saying at that time was, "Oh, no, it's a coronavirus. I need to go back and check on those viruses that we've got and see: Is it one of them?" And she did, and it wasn't. That's what any reasonable person would do.

You implied in early 2020 that RaTG13 was not fully sequenced by WIV until late 2019 or later. And then afterwards, Shi revealed that it had actually been fully sequenced in 2018. When and how did you first learn about the true date that this virus was sequenced?

I don't actually know the true date of when this virus was sequenced. I didn't see an interview with Zhengli where she said, "We sequenced it in 2018." I don't know when and I don't think they ever got the full genome. There are parts of that virus that aren't correctly sequenced. Bear in mind, RaTG13 was not from a sample collected under the NIH grant. So we didn't have any oversight on that or any knowledge of it.

A colony of bats in a cave in the Maramagambo forest of Queen Elizabeth National Park, Uganda.

Missing Data

Did you have access to the Wuhan Institute of Virology's database of viral samples and sequences that went offline in September 2019?

MORENS_SUBPOENA_005848
MORENS_NIH_014406
REL0000478831

I've never actually seen the database. I've seen pages of it from the internet, Twitter, chats. But I've never looked at the database.

Did your staff have access to it?

No. We didn't need to! We had all the data we needed. Some folks find this missing database indicative of a cover-up or something. When we were in Wuhan [with the WHO mission] in the Institute of Virology, I said, "Why did you take the database offline?" And their response was, "We took it offline before the outbreak. We were then getting hacking attempts, hundreds, thousands of hacking attempts. So we decided it wouldn't be wise to put it back up." Now, you may not believe them. But it is a perfectly reasonable explanation. And I think people should try and go for the most likely reasonable explanation for these things.

So why did they take it offline in September 2019?

They told us — and it's in the WHO report — that they were trying to update it to make it modern. WIV was trying to present itself like a globally significant virology institute, and it is. But when you look at Chinese websites, they can be really old and stuffy and clunky. What they were trying to do, they told us, was to make it interactive so that you can click on something and a map would show. They were trying to make it fit in with the national databases.

I find it quite ironic that the focus on the database of WIV is so intense, whereas what actually happened was we took the data and, with China, put the data into the NIH's own database to make it public. That's a great win for the U.S.

In April 2020, you wrote in an email, "It's extremely important that we don't have these sequences as part of our PREDICT release to Genbank at this point. As you may have heard, these were part of a grant just terminated by NIH. … Having them as part of PREDICT will being [sic] very unwelcome attention to UC Davis, PREDICT and USAID." Why did you think that publishing these sequences would bring unwelcome attention?

Because we just had our grant terminated by NIH.

So you didn't think it would be important to release this data, given that there was a pandemic?

Those sequences were released publicly by publishing them in a scientific paper, which is what scientists do. The email that you're reading out is not about whether sequences should be made public; it's about whether sequences should be made public via a USAID mechanism or via publishing through the NIH mechanism. And what I was saying to the UC Davis team that ran PREDICT was that these are NIH-funded

sequences and should be reported through the NIH system. It's really that simple.

And which paper were they reported in?

Latinne et al, published in Nature Communications. We were struggling to get that paper out. It was very, very difficult, once the pandemic started, to keep communication with Chinese scientists. The utmost priority as a scientist is to get the data published, not to upload it into some database that's going to take months to go through. And by the way, that database is somewhere on the USAID government system. It's very difficult to find. The paper had already been submitted for publication, and the sequences were uploaded into GenBank, the NIH system. And then once the papers were accepted, they became public. And that's exactly what we did.

Are there sequences that have not been made public?

To my mind, there are no sequences of SARS-related coronaviruses that have not been made public. Some people think there are still viruses that are SARS-related that haven't been put in GenBank. That's not true. We've uploaded all of the SARS-related coronavirus sequences, or we've reported them to NIH, or we've published them in scientific papers. And in fact, for most of them, we've done all the above. We had them all uploaded before the pandemic. Most of them anyway.

You were on the WHO mission to investigate the origins of SARS-CoV-2. When the NIH grant documents were released, it was a surprise to many people that animal experiments were being done at Wuhan University. If you knew this information, did you share it?

It wasn't a surprise to NIH because the NIH knew about them.

Right. But did you share that information with the WHO committee or with others who were investigating the origins?

The Wuhan University BSL-3 facility is what we're talking about. They do humanized mouse work. That was not looked at by the WHO origins group. It's a BSL-3 lab that had humanized mice under BSL-3 conditions. It's highly unlikely to be the source of the Covid-19 outbreak.

Did you mention it to the committee?

I mentioned all my work to the committee, of course. We talked about it, for sure.

The Challenges of Public

MORENS_SUBPOENA_005850
MORENS_NIH_014408
REL0000478831

Scrutiny

Dr. Michael Lauer at the NIH has repeatedly asked you for biosafety records from the WIV and said that he has been unable to get some of them.

He says that, but it's not true. We've supplied everything we could possibly supply on the issues that they've asked for.

In one of his letters to you, Lauer asked about the biosafety oversight of the work at WIV. In your response to him, you wrote that it consisted of semiannual meetings with the lead investigator and assessments of compliance with all conditions of the award. Biosafety experts have said that this falls short of the level of oversight one would want for this kind of work. You mentioned in an exchange with Lauer that you were offering to pay from EcoHealth's own coffers for additional biosafety measures. Why did you offer to do this? Did you feel that the biosafety oversight was adequate?

We're talking about a world-class virology lab run by the Chinese government that is probably the best virology lab in China, and China is very good at virology. It's very efficiently run, and the biosafety conditions are very good. Just because people think that Covid-19 might have come from WIV doesn't mean that therefore our oversight of biosafety wasn't sufficient. We did everything normal in oversight of that lab.

Then why did you suggest these additional measures, if the others were already adequate?

Because I was worried that they were going to terminate our other grants. This is the key driving force for every action we've taken since April 24, 2020. I don't know why people don't realize that.

Once NIH shows you that it's willing to terminate your funding and kick people out of a job and put your whole organization under pressure simply because a single politician tells them to, then you start worrying about every other grant and contract that NIH controls. We live in fear that they're going to do similar abrupt terminations with no cause and no rationale and no logic.

What I was doing then was saying to Michael Lauer, please be reasonable. We're trying to do everything we can, within the normal bounds of what organizations do. We probably have the best biosafety and field teams in the world.

We're overcompliant and yet still being accused of lack of compliance.

On February 24, House Energy and Commerce Committee Republicans sent a

MORENS_SUBPOENA_005851
MORENS_NIH_014409
REL0000478831

letter to NIH alleging that it is "highly suspicious" that EcoHealth reported the humanized mouse experiment results over two years, and suggesting that more work may have been done that was not reported. How would you respond to that?

This is a simple issue of Chinese nationals writing a report and then us drafting our report to NIH. So there's a word in there where they say we continued the studies. That doesn't mean they continued infecting mice with new viruses. No. What it means is they continued doing the research on the one experiment that they've done. And that continuation is a lot of work. So they did all the pathology, which means at the end of the experiment, you take all the mice, and you look at every organ in the body. You do detailed microscopical analysis. It takes months. So that's why it dragged on because you've got months of after-the-experiment analysis. And we included the mortality data as part of the pathology data. That's completely normal.

The House Energy and Commerce Republicans don't write to us, they write to NIH. Sometimes we hear about it, sometimes we don't. NIH doesn't copy us on their responses. Then eventually we get a letter from NIH asking questions, which we always respond to, always within the timeframe and always refuting any allegations with evidence. So that's what we've done.

The latest letter from the House Energy and Commerce Republicans accused us of being overfunded, effectively having two grants to do the same thing. It's simply not true. The USAID PREDICT grant has completely different goals to the NIH coronavirus grant. For instance, PREDICT looks for between seven and 18 different viral families within samples, not just coronaviruses. NIH is focused solely on coronaviruses. So the goals are different.

The agencies do, as a standard procedure, a review of a grantee's other proposals to see if there's overlap between them, because they don't want to fund the same thing twice. This is absolutely refutable with documentary evidence.

What's your understanding of the Republicans' motivation?

Any bipartisan requests for information from the House or the Senate, we've responded to. We've been working with the U.S. government since the pandemic began to get information to them about every single aspect of this pandemic, including unpublished data. The politicians who are attacking us probably don't realize or know or care, in some cases. When there's a request from one side of the political spectrum, we try not to respond to that. We've had hundreds of questions sent to us by letter, including requests for thousands of pages of documents. We don't have the staff to do that. And bear in mind our grant has been terminated and now suspended. We don't have access to funding. We don't have the staff to do this work. It's a horrible, cruel irony that, on the one hand, your funding is cut; and on the other hand, there are now outrageously huge

number of demands for us to do work to show data from that funding that's been cut.

Don't you have ongoing funding for two other NIH projects?

Yes. Well, you can't use that money.

What have you been asked to get by NIH that you feel you can't get?

There are a whole series of things that we've been unable to get. A vial of virus. Information on a person that was removed from the website (I did ask them that, and they gave us an explanation, which is perfectly reasonable). NIH asked us for an inspection of the WIV. Every right-minded person on the planet realizes that the World Health Organization asked for an inspection of that lab, and we did go into the lab and ask questions and go around the facilities. For NIH to say that I should organize a U.S.-only, NIH-based or National Academy-based inspection of the lab facilities is a request that is way beyond what's possible. You know, you can't go into CDC as a foreigner and do an inspection of the lab.

NIH writing to us saying, "We demand that you do this," puts us in jeopardy and it's a security risk. If I was to take that letter from NIH and go to the Beijing airport and say, "I'm here to do this," I would be arrested and put in jail and probably put on trial, in the same way that scientists from China have come to the U.S. and tried to take vials of virus back to China and been arrested and convicted. NIH doing this is clearly a way for them to try to get the public behind a decision they made that was political about terminating our grant. Ever since that decision, we've been put under similar pressure over and over again. The Republicans write to NIH with some fairly outrageous accusations. NIH responds and says, "Don't worry, we will go and make EcoHealth do this, this, this, and this."

Origins of Covid

Read Our Complete Coverage

I don't think that those questions are posed to truly get to the bottom of the origins of Covid. While the House Republicans are putting pressure on NIH for tiny bits of administrative information, scientists are going out and finding that actually things are

MORENS_SUBPOENA_005853
MORENS_NIH_014411
REL0000478831

really pointing towards a natural origin. And meanwhile, we're left refuting each one of those allegations. They're all false. There's no substance to them at all.

A good proportion of the public have been pushed by misinformation to believe a narrative — and this narrative is repeated daily — that gain-of-function work was funded by Tony Fauci as a back channel to China, and EcoHealth funneled funds to China. Those stories are very beguiling, they sort of make you feel, "Ah! I knew it." But actually, there's not a grain of truth to them. Every single action that EcoHealth Alliance has taken has been things that scientists do in the normal course of doing their work.

Closing down that line of research means we lose eyes and ears on the ground in China. And it doesn't benefit us from a public health point of view or a national security point of view. It's a huge mistake.

Subject: FW: Process at NAM for dealing with accusations from Republican members of the House E&C Committee
From: Peter Daszak <(b) (6)
To: keusch <(b) (6) David Morens <(b) (6) Roberts, Rich <(b) (6) Hotez, Peter Jay <(b) (6)
CC: Aleksei Chmura <(b) (6) Jeff Sturchio <(b) (6)

Follow the email chain below for the latest from NAM on my 'accusations'.

As well as them refusing to give me a copy of the regulations and procedures, I've just received emails suddenly 'rescheduling' or canceling my NAM and NASEM committee calls this week.

I have zero faith in this process at the moment. Every time I email this person and cc. Aleksei, she responds without the cc. She's told me not to share any of this information, yet won't share any details about the rules and regulations. At the same time my reputation is on the line again, and in the hands of a small number of unknown people who clearly want to keep things quiet so that NAM doesn't come under attack.

Cheers,

Peter

Thanks very much for the prompt reply.

I look forward to hearing from you once the Assessment Committee has determined the next steps. I sincerely hope this will not become a full-blown review by the Conduct Review Committee – these accusations are part of a political campaign that is designed to undermine and discredit scientists to push a political agenda.

Dr. Daszak,

Thank you for the follow-up note.

The process is outlined in an internal document that is not part of the members' materials posted on the website nor available in another location.

I can share with you that the first process is a review by the President, Home Secretary, and Membership Director. Following a preliminary review, the NAM's Assessment Panel is convened to review the materials. The Assessment Panel is charged with reviewing the allegations, determining whether supplemental materials are needed, and making a recommendation whether to convene the Conduct Review Committee.

I am in the midst of scheduling a meeting of the Assessment Panel; we all understand the issue of time-sensitivity. I will do my best to operate in the most expeditious manner possible.

Best,
Elena Fuentes-Afflick

Subject: Process at NAM for dealing with accusations from Republican members of the House E&C Committee

Dear Elena,

Thank you for your email re. confidentiality. Unfortunately, as is typical with these political attacks, the Republican members of the House E&C Committee have not kept this confidential. In fact, they posted the letter in full on their website as soon as they sent it to you. Their goal by making these easily refuted accusations public, like their previous attacks, is to undermine the science on COVID origins, and to smear scientists publicly so as to discredit us.

Again, I am asking again for you to send me the written processes and rules for how accusations of misconduct against members are to be dealt with. It seems unfair that these accusations are now public so colleagues can see them, but as a NAM member I don't have clear guidelines on what I am and am not allowed to do or say, on who exactly will be making a decision on these awful allegations, nor on how long this will hang over me. As I mentioned to you in my last email, I searched long and hard on the website and was unable to find details specific to the process and procedures, even on the NAM member-protected pages.

I understand none of us wants to be in the position of having to deal with this, but I am simply trying to clear my name and reputation as rapidly as possible.

Cheers,

Peter

Cc: Aleksei Chmura
Subject: RE: follow-up

Thank you for the call today Elena. I've cc'd our Chief-of-Staff, Dr. Aleksei Chmura, who also joined us. I appreciate your explanation and will do my best to adhere to the policies of the NAM as we go through this process.

My only hope is that the review can be as rapid as possible. Our organization has been the focus of a horrific series of political attacks from the hard right wing as part of their political goals regarding Dr. Fauci, NIH and ultimately the Biden administration. These tie up resources and staff answering pages upon pages of false accusations, all carefully worded to give the impression of a thoughtful and sincere inquiry.

Again, I want to reassure you that none of the accusations from Republicans on the House E&C Committee have the slightest bearing in fact. We have acted honorably and with the highest scientific integrity throughout the pandemic, and simply want to be allowed to continue our work without constant, politically-motivated harassment.

sincerely,

Peter

David: This is a terrific article – clear, persuasive, and fully documented. It reminds me of what Carl Sagan once said in response to questions about where there was intelligent life elsewhere in the universe: "It's possible – but there isn't a smidgen of evidence for it."

Kristian Andersen deserves a medal for taking the time to unravel the ins & outs of his interactions with McNeil – and how McNeil used selective evidence to build a case that isn't supported by the facts. Note, for example, that McNeil keeps banging on about the alleged insertion of a furin cleavage site into a bat coronavirus to turn it into SARS-CoV-2 as a "smoking gun" – and how Kristian Andersen dismisses that argument quickly and elegantly.

As ever,
Jeff

EXTERNAL SENDER

It's great they're doing this.

I'm also talking with the AIDS activist Peter Staley this weekend who's going to try to get an Op Ed written focused on EcoHealth's horrible situation.

Please keep circulating every article you find that pushes back against this wall of conspiratorial thinking – it's awful to see how this has become mainstream in the press, and is leading to damaging political decisions. It's not just David's situation, EcoHealth's proposed debarment and the SSCP targeting Peter H. and Jeff. Sturchio, it's also now a potential poorly defined ban on 'gain-of-function' that potentially includes a catch-all for 'risky research' (not defined):

https://www.congress.gov/bill/117th- congress/senate-bill/3012

Here's the news on this – it's Senator Marshall, calling for urgent reconsideration of this bill.

https://www.marshall.senate.gov/newsroom/press- releases/senator- marshall-again-calls-for-the-immediate-halt-of-deadly-gain-of-function-research/

Marshall is the same person who accused EcoHealth of 'double-billing' for our work in China because we had a grant from NIH and one from PREDICT. We explained that this was for different lab work and research goals, but he called for an OIG investigation and we have now had the HHS OIG and the Dept State OIG asking for information for well over a year, with no end in sight.

These people are not making the world a safer place!

Cheers,

Peter

Subject: RE: The NAM are now investigating me based on some of the allegations from the Republican congressional members

From: "Keusch, Gerald T" <(b) (6)

To: Jeffrey Sturchio <(b) (6)

CC: Hotez, Peter Jay <(b) (6) Rich Roberts <(b) (6) David Morens <(b) (6) >; Aleksei Chmura <(b) (6) >;

Hi Jeff,

I agree, and so is his committee. My first thought in response is the following. When this originally came up I was in touch with Bruce Alberts and Harvey Fineberg, both past Presidents at NASEM, and asked them to intervene. They did and were not favorable to NAM pursuing these allegations. I could follow up with them with the latest information and see what they have to say. The conundrum is that the NAM cover letter dated April 11 says that "all involved respect the confidentiality of the review process" and the attached document says it is "Privileged and Confidential". Peter will be in conflict with these instructions if he shares the material, and perhaps more so if any of us then further disseminates (however precisely) the material. Having no sense of what they are actually thinking, is this just a cover their ass process or do they actually believe there is a real issue, it is impossible to figure out where they are going with it.

My advice on the phone to Peter was to take it slow, restrain the anger and the frustration, and figure out how to respond based on a personal code of behavior as a scientist involved in research both before and after it was politicized, from being the darling of NIH and NAM to being trolled by people who have nothing but raw politics as the ideal they follow. Let's talk among ourselves, and think about the pros and the cons for any action taken. Then with Peter. Some of us could talk to Tony Fauci confidentially, and be confident it would be confidential. I think I could talk to Bruce Alberts in a confidential manner, and he is at UCSF, the same institution as the writer of the letter, Elena Fuentes-Afflick, so he presumably knows her and she certainly would know of him.

Is there any strategy that would include having Peter write to Fuentes-Afflick to say he has to consult with scientific colleagues and respected members of the Academies as part of his preparation of a response – its not just what he did or said or didn't do or say, its about the very soul and conscience of science and being a scientist when attacked in an aggressive and politically charged manner like this.

I didn't expect it to go to this step, which is why I am struggling here. Your thoughts, and maybe a call soon?

Jerry

<(b) (6)
Subject: RE: The NAM are now investigating me based on some of the allegations from the Republican congressional members

Jerry:

This situation is outrageous. The NAM is not covering itself in glory right now – rather than standing up for the freedom of scientific inquiry, they are abetting politically-motivated character assassination. As Peter H observes, the NAM could just tell Congress to stuff it – instead they are doing their dirty work. Victor Dzau could have exercised leadership on this question – instead he is hiding behind anonymous process. Is there any way we can bring pressure to bear on Dzau to put a stop to this?

Best regards,
Jeff

Just off the phone with Peter D. He is really down with this shameful news from NAM, on top of being hit with COVID since Saturday. A word of encouragement, and willingness to brainstorm with him on the response would be immediately helpful.

My outrage aside…The legality of this does not make sense. NAM is not a government entity, right? So NAM could tell them to get stuffed if they wanted to?

Please see the email below that I just received and the attachments.

They've cut down the allegations to a handful that I have to respond to within 30 days. But as I see this, these are grey areas that they could use to easily push me out, no matter my response. It would save them political hassle if they get rid of me, and I'm very worried that this is their ultimate goal.

Obviously, I'll try to be as aggressive as possible in defending against this, but this is devastating to me personally to have to go through this and if they expel me, it would likely cost me my job and career. Even more worrisome is the last paragraph in the letter from the Congressional members – they are playing pure politics here – if I'm found to be in breach, they are demanding that every report I've been involved in, and every committee be investigated.

This feels like a purge orchestrated by politicians for a political goal, and an academy that is too weak to push back.

Cheers,

Peter

Fauci: There's 'accumulating evidence' of natural COVID origin

- There is still no consensus on the origin of COVID-19
- Dr. Anthony Fauci says "accumulating evidence" points to natural transmission
- A lab leak is now the lead theory at the FBI

Tyler Wornell
Updated: Apr 6, 2023 / 09:41 PM CDT
(NewsNation) — Dr. Anthony Fauci is maintaining he has an open mind about the origins of COVID-19, but pointed to "accumulating evidence" that it was transmitted naturally as opposed to through an accidental lab leak.
The U.S. intelligence community remains divided on a definite origin, partly because China has not been forthcoming with information about the outbreak and a wet market in Wuhan where it might have first spread.
"We may not ever get (definitive proof), and that's one of the frustrating things," Fauci said Thursday on "Elizabeth Vargas Reports."
Fauci's comments came on the heels of a new study published Wednesday that shows large amounts of the virus were mixed in with genetic material from racoon dogs at an outdoor wet market in Wuhan.
The research focused on swabs taken in Wuhan in the early days of the pandemic. Chinese researchers confirmed DNA from raccoon dogs and other animals was found in COVID-19 samples, especially from one corner of the wet market where exotic wildlife was sold.

I'm OK at 10 or 11 on the 19th. I'm in an FAO briefing on COVID origins in the afternoon, potentially starting at 1 so that is problematic.

The 20th is OK.

So is the 21st but its best to pick a date when Rich is available to join. Jerry

EXTERNAL SENDER

Greetings all,

I'm including some additional dates to better encompass everyone's schedule. Please let me know what works for best for you.

Monday, June 19th at 10, 11 or 1 pm CT

Tuesday, June 20th at 1 or 3 pm CT

Wednesday, June 21st at 11 am or 1 pm CT

Thank you!

Mary

Greetings all,

What an incredible meeting of minds last week! It was great to hear from such a diverse range of people on such an important topic. We so appreciate everyone's time and effort. I have pages of notes and am looking forward to reviewing others as well. As Dr. Hotez mentioned, we have this seed funding from the Mitchell Foundation and the potential for more once plans develop. Dr. Hotez and I will both be in New York City May 30th. If available, could this convening group meet to discuss next steps? Happy to offer some times for a zoom call if that date doesn't work for an in person meeting.

Thank you!

Mary

I have no problem highlighting the NIH's incompetence. But we need a serious science journalist to step up and detail what's going on to set the record straight. We need an Atlantic or New Yorker article to exonerate Peter Daszak and EcoHealth. Who would that be? Michael Hiltzik? Amy Maxmen? Molly Jong Fast? Mehdi Hassan?

On May 17, 2024, at 3:19 PM, Keusch, Gerald <(b) (6) wrote:

Regarding Tabak's comments on GoF, this is what the text below shows.

Rep. Lesko: "Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?"

Dr. Tabak: "It depends on your definition of gain-of-function research. If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

So it is not what he said but how the SSCP spun it. That's a weakness that should be exploited in the press. It is deliberately spinning information into disinformation and that is both lying and dangerous. We need to point it out, find other examples where it is easy to refute what they are saying about Peter, EHA, and David, and make sure

MORENS_NIH_045154
REL0000478860

others will amplify that and delegitimize the committee. I'm going to point out that one to Hiltzik and Kaiser.

Press Release Published: May 17, 2024
Hearing Wrap Up: NIH Refutes EcoHealth's Testimony, Tabak Reveals Federal

Grant Procedures in Need of Serious Reform

WASHINGTON — The Select Subcommittee on the Coronavirus Pandemic held a hearing titled "Overseeing the Overseers: A Hearing with NIH Deputy Director Lawrence Tabak" to examine the National Institutes of Health's (NIH) process for funding and overseeing scientific research as well as investigate NIH's relationship with EcoHealth Alliance, Inc. (EcoHealth). Members pressed former Acting NIH Director and current Principal Deputy Director, Dr. Lawrence

MORENS_NIH_045156
REL0000478860

Tabak, to explain numerous inconsistencies between the public and private testimonies of NIH employees and EcoHealth President, Dr. Peter Daszak. Dr. Tabak offered substantial evidence that Dr. Daszak purposefully misled both the NIH and the Select Subcommittee about EcoHealth's efforts to comply with grant procedures. In a shocking admission that directly contradicts Dr. Fauci's previous statements, Dr. Tabak testified that the NIH was funding gain-of-function research in Wuhan, China through a

MORENS_NIH_045157
REL0000478860

grant to EcoHealth. Members highlighted the dangers of continuing to fund gain-of-function research in foreign laboratories where NIH cannot ensure proper biosafety measures are implemented. Both Dr. Tabak and Select Subcommittee Members agreed that, in "hindsight," the NIH could have done more to protect the American taxpayer from EcoHealth.

Key Hearing Takeaways

- **NIH Deputy Director and former Acting NIH Director, Dr. Lawrence Tabak, acknowledged that NIH funded gain-of-function research in Wuhan, China.**
- **Dr. Lawrence Tabak repeatedly refuted EcoHealth Alliance President Dr. Peter Daszak's public and private testimonies. It is now clear that Dr. Daszak misled both the Select Subcommittee and the NIH on numerous occasions.**
- **Serious shortcomings and failures in the NIH's grant awarding and grant oversight procedures enabled EcoHealth to facilitate gain-of-function research in Wuhan, China. These NIH deficiencies were exploited by Dr. Daszak and his team in an effort to avoid oversight and maintain funding.**
- **The U.S. Department of Health and Human Services' (HHS) decision to immediately suspend funding and commence debarment proceedings against EcoHealth is backed by substantial evidence and necessary to protect America's national security. The Select Subcommittee also recommends that HHS immediately begin**

MORENS_NIH_045158
REL0000478860

debarment proceedings against Dr. Peter Daszak personally.

- The NIH often lacks the necessary subject matter and scientific expertise to ensure U.S. taxpayer funds are spent and overseen safely. Dr. Tabak testified to these gaps in NIH's system today, and former NIH Director Dr. Francis Collins recounted similar problems during his transcribed interview found here.
- The Select Subcommittee's investigation into EcoHealth's impropriety is far from over. Chairman Wenstrup appreciates Dr. Tabak's honesty today and intends to use his testimony to hold EcoHealth accountable for its facilitation of gain-of-function research and its blatant contempt for the American taxpayer.

Member Highlights Select Subcommittee on the Coronavirus Pandemic Chairman Brad Wenstrup (R-Ohio), D.P.M, pressed Dr. Tabak to address Dr. Daszak's testimony that EcoHealth was "locked out" of the NIH's grant reporting system. NIH conducted an internal forensic audit which proves EcoHealth was, in fact, not "locked out" from submitting its required NIH grant

MORENS_NIH_045159
REL0000478860

research update report on time. Notably, EcoHealth finally submitted its report nearly two years after the required deadline. According to the facts gathered by NIH, Dr. Daszak's sworn testimony appears to be false.

<image001.png >

Chairman Wenstrup: "

EcoHealth, like every other NIAID grantee, was required to submit a five-year progress report, as you know. This report was submitted nearly two years late. Dr. Daszak testified that EcoHealth

MORENS_NIH_045160
REL0000478860

had tried to submit the report on time but was locked out of the NIH system. Dr. Lauer testified that a forensic audit was conducted, and no such system error was detected. Is NIH now willing to share the findings of this forensic audit with the Select Subcommittee?
"

Dr. Tabak: "*We certainly will work together with you to obtain things that you require, sir*."

Chairman Wenstrup: "*Does the audit indicate that EcoHealth could have submitted their report on time?*"

Dr. Tabak: "*That's*

MORENS_NIH_045161
REL0000478860

what our audit indicates, yes."

Chairman Wenstrup: "*When EcoHealth eventually submitted its year-five report, Dr. Daszak testified it took 11 days to unlock the NIH system. Is this true?*"

Dr. Tabak: "*We have no evidence of that.*"

...

Dr. Tabak: "*All I can say to you is that our system did not lock them out and there was no impediment for them to provide that report on time.*"

Committee on Oversight and Accountability Chairman James Comer (R-Ky.) questioned Dr. Tabak about the employment

MORENS_NIH_045162
REL0000478860

status of alleged federal records violator and top advisor to Dr. Anthony Fauci — Dr. David Morens — who was placed on administrative leave after the Select Subcommittee uncovered incriminating information. Dr. Morens used his personal email(s) to hide conversations about the origins of COVID-19 and undermine the operations of the NIH.
<image002.png >

Chairman Comer: "*What is Dr. Morens's current employment status?*"
Dr. Tabak: "*He is an employee of NIH.*"
Chairman Comer: "*Well, I*

MORENS_NIH_045163
REL0000478860

think you see where my lines of questioning were leading. We have some serious concerns. We have fought in this Select Subcommittee, the Oversight committee, on obtaining information. And here you have an admission of deleting information, going to great lengths to not be transparent, in an apparent cover-up of something that I think we would agree, in a bipartisan manner, is one of the most serious issues that our country has ever faced, the COVID 19 pandemic."

Rep. Debbie

MORENS_NIH_045164
REL0000478860

Lesko (R-Ariz.) elicited an admission from Dr. Tabak that the NIH funded gain-of-function research at the WIV through a grant to EcoHealth. This directly contradicts Dr. Fauci's U.S. Senate testimony in 2021 in which he claimed the NIH "has not ever and does not now fund gain-of-function research in the Wuhan Institute of Virology." This type of research is known to be dangerous and even former NIH Director Francis Collins and Dr. Fauci

MORENS_NIH_045165
REL0000478860

were willing to admit that there are risks associated with this experimentation.
<image003.png >

Rep. Lesko: "*Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?* "

Dr. Tabak: "*It depends on your definition of gain-of-function research. If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's*

MORENS_NIH_045166
REL0000478860

not regulated is it poses no threat or harm to anybody."
Rep. Rich McCormick (R-Ga.), M.D., proved that EcoHealth violated the terms of its NIH grant when it failed to produce "laboratory notebooks" with information about the WIV's gain-of-function research. On May 1, Dr. Daszak falsely testified that he was not required to produce these notebooks as a condition of his grant.
<image004.png >

Rep. McCormick: "*When the National Institutes*

MORENS_NIH_045167
REL0000478860

of Health requested the notebooks from EcoHealth, was EcoHealth required to produce them under its grant terms?"

Dr. Tabak: "*Yes, they were.*"

Rep. McCormick: "*When NIH requested notebooks from EcoHealth should EcoHealth have been able to access them or already have access to them?*"

Dr. Tabak: "*That's correct.*"

Rep. McCormick: "*Did EcoHealth ever produce the requested notebooks?*"

Dr. Tabak: "*They have not.*"

Rep. McCormick:

MORENS_NIH_045168
REL0000478860

"Dr. Daszak testified two weeks ago that he was not required to produce the lab notebooks. Would NIH disagree with that testimony?"

Dr. Tabak: *"Yes, we disagree with that testimony."*

Rep. McCormick: *"The testimony here today clarifies the inconsistency between Dr. Daszak's testimony and the testimony of numerous NIH officials and NIAID officials, also, including yourself. Dr. Daszak continues to thwart congressional oversight through semantics and outright dishonesty,*

MORENS_NIH_045169
REL0000478860

quite frankly. He has routinely failed to produce pertinent documents and made countless misleading statements to the Select Subcommittee right here."

Rep. Mariannette Miller-Meeks (R-Iowa), M.D., uncovered serious shortcomings in NIH's grant awarding and grant oversight procedures. Dr. Tabak testified that he would never again support a grant to EcoHealth Alliance to fund gain-of-function research in Wuhan and believes the NIH relied too heavily on Dr. Daszak

MORENS_NIH_045170
REL0000478860

attestations.

<image005.png>

Rep. Miller-Meeks: "*As I mentioned, the Understanding the Risk of Bat Coronavirus Emergence Grant was an almost $4 million grant that partially went to the Wuhan Institute of Virology and the Wuhan University of Public Health. Do you believe this grant was an effective use of taxpayer dollars, and would you support issuing the same grant today?*"
Dr. Tabak: "*Well, with the benefit of what we know today, no, of course not.*"

MORENS_NIH_045171
REL0000478860

Rep. Miller-Meeks: "*There is great concern with Dr. Daszak interaction with NIH and NIAID pertaining to the one log growth term of the award. The NIH relied on Dr. Daszak to monitor and report virus growth after being a month late on his annual reporting requirements, which were outlined in the grant. Dr. Tabak, looking back, did the NIH rely too much on Dr. Daszak's self-reporting information?* "

Dr. Tabak: "*Again, with the benefit of hindsight, we did because we never*

MORENS_NIH_045172
REL0000478860

received the information."

Rep. Miller-Meeks: "*Well, as an ophthalmologist, hindsight is always 20/20.*"

Rep. Nicole Malliotakis (R-N.Y.) revealed NIH's honest viewpoint regarding its funding of EcoHealth's risky research at the WIV. Dr. Tabak testified that NIH believed it was not funding any dangerous research prior to or during the COVID-19 pandemic.
<image006.png>

Rep. Malliotakis: "*We also know that at least 20 more EcoHealth research*

MORENS_NIH_045173
REL0000478860

projects received funding since March of 2020, and they are conducting research Nipah, zoonotic viruses, bat coronaviruses, MERS. They are doing a lot of this research, mostly actually in third world countries. Subpar safety conditions. How do you ensure that our federal dollars are not going to do risky experiments in countries where there are subpar safety regulations? And do you believe that should be a criteria that is put forth to ensure that the money doesn't?"
Dr. Tabak:

MORENS_NIH_045174
REL0000478860

"Well, again, once we established special conditions for award on EcoHealth Alliance, we have monitored them very carefully with regard to expenditure and with regard to their various administrative processes. There was never a concern with the danger, if you will, of the experiments that NIH approved for EcoHealth Alliance to with under subaward with WIV."

Cheers,

Hi Peter,

We haven't spoken for a year or two since I was covering vaccine misinformation. Anyway, I'm being put back on the origins of COVID beat ahead of the Fauci hearing next month. I've been loosely following the twists and turns with EcoHealth and NIH and all the rest, but I'm needing to get a little more caught up.

Would you be up for a quick background conversation?
Best,
Geoff

Yes. He said in essence that it was not sufficiently rigorous to take as likely and therefore the two pathways, natural spillover and lab leak, were both viable and thus essentially of equal probability.

And, he never says there were Commissioners who did not agree with the conclusions he was presenting although the report makes a minor reference to the fact that some Commissioners had other views.

Earlier that year, Daszak had signed on to a public statement published in The Lancet on behalf of scientists who said they "condemn conspiracy theories suggesting that COVID-19 does not have a natural origin."

Related

Peter Daszak Answers Critics and Defends Coronavirus Research

Yet that early certainty about the pandemic's origins — and the sense of shared civic responsibility among members of the Lancet task force — soon disintegrated. In February 2021, emails revealed that Daszak coordinated the public statement in The Lancet tamping down suspicions of a lab leak. And by June 2021, Sachs was expressing his openness to the possibility of a lab origin, writing that NIH-funded research at the Wuhan Institute of Virology "deserves scrutiny under the hypothesis of a laboratory-related release of the virus." Three months later, he disbanded the task force that had been organized to "carefully scrutinize the origin of the SARS-CoV-2 virus" in the hopes of preventing future disease outbreaks, explaining that he had concerns that several members of the commission had

MORENS_SUBPOENA_006046
MORENS_NIH_014777
REL0000482724

conflicts of interest because of their ties to EcoHealth Alliance.

After leading the mainstream scientific inquiry into the origins of the pandemic, Sachs is now skewering it. "A steady trickle of disquieting information has cast a darkening cloud over the agency," he and Harrison write of the NIH, going on to accuse the entire federal government of not doing enough to explore the possible role of its grantees in the emergence of SARS-CoV-2 and investigate "overlooked details" such as the matching amino acid sequences.

Noting that the NIH has insisted that "the pandemic virus could not have resulted from the work sponsored by" the agency, Sachs and Harrison write that "blanket denials from the NIH are no longer good enough."

Cheers,

Peter

Jesse Bloom is the person driving it – he buys into the lab leak theory and found that some folks from WIV uploaded partial genomes early on, then added a bunch of more complete ones, and asked for the partial sequences to be removed. Absolutely normal, but he's trying to turn it into a 'mystery'.
> >
> > Of course, NIH makes it all worse by not releasing emails, redacting critical parts of them, and failing to explain why they follow the wishes of the submitter re. Genbank. It's perfectly logical really – if NIH now starts releasing sequences you as a submitter asked them to remove for whatever reason, submitters will think twice about using Genbank. We already have China working with its own database and all this BS will make them twice-shy about submitting.
> >

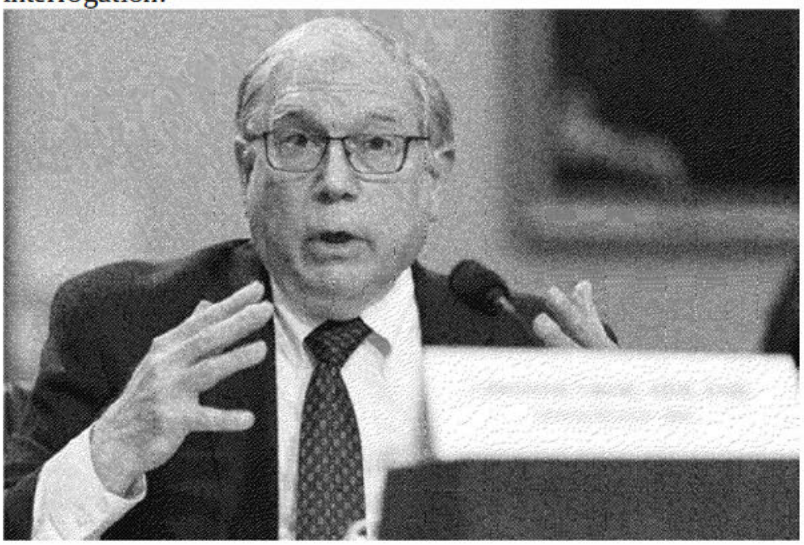
NIH director confirms agency hid early COVID genes at request of Chinese scientists

By
Steven Nelson
May 11, 2022 3:47pm



National Institutes of Health acting director Lawrence Tabak confirmed to lawmakers Wednesday that US health officials concealed early genomic sequences of COVID-19 at the request of Chinese scientists — but insisted the data remains on file.
Tabak told a House Appropriations subcommittee that the NIH

"eliminated from public view" the data from the pandemic epicenter in Wuhan, China, before adding that researchers can still access it via an archaic "tape drive."

Vanity Fair recently reported that the information was hidden in response to a request from Chinese scientists, despite potentially resolving whether the virus leaked from the Wuhan Institute of Virology or passed naturally from animals to humans.

Rep. Jaime Herrera Beutler (R-Wash.) asked Tabek to explain why US officials would comply with such a request.

"There's no question that the communication that we had about the sequence archive — Sequence Read Archive — could have been improved. I freely admit that," Tabek said. "If I may, the archive never deleted the sequence, it just did not make it available for interrogation."

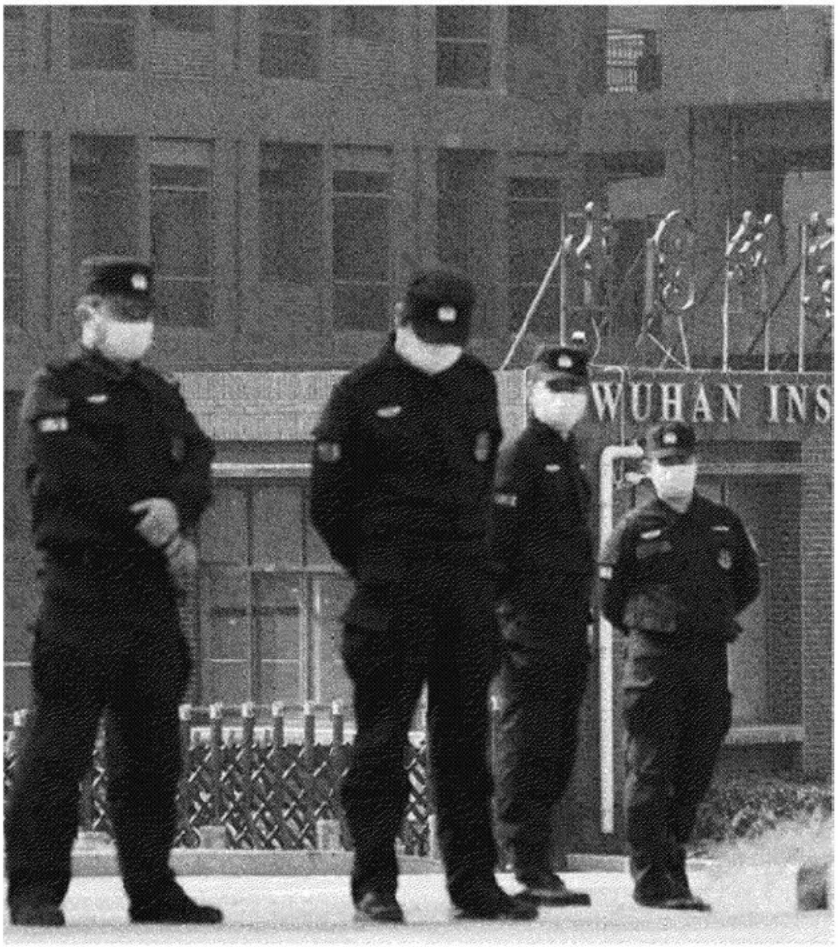
Lawrence Tabak, acting director of the National Institutes of Health, testifies on May 11. Jacquelyn Martin/AP

"So wait, you have the information still?" Beutler followed up.

"We have the information … Anybody who submits to the Sequence Read Archive is allowed to ask for it to be removed," Tabak explained. "And that investigator did do that. But we never erase it."

"So you don't have the information anymore?" Beutler asked.

"We do. We never erase the information. We keep it," Tabak clarified.



"So they were able to withdraw public viewing of it?" the congresswoman followed up.

"That's correct," he said.

"OK, so researchers can apply to the NIH and get the information from you?" Beutler asked.

"In the way that it was originally eliminated from public view, it was withdrawn, and that's the most difficult for people to access," Tabak replied. "The error that was made, and we found this out after a review of all of our processes, was it should have been suppressed. The distinction being that if it's withdrawn, it is kept archivally on a tape drive — old technology, but that's how it's done. But when it is withdrawn, it can still be accessed by accession number, and so

researchers are able to access that information."

Security personnel keep watch outside Wuhan Institute of Virology during the visit by the World Health Organization on Feb. 3, 2021. Thomas Peter/REUTERS

"So the information is still there?" Beutler summed up.

"That's correct. The information was never lost," Tabak repeated.

In a March 31 article, Vanity Fair reported that evolutionary biologist Jesse Bloom discovered last year that early COVID-19 sequences had disappeared from a federally run data repository. When Bloom raised the issue, he was reportedly ganged up on by a group of researchers assembled by then-NIH Director Francis Collins and infectious disease institute head Dr. Anthony Fauci. Bloom shared a draft academic paper with Collins and Fauci, who allegedly objected on a June 2021 Zoom video conference to Bloom's description of Chinese scientists "surreptitiously" removing the sequences. Fauci said the word was "loaded" and implied a coverup, the report said.

Evolutionary biologist Kristian Andersen, who was selected to participate on the call by Collins, allegedly told Bloom that the Wuhan team had a right to claw back early pandemic information and that it was unethical for Bloom to question it.

Tabak noted that while the request for information to be removed was honored, it was not erased fully.ECOHEALTH ALLIANCE Andersen allegedly went so far as to offer to delete Bloom's article from a "preprint" server "in a way that would leave no record that this had been done."

China's government has refused to cooperate with an international investigation of the origins of the pandemic. The COVID-19 virus has killed about 1 million Americans since March 2020 and caused massive social, economic and educational disruptions.

The US intelligence community said in an August report that it's possible the virus leaked from the Wuhan Institute of Virology, calling the theory one of two "plausible" explanations along with natural transmission from animals.

Lawrence Tabak confirmed Wednesday that early genomic sequences of COVID-19 were concealed at the request of Chinese specialists. Jacquelyn Martin/AP

President Biden rarely speaks publicly about wanting China to be transparent about the origins of the pandemic. Former President Donald Trump, by contrast, has demanded that China pay $10 trillion in reparations.

The Biden administration is considering undoing some of Trump's tariffs on Chinese goods "separately" from US pressure for coronavirus transparency, White House press secretary Jen Psaki told The Post on Monday.

Documents published in September by The Intercept revealed that US health officials indirectly funded so-called "gain of function" research at the Wuhan lab — including the modification three bat coronaviruses distinct from COVID-19 and the discovery that they became much more infectious among "humanized" mice when human-type receptors were added to them.

Importance: High

EXTERNAL SENDER

Dear all,

Just wanted to let you know that I found out my name was on a 'kill list' posted on the Right wing anonymous internet site 4Chan. Someone posted the names of 6 virologists, including myself, and encouraged people who have had enough and were ready to commit suicide, to take go out and murder this group first. Even more horrific, they named my wife (who's got a different last name to mine, so is now traceable) and my eldest daughter, posting her name and University name also.

I'm traveling in Malaysia/Singapore with Janet this week, but have already contacted the FBI and both daughter's universities, but as you can imagine this is pretty awful, though sadly not unexpected.

I expect this will get worse after the mid-terms, when the truly heinous folks on the Right start the launch of their McCarthyesque witch hunts against scientists re. covid origins, vaccines, masks etc.

Cheers,

Peter

Rich: Your summary of my summary is right on point – that was exactly the vibe of Sachs's comments during the webinar. He let Ebright and Kopp spell out the crazier aspects of the lab leakers' viewpoint. Chan was more balanced than I expected her to be (although her summary clearly had a thumb on the scale).
Best regards,
Jeff

moderated a Lancet Commission webinar on COVID-19 origins this morning

Jeff:

Great summary, but nothing really new as all the presenters had well-known views. My only comment is that Sachs recently seems to be a little less adamant that it was a lab leak and just now relies on innuendo.

REL0000482729

All: I listened in this morning on the webinar on COVID-19 origins that Jeff Sachs moderated under the auspices of the Sustainable Development Solutions Network (SDSN). I wasn't able to stay until the end of the Q&A, but I did hear the three main presentations. Sachs said that he plans to post the recording of the session (on SDSN?). This was the first of three planned webinars – the second (on global health financing) will take place on November 22, the third (on health system strengthening) on December 8.

Sachs served as moderator. His introduction was fairly mundane. His basic premise was that there are two "absolutely viable" hypotheses for the origin of COVID-19 – either zoonotic or due to a lab leak. (Note that the language he uses – "absolutely viable" – obscures the fact that the evidence differs significantly for each of the two hypotheses. But this was a bias that ran through all of the presentations.) He then argued that we need to follow both lines of inquiry equally, to have a proper understanding of both possibilities. He alluded to the bimodal distribution of most discussion of these questions – with "mainstream media" coming down on natural origins, and "alternate media" arguing for laboratory origins (including in this Senator Burr's Senate Minority Report). He then turned to two "leading scientists" and a "leading reporter" for further perspectives.

The speakers were Alina Chan (Broad Institute), Richard Ebright (Rutgers University) and Emily Kopp (US Right to Know) – no great surprises there.

Alina Chan's main argument was that there is not enough evidence to decide which hypothesis is true, and that all the evidence is circumstantial. She did say that there is no argument over the fact that the pandemic originated in spillover from bats – just a difference of opinion on how and where this happened.

She presented a set of factors that would explain the chain of causation for each of the two hypotheses:

<u>Natural origins</u>
- Earliest cases handled live animals?
- Were there infected animals in markets or farms?
- Were there animal variants of the virus?
- Was there antibody evidence of infected animals or traders (not presenting with pneumonia)?
- Was there a strong wildlife conduit between known bat reservoirs and the outbreak site?

She then claimed that none of these have been established for SARS-CoV-2, and thus we can't say that natural origins hypothesis is true.

Lab leak
- WIV was the HQ for virus hunting program targeting both animals and humans
- WIV found and developed SARS-CoV-2-like viruses by 2013
- WIV did advanced work with virus isolates and "seamless clones"
- Live virus work was done in BSL2 and BSL3 environments, which could not contain airborne viruses
- WIV and collaborators were planning to insert furin cleavage sites in different viruses (she referred to a "pipeline" of risky research and made a big deal of the rejected DARPA proposal, for which the research was never done)

Her conclusion: evidence is not definitive for either hypothesis, but these aspects of research at the WIV were "very concerning" and thus we need to investigate both conclusions.

Richard Ebright was then asked what should be done about improving the oversight of research in this area from the perspective of biosafety, biosecurity, and biorisk management. He concurred with Sachs and Chan that the available data do not enable a choice between the two hypotheses of COVID-19 origin. But regardless of where one stood on this question, the research by EcoHealth Alliance, WIV, and their collaborators – according to Ebright – used inadequate biosafety protocols and lacked transparency. Again, according to him, this points to, but does not prove, a research spillover as the origin of COVID-19.

I've attached a screen shot of the slide he shared that lays out his bill of complaint. As you can see, he's fixated on the work that WIV and EHA did from 2016-2019, arguing that, while this doesn't prove laboratory origins, it "exceeds the standard of probable cause" and provides "ample basis to initiate investigation and ample basis to improve oversight." (Like Chan, he also made much of EHA's rejected DARPA proposal, trying to use it as a "smoking gun" for malign intent by EHA and WIV, despite the fact that this research was never done!)

He spent most of his time, however, outlining a basis for and recommendations for improved research regulation and oversight in biosafety, biosecurity, and bio risk management.

Sachs and Ebright had an exchange about the recent news of the creation of a variant of COVID-19 that appeared to be more virulent than Omicron, without the "knowledge or approval of NIH." This was evidence for both of them of the need for enhanced oversight.

Emily Kopp, an investigative journalist with US Right to Know, then made a breathless presentation about her attempts to bring the truth about COVID-19 origins to light through FOIAs and dogged persistence. The gravamen of her

complaint is that much of the relevant research has been underwritten by NIH, DOD, and USAID with taxpayer funds, and conducted in the US (at EHA, University of North Carolina, University of Texas, and UC Davis), yet she and her colleagues have had to file dozens of FOIA requests and lawsuits to get access to what they consider to be relevant information.

She reviewed five categories of evidence:

1. EHA progress reports to the NIH: She noted that the Intercept is going after 31 EHA NIH proposals and over 1000 other documents not yet released. They also plan to go after EHA Board members and collaborators at the U of Maryland and UC Davis.

2. USAID databases from PREDICT.

3. NIH bioinformatics databases for sequence data from WIV: She was quite exercised about the "apathy" of NIH at not going through archived sequences to provide the information that USRTK wants.

4. The Baric Lab at UNC: She said as yet there are few clues to planned work on genetic engineering techniques here.

5. Department of Defense: Again, she railed about the lack of transparency about the rejected EHA DARPA proposal, which she claimed DARPA tried to conceal. She also mentioned data from PREEMPT.

She then claimed that the public can't trust the credibility and integrity of the NIH on these matters, since they tried to obscure the existence of relevant data – and event tried to obscure the involvement of other scientists in the discussion of COVID-19 origins in the conversations that led to the *Nature Medicine* correspondence in 2020 (I lost her here – the discussion became very "inside baseball"). She concluded with a plea that the public deserves more clarity about the pandemic's early days.

Sachs then threw her a softball about the *Nature Medicine* correspondence, inviting her to tell the listeners how it appeared that NIH was trying to obscure who came up with the zoonotic origins theory (and then didn't credit those authors on the publication). She then said that the virologists who were on this correspondence have continued "to be aggressive about natural origins and to marginalize other theories" – asking (rhetorically) if they have shown integrity.

Sachs then said that all of this information had to be pried out of the NIH and the USG, rather than being offered transparently. He showed how the NIAID had redacted most of the 300-page COVID strategic plan of April 2020, and also made a point of saying that Robert Redfield had wanted to attend today's

webinar but couldn't, noting that he believes a lab leak is more likely – and that he was shut down by NIH when he tried to call for further investigation. Sachs then teased that there may be new revelations that the WIV and US scientists were implicated in evidence that COVID-19 emerged in China before December 2019. (This latter evidence-free speculation seems to refer to Mike Pompeo's evidence-free contention that the USG had evidence of this – but that evidence has never materialized.)

Sachs then reiterated his contention that both hypotheses need further investigation – and that the relevant information may be in the US, not China. We need an independent, rigorous, transparent scientific investigation. (Despite this language, I think you can sense from my summary of the webinar that Sachs is actually shading the argument toward his belief that COVID-19 had a laboratory origin.)

I wasn't able to stay on for the Q&A, but we should be able to review the rest of the session when Sachs posts the recording.

Hope this is helpful.

As ever,
Jeff

Dear All,

I just wanted to give you a quick update on this issue. Below is an email I just sent to Peter Staley, the AIDS activist who spoke out forcefully when Trump terminated our NIH grant – he's a colleague of Dr. Fauci's. In it are 5 key points re. why this amendment should be taken seriously and removed. Additionally, I've attached some information about EHA specific to why we're under attack and need people's help to defend against it. I'm hoping these may be useful as you reach out to colleagues and contacts.

We've heard back from Sen. Gillibrand's staff and are talking with them on Tuesday afternoon next week. So far that's the only Senator's office that has responded and expressed an interest in doing something about the amendment. We don't know what they'll propose yet, and don't know what the timeline will be, but obviously at this point we're very worried.

Any continued help you can give us is very much appreciated. Rich – I wondered whether Elizabeth Warren's office has gotten back to you and Rich/Jerry, whether Sen. Ed. Markey's office has responded.

I'm talking with a contact of our Board tomorrow who may have a way to reach Sen. Schumer, but given the chaos in Washington, I suspect this will be difficult…

Cheers,

Peter

Subject: Amendment to defund EcoHealth Alliance was passed by the House last Thursday night and now moves to the Senate
Importance: High

Dear Peter,

I really appreciate your time a few months ago to talk about the ongoing pressures we're under here at EcoHealth Alliance. The latest action is a particularly significant threat to our organization – last January one of the House Republicans, Congressman Reschenthaler, filed a bill titled HR591 "Defund EcoHealth Alliance Bill" and managed to get passed by the House last Thursday night as Amendment #148 (https://rules.house.gov/bill/117/hr- 4350) to the National Defense Authorization Act (HR 4350) (https://armedservices.house.gov/ndaa). The five other co-sponsors are all Republicans: Van Drew, Perry, Harshbarger, Keller, and Budd.

EcoHealth Alliance is a non-profit based in Midtown Manhattan that employs around 50 people whose jobs depend on the funding we receive each year. If this amendment continues forwards, we stand to all lose our jobs and close down the organization. We're deeply worried about this amendment and are desperately trying to reach anyone who is willing to talk to their colleague in the Senate to try to get this amendment removed. We were hoping you'd be able to speak out on our behalf. The main reasons we hope you'll be able to get across are:

1. It is based on the false premise that the virus emerged from a laboratory – the majority of scientists, and of intel agencies believe it has a natural origin

- It sets a precedent that an individual member of congress can circumvent normal protocols for funding contracts and grants set up by government agencies, based on political motives
- It accuses an organization of being implicit in causing a terrible pandemic, with no evidence, and without due process
- No DoD funding to this organization (EcoHealth Alliance) has ever been used to conduct work in China. This was already clarified in a response to a letter to DoD from this Congressman in Summer 2020
- This amendment would effectively close down a non-profit that does work to protect US citizens from future pandemic threats, and would mean New York City residents losing their jobs.

Peter – any advice or help you are willing to give us will be much appreciated. We've reached out to Senator Gillibrand's staff and are talking with them on Tuesday next week, but are just very concerned that we don't know what the timeline is for this, and that it might just end up being passed because it didn't rise to the right level of concern. Everyone at our organization remains fully committed to our mission and just wants to get back to work protecting the US from future pandemic threats, but right now, we're at the mercy of politics.

I'm available any time for a call, or if you're able to reach out to colleagues with influence on the Senate, please do. I've also attached a brief explanation of the details to EcoHealth's work and why we're under attack.

Cheers,

Peter

Attachments:	March 2021 letter to NIH Director. Republican members Energy Commerce etc..pdf

This letter from Republican leaders of Committee on Energy & Commerce was filed yesterday. I don't know what normally happens with this, but I'm assuming NIH will respond and I won't have to do anything. Note that Dr. Relman is cited and center, and I believe he's agitating to head up an inquiry from the NASEM. I've thought this for a long time after he approached me a couple of times a year ago to inquire about my work in China.

This letter is part of a barrage of daily attacks at this point. Today, the US Right to Know filed a FoIA at Erasmus Univ Netherlands where Marion Koopmans (also on the WHO mission) works, for emails to me and the WHO people, adding to multiple broadsheet articles over the past week from WSJ and less sophisticated right wing papers. I don't know if they can FoIA a foreign Univ, but I've now got to spend hours of my time with their lawyers and ours to find out.

On the good side, I was asked to brief staffers at the House Committee on Science, Space, and Technology, which I'm assuming will be a positive experience, and I'm reaching out to the State Dept and NSC to offer briefings on WHO findings ahead of the report. Additionally, 60 minutes is doing a piece on the report and interviewed me, but I suspect they're going to dwell on the lab release hypothesis.

Meanwhile, I'm drafting a response to the 10 conditions from Collins & Lauer and will have a draft within a few days for your comments if that's ok. Given Biden's theatrical show at the China summit today, I don't hold up much hope that this sort of aggression is going to dissipate quickly…

Cheers,

Peter

Yes – I've also seen this hypothesis that the African Swine Fever outbreak may have increased consumption. To be honest, consumption was pretty shockingly high already – with every city in China having multiple markets where farmed wildlife can be bought.

Definitely a valid hypothesis, and look forward to reading the paper.

Subject: RE: Fox News: GOP senators demand COVID-19, Wuhan documents from HHS, NIH

I just read the attached recent pre-print paper, and it is really interesting and will, I am sure be reviewed and published rapidly in a highly respected journal. What is rather unique in their ruminations on the pathway to humans is the following excerpt from the conclusions.

"One possible recent disruption that caused widespread and unusual movements of animals in China and may have increased the permeability of this barrier, was the dramatic shortage of pork products in 201937 attributable to an African swine fever virus (ASFV) outbreak impacting 100s of millions of pigs in China38. Such a major disruption in the food supply chain will have potentially brought humans into increased contact with Sarbecovirus infected animals as i) exotic meats

replaced pork, ii) animals from rural locations were brought to city markets and/or iii) by meat from infected animals being transported in cold chain processes."

Can science actually counter propaganda? David, this is a good new piece of work for a follow up for ASTMH.

Jerry

This letter had me worried because I thought it was FROM the HHS secretary, but then I saw Rand Paul's name at the bottom and swiftly realized that this is a shameless act of political theater from disingenuous politicians who aren't actually interested at all in where the real origins of COVID began.

I will file it and then continue with the hard work of trying to use every bit of scientific skill and energy we have left to work on identifying the origins of COVID so that hopefully these horrific attacks will end, and we can then start to focus on preventing the next pandemic, perhaps by reducing the horrific exploitation of wildlife around the world in a wildlife farm/market system that employed 14 million people in China alone.

Of course, my task would be made a lot easier if I had access to the NIH funding we had in place to do exactly that, and if I didn't have to spend most of each day trying to prevent our other funders leaving our organization (I was literally just on an awful call with a nervous funder who's wavering).

Cheers,

Peter

Group demands unredacted copies of Fauci emails

By **Tyler Olson | Fox News**

A group of Republican senators is demanding a trove of documents on behind-the-scenes deliberation within the Department of Health and Human Services (HHS) and the National Institutes of Health (NIH) about the origin of the coronavirus and the possibility it escaped from the Wuhan Institute of Virology.

Sens. Ron Johnson, R-Wis., Rick Scott, R-Fla., Josh Hawley, R-Mo., James Lankford, R-Okla., and Rand Paul., R-Ky., authored the letter asking for the documents. The letter says the "release of approximately 4,000 pages of NIH email communications and other documents from early 2020 has raised serious questions about NIH's handling of COVID-19."

The emails the senators are referring to were released by outlets like the Washington Post and Buzzfeed via Freedom of Information Act (FOIA) requests. Among the questions raised by the materials, according to the senators, are how seriously officials, including National Institute of Allergy and Infectious Diseases (NIAID) Director Anthony Fauci, took the lab leak theory before later dismissing it.

MORENS_SUBPOENA_016860
MORENS_NIH_035016
REL0000482736

"These documents, though heavily redacted, have shed new light on NIH's awareness of the virus' origins in the early stages of the COVID19 pandemic," the senators said in a letter to HHS Secretary Xavier Becerra and NIH Director Francis Collins.

2021-06-11 Letter From Five... by Fox News

"It is unclear the extent to which NIH officials, including Dr. Fauci, considered the possibility that the virus originated in a laboratory and what, if any, actions they took to seriously investigate this possibility," they continued. "It is also unclear why NIAID officials eventually decided to downplay the likelihood that the virus originated in a laboratory and, instead, promote that it originated naturally."

The letter, sent last week but released Monday, notes a handful of highly publicized exchanges, including one email Fauci sent to his deputy, Hugh Auchincloss.

"Hugh: It is essential that we speak this AM. Keep your cell phone on," Fauci wrote in an email with a subject line that referenced gain of function research. This email was among those obtained by Buzzfeed. "Read this paper as well as the email that I will forward you now. You will have tasks today that must be done."

"The paper you sent me says the experiments were performed before the gain of function pause but have since been reviewed and approved by NIH," Auchincloss said in an email to Fauci, which was also published by Buzzfeed. "Not sure what that means since Emily is sure that no Coronavirus work has gone through the P3 framework. She will try to determine if we have any distant ties to this work abroad."

Scott said Tuesday that Americans "deserve answers" about the origins of the pandemic that shut down the economy, killed hundreds of thousands and had rippling consequences through society, from increased drug abuse to children falling behind in school due to remote learning.

"The American people deserve the truth and transparency that Senator Scott has been calling for since this pandemic started. We know the Communist Chinese government is responsible for the coronavirus pandemic, and they lied to cover it up with the help of the World Health Organization

MORENS_SUBPOENA_016861
MORENS_NIH_035017
REL0000482736

(WHO)," a spokesperson for Scott said. "It's been over a year since Senator Scott called for a congressional hearing into the WHO and its role in covering up the pandemic. Now, the American people deserve answers about how this pandemic got started and who is responsible. It's time for accountability."

The senators, all members of the Homeland Security and Governmental Affairs Committee, are requesting unredacted copies of the recently released FOIA troves from the Washington Post, Buzzfeed and Judicial Watch.

Security personnel gather near the entrance of the Wuhan Institute of Virology during a visit by the World Health Organization team in Wuhan in China's Hubei province on Wednesday, Feb. 3, 2021. (AP Photo/Ng Han Guan) (AP)

They're also requesting very broadly "[a]ll records" from Fauci, Auchincloss, Collins and several other officials "referring or relating to the Wuhan Institute of Virology, COVID-19, coronavirus, EcoHealth Alliance, or Dr. Baric's 2015 coronavirus study."

HHS did not respond to a request for comment.

The possibility that the coronavirus escaped from a Chinese lab was largely panned last year by the media and experts. But Fox News reported in April 2020 that some in the intelligence community were taking the lab leak possibility seriously. And emerging facts led many, especially Republicans, to put more stock in the theory in recent months.
House and Senate Republicans have pushed the Biden administration to release more information on the possibility that China was at fault for allowing the coronavirus to escape from a lab. This has been done through other document requests, a bill that would force the president to declassify intelligence related to the lab leak theory and more.

White House Press Secretary Jen Psaki and President Biden have also indicated in recent months that the administration takes the possibility of a lab leak seriously. But the White House has stood

behind Fauci even as his recently released emails show he was concerned with the Wuhan Institute of Virology early in the pandemic only to dismiss the lab leak theory later.

Dear colleagues,

Sadly we're getting close to my upcoming public hearing with the SSCP. There are some details and a link below that you can use to watch it live on the day: https://uspolitics.einnews.com/pr_news/706672646/hearing- advisory-ecohealth-alliance-president-dr-peter-daszak-to-testify-on-may-1

Hearing Advisory: EcoHealth Alliance President Dr. Peter Daszak to Testify on May 1

WASHINGTON — On May 1, 2024 at 10:00am ET, the Select Subcommittee on the Coronavirus Pandemic will hold a hearing titled, "A Hearing with the President of EcoHealth Alliance, Dr. Peter Daszak." This hearing will examine EcoHealth Alliance's (EcoHealth) use of U.S. taxpayer dollars to fund dangerous gain-of-function research at the Wuhan Institute of Virology as well as hold Dr. Daszak publicly accountable for any and all

discrepancies between his closed-door transcribed interview and available evidence. Prior to Dr. Daszak's public testimony, the Select Subcommittee will release the full transcript from Dr. Daszak's transcribed interview and publish a detailed report about EcoHealth's impact on the origins of COVID-19.

Read more about Dr. Daszak's upcoming hearing here.

WHAT: Hearing titled "A Hearing with the President of EcoHealth Alliance, Dr. Peter Daszak"

DATE: Wednesday, May 1, 2024

TIME: 10:00AM ET

LOCATION: 2154 Rayburn House Office Building

WITNESS:

Dr. Peter Daszak

President

EcoHealth Alliance, Inc.

WATCH: The hearing will be open to the public and press and will be livestreamed online at https://oversight.house.gov/hearing/a-hearing-with-the-president-of-ecohealth-alliance-dr-peter-daszak/.

RSVP: Media must be congressionally credentialed and RSVP by Tuesday, May 1 at 5:00 PM ET.

###

Had a very successful EcoHealth Alliance benefit last night – sorry some of you couldn't be there.

Michael Mann was our main honoree, and he was great! We raised well above our expectation – all critical to keeping us afloat given the increased pressure we're under right now.

Speaking of which – here's the latest attempt from the SSCP to smear David Morens, EcoHealth Alliance

and others as being involved in a 'cover up'

https://nypost.com/2024/04/19/us- news/ex-fauci-adviser-shared-confidential-nih-info-with-ecohealth-about-covid-biosafety-levels-docs/

Basically, they've found an email from me to David, Jerry others when the allegations that EcoHealth expts were conducted at an insufficient BSL level first came out. Tony Fauci was interviewed and said that he would look into it. I sent David M. a review I'd done of the BSL rules for Bat CoVs in various countries, which clearly show that we were operating at the correct biosafety levels.

Subject: EcoHealth Statement and Email release today has relevance to NIH and Michael Lauer issues
Importance: High

Good to talk with you yesterday Michael. We got more negative press yesterday, this time related to emails that allegedly show coverups and inappropriate behavior among scientists. The Republicans released only the subject line and addresses etc. (https://oversight.house.gov/release/wenstrup- reveals-emails-from-whistleblower-alleging-additional-attempts-by-fauci-advisor-to-subvert-transparency-about-covid-19-origins/), leading to BS stories in the usual right wing press. We released the full text of the emails today:

https://www.ecohealthalliance.org/2024/04/ecohealth- alliance-releases-emails-that-are-the-subject-of-false-allegations-in-the-press

These are all from me to senior NIAID staffmember David Morens and former NIH Center Director Jerry Keusch, trying to make sense of the termination of our grant by Trump, and to find a way to get it reinstated. In the end NIH did reinstate the grant (May 2023). One of the chains shows emails that refer to the pressure from Michael Lauer, and the fact NIH instructed me not to talk with our program officer (Erik Stemmy) and direct all communications to Grants Management (Emily Linde). That was another highly unusual move from NIH and is part of the pattern that I was talking with you about.

Here is that particular set of emails: https://www.ecohealthalliance.org/wp-content/uploads/2024/04/Emails-01.pdf

MORENS_NIH_047991
REL0000482737

Peter,

Let's set up a time to talk next week (Wednesday or later best for me). On first glance, it strikes me that I'm glad I'm not in the grants-application business, because the bureaucratic behavior here seems incomprehensible, at least to a layman.

What's the overarching theme in their relations with you? Is it pressure from the lab-leak crowd, the FOIAing from Tobias, which as far as I can tell has yielded nothing of any substance? A spillover from the Trump era?

I read the Science piece, which was thorough in detailing what was done to the Chinese researchers but silent on what provoked it....what was the question I was left with--Why did NIH do all this?

MH

On Sat, Apr 6, 2024 at 12:03 PM Peter Daszak <
(b) (6)
> wrote:

> Hi Michael, I'm just contacting you off the record in case you or others are interested in reporting on what's going on at NIH with respect to EHA's grants. We were trying to deal with this privately, without it becoming public, but we found out last week that some of our recent correspondence with Emily Erbelding asking for her help is in a batch of FoIA's emails that will be released to Jimmy Tobias in the next couple of weeks. Tobias is in the habit of simply dumping these on the internet, so we wanted to get these to a bona fide reporter before that happens.
>
> As you probably know, our organization has been funded by NIAID for around 20 years, conducting successful research on emerging diseases, and working closely with communities, scientists and governments in emerging disease hotspot countries to try to reduce the risk of disease emergence. Prior to the termination of our R01 grant in April 2020 that would have had the Wuhan Institute of Virology as a subrecipient, we had never had any issues with NIH or NIAID, and had been lauded by program officers for our cutting edge research into viral emergence, and the many papers in Science, Nature, NEJM and others based on NIH funding.
>
> After the termination of our grant, the HHS OIG was called in to audit our work and NIH's oversight. They reported back after an 18 month audit with recommendations for both us, and for NIH, most of which were minor and easily addressed. We rapidly complied and NIH's DFAS group confirmed that all audit findings were resolved. However, we continued to receive further actions from the Office of the Director (Michael Lauer, who *Science* wrote about re. NIH's actions on grantees with China connections https://www.science.org/content/article/pall- suspicion-nihs-secretive-china-initiative-destroyed-scores-academic-careers), and the NIH

group that manages oversight (OPERA) directly under Michael Lauer. In April 2023, Michelle Bulls from Opera and Emily Linde from NIAID placed 4 Specific Award Conditions (SACs) on our grants. At the time, Michael Lauer had contacted Tufts University who oversaw our IACUC approvals to conduct wildlife sampling because EHA doesn't have an animal facility. This led to Tufts canceling our interinstitutional agreement. The only way for us to proceed was to request an Animal Welfare Assurance from OLAW (based at NIH), but this was denied because of these SACs. One of the SACs stated that all of our subcontracts must be reviewed and revised by NIH reviews. We worked extremely hard to rapidly respond (often within days) to every single request, despite many of them being contradictory or having no material impact on the contracts. In the original letter NIH set a deadline of September 2023 to resolve the SACs, which due to repeated delays by NIH grants management staff in responding to us, continued further requests and shifting of the goalposts means we still do not have resolution. Furthermore, grants management are now suggesting that we are beyond the period of work and our subcontractees won't be able to be reimbursed. Additionally, during the past 12 months, NIH has only reimbursed EcoHealth for around $50K of the now nearly $2 million we are expecting and have expended.

As you can imagine, this puts us in a very difficult position, with institutions like UNC and Uniformed Services University likely to be outraged that their funding is threatened, and with us unable to do our work fully – work that has been reviewed, scored well, and is critical to pandemic prevention. We've tried every possible avenue to get a fair and reasonable rapid resolution. We've informed Emily Erbelding of these issues (hence the FoIA'd email), and Program staff at NIAID remain supportive of our work, but we still have no resolution. Every time we try to seek a meeting or resolution, we get a hard response from NIH that we're out of compliance and they set further deadlines and further minor issues for us to fix. Right now I believe we're probably in greater compliance with NIH rules and just about any other institution in the US, given the level of scrutiny we've gone through. I've attached some of the many recent letters between NIH OPERA, NIAID Grants managements and EcoHealth Alliance to give you an indication of the levels of detailed work that we've gone through to try and resolve these issues.

We don't know the reasons why this is happening – all our subcontracts prior to April 2023 covered every single requirement in NIH's grants management guidance, subrecipients had to sign that they would adhere to these. The stonewalling, and shifting of goalposts by NIH is linked to emails that they send us stating that we're 'delinquent' or 'out of compliance', or that they're 'concerned' etc. and seem to us designed ready to be FoIA'd (which they are being) or to be used when NIH has to show Congressional Republicans that EcoHealth is being treated in the way they are calling for. Meanwhile, important findings can't be reported, including a novel SARS-CoV-2 related virus able to bind well to human ACE2 that we have found in one of our country sites, but are

MORENS_NIH_047993
REL0000482737

now unable to publish because our subrecipient is concerned they don't yet have an approved contract. This is hurting our ability to conduct pandemic prevention work, and the US's ability to be informed about public health threats that could emerge and threaten our citizens.

If you want to report on this, I'm happy to talk on-the-record on some issues, and there are others who are aware of these problems that I can put you in touch with, including at NIH and senior people from outside.

Cheers,

Peter

Dear Dr. Daszak,

My name is Greg Symmes and I'm the Chief Program Officer of the National Academies of Sciences, Engineering, and Medicine. You may remember meeting me years ago during your service on the Committee to Advise the US Global Change Research Program, when I was executive director of the Academies' Division on Earth and Life Studies.

I'm reaching out to schedule a zoom call with you to discuss potential impact of the recent HHS decision on your service to the National Academies.

My executive assistant Tasha Wood will be in touch with your office to arrange a time for us to meet. Please let me know if there is someone in your office Tasha should work with to help with your schedule.

I look forward to meeting with you.

Best,
Greg Symmes

The GAO was asked by the Biden administration to look into political interference in science by the white house under Trump. They interviewed me repeatedly last year and this year about the termination of our R01 grant.

https://www.gao.gov/products/gao- 22-104613

This is the first report from them on the topic. It's massively disappointing, of course, because it just comes up with broad recommendations on what agencies should do to protect themselves against political interference. However, if you read the email below, this is the first of two reports, and the second one should hopefully go into more detail about the NIH actions on EcoHealth's grant.

Cheers,

Peter

Subject: New GAO Report on Scientific Integrity at HHS

Dear Peter,

Thank you for participating in our report on scientific integrity at HHS. Our completed report can be accessed here. Please feel free to share it with your network and colleagues. We plan to issue an additional report that will examine the key characteristics that can insulate agencies from political interference, and how, if at all, the selected HHS agencies have experienced potential political interference while carrying out their missions.

Thank you again for your time and providing information on this important topic.

Sincerely,

Rob Marek

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

EXTERNAL SENDER

Article in NPR this morning (https://www.npr.org/sections/health- shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

This image shows purified particles of mpox virus, formerly called monkey pox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious attack.

MORENS_SUBPOENA_015746
MORENS_NIH_033443
REL0000478090

They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.

The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.

"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.

Sponsor Message

He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.

Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.

"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message

"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.

He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind

MORENS_SUBPOENA_015747
MORENS_NIH_033444
REL0000478090

of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.
If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."
But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message
Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the bigscientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it."
He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

Subject: RE: Tweet by Miner Flux on Twitter

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Jerry

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Ranking Member Ruiz's Opening Statement at Select Subcommittee Hearing on Scientific Journals and the Peer Review Process

April 16, 2024

•

Press Release

Washington, D.C. (April 16, 2024)—Below is Ranking Member Raul Ruiz's, M.D. opening statement, as prepared for delivery, at today's Select Subcommittee on the Coronavirus Pandemic hearing examining the peer review process and the relationship between scientific journals and the federal government.

Opening Statement

Ranking Member Raul Ruiz, M.D.
Select Subcommittee on the Coronavirus Pandemic
Hearing on "Academic Malpractice: Examining the Relationship Between Scientific Journals, the Government, and Peer Review"
April 16, 2024

Scientific journals play an important role in informing the public about the world around us, critical issues facing our nation, and advances in science and medicine.

Since their inception, these journals have placed objectivity at the forefront of their efforts to study,

review, and publish articles that advance our research enterprise.
And when a once in a generation pandemic struck our nation in 2020, this was no different.
Despite the Majority's claims, the Select Subcommittee has not uncovered any evidence that directly implicates Drs. Fauci and Collins in a cover up of the pandemic's origins fueled by their collusion with scientific journals to suppress the lab leak hypothesis.
Under the guise of investigating COVID-19's origins, the Majority has continually advanced a conspiratorial narrative against our nation's public health officials relying purely on speculation.
Their probe into federally funded research has spanned more than half a million pages of documents, more than a dozen transcribed interviews, and multiple hearings, and yet it has failed to substantiate any of their claims about Drs. Fauci and Collins or even bring us closer to understanding how COVID came to be.
Instead, it has only further politicized an issue of great importance to our public health and national security, which is not without consequence.
In fact, we're already seeing growing divides when it comes to trust in our nation's institutions and how that influences people's behavior when it comes to protecting their health.
Rebuilding the American people's trust in public health is critical to our ability to prevent, prepare for, and respond to future pandemics.
And the way we go about that is not by continuing to manufacture distrust in our nation's institutions by amplifying harmful—and often outright false—information about public health or by jumping to conclusions about how this virus emerged when its origins are still inconclusive.
Instead, it is by having honest conversations—that are rooted in fact—about what we can do better in the future.
So, as we begin today's hearing, I want to take a moment to address some of the allegations that have been levied by the Majority over the course of this probe and what the facts of the case have actually told us.
First, my Republican colleagues have alleged that Drs. Fauci and Collins orchestrated the "Proximal Origin" paper to suppress the lab leak theory, despite all evidence to the contrary.
Documents and testimony made available to this committee have repeatedly shown that British scientist Dr. Jeremy Farrar played the lead role in organizing and shepherding the paper through publication.
And second, my Republican colleagues have alleged that Drs. Fauci and Collins orchestrated a "takedown" of the Great Barrington Declaration.
Dr. Collins testified before this committee that he had privately called for "a quick and devastating published take down of its premises" out of concern for the public's health.
Documents and testimony provided to this committee have never shown that Dr. Collins pressured an NIH employee or scientific journal to "take down" the Great Barrington Declaration.
This committee seems to be forgetting that there is a difference between government speech—which the Supreme Court has previously ruled government entities have a right to —and government coercion, which my Republican colleagues are accusing public health officials of without a shred of evidence.
That aside, I have to say, I'm worried that today's hearing is setting a dangerous precedent—that if Congress doesn't like what you publish, you'll be hauled in before a congressional committee to answer for it.
The fact is, Congress should not be meddling in the peer review process.
And it should not be holding hearings to throw around baseless accusations, especially when there is so much work we can and should be doing to prevent and prepare for future pandemics.
Every minute wasted on spurious conjecture, every sentence spoken amplifying false information, and every hearing spent on unsubstantiated allegations comes at a cost.
And at the end of the day, it will be the American people who will pay the biggest price.

Totally agree Dan – I can't believe WHO put this out – it's hyped up and overstated – viruses are not likely to survive well in culture, or in a freezer after days of no electricity and no back up generators. Likewise, it's improbable to think that the warring factions in Sudan would have the expertise or intent to use them as weapons. It's also irresponsible in that the hype surrounding this announcement gives the people who control that patch of land clear leverage to use the lab as a threat. And WHO must have known this hype would be instantly used by the people pushing a lab leak origin of COVID.

Sure enough, the articles have already begun. First amplifying this story and linking it to the lab leak theory for COVID origins, then directly blaming Tony Fauci for it:

https://warroom.org/us-govt-funded-seized-sudanese-biolab/

The article above is from Steve Bannon's war room podcast. It will no doubt be picked up by other Right wing outlets, amplified, honed, and then emerge in the Daily Mail, NY Post and Fox News.

Cheers,

Peter

Articles like this Sudan: WHO says fighters seized laboratory as violence mars US-brokered ceasefire | CNN, which include comments from CNN's medical source of the lab being a "germ bomb" and the WHO rep saying it is "extremely dangerous" won't help calm fears and flames.

Not that I think that we should be making this argument publicly, and not do discount legitimate biosafety and biosecurity concerns, but I think that the risk is often overplayed. Lack of lab maintenance would probably lead more often to virus degradation (e.g., as freezers and samples thaw out) and most of the pathogens are ubiquitous in the environment. Wild type polio would obviously be an important exception.

FOR IMMEDIATE RELEASE
April 20, 2023

CONTACT: Press Office
(202) 226-4972

Chairs Rodgers, Griffith Announce Subcommittee Hearing on Biosafety and Risky Research

Washington, D.C. — House Energy and Commerce Committee Chair Cathy McMorris Rodgers (R-WA) and Subcommittee on Oversight and Investigations Chair Morgan Griffith (R-VA) today announced a hearing titled "The Biosafety of Risky Research: Examining if Science is Outpacing Policy and Safety."

The hearing will occur as part of the Committee's ongoing investigation into the origins of COVID-19 and other research involving potential pandemic pathogens. It follows a February 1, 2023, oversight hearing titled "**Challenges and Opportunities to Investigating the Origins of Pandemics and Other Biological Events**" at which witnesses discussed obstacles to determining the root cause of infectious disease outbreaks and biological incidents.

Chairs Rodgers and Griffith released the following statement:

"Our Committee's ongoing work has ignited heightened concerns about how we conduct and fund risky research and whether current biosafety measures are still sufficient to mitigate risks. As scientists, government investigators, and journalists continue to uncover more information, it is important to have public discussion and debates to ensure our policies and practices evolve to protect the safety of the American people and the world. This hearing will provide members and the public an opportunity to better understand specific risks involved with gain-of-function research on potential pandemic pathogens, current biosafety practices at high-containment laboratories, and will help better inform upcoming policymaking decisions."

Subcommittee on Oversight and Investigations Hearing titled "The Biosafety of Risky Research: Examining if Science is Outpacing Policy and Safety."

WHAT: A Subcommittee hearing to discuss how virus research can be conducted more safely.

DATE: Thursday, April 27, 2023

TIME: 2:30 PM ET

LOCATION: 2322 Rayburn House Office Building

WITNESSES: Witnesses will be announced and are by invitation only.

This notice is at the direction of the Chair. The hearing will be open to the public and press and will be live streamed online at **https://energycommerce.house.gov/**. If you have any questions concerning the hearing, please contact Lauren Eriksen with the Committee staff at **Lauren.Eriksen@mail.house.gov**. If you have any press-related questions, please contact Christopher Krepich at **Christopher.Krepich@mail.house.gov**.

Peter – chiming in with Dan on this … we/ASTMH will always advocate for sound science, policies and open and free scientific discourse. I and Linnie Golightly, our President-elect look forward to being at this meeting and the dinner that evening.

See you in a couple of days.

Karen

Agreed Dan, and this is why we need to rapidly move on a coalition, so no single organization or scientist is singled out.

Cheers,

Peter

Hi Peter,

Very disturbing news in your second paragraph (although I can't say surprising). ASTMH may serve as one avenue for advocacy here as this moves forward (although hopefully it won't). We're 501c3, and thus can't take a political stance per se, but we can, should, and will advocate for sound science and public health policy.

Best,
D.

No problem Dan – we'll definitely keep you on all the follow-up and are very glad you're supportive.

We're just getting information here that the Republicans in Congress plan on a series of hearings to attack virus research that will last right up to the next election. This goes way beyond 'gain-of-function' – they're intent on undermining a whole field, and doing that for the next 18 months to get maximum media and political impact.

Cheers,

Peter

Hi Peter,

Would like to attend but have dinner meeting with EU colleague at that time. Nevertheless, definitely support the initiative and hope to be able to contribute as moves forward.

Best,
Dan

Subject: Inv eeting with the Ro ext Thursday april 2 launch of a Coalition to address anti-science attacks on public health
Importance: High

Hi Dan,

Just thought you might want to join our meeting next week by zoom. Here's the invite I'm sending out to people who we hope can join virtually. No problem if you're busy, but if you want to join, please respond and we'll send you a zoom link.

Here's the email I'm sending out to others…

I'm writing to invite you to take part in a meeting on April 27th 1-3pm by zoom to discuss the formation of a Coalition to defend against attacks on public health science. We're setting up the meeting to deal with the growing momentum around anti-vaccine 'anti-expert' conspiracies that have led to attacks on science and scientists, and efforts to undermine the funding and pursuit of research of critical value for public health. This includes efforts to undermine basic and applied research in virology, the growing movement that promotes efforts to undermine commonsense science-based public health measures, conspiracies around alleged health impacts of vaccines and the origins of COVID, as well as others. These attacks range from online hate speech to political efforts to defund science and harass scientists.

A group of us (Jerry Keusch of BU NEIDL, Peter Hotez of Baylor College of Medicine, Rich Roberts of New England Biolabs and the Nobel Laureates Campaigns group, David Morens of NIAID, Jeff Sturchio of CSIS/Corporate Council on Africa, and Peter Daszak of EcoHealth Alliance) have been meeting by zoom on a regular basis to discuss how we can avoid the problem that individual scientists and organizations are being attacked, and when someone speaks out about it, they also become a target. We believe that if leaders in our fields and the organizations they represent can come together to protect science, we will be much better prepared to promote resilience against coordinated efforts to undermine our work. Note that while the topics of the day are COVID origins, school closures, mask mandates, our goals are broader and focused on ensuring that valid and important scientific research that has a goal of preventing pandemics, is supported by politicians, the agencies and the public.

Rockefeller Foundation has agreed to host our first in-person meeting for those in the New York City region on April 27th from 1-3pm. While we do not have funding to pay for travel to that meeting, we hope you will be able to join us, along with senior leaders from ASTMH, CUGH, universities and other organizations to take part in our discussion by Zoom.

Please respond back to this email, cc'ing Alison Andre, and we'll send an agenda and Zoom invite in due course,

Look forward to hopefully talking with you on April 27th!

Yours sincerely,

Peter

Cheers,

Peter

E&C Republicans Send Second Letter to NIH Director Regarding Grants Issued to EcoHealth Alliance

06.10.21

Washington, D.C. — Republicans on the House Energy and Commerce Committee sent a second letter to National Institutes of Health (NIH) Director Francis Collins, today asking NIH to produce grant reports and related documents to inform a complete, scientific investigation into the origins of the COVID-19 pandemic.

The letter states:

"The Chinese Communist government has not yet allowed Chinese scientists to cooperate with an investigation into COVID-19 origins, and has admitted to destroying samples and records pertinent to such an investigation. Thus, it is imperative we assemble all data and information in U.S. possession about bat coronavirus research experiments and lab safety protocols from all sources outside of China, particularly from EcoHealth Alliance (EHA). EHA is an NIH grantee who has been involved in bat coronavirus research in China and has issued grant subawards to the Wuhan Institute of Virology (WIV). It is also essential to collect information about the WIV, the laboratory that was conducting bat coronavirus experiments located in Wuhan, China, the epicenter of the COVID-19 outbreak. **As a federal cognizant grant-making agency that funded bat coronavirus research at the WIV through EHA awards, NIH is in a unique position to share publicly detailed research reports in its possession. Importantly, NIH has full access to EHA records and EHA has refused to cooperate with our inquiry. Therefore, it is critical for NIH to cooperate with our objective fact-finding investigation as we continue to collect data about U.S. funded bat coronavirus research."**

The Republicans on Energy and Commerce ask asking for reports and documents related to:

- **NIH's Award of $2 million to EHA Despite Grant Suspension**
- **NIH's Inadequate Oversight of EHA's Other Support**
- **NIH's Inadequate Oversight of EHA's Delinquent Financial Reports**
- **NIH's Possible Funding of EHA for Duplicative Research in China**
- **NIH's Inadequate Reconciliation of EHA's Grant Subawards**
- **NIH's Inadequate Oversight of EHA's Place of Performance Reporting (China)**
- **NIH's Lack of Visibility into EHA's Grant Subawards**
- **NIH's Inadequate Oversight of EHA's Grant Fund Accounting and Eligibility**
- **NIH's Inadequate Oversight of Its Funded Researchers in China**
- **NIH's Lack of Cooperation with Congressional Oversight Inquiry**

Great – I think she'll reach out to you. Apparently she contacted NIH and no one was put forward to talk with her.

To be honest, I don't know what her angle will be, but all I see from reporters at the moment is an obsession with the lab leak hypothesis – it's got everything that people want to read in a story – intrigue, geopolitics, a cabal of powerful people hiding the truth (that's NIH, me, Scientists in general) and a group of internet sleuths who are uncovering uncomfortable 'facts' (that's the online innuendos being put out there daily).

It would make for a great science fiction or spy novel. Science fact, it is not…

Cheers,

Peter

Peter, i hope she does contact me and if she does i can twll her on background, or YOU can tell her, that it may not be impossible to talk to me on the record. I am totally glad to speak on the record, but for that to happen, the reporter has to be aggressive in not letting our minders turn them away. If a reporter wereto say: are you censoring Morens?, they would probably back down and try to go into damage control mode. Once i get the go ahead to speak to a reporter i can say anything

In short, i and other like me are NOT under censorship but rather a very elaborate and aggressive attempt to throw reporters off the trail by directing them to the pablum-speakers. D

On May 5, 2021, at 18:01, Peter Daszak <(b) (6) > wrote:

I spoke off-the-record with a reporter from Vanity Fair (Katherine Eban) who is a good health and investigative reporter, but just did the usual questions about the Wuhan lab. She told me she wants to do a deep dive on the origins of COVID, but didn't ask a single question about the wildlife farms of S. China (where the virus prob. came from). She told me a growing number of serious scientists are starting to speak about the lab leak – I asked who, her response David Relman (who I suspect she's interviewed). I explained he's not a virologist and approaches this from a mission of reducing biosafety labs and controlling gain-of-function work. I also explained that we don't do gain of function work in China, and that there is no evidence for it being involved in SARS-CoV-2, nor actually any evidence the virus escaped from a lab.

I have just sent her an email (below), giving her a list of people who she should talk with and I hope she'll reach out to you. Please talk with her if you can – we need a diversity of voices getting the message out there to journalists right now.

Here's what I wrote to her:

Dear Katherine,

Please consider this email off-the-record.

Apologies that I can't have a decent on-the-record conversation with you, but as I mentioned, my speaking about the lab leak hypothesis publicly doesn't help us get any closer to EHA's goal, which is to understand where COVID came from, and to prevent the next one. Every time I speak with the press on this issue, it brings more oppressive actions (e.g. bill to defund EHA) and more threats.

Here are some people that I hope are useful to you as you dig in on your story. Some of them I work with, others I don't. They are all aware of the issues, and all are bona fide researchers who have conducted significant work in their careers on viral emerging diseases:

- Members of the WHO team who were members of the Animal & Environment working group/veterinarians – Marion Koopmans (b) (6) ; Fabian Leendertz (b) (6) ; David Hayman (b) (6) or the lead of the team, Peter Ben Embarek (b) (6)
- Kristian Andersen - conducted substantial research ence of SARS-CoV-2 & repeatedly spoken out about how a lab leak is 'extremely unlikely' (b) (6) u Twitter DM: @K_G_Andersen
- Trevor Bedford – as above (b) (6) Twitter DM: @trvrb
- In the WHO report (here: https://www.who.int/publications/i/item/who- convened-global-study-of-origins-of-sars-cov-2-china-part) and the Annexes (here: https://www.who.int/docs/default- source/coronaviruse/who-convened-global-study-of-origins-of-sars-cov-2-china-part-annexes.pdf?sfvrsn=3065bcd8_5) the Joint Mission finds the most likely pathway that COVID took is from a bat via an intermediate host (e.g. those found in domestic wildlife farms) into people. In the annex (p. 191) there's a short statement from Prof. Eddie Holmes who visited the market in 2014 and found live mammals for sale of the type that carry coronaviruses. China denies that this was happening prior to the outbreak, but there is unsubstantiated evidence on the web that it was. I recommend talking with Eddie Holmes, who is very well known and gives great quotes: (b) (6) Twitter DM: @edwardcholmes
- A good person to talk with about biosecurity labs and the NIH action is Jerry Keusch who set up and is now Director of the Boston BSL-4 lab (b) (6)
- You also mentioned the termination of EcoHealth's NIH grant. There is a wealth of information (letters, responses etc.) on what happened with that NIH grant on the following websites run by the Nobel Laureate Campaigns group: https://nlcampaigns.org/daszak_grant.html & https://nlcampaigns.org/daszak_grant2.html .
- One of the Nobel laureates, Rich Roberts would be a good person to talk with – he's aware of the issues politically and has spoken out about them: (b) (6)
- Another key person might be David Morens, who works at NIAID (Dep. Director level for Tony Fauci), but would talk on background: (b) (6)
- Jerry Keusch (above re. biosecurity labs) incidentally was the head of an NIH center (Fogarty International Center) for many years and would also be able to speak knowledgeably about whether the NIH action was unusual or not.

MORENS_SUBPOENA_014183
MORENS_NIH_026781
REL0000478103

Finally, I hope you take my conversation in the way it was intended – having seen this develop over the last 15 months, I've seen clear evidence that stories focusing on the idea that the virus escaped from a Wuhan lab do nothing to help us get any closer to understanding where it came from. There is no evidence for a lab leak, including of any lab anywhere in the world having a virus that could plausibly be a progenitor for SARS-CoV-2 prior to the outbreak. There is no evidence that the Wuhan lab had sequences or isolates (cultures) of SARSr-CoVs that they were hiding from us or not reporting, and as I mentioned, we published in early 2020, sequences of >150 novel SARSr-CoVs. Finally, despite the headlines, we have not been secretly 'funneling' or 'channeling' funding to WIV or 'hiding $40 million of defense funding' – all of our funding sources are publicly registered and reported on and our DoD funding is from the Defense Threat *Reduction* Agency which is well known for its work in trying to reduce the threat of bioweapons.

I strongly hope you are able to do a balanced job of reporting this. Some of the scientists above have been publicly vilified for speaking out about the lack of evidence on the lab leak theory, and they may be reluctant to talk. If so, please tell them I suggested their name and hopefully it will help.

Cheers,

Peter

I just think that anyone who really looks at the origins issue as a scientist, with objectivity, just can't come out with comments like this. RNA viruses exist in huge diversity in nature, so of course, the one that eventually causes an outbreak 'appears' to have come ready to infect – it's called "Natural Selection"!

Someone needs to send her a copy of "On the origin of the species" – methinks she hasn't read it yet…

It's less than $20 on Amazon….

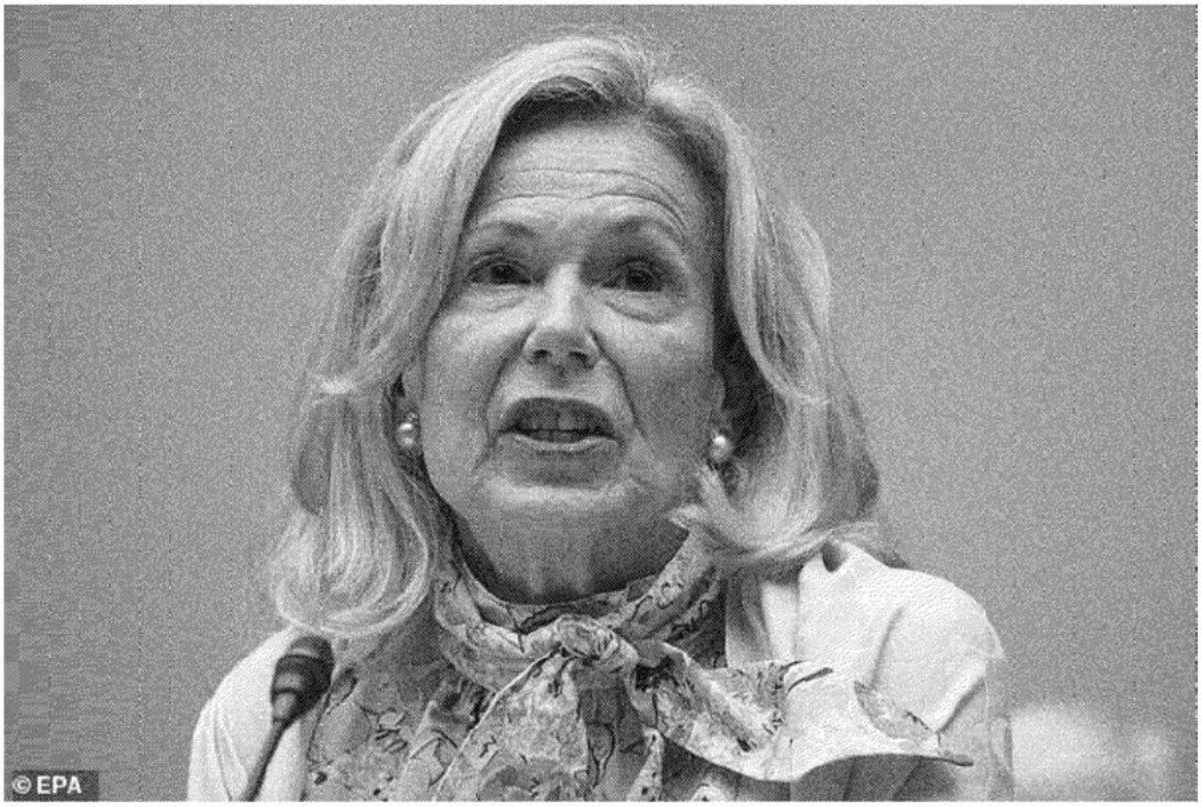
Trump aide claims Covid 'came out of the box ready to infect' - claiming virus was being worked on by scientists in a Chinese lab

- **Dr Deborah Birx said most viruses take months or years to become infectious**
- **But the infectious diseases expert and former presidential Covid adviser said Covid 'was already more infectious than flu when it first arrived'**
- **She said that meant Covid was either an 'abnormal thing of nature' or that Chinese scientists were 'working on coronavirus vaccines' and became infected**
- **She accused China of initially covering up how infectious Covid was**
- **'China was implying that they were containing it, but asymptomatic spread cannot be contained without testing,' she said**

By Ethan Ennals For The Mail On Sunday
Published: 20:30 EDT, 16 July 2022 | Updated: 23:33 EDT, 16 July 2022

Former President Donald Trump's adviser believes Covid-19 could have leaked from a Wuhan lab where scientists were working on vaccines for similar viruses.



Infectious diseases expert and former presidential Covid adviser Dr Deborah Birx told The Mail on Sunday that **coronavirus** 'came out of the box ready to infect' when it emerged in the Chinese city of Wuhan in December 2020.

The adviser said most viruses take months or years to become highly infectious to humans. But, Dr Birx said, Covid 'was already more infectious than flu when it first arrived'.

She said that meant Covid was either an 'abnormal thing of nature' or that Chinese scientists were 'working on coronavirus vaccines' and became infected.

'It happens, labs aren't perfect, people aren't perfect, we make mistakes and there can be contamination,' she said.

-

Former US President Donald Trump's Covid adviser Dr Deborah Birx (pictured) believes the virus could have leaked from a lab where it was being worked on by scientists

She accused China of initially covering up how infectious Covid was.

Birx said Covid's infectiousness was consistent with a virus which had been experimented on in a lab.

'In laboratories you grow the virus in human cells, allowing it to adapt more. Each time it passes through human cells it becomes more adapted,' she said.

Because people can catch Covid asymptomatically – meaning they don't show symptoms – Dr Birx argues a Wuhan scientist could have easily walked out of the lab with it.

'Someone working in the lab with one of the strains could've caught it and not known they had it,' she said.

Dr Birx also added that lives could've been saved if China had admitted the virus spread asymptomatically, when it was first discovered.

'China was implying that they were containing it, but asymptomatic spread cannot be contained without testing,' she said.

The then-President Donald Trump listens as Dr. Deborah Birx, White House coronavirus response coordinator speaks about Covid in 2020

MORENS_SUBPOENA_008272
MORENS_NIH_018146
REL0000478104

Birx is pictured above during a viral reaction to Trump's 2020 comments that injecting disinfectant might cure coronavirus

'I think the world lost several months of preparation because we were thinking there wasn't that level of human-to-human spread when there clearly was.'

Dr Birx's comments came a month after the MoS revealed that the head of the World Health Organization privately believes the Covid pandemic started following a Chinese lab leak.

China has repeatedly denied claims of a lab leak and branded the idea as a 'conspiracy theory'.

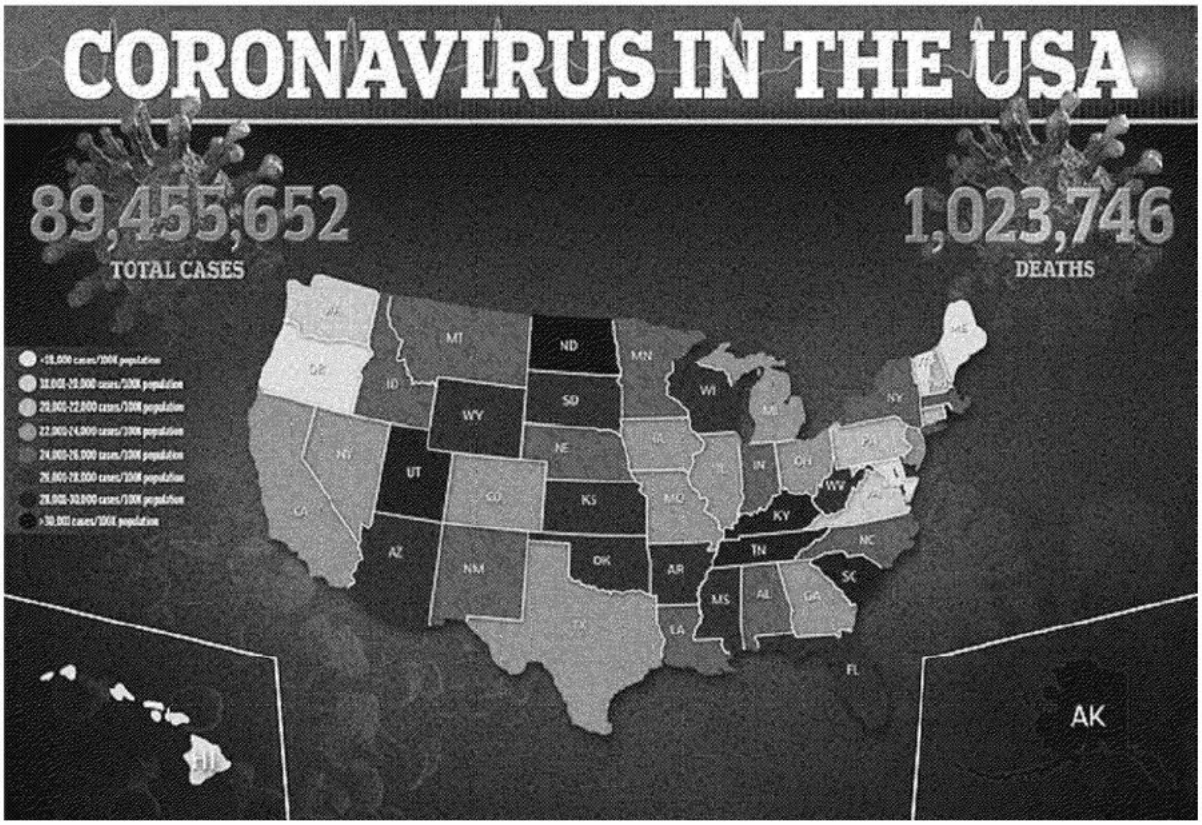
But alternative theories – that Covid came from human contact with bats or from a meat market in Wuhan – are not backed by evidence.

The lab leak theory was touted early on but was shut down by liberal media who ridiculed the idea and even branded it racist.

It took many mainstream left leaning news sites more than a year from the spread of the virus, to concede that the lab theory held weight.

Some outlets, such as the Huffington Post, even branded any suggestion the virus could have stemmed from a lab as a 'toxic conspiracy theory.'

When Donald Trump, on May 1, 2020, said he had 'a high degree of confidence' that the virus escaped from a lab, the New York Times, CNN, and NPR were quick to mock his comments.



CNN was almost gleeful in its mockery of the idea that the virus could have come from a laboratory.

The Washington Post, New York Times, and NPR were equally dismissive of suggestions that the virus could have come from a laboratory.

Few were able to suggest that COVID-19 could have stemmed from a research facility without backlash but that didn't stop some media, including the Daily Mail, from questioning the narrative.

Fox News' Tucker Carlson was also clear in demanding an investigation into whether it could have escaped from the lab.

Finally, in early 2021, came the first signs that opinion was beginning to change.

-

In January, a World Health Organization (WHO) report only served to raise more questions after Beijing strictly controlled an on-site visit and who the researchers compiling the report spoke to. The WHO team was only allowed three hours inside the Wuhan lab and was unable to examine any of the Wuhan institute's safety logs or records of testing on its staff.

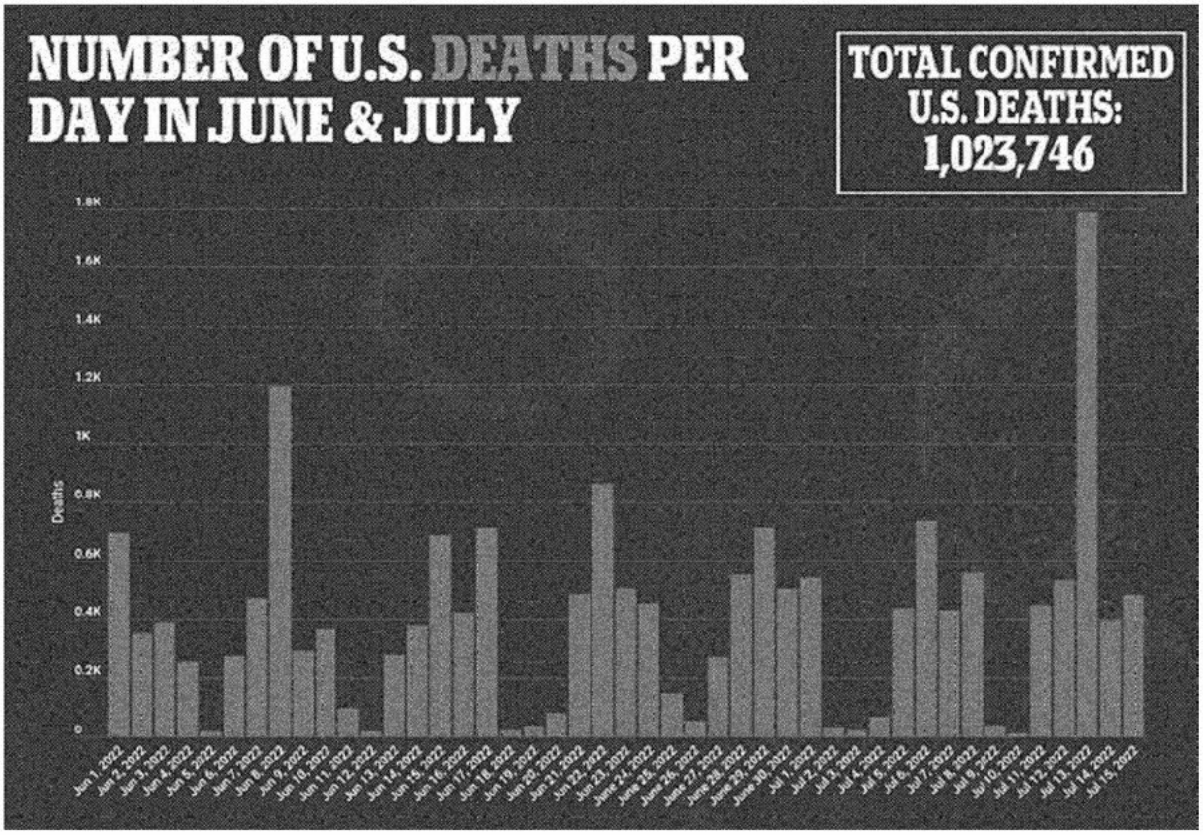
By May 11, 2021, the leading public health expert in the United States, Dr Anthony Fauci, had accepted that the idea of the virus escaping from a lab had been too quickly dismissed.

Asked whether the virus originated naturally, Fauci replied that he wants to look closer into the matter.

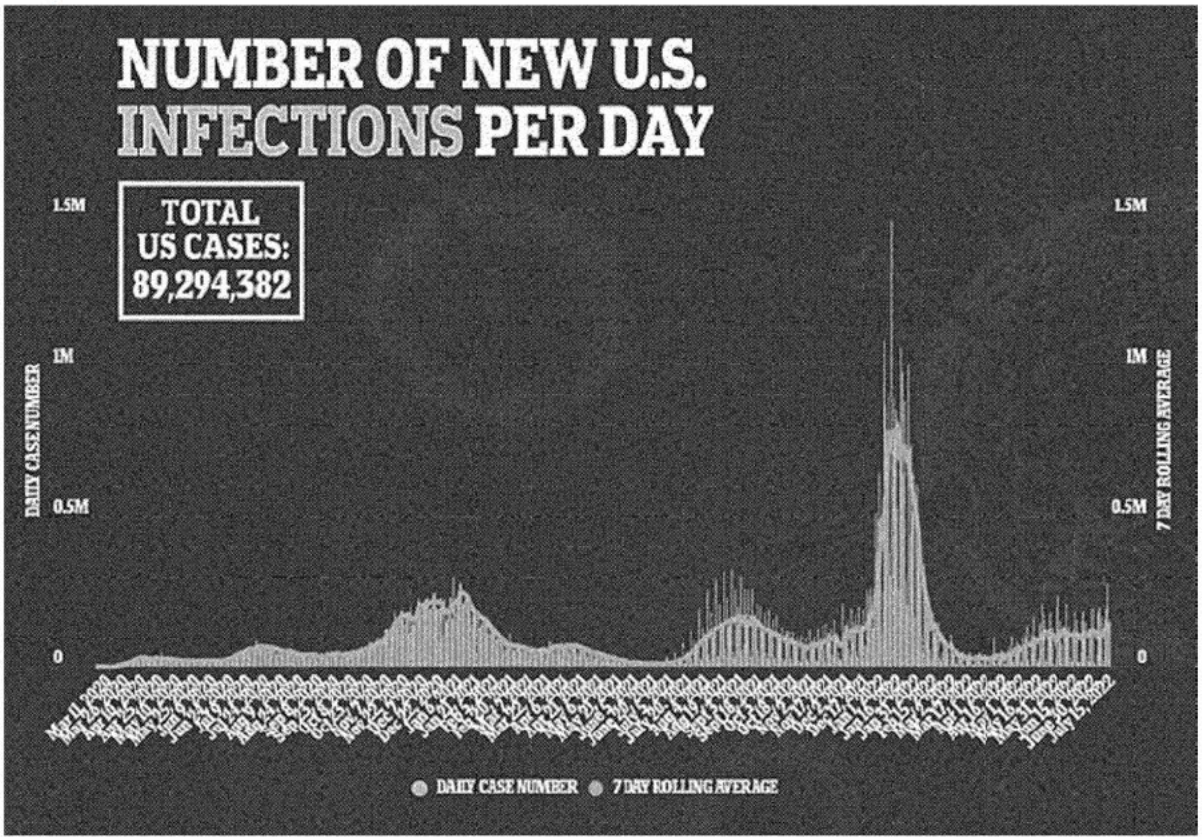
'I am not convinced about that,' **he said.** 'I think we should continue to investigate what went on in China until we continue to find out to the best of our ability what happened.

When the pandemic begun, Birx together with Dr Fauci were two of President Trump's most visible advisers, regularly speaking alongside one another.

As the White House Coronavirus response coordinator, Birx was present at the April 2020 press conference during which the president suggested people should inject themselves with disinfectant as a possible COVID treatment.

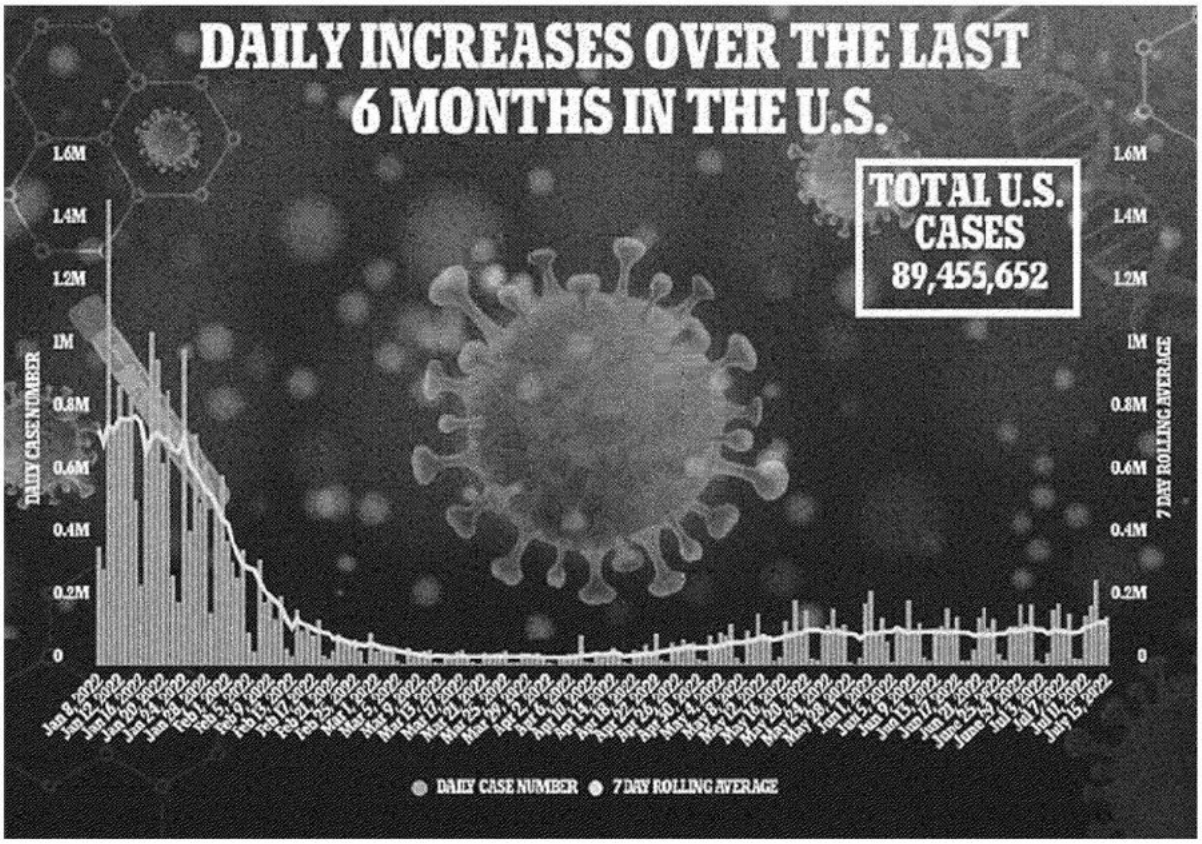


Close-up video of Birx's reaction went viral online, with many social media users setting her reactions to music from comedy shows.



Birx smirked briefly and looked down as dejection set in.

The health expert drew criticism for not speaking up more publicly to contradict Trump's claims that drinking bleach could kill the virus.



'Frankly, I didn´t know how to handle that episode,' Birx told ABC television in March 2021. 'I still think about it every day.'

•

But by the summer of 2020, things began to unravel having fallen out of favor with Trump, who initially considered her 'classy' and 'a lady,' according to White House sources.

In August that year, the president replaced her with Dr Scott Atlas, a radiologist who had no epidemiological experience, but whom Trump had seen speak on Fox News.

Trump later called Birx 'pathetic' when she warned Americans that the pandemic is 'extraordinarily widespread' in the US.

Birx then took her message to states and localities, reportedly trying to counteract Atlas' public messaging on masks and social distancing.

Earlier this year, Birx published a tell-all memoir of her time as the Covid-19 task force coordinator; 'Silent Invasion: The Untold Story of The Trump Administration, COVID-19, and Preventing the Next Pandemic Before It´s Too Late.'

'I wrote `Silent Invasion' to document the full extent of what I witnessed as I tried to save lives during this devastating time,' Birx said in a statement. 'In the book, I expose the true cost of mistakes that were made at all levels of the federal government, but I also clarify the things that went right yet remained largely unseen - the insights and innovations that saved American lives in this pandemic and are essential to preparing for the next.'

Birx came to the White House coronavirus task force with a sterling reputation.

A public servant since the Reagan administration, Birx has served as a US Army physician and a globally recognized AIDS researcher.

She was pulled away from her ambassadorial post as the US global AIDS coordinator to help the task force in late February 2020.

She stayed in Trump's good graces far longer than Dr Anthony Fauci of the National Institutes of Health, who frequently contradicted Trump.

But Birx also drew criticism when she traveled to Delaware over Thanksgiving in 2020 even as the Centers for Disease Control (CDC) recommended against holiday travel.

She was accompanied by her husband Paige Reffe, one of her daughters, son-in-law and two grandchildren for the Black Friday trip, though she had warned Americans to 'be vigilant' and limit celebrations to 'your immediate household.'

Birx insisted the roughly 50 hour trip to Fenwick Island was to deal with the winterization of the property before a potential sale, and added that she did not celebrate Thanksgiving there.

Birx in October told congressional investigators that the 2020 election provided a 'distraction' to the Trump team from the Covid

MORENS_SUBPOENA_008276
MORENS_NIH_018150
REL0000478104

response, which she estimated cost the U.S. some 130,000 lives.
The election year 'just took people's time away from and distracted them away from the pandemic in my personal opinion,' Birx said.
'I believe if we had fully implemented the mask mandates, the reduction in indoor dining, the getting friends and family to understand the risk of gathering in private homes, and we had increased testing, that we probably could have decreased fatalities into the 30-percent-less to 40-percent-less range,' she concluded.
Birx has also testified about her battles with her successor, Dr. Atlas.
'I could see the consequences of what was occurring out across the United States and the severity of the virus among the most ill, and my concern about those who were potentially less ill,' Birx told the congressional panel. 'And inside the White House is a person that is basically wanting community spread to increase.'
Last week the UK surpassed 200,000 Covid deaths but worldwide the disease has killed more than six million.

They've finally re-upped their letters from December, now that they're actually in power.

We've already responded to confirm receipt, tell them we'll comply with information, and explain we need an extension and reduction in scope (their deadline is 1 week!).

Fox News asked for comment 30 mins after we received the letter, so there will be the usual BS in the press.

They've also asked for similar docs and testimony from Francis Collins, Xiaver Beccara, Avril Haines from "Intelligence" (they can't be that intelligent if they're still buying into the lab origin BS) and Tony Fauci (just testimony):
https://oversight.house.gov/release/wenstrup- comer-launch-first-select-subcommittee-investigation-into-covid-origins-and-u-s-taxpayer-dollars-funneled-to-the-wuhan-lab%EF%BF%BC/

Seems like EcoHealth (and me specifically) will be the unfortunate scapegoat in their political theater!

Cheers,

Peter

RE: Follow up from our call

The more the merrier as we say in the UK!

I think our goal should be to really get a lot of support from all segments of society. We definitely should avoid the claim that we are just being elitists.

Would engaging with the AAAS Committee on Scientific Freedom and Responsibility be useful? Here's some information on the CSFR from the AAAS website:

Committee on Scientific Freedom and Responsibility

The Committee on Scientific Freedom and Responsibility (CSFR) was established in 1976 by AAAS. The Committee Charter is as follows:

The Council recognizes that the CSFR, as a standing committee of the AAAS, plays a significant as well as potentially controversial role for the Association. The increasing complexity of the interactions among science, technology, and the public interest raise new issues and problems concerning the human rights, freedom of scientific inquiry, and professional responsibilities of scientists and engineers. The Association affirms at the outset that scientific freedom is grounded in basic human rights and implies special responsibilities to extend and disseminate knowledge for the good of humanity.
With these perspectives in mind, and within the resources allocated by the Board of Directors, the Committee on Scientific Freedom and Responsibility is charged with the following duties on behalf of the Association:

1. To formulate and recommend principles and procedures to guide the Association in a continuing review of issues that affect scientific freedom and scientific responsibility, and to search for means that will effectively bring these issues to the attention of both scientists and others.
1. To monitor whether the actions and policies of the government of the United States, the governments of other nations, and of private organizations circumscribe or restrict the freedom of scientists or their ability to carry out their responsibilities.
1. To collect information on restrictions of scientific freedom and of the ability of scientists to carry out their responsibilities, and to make such information available to scientists, scientific societies, and others who may be interested in taking action to counter these restrictions.
1. To encourage and assist the AAAS, its affiliates, and other scientific groups to develop statements of principles governing professional conduct, and to establish policies, procedures, and educational activities designed to encourage scientists to accept their professional responsibilities both with regard to safeguarding the integrity of science and with regard to the application of science in the promotion of human rights and general welfare.
1. To encourage and assist the AAAS and its affiliates to develop policies and procedures to protect scientists against infringements of scientific freedom; to collect information about the procedures of affiliated societies for dealing with documented allegations of such infringements; to facilitate communication among the societies with a view to strengthening of these procedures; and, in exceptional circumstances and within the criteria developed by the Committee, to conduct an analytic review of cases where the ramifications are deemed to be especially significant for the scientific community at large.
1. To report annually to the Association, through the Council–and, as appropriate, to other scientific and technological communities and to the general public–the activities of the Committee and its general assessment of significant developments during the year that affect scientific freedom and scientific responsibility and that call for examination, discussion and possible action.

As part of the attempt to fulfill its mandate, the CSFR in 1977 established a Science and Human Rights Subcommittee, specifically to address issues of human rights as they occur in relation to all these duties.

Adopted by the Committee for Scientific Freedom and Responsibility February 9, 1996.

LeBron was not great on the vaccine issue, he refused to rebuke Kyrie Irving, citing "freedom of choice". We need a strong NIH Director, and more forceful statements from the National Academies. I speak with Holden pretty regularly who gets it and is concerned. When I pick up my Purple Heart AAAS Scientific Freedom Medal on March 5, he'll be there and hopefully we can strategize then. So far only AAAS and to some extent AMA and AAMC seem interested or worried.

Many thanks Rich!

Hi:

I have spoken with several people about the idea of a campaign to protect science and most seem on board with the idea, but a little short on ways to implement it in a way that might get wide public acceptance.

I spoke with Keith Yamamoto at some length. He is extremely supportive. He did have some insights about the NIH Directorship. He said that Biden had taken over the selection personally and no-one else seemed to be involved. His view and mine is that that means it is dead for now. He had been talking with Harold Varmus and Bob Horvitz, both of whom are very concerned about the Republican attacks on science. I will be talking with both of them tomorrow afternoon.

I spoke with John Deutsch (ex-President of MIT) and he is supportive, but has no clear ideas of how to proceed. He did say that we should talk with Holden Thorp (as we had discussed) and get AAAS involved. I had contacted Holden previously and he and I have a talk scheduled for next week.

Some of the more interesting suggestions that have emerged are that we should try to garner support from individuals and organizations that are not viewed by the general public, or politicians, as belong to the "elite" segment of society. I am thinking that someone like LeBron James could be an excellent spokesperson if we can reach him and his views are pro-science. He seems like a decent person and so maybe he is Pro-science. There are others who fit that category such as other sports stars and even some Hollywood people. I believe George Clooney would be favorable and maybe Harrison Ford, whom I met many years ago.

Subject: Notes from our call
Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress
Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.
Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
  - AAAS
  - AIDS Vaccine Advocacy Coalition
  - American Public Health Association (Georges Benjamin)
  - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
  - Association of Public & Land-Grant Universities
  - Georgia Global Health Alliance
  - Bay Area Global Health Alliance
  - Consortium of Universities for Global Health
  - COVID Collaborative
  - Global Health Council
  - Global Health Technologies Coalition
  - Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
  - International AIDS Vaccine Initiative
  - Nobel Laureates Campaigns
  - Pandemic Action Network
  - PATH
  - Research!America – Reach back out – Jerry will
  - Union of Concerned Scientists
  - Washington Global Health Alliance
  - 156 virologists letter
  - NAM
  - NAS
  - NL Campaigns (to be kept informed of progress by Rich)
  - CUGH
  - The pandemic action coalition
  - FASEB
  - Global Health technologies coalition
  - APLU (KHG has connection)

Dear All,

I'm looking forward to our discussion today at 1pm. Attached is a concept note that Jeff Sturchio drafted to frame some ideas around what we might try to do.

I've also attached a rough agenda for us.

Here are the details of the zoom call, and I look forward to speaking with you all later on:

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

MORENS_SUBPOENA_018679
MORENS_NIH_038155
REL0000478106

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and

MORENS_SUBPOENA_018680
MORENS_NIH_038156
REL0000478106

vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines, hundreds of thousands of Americans died after refusing it. Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized,

MORENS_SUBPOENA_018681
MORENS_NIH_038157
REL0000478106

politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations,

what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?

Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.

Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?

Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus. After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers.

MORENS_SUBPOENA_018683
MORENS_NIH_038159
REL0000478106

On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism*, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists

take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific

MORENS_SUBPOENA_018686
MORENS_NIH_038162
REL0000478106

community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.
And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

EXTERNAL SENDER

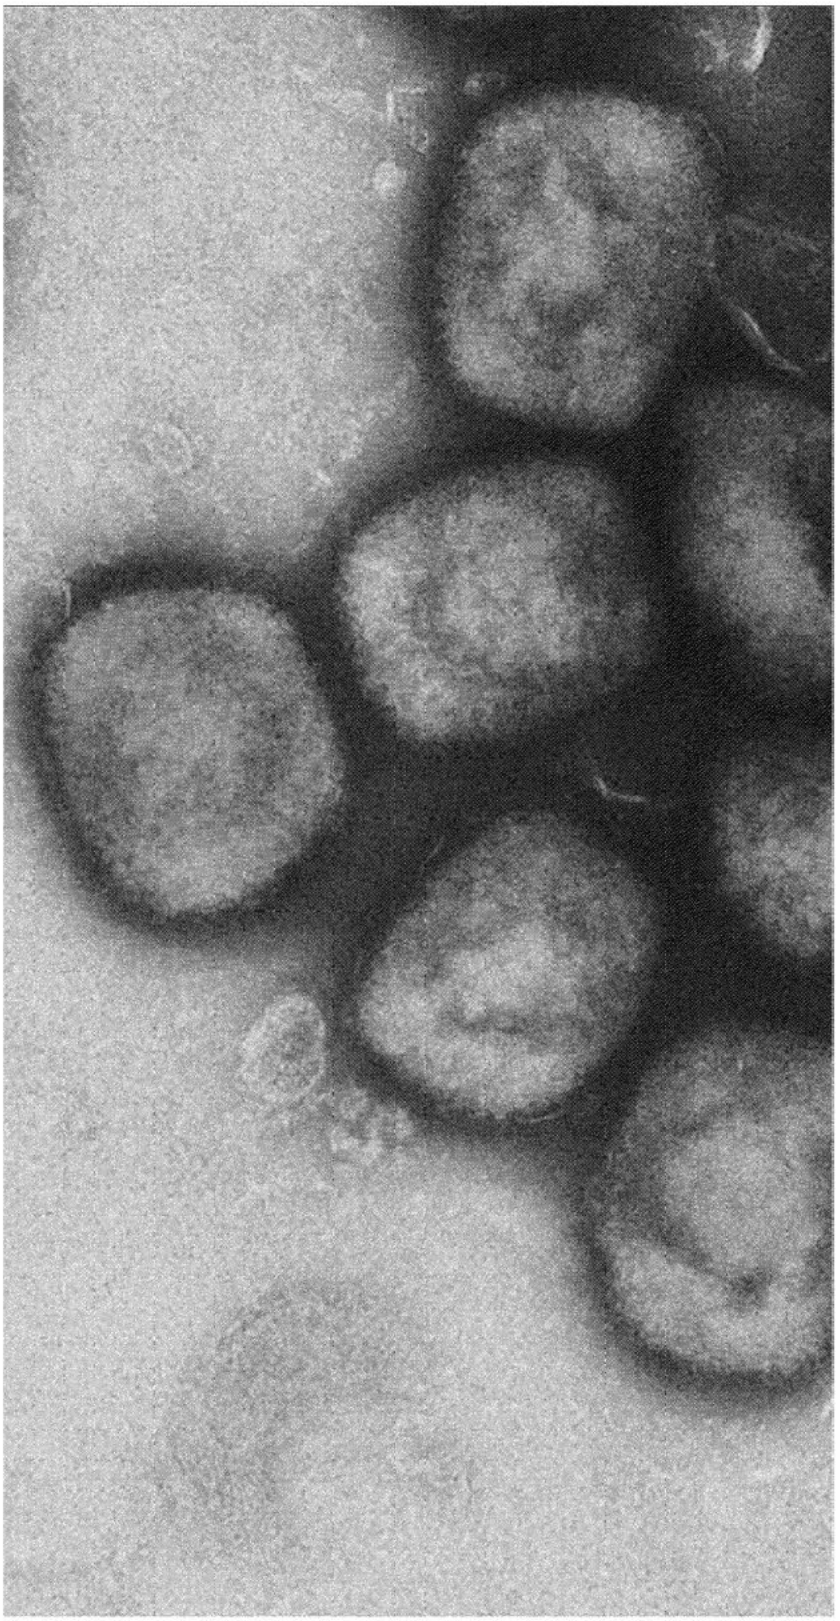
Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the

anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!



POLICY-ISH

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to

MORENS_SUBPOENA_018693
MORENS_NIH_038169
REL0000478106

date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers

who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.
That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.
"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.
If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."
But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're

MORENS_SUBPOENA_018695
MORENS_NIH_038171
REL0000478106

really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it."
He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by Miner Flux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is

widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6)
from (b) (6) . Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one

being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Just to let you all know that I heard from Peter Staley, who's one of the original Act Up! Members who protested NIH then became a close friend of Tony Fauci. I let him know what had happened to us re. the SSCP, the Democrats, HHS Secretary, NIH Director, all lining up to allow us to be suspended and proposed for debarment.

He said that what's happening to EcoHealth is a 'travesty' and that he, Peter, first heard about it from Tony Fauci, who was "shocked by the development".

Cheers,

Peter

EXTERNAL SENDER

Dear Rich: I'm giving visiting lectures at Stanford and have been speaking again with Carolyn Bertozzi, last year's Nobel Laureate in Chemistry. I briefed her on the House Subcommittee hearings and she is very concerned about what's going on and i think is prepared to help in the defense of science. So as you organize the other laureates, I would encourage you to keep her in mind, In addition to Marty Chalfie, best Peter

Dr. Hotez,

I received an anonymous tip regarding an apparent conflict of interest relevant to your criticism of the GOP investigation into the possibility that a lab accident sparked the pandemic.

The tipster pointed out that your grant to develop a SARS vaccine was in part motivated by the possibility that a lab accident or bioterrorist attack could result in a SARS outbreak.

Questions:

1. Could you please clarify why you believe the lab origin theory of SARS-CoV-2 is ridiculous pseudoscience, even though you did research under the presumption that a SARS-like virus escaping from a laboratory was possible? Taxpayers devoted $1.6 million in funding toward that project - was it under pseudoscientific pretenses?

2. Could you clarify your involvement in this research project underwritten by both your grant and EcoHealth Alliance's controversial "understanding the risk of bat coronavirus emergence" grant? Do you have a personal or professional relationship with Shi Zhengli? What about Peter Daszak? Have you ever funded or co-funded research at the Wuhan Institute of Virology?

Thank you,

--

Thanks all for your positive comments. I'm going through my usual phases of mourning every time a new attack happens. First it's despair, then sadness, then realization that my only option is to fight back and hope that people accept that all we've ever done at EcoHealth is follow the standard scientific process and kept our integrity through that – including not handing over information on unfunded proposals, and responding to every attack from the right wingers.

What's clear to me is that all of the normal checks and balances we rely on in our careers are managed by a small number of gatekeepers who we expect to stand up and speak out on principle when fellow scientists are treated like garbage. Some do – yourselves included. Most don't, and it seems that includes Victor Dzau, Francis Collins, Richard Horton.

Cheers,

Peter

EXTERNAL SENDER

Please see the email below that I just received and the attachments.

They've cut down the allegations to a handful that I have to respond to within 30 days. But as I see this, these are grey areas that they could use to easily push me out, no matter my response. It would save them political hassle if they get rid of me, and I'm very worried that this is their ultimate goal.

Obviously, I'll try to be as aggressive as possible in defending against this, but this is devastating to me personally to have to go through this and if they expel me, it would likely cost me my job and career. Even more worrisome is the last paragraph in the letter from the Congressional members – they are playing pure politics here – if I'm found to be in breach, they are demanding that every report I've been involved in, and every committee be investigated.

This feels like a purge orchestrated by politicians for a political goal, and an academy that is too weak to push back.

Cheers,

Peter

Looks like Sachs has been taken down yet another rabbit hole by a scientist at Columbia (Harrison) who doesn't work in the field, and is just plain wrong. It's the old Furin cleavage site hypothesis again, without any new data or evidence. Of course, that's their point – the lack of evidence means we're all hiding information and need to be hung, drawn and quartered.

They've published an opinion piece in PNAS (attached) and there's this article in 'The Intercept'. Ebright is quoted, of course!

https://theintercept.com/2022/05/19/covid- lab-leak-evidence-jeffrey-sachs/

All this will be put straight into the subpoena letters that we've been told by Democrat staffers to expect to arrive in Jan/Feb 2023 when the Republicans takeover the house (their words, not mine).

JEFFREY SACHS PRESENTS EVIDENCE OF POSSIBLE LAB ORIGIN OF COVID-19

An article in the Proceedings of the National Academy of Sciences calls for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of Covid.

Sharon Lerner
May 19 2022, 4:00 p.m.

IN AN ARTICLE published Thursday, economist Jeffrey Sachs called for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of the Covid-19 pandemic. Writing in the Proceedings of the National Academy of Sciences, Sachs and his co-author, Neil Harrison, a Columbia University professor of molecular pharmacology and therapeutics, said that federal agencies and universities possess evidence that has not been adequately reviewed, including virus

databases, biological samples, viral sequences, email communications, and laboratory notebooks. Sachs and Harrison also highlighted a tantalizing scientific detail that may be an indication that SARS-CoV-2, the coronavirus that causes Covid-19, originated in a laboratory: a sequence of eight amino acids on a critical part of the virus's spike protein that is identical to an amino acid sequence found in cells that line human airways.

Sachs and Harrison are hardly the first to suggest that SARS-CoV-2 might have been created in a lab. Since its genetic sequence was first published in February 2020, scientists have puzzled over the furin cleavage site, an area on the virus's spike that allows it to be broken apart by a protein on the membrane of human cells and makes the coronavirus particularly dangerous to people. Once split, the virus releases its genetic material into the cell and reproduces. While all viruses work by attaching themselves to cells, breaking apart, and releasing their genetic material, SARS-CoV-2 is the only one of its class, sarbecoviruses, to use this particular mechanism to do so.

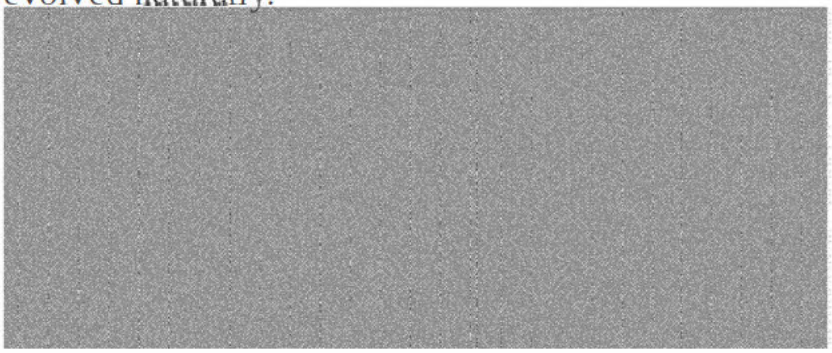
As with past discussion of a possible lab origin of SARS-CoV-2, this latest theory has already been met with considerable pushback. Even some scientists who are open to the idea that a lab accident could have sparked the pandemic remain unconvinced by the particular trail of evidence laid out by Sachs and Harrison.

The journal article offers a scientific road map for how this unusual sequence of amino acids could have made its way into the furin cleavage site, or FCS, of the virus. Sachs and Harrison acknowledge that the sequence could have arisen naturally. But they also lay out another possibility: that scientists might have purposefully inserted this particular string of amino acids into a bat coronavirus in the course of their work. They focus particularly on scientists who submitted an unfunded grant proposal to a division of the Defense Department called the Defense Advanced Research Projects Agency, or DARPA, laying out plans to insert a furin cleavage site into a bat coronavirus.

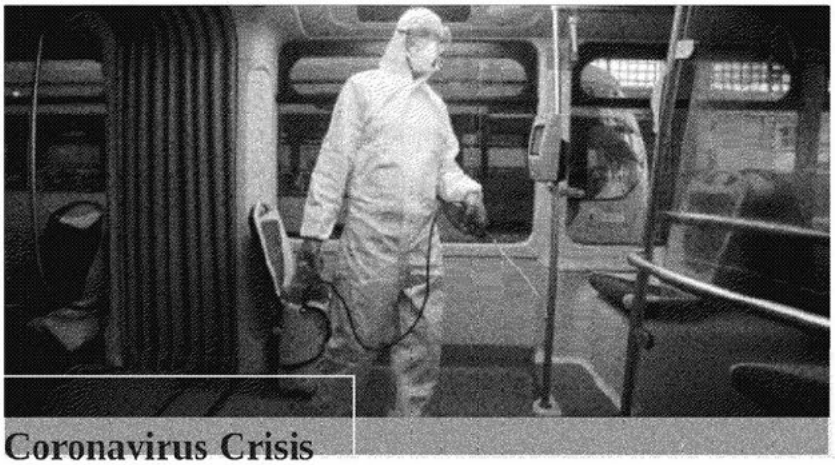
"We do not know whether the insertion of the FCS was the result of natural evolution — perhaps via a recombination event in an intermediate mammal or a human — or was the result of a deliberate introduction of the FCS into a SARS-like virus as part of a laboratory experiment," Sachs and Harrison write. "We do know that the insertion of such FCS sequences into SARS-like viruses was a specific goal of work proposed by the EHA-WIV-UNC partnership within a 2018 grant proposal ("DEFUSE") that was submitted to the US Defense Advanced Research Projects (DARPA)."

EHA is a reference to EcoHealth Alliance, a nonprofit research group based in New York City that has received more than $118 million in grants and contracts from federal agencies. WIV, or the Wuhan Institute of Virology, is a Chinese research organization that collaborated with EcoHealth Alliance in the past and was listed as a subcontractor on the DARPA grant. UNC is mentioned because Ralph Baric, a molecular biologist at

the University of North Carolina, Chapel Hill, was to have conducted part of the work pitched to DARPA. The grant proposal touted Baric's "two-decade track record of reverse engineering [coronavirus] and other virus spike proteins."



The intent of the DARPA proposal was to prevent emerging pathogenic threats, but the work, if conducted, could have created a novel virus capable of infecting humans. "We will introduce appropriate human-specific cleavage sites and evaluate growth potential in [a type of mammalian cell commonly used in microbiology] and [human airway epithelial cell] cultures," the proposal stated.



Several scientists interviewed about the DARPA proposal in September told The Intercept that scientists often begin research before seeking funding and thus that some of the experiments described in the proposal could have already been completed. But when asked about that possibility in an interview, Peter Daszak, the president of EcoHealth Alliance, rejected it: "The DARPA proposal was not funded. Therefore, the work was not done. Simple."

A Rational Choice

As Sachs and Harrison note, the part of a protein on the cell membrane that shares its amino acid sequence with the bat coronavirus is critical for lung function. Known as an epithelial sodium channel-alpha, or ENaC-alpha, it is found in human airway cells, as well as in human kidneys and colons. Intriguingly, like SARS-CoV-2, ENaC-alpha, which facilitates the absorption of fluid in cells, is also activated by the unusual furin cleavage site. Harrison, a physiologist affiliated with Columbia's Department of Molecular Pharmacology and Therapeutics, studies ion channels, the larger category to which ENaC-alpha belongs.

Other scientists have already pointed out the match between the amino acid series in the furin cleavage site of SARS-CoV-2 and the ENaC-alpha found in human airways. In 2020, a team from the biomedical company Nference suggested that the overlap between the virus and the sequence found in human lungs is part of the reason that Covid-19 is so damaging to the respiratory system. Those scientists described the sequence as having evolved naturally.

Read Our Complete Coverage **The Coronavirus Crisis**

Sachs and Harrison, in contrast, suggest that researchers may have inserted the string of amino acids into a bat coronavirus precisely because of its known importance to lung function. "For a research team assessing the pandemic potential of SARS-related coronaviruses, the FCS of human ENaC — an FCS known to be efficiently cleaved by host furin present in the target location (epithelial cells) of an important target organ (lung), of the target organism (human) — might be a rational, if not obvious, choice of FCS to introduce into a virus in order to alter its infectivity, in line with other work performed previously," they write.

Such a choice, they point out, would have been in keeping with another viral research project on which EcoHealth Alliance, the Wuhan Institute of Virology, and UNC's Baric collaborated: a 2014 grant from the National Institute of Allergy and Infectious Diseases that involved increasing the transmissibility and pathogenicity of bat coronaviruses.

Ralph Baric, a researcher at the University of North Carolina's Gillings School of Global Public Health, in Chapel Hill, N.C., on Feb. 14, 2020.

Photo: Christopher Janaro/Bloomberg via Getty Images

Growing List of Coincidences

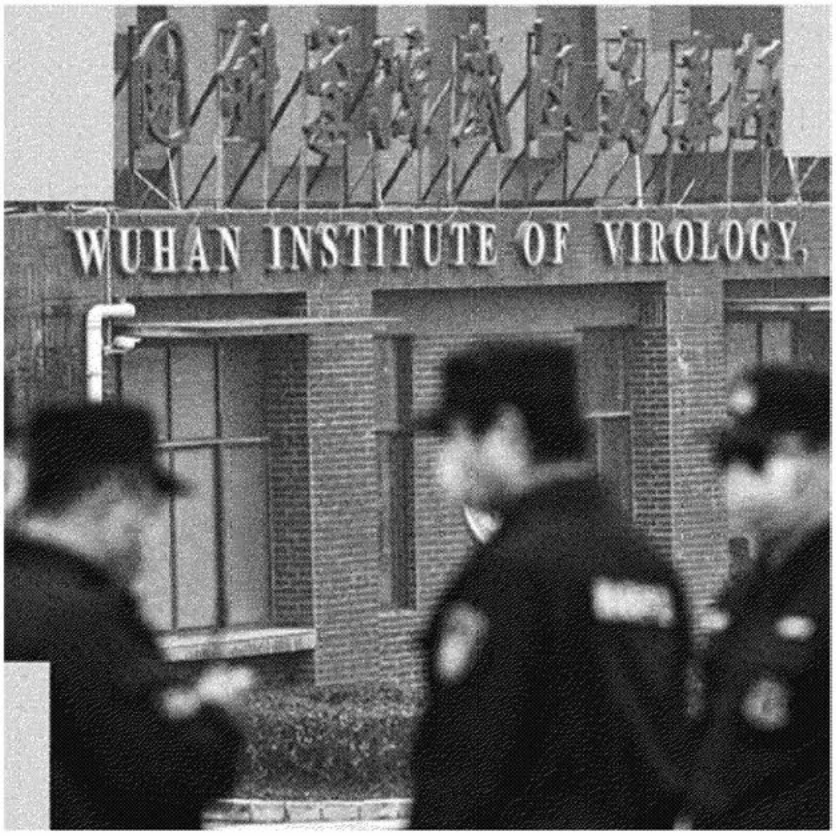
The intriguing theory of viral engineering hinges on two observations: that the amino acid sequences match and that experts in both the ENaC-alpha furin cleavage site and the insertion of genetic sequences into bat coronaviruses happen to work at the same academic institution: the University of North Carolina, Chapel Hill.

MORENS_SUBPOENA_010382
MORENS_NIH_020895
REL0000478126

Baric, whose work aims to prevent and create treatments for viral outbreaks, has previously inserted segments of DNA and RNA into viruses and created an infectious clone of SARS using his own patented "No See'm" method of inserting genetic materials without a trace. He has also collaborated on coronavirus research with scientists from a center for lung studies at UNC-Chapel Hill who are knowledgeable about ENaC-alpha. In one 2016 study, the scientists created a new virus using the spike of a bat coronavirus that had been isolated and characterized by the Wuhan Institute of Virology. The experiment found that the new virus "replicated efficiently" in human airway cells that were cultured in a lab.

In another paper, published a year earlier, Baric, along with the Wuhan Institute of Virology's Shi Zhengli and a lung expert UNC-Chapel Hill's lung institute, described creating a hybrid virus using a SARS-like virus from a bat and a "mouse-adapted" coronavirus. The new virus caused mice to get sicker than those exposed to the original virus. The goal of these experiments was to prepare for the possibility that a virus might jump naturally from animals to humans, as SARS had in 2003. But even before the pandemic, the experiment drew criticism from other scientists, who were concerned because the researchers had created a virus that was able to spread in humans.

Sachs and Harrison note that the scientists who co-authored the DARPA grant proposal would have been aware of research on coronavirus furin cleavage sites, including one 2006 experiment in which a furin cleavage site was inserted into a coronavirus. "The research team would also have some familiarity with the FCS sequence and the FCS-dependent activation mechanism of human ENaC, which was extensively characterized at UNC," they write.



"The list of coincidences is getting verrrrrrrrrry long."

Still, both the overlap in the amino acid sequence and the fact that experts in the furin cleavage site of the ENaC-alpha and insertion of genetic material into bat coronaviruses work at the same university could be coincidental, as Harrison and Sachs acknowledge. Some virologists, though, say that the coincidence strains credulity.

"Could be," Richard Ebright, a molecular biologist at Rutgers University, wrote in an email to The Intercept when asked about the possibility that these things are both chance occurrences. "But the list of coincidences is getting verrrrrrrrrry long."

Ebright, a vocal proponent of the lab-leak theory whom Harrison and Sachs thank "for helpful commentary on the manuscript," spelled out some of the other Covid coincidences that he considers questionable, including its initial outbreak in a city that, well before 2019, had already been pegged as a biosafety risk. Ebright also noted

Wuhan's 1,000-mile distance from the nearest wild bats that carry the type of SARS-related coronaviruses that caused the pandemic. And he pointed to the particular coding of the amino acids in the furin cleavage site of SARS-CoV2.

Related

The Lab-Leak Theory Is Looking Stronger by the Day. Here's What We Know.

"The sequence encoding the FCS of the pandemic virus contained two consecutive CGG arginine codons," Ebright explained in his email. (A codon, or a combination of three nucleotides, supplies the genetic code for a single amino acid, though most amino acids can be represented by multiple different codons. Each nucleotide is represented by a letter — for RNA, either A, C, U, or G.) "This codon usage is unusual for a natural bat SARS-related coronaviruses (for which fewer than 1 in 30 arginine codons are CGG) but is optimal for humans (for which most arginine codons are CGG codons)."

Still, Ebright said that at first he didn't see the identical amino acid sequences as particularly suspicious. "I had known for more than a year that there was a perfect match to an eight-amino acid sequence present in human ENaC. What I had not known was that the sequence was known to be a functional furin cleavage site and that it was a sequence extensively studied at UNC," he said. "The crucial point that the ENaC sequence was a known functional site, not just that there happens to be a match to a protein that happens to be in humans. … That suddenly turned it from what I thought to be largely irrelevant

to being a logical and obvious choice to proceed."

Ralph Baric and the University of North Carolina did not immediately respond to requests for comment.

The Wuhan Institute of Virology in Wuhan, China, on June 24, 2021.

Name Calling

Other scientists dismiss the idea that the ENaC sequence might have been purposefully

MORENS_SUBPOENA_010385
MORENS_NIH_020898
REL0000478126

inserted into a coronavirus. Scientists who are already convinced that the new coronavirus emerged naturally are unlikely to be persuaded by Sachs and Harrison's article, which appears in the opinion section of the esteemed journal. Over the past year, many scientists involved in the debate over the origins of the pandemic have settled into an increasingly acrimonious, coarse, and unyielding opposition.

Some proponents of the natural origin theory became particularly dismissive of those open to the possibility of a lab leak after the February release of two pre-print studies mapping the early spread of the virus at the Huanan market in Wuhan. Angela Rasmussen, one of a team of virologists who worked on the project, described it on Twitter as "dispositive evidence of a zoonotic origin" that will "drive those with personal interest in the lab leak hypothesis out of their goddam minds." In another tweet, Rasmussen referred to proponents of the lab-leak theory as a "pack of ghouls, who through gullibility, stupidity, & conspiracist thinking have decided this is their thing despite zero expertise."

Although the pre-prints had not been peer-reviewed and may have simply illustrated the spread of the virus rather than its original outbreak, the New York Times ran a front-page story about them that quoted an epidemiologist as saying that the origins debate "has been settled with a very high degree of evidence." The story, which was announced by a push notification from the paper, also noted a lack of direct evidence for a lab leak.

Meanwhile, Kristian Andersen, another co-author of the pre-prints and a virologist at the well-regarded Scripps Research Institute, used the "poop" emoji to criticize a deeply researched article by Katherine Eban about EcoHealth Alliance. On Twitter, Andersen tarred Eban, New York Times columnist Zeynep Tufekci, and others reporting on biosafety issues that could have led to the release of SARS-CoV-2 as "deep in conspiracy theories" and on the other side of "a clear split" from journalists who dismiss the possibility of a lab origin, whom Andersen referred to as "science-based."

Even some scientists who have been vocal about the possibility that the pandemic may have been sparked by research have expressed skepticism about the theory suggested by Harrison and Sachs. "I'm sure that these authors believe in their own hypothesis and arguments, but to me, it's not one that is particularly convincing," said Alina Chan, a scientist who laid out a number of possible routes for how the coronavirus might have emerged through research-related incidents in her recent book "Viral: The Search for the Origin of Covid-19."

"There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

MORENS_SUBPOENA_010386
MORENS_NIH_020899
REL0000478126

While she is open to the possibility that the furin cleavage site might have been purposefully inserted into the coronavirus, Chan said there was no reason to think that researchers would mine humans for such material. "These scientists literally had access to hundreds of SARS-like viruses and sequences," said Chan, referring to the vast collection of coronaviruses from bats and other animals that researchers amassed at the Wuhan Institute of Virology. "There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

Jack Nunberg, a virologist at the University of Montana, was also not immediately persuaded by the theory of engineering suggested by Sachs and Harrison. "It's possible," Nunberg said of the idea that the ENaC segment was inserted into a bat coronavirus as part of research designed to gauge the pandemic potential of a virus. "But I don't find their evidence on ENaC compelling because furin cleavage sites have a lot of common amino acids, and therefore it may just have happened by chance."

Others say that the article adds noteworthy information to the public conversation about the origins of the pandemic. "The defenders of the natural origin indicate that the virus on which this type of experiment could have been done — the backbone — has never been published and that specialists in the furin cleavage sites would have chosen a more commonly used furin cleavage site like RARR rather than PRRAR. The Proceedings of the National Academy of Sciences article contradicts this argument and indicates that specialists knew that the RRAR'SVAS site was efficiently cleaved by furin," Etienne Decroly, director of virology research at the Aix-Marseille Université in France, wrote in an email to The Intercept.

Decroly added, "It is impossible to decide on the basis of the information currently available and it is urgent that the WHO Special Advisory Group for the Origins of Novel Pathogens investigate this question."

On the suggestion of an investigation, Nunberg is in agreement. "You can't argue with that," he told The Intercept. "Who's going to argue for burying one's head in the sand?"

For their part, Sachs and Harrison emphasize that they're not saying laboratory manipulation was involved in the emergence of the pandemic virus, only "that it could have been." They also give a nod to other possibilities, including that an airborne virus might have infected a laboratory worker. Rather than argue that any of these conceivable scenarios happened, they present the clues of the matching amino acid sequences to argue for an independent and transparent scientific investigation of the U.S.-based evidence related to the origins of the virus.

Among the institutions that Sachs and Harrison list as possibly having "knowledge of the detailed activities that were underway in Wuhan and in the United States" are the National Institutes of Health; the Defense Threat Reduction Agency, which has provided

grant funding to EcoHealth Alliance; the Department of Homeland Security; DARPA; the U.S. Agency for International Development, which funded the $200 million PREDICT program that catalogued potential pandemic viruses; and the University of California, Davis, which participated in that program.

The authors suggest that EcoHealth Alliance and UNC may have particularly important untapped resources. "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the US and China, has not been disclosed for independent analysis," they write. "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown."

A Reversal

The publication in the prestigious Proceedings of the National Academy of Sciences marks a reversal of sorts for Sachs, the chair of the Lancet Covid-19 Commission who, in November 2020, appointed Daszak, the EcoHealth Alliance president, to lead a task force to investigate the origins of the pandemic. Earlier that year, Daszak had signed on to a public statement published in The Lancet on behalf of scientists who said they

MORENS_SUBPOENA_010389
MORENS_NIH_020902
REL0000478126

"condemn conspiracy theories suggesting that COVID-19 does not have a natural origin."

Related

Peter Daszak Answers Critics and Defends Coronavirus Research

Yet that early certainty about the pandemic's origins — and the sense of shared civic responsibility among members of the Lancet task force — soon disintegrated. In February 2021, emails revealed that Daszak coordinated the public statement in The Lancet tamping down suspicions of a lab leak. And by June 2021, Sachs was expressing his openness to the possibility of a lab origin, writing that NIH-funded research at the Wuhan Institute of Virology "deserves scrutiny under the hypothesis of a laboratory-related release of the virus." Three months later, he disbanded the task force that had been organized to "carefully scrutinize the origin of the SARS-CoV-2 virus" in the hopes of preventing future disease outbreaks, explaining that he had concerns that several members of the commission had conflicts of interest because of their ties to EcoHealth Alliance.

After leading the mainstream scientific inquiry into the origins of the pandemic, Sachs is now skewering it. "A steady trickle of disquieting information has cast a darkening cloud over the agency," he and Harrison write of the NIH, going on to accuse the entire federal government of not doing enough to explore the possible role of its grantees in the

emergence of SARS-CoV-2 and investigate "overlooked details" such as the matching amino acid sequences.

Noting that the NIH has insisted that "the pandemic virus could not have resulted from the work sponsored by" the agency, Sachs and Harrison write that "blanket denials from the NIH are no longer good enough."

Cheers,

Peter

It's all so convoluted I can even understand it. We'll see if they pick Mary Klotman from Duke to be next NIH Director. I know her quite well, her husband is Baylor President and my boss.

This is an utterly ridiculous set of BS. Jesse Bloom is the person driving it – he buys into the lab leak theory and found that some folks from WIV uploaded partial genomes early on, then added a bunch of more complete ones, and asked for the partial sequences to be removed. Absolutely normal, but he's trying to turn it into a 'mystery'.

Of course, NIH makes it all worse by not releasing emails, redacting critical parts of them, and failing to explain why they follow the wishes of the submitter re. Genbank. It's perfectly logical really – if NIH now starts releasing sequences you as a submitter asked them to remove for whatever reason, submitters will think twice about using Genbank. We already have China working with its own database and all this BS will make them twice-shy about submitting.

Even worse, Tabak now says that 'don't worry, we still have the data on back up tapes' so everyone now knows that NIH keeps the stuff you thought they agreed to delete, and no doubt has already handed it over to the FBI and the CIA.

It's a conspiracy, wrapped within an enigma, encapsulating a riddle….

PS – heres a cracker of an email from an NIH press office (?) person at O/D ripping into a journalist (Carl Zimmer) who wanted information on the 'missing' china sequences. Now it turns out that US submitters also deleted early COVID genomes…even more reason for the public to not trust scientists…:

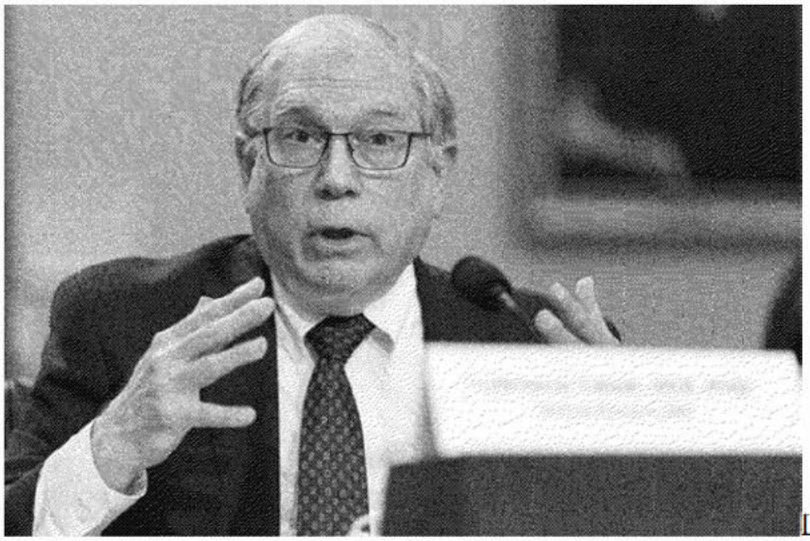
NIH director confirms agency hid early COVID genes at request of Chinese scientists

By
Steven Nelson
May 11, 2022 3:47pm

National Institutes of Health acting director Lawrence Tabak confirmed to lawmakers Wednesday that US health officials concealed early genomic sequences of COVID-19 at the request of Chinese scientists — but insisted the data remains on file.



Tabak told a House Appropriations subcommittee that the NIH "eliminated from public view" the data from the pandemic epicenter in Wuhan, China, before adding that researchers can still access it via an archaic "tape drive."

Vanity Fair recently reported that the information was hidden in response to a request from Chinese scientists, despite potentially resolving whether the virus leaked from the Wuhan Institute of Virology or passed naturally from animals to humans.

Rep. Jaime Herrera Beutler (R-Wash.) asked Tabek to explain why US officials would comply with such a request.

"There's no question that the communication that we had about the sequence archive — Sequence Read Archive — could have been improved. I freely admit that," Tabek said. "If I may, the archive never deleted the sequence, it just did not make it available for interrogation."

MORENS_SUBPOENA_010396
MORENS_NIH_020909
REL0000478126

Lawrence Tabak, acting director of the National Institutes of Health, testifies on May 11. Jacquelyn Martin/AP

"So wait, you have the information still?" Beutler followed up.

"We have the information … Anybody who submits to the Sequence Read Archive is allowed to ask for it to be removed," Tabak explained. "And that investigator did do that. But we never erase it."

"So you don't have the information anymore?" Beutler asked.

"We do. We never erase the information. We keep it," Tabak clarified.

"So they were able to withdraw public viewing of it?" the congresswoman followed up.

"That's correct," he said.

"OK, so researchers can apply to the NIH and get the information from you?" Beutler asked.

"In the way that it was originally eliminated from public view, it was withdrawn, and that's the most difficult for people to access," Tabak replied. "The error that was made, and we found this out after a review of all of our processes, was it should have been suppressed. The distinction being that if it's withdrawn, it is kept archivally on a tape drive — old technology, but that's how it's done. But when it is withdrawn, it can still be accessed by accession number, and so researchers are able to access that information."

Security personnel keep watch outside Wuhan Institute of Virology during the visit by the World Health Organization on Feb. 3, 2021. Thomas Peter/REUTERS

"So the information is still there?" Beutler summed up.

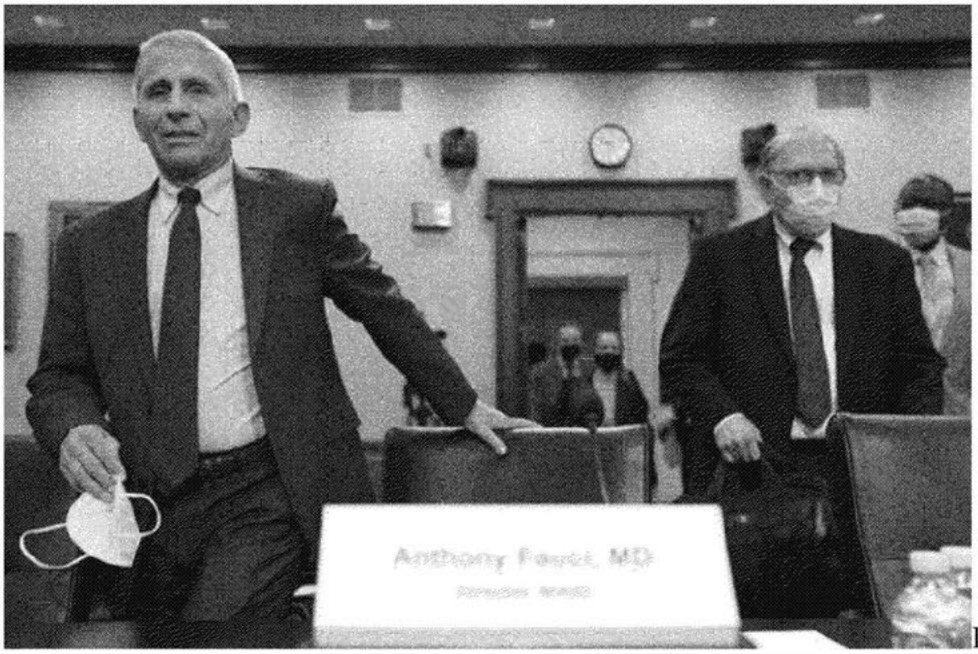
"That's correct. The information was never lost," Tabak repeated.

In a March 31 article, Vanity Fair reported that evolutionary biologist Jesse Bloom discovered last year that early COVID-19 sequences had disappeared from a federally run data repository.

When Bloom raised the issue, he was reportedly ganged up on by a group of researchers assembled by then-NIH Director Francis Collins and infectious disease institute head Dr. Anthony Fauci.

Bloom shared a draft academic paper with Collins and Fauci, who allegedly objected on a June 2021 Zoom video conference to Bloom's description of Chinese scientists "surreptitiously" removing the sequences. Fauci said the word was "loaded" and implied a coverup, the report said.

Evolutionary biologist Kristian Andersen, who was selected to participate on the call by Collins, allegedly told Bloom that the Wuhan team had a right to claw back early pandemic information and that it was unethical for Bloom to question it.



Tabak noted that while the request for information to be removed was honored, it was not erased fully.ECOHEALTH ALLIANCE

Andersen allegedly went so far as to offer to delete Bloom's article from a "preprint" server "in a way that would leave no record that this had been done."

China's government has refused to cooperate with an international investigation of the origins of the pandemic. The COVID-19 virus has killed about 1 million Americans since March 2020 and caused massive social, economic and educational disruptions.

The US intelligence community said in an August report that it's possible the virus leaked from the Wuhan Institute of Virology, calling the theory one of two "plausible" explanations along with natural transmission from animals.

Lawrence Tabak confirmed Wednesday that early genomic sequences of COVID-19 were concealed at the request of Chinese specialists. Jacquelyn Martin/AP

President Biden rarely speaks publicly about wanting China to be transparent about the origins of the pandemic. Former President Donald Trump, by contrast, has demanded that China pay $10 trillion in reparations.

The Biden administration is considering undoing some of Trump's tariffs on Chinese goods "separately" from US pressure for coronavirus transparency, White House press secretary Jen Psaki told The Post on Monday.

Documents published in September by The Intercept revealed that US health officials indirectly funded so-called "gain of function" research at the Wuhan lab — including the modification three bat coronaviruses distinct from COVID-19 and the discovery that they became much more infectious among "humanized" mice when human-type receptors were added to them.

International panel calls for tighter oversight of risky pathogen studies

Pathogen Project's report does not rule out gain-of-function research and virus hunting, but urges better biosafety and biosecurity

- 28 Feb 2024
- 10:00 AM ET
- ByJocelyn Kaiser

New rules are needed for lab research on pathogens that could cause a pandemic, an expert panel says.Jane Barlow/PA Images via Getty Images

Research on dangerous human pathogens is essential to protect people from epidemics and pandemics, but safety rules for such work need to be tighter and more consistent around the world, according to a report released today by a broad international task force launched in the wake of the COVID-19 pandemic. "All countries must look carefully at pathogen security, and we hope our report provides a universal framework," said co-chair Ravindra Gupta, a virologist at the University of Cambridge.

The report drew praise from scientists who acknowledge the risks of some types of virological experiments but worry more safety rules might hamper biomedical progress. It "attains a balance that has sometimes been lost in the past when the focus was on risks, with little attention paid to benefits," says virologist Michael Imperiale of the University of Michigan. "The recommendations are reasonable."

The Pathogens Project was launched in the fall of 2022 by the Bulletin of the Atomic Scientists, a group best known for its Doomsday Clock assessing nuclear and other threats. Organizers were concerned about the growing number of high-containment labs around the world that work with deadly pathogens, and the risk that an accident or a deliberate release of a virus or bacterium could spark a health catastrophe.

The project also addressed concerns about so-called gain-of-function (GOF) studies, a controversial type of research that involves modifying potential pandemic pathogens, such as H5N1 avian influenza, in ways that could make them more harmful to people. Some experts worry such research could have led to the release of SARS-CoV-2.

The bulletin assembled a 28-member independent task force consisting of experts in biosafety, biosecurity, microbiology, epidemiology, ethics, and other areas from around a dozen countries. Among them are virologist George Gao, former director of the Chinese Center for Disease Control and Prevention; chemist and former Mauritian President Ameenah Gurib-Fakim, a co-chair; and molecular biologist Alina Chan of the Broad Institute, who has promoted the notion that COVID-19 originated in a Wuhan, China, lab. The international expertise and diversity of viewpoints make the 53-page report stand out, says co-chair David Relman, a microbiologist at Stanford University.

The task force embraces a proposal from a U.S. government advisory group reviewing rules for taxpayer-funded GOF studies to expand the definition of a potential pandemic pathogen to include moderately virulent or transmissible viruses—which includes SARS-CoV-2—that could pose serious public health risks. (Current rules require stricter review only of studies using pathogens that are both highly virulent and highly transmissible, such as H5N1 and Middle East respiratory syndrome.)

The report also recommends that proposed studies on both natural and manipulated pandemic pathogens be done only if safer, alternative methods, such as studying the properties of a virus' surface proteins, aren't

sufficient. These "surrogate" studies have benefits, the report points out: They can be far cheaper than working in high-containment labs and allow for more statistically rigorous experiments.

But the panel stopped short of ruling out work with dangerous live viruses or even GOF studies on potential pandemic pathogens, which some scientists and lawmakers want to ban. Surrogate methods have "caveats and limitations," and results "often need to be confirmed using actual virus research," the report concludes. Despite the dangers, "We all agreed that work on some of the more potentially risky pathogens needs to happen for a whole lot of important reasons," Relman says.

The panel also supports the practice of collecting wild viruses in nature and studying them in the lab in hopes of predicting which of them could trigger a pandemic. Some scientists have called for limiting or ending such studies, in part because they sometimes take place in so-called biosafety level-2 (BSL-2) laboratories, which have fewer security safeguards than BSL-3 or BSL-4 labs designed to contain more dangerous pathogens. Chinese scientists, for example, have drawn criticism for studying bat coronaviruses related to SARS-CoV in BSL-2 laboratories.

But the task force found these field studies to be valuable, Relman says. However, it urges that viruses of unknown risk be studied at the same biosafety level as well-characterized, "taxonomically close relatives." Under that approach, poorly understood bat coronaviruses, for example, would likely be studied in BSL-3 laboratories. The idea is "common sense" and would likely be the norm in the United States, says task force member Gustavo Palacios, a virologist at the Icahn School of Medicine at Mount Sinai.

Reviewers of proposed studies on pandemic pathogens should weigh studies' public health benefits—such as the development of drugs, vaccines, and diagnostics—against their risks, and should seek input from outside groups for especially risky studies, the report says. The report also calls for laws and policies specifically regulating research on potential pandemic pathogens, international protocols for lab work and field studies, mandatory reporting of lab accidents—which sometimes get swept under the rug—and more research on lab safety and security risks.

Johns Hopkins University biosecurity expert Gigi Kwik Gronvall praises the report's biosafety recommendations. But achieving those goals "really comes down to the details," she says. "The next step is to actually drill down into what procedures, notifications, or processes are required to have oversight" while allowing "meaningful work [to] proceed in a way that doesn't hobble our ability to create vaccines and to do public health surveillance."

EXTERNAL SENDER

I really appreciate your email to Victor Jerry.

Since this is all in the public domain, I've attached the response I sent to NAM on Friday re. their decision to do a full investigation of some of these allegations against me and EcoHealth. It's much weaker and wimpier than I'd like, but just as with the NIH situation, I'm in no position to fight back since my future is entirely in the hands of a small group behind closed doors.

I'm extremely worried that Victor doesn't have the mettle to stand up to this political pressure. I believe he's just hoping that he can walk the line of least resistance between the political attacks – which are coordinated and relentless – and any protests from scientists (which haven't really begun re. this issue). My worry is that this cold calculation means he's going to do his utmost to protect NAM against receiving direct criticism from politicians on the right should they not provide them with a pound of flesh, and this means throwing me and EcoHealth under the bus. This is likely the same calculation made by Collins, Tabak and Lauer at NIH, who stated publicly that EcoHealth has a long history of lack of compliance, despite us providing documentary evidence that this is false.

Cheers,

Peter

I sent the note below to Victor, now that the internal investigation at NAM is in the public domain.
Rich, it is time to mobilize the Nobel laureates. This is going too far and there must be pressure, all the pressure possible from the scientific community, and applied to Victor and NAM to stop it now.

Jerry

Subject: Investigation of Peter Daszak

Dear Victor,

I am surprised to see the Republican members of the House Energy and Commerce Committee providing information to Fox News about supposedly confidential procedures at NAM. They of course are repeating the baseless accusations we discussed previously, but there is the uncomfortable reality that when lies are repeated time after time people begin to believe them. But now this is in the public domain. NAM no longer has the luxury of working through this in protected space. You are in the spotlight, and like it or not you and the Academy are being dragged into this dreadful episode in the history of science.

I would hope NAM has the courage to stop this in its tracks by issuing a brief memo to them saying the initial investigation has revealed no violation by Peter Daszak of the code of conduct and their request is denied. Period. The stakes are high, certainly for Peter and his career and his organization which has generated so much critical science for the past 20 years. But beyond Peter it is the very integrity of science and the stewardship of science and separation of politics away from science that is so threatened by these accusations.

I am convinced there will be an uproar at NAM if there is any adverse judgement passed on Peter and his integrity. Please stop it in its tracks while you can.

Jerry

Hi Peter,

First, and I already told Peter, my note to NAM members last night has had a few direct responses to me indicating it was received and people are already writing to Victor Dzau about it, providing membership input that the attack from the republicans is political and not an indication of misconduct. That's important.

The LA Times said no yesterday, in part because they didn't have the evidence to corroborate the charges I make, and because "the conflict between Peter Daszak and NIH over the past year could be a good subject for news reporting". I wanted to move the focus above the specifics of Peter and EcoHealth to the level of Francis Collins and his inability to defend the integrity of science and his spreading of misinformation. So I wrote back with my willingness to share the "evidence" and the need to get this out now before Collins leaves at the end of the year.

I am preparing to send it to the Boston Globe if I don't hear back in the next couple of hours.

Jerry

Hi Peter,
I have written to the list serve of NAM members who signed on to my letter to the NASEM Presidents in 2020 to speak out about political interference in the peer review process at NIH, many of whom also signed the Op-Ed I published with Rick Klausner and Ken Olden in The Hill. I included the republic E+C committee members letter to Victor Dzau, discussed the flaws and the bias, and asked them to write in support of you and EHA.

I am still fighting the battle over the Op-Ed about Collins and NIH.

Jerry

Follow the email chain below for the latest from NAM on my 'accusations'.

A swell as them refusing to give me a copy of the regulations and procedures, I've just received emails suddenly 'rescheduling' or canceling my NAM and NASEM committee calls this week.

I have zero faith in this process at the moment. Every time I email this person and cc. Aleksei, she responds without the cc. She's told me not to share any of this information, yet won't share any details about the rules and regulations. At the same time my reputation is on the line again, and in the hands of a small number of unknown people who clearly want to keep things quiet so that NAM doesn't come under attack.

Cheers,

Peter

Thanks very much for the prompt reply.

I look forward to hearing from you once the Assessment Committee has determined the next steps. I sincerely hope this will not become a full-blown review by the Conduct Review Committee – these accusations are part of a political campaign that is designed to undermine and discredit scientists to push a political agenda.

Cheers,

Peter

Dr. Daszak,

Thank you for the follow-up note.

The process is outlined in an internal document that is not part of the members' materials posted on the website nor available in another location.

I can share with you that the first process is a review by the President, Home Secretary, and Membership Director. Following a preliminary review, the NAM's Assessment Panel is convened to review the materials. The Assessment Panel is charged with reviewing the allegations, determining whether supplemental materials are needed, and making a recommendation whether to convene the Conduct Review Committee.

I am in the midst of scheduling a meeting of the Assessment Panel; we all understand the issue of time-sensitivity. I will do my best to operate in the most expeditious manner possible.

Best,

Subject: Process at NAM for dealing with accusations from Republican members of the House E&C Committee

Dear Elena,

Thank you for your email re. confidentiality. Unfortunately, as is typical with these political attacks, the Republican members of the House E&C Committee have not kept this confidential. In fact, they posted the letter in full on their website as soon as they sent it to you. Their goal by making these easily refuted accusations public, like their previous attacks, is to undermine the science on COVID origins, and to smear scientists publicly so as to discredit us.

Again, I am asking again for you to send me the written processes and rules for how accusations of misconduct against members are to be dealt with. It seems unfair that these accusations are now public so colleagues can see them, but as a NAM member I don't have clear guidelines on what I am and am not allowed to do or say, on who exactly will be making a decision on these awful allegations, nor on how long this will hang over me. As I mentioned to you in my last email, I searched long and hard on the website and was unable to find details specific to the process and procedures, even on the NAM member-protected pages.

I understand none of us wants to be in the position of having to deal with this, but I am simply trying to clear my name and reputation as rapidly as possible.

Cheers,

Peter

Cc: Aleksei Chmura
Subject: RE: follow-up

Thank you for the call today Elena. I've cc'd our Chief-of-Staff, Dr. Aleksei Chmura, who also joined us. I appreciate your explanation and will do my best to adhere to the policies of the NAM as we go through this process.

My only hope is that the review can be as rapid as possible. Our organization has been the focus of a horrific series of political attacks from the hard right wing as part of their political goals regarding Dr. Fauci, NIH and ultimately the Biden administration. These tie up resources and staff answering pages upon pages of false accusations, all carefully worded to give the impression of a thoughtful and sincere inquiry.

Again, I want to reassure you that none of the accusations from Republicans on the House E&C Committee have the slightest bearing in fact. We have acted honorably and with the highest scientific integrity throughout the pandemic, and simply want to be allowed to continue our work without constant, politically-motivated harassment.

sincerely,

Peter

Peter, i had some long discussions with the Trop med folks today

They want me to write something, a follow up to what we did last july.

But they are 14 leaders not on the same page

I suggested a follo
w up one year later that does NoT emphasize rebutting the crazies but says here is what is needed now, urgently, and includes 5-10 things such ad 1 international open collegial collaboration
with China and other countries in the region, wider sampling/sequencing to look at the sarbecovirus universe, phylogenetics, serosurveys, etc.
Can you and your folks help me compile a list of top research priorities with supporting data?

I would also ask for good msps of Rhinolophus range separated by those species that are and are not enzootic for SARS-like viruses

MORENS_SUBPOENA_020114
MORENS_NIH_040632
REL0000478136

ETc….

The focus would be : proactive. This is an emsrgrncy. Science needs to get cracking! What must me do asap? (Funding you, and then what?). d

We've lost two significant funders this week
Importance: High

EXTERNAL SENDER

Thanks for sharing.

We're getting mounting damage at EcoHealth. One of our corporate funders has pulled out because of the news (Swiss Re). They donated $30K per year and I talked with the senior execs about pandemic risk.

We heard today that our brand new 3-year Gates Foundation grant for One Health work in India will now be "re-assigned". They're telling us they'll still fund us, but I think they're just being polite. This is a loss of $500K per year.

I'm extremely worried right now. People's jobs, careers, reputations are on the line, not just mine – the Gates grant is Jon Epstein's.

Cheers,

Peter

Despite Trump's new round of bullying, Fauci says COVID likely didn't leak from a Chinese lab | Opinion

BY ANDRES OPPENHEIMER
JUNE 08, 2021 09:13 AM,
UPDATED 19 MINUTES AGO

Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, says the coronavirus likely jumped species, from animal to human. *GETTY IMAGES*

Former President Trump, perhaps trying to divert attention from his own disastrous

MORENS_SUBPOENA_020118
MORENS_NIH_040636
REL0000478136

handling of the COVID-19 pandemic, is now lashing out against Dr. Anthony Fauci for allegedly failing to seriously consider that the virus might have originated from China's Wuhan lab, rather than from an animal's transmission to humans.

But judging from what Fauci told me in a June 4 interview, the most

MORENS_SUBPOENA_020119
MORENS_NIH_040637
REL0000478136

respected U.S. infectious diseases expert has not yet seen any convincing evidence that the virus may have escaped from a Chinese lab.

Fauci, who heads the U.S. National Institute of Allergy and Infectious Diseases, and is a top medical adviser to President Biden, said, “It is more likely” that — much like

MORENS_SUBPOENA_020120
MORENS_NIH_040638
REL0000478136

SARS, ebola, influenza and HIV — COVID-19 “originated from an animal reservoir and jumped species to humans.” He added, “There’s the possibility that it came from the lab, but I believe that that’s a much less likely possibility.”

In the interview, scheduled to be aired Sunday , June 13 n “Oppenheimer Presenta” on CNN en Español, Fauci said that it’s “important” to try to find out the exact origin of the pandemic, so that we can prevent it from happening again.

Biden has asked U.S. intelligence agencies to investigate the

MORENS_SUBPOENA_020121
MORENS_NIH_040639
REL0000478136

origins of COVID-19 and come back with a report before the end of August.

Asked how the investigation into the source of the virus should be conducted, Fauci said that the World Health Organization has indicated that it will go back to China to continue its investigation.

"I think it needs to be done in a collegial way, with the collaboration of the Chinese scientists, because you're going to have to have cooperation and do it in a way that you

MORENS_SUBPOENA_020122
MORENS_NIH_040640
REL0000478136

can best get the information," he said.

Regarding his emails obtained by BuzzFeed and the Washington Post through the Freedom Of Information Act, Fauci told me that his critics "cherrypick things out of context" when they claim that he knew more than he was saying publicly about the possibility that the virus

MORENS_SUBPOENA_020123
MORENS_NIH_040641
REL0000478136

came out of a Chinese lab.

Stressing that he never totally discarded the lab theory — though he never thought it was a major possibility — Fauci added that, "I think what has increased is the interest, not necessarily the evidence."

Right-wing media have had a field day with the

MORENS_SUBPOENA_020124
MORENS_NIH_040642
REL0000478136

Fauci emails, claiming that he was alerted about the "lab theory" early on and allegedly failed to take it seriously. Much of their claims are based on a Jan. 31, 2020, email, in which infectious-disease expert Kristian Andersen wrote to Fauci that some of the virus' features "[potentially] looked engineered."

But what most right-wing media fail to mention is that, a few weeks later, Andersen concluded, upon

MORENS_SUBPOENA_020125
MORENS_NIH_040643
REL0000478136

further investigation, that the "lab theory" was implausible. So the criticism that Fauci was wrongfully hiding the "lab theory" from the public does not hold up.

Of course, Trump now is trying to paint Fauci as the culprit for the fact that America holds the world's record for COVID-19 deaths in absolute numbers. In a mass email on June 3, Trump claimed that "President Trump was right about the China Virus coming from the Wuhan

MORENS_SUBPOENA_020126
MORENS_NIH_040644
REL0000478136

Lab," and suggested that Fauci was defending China.

But, until we see any hard evidence that COVID-19 emerged from the Wuhan lab, Trump's accusations should be seen as just another attempt to bypass science and divert public attention from the COVID-19 deaths caused by his failure to tackle the pandemic.

MORENS_SUBPOENA_020127
MORENS_NIH_040645
REL0000478136

Remember, Trump knew early on that COVID would be deadly — he is on tape telling author Bob Woodward this in February 2020 — but chose to lie to the American people for fear that it would ruin his re-election chances. What's more, Trump consistently refused to wear a mask or preach

MORENS_SUBPOENA_020128
MORENS_NIH_040646
REL0000478136

social distance, as scientists were recommending.

As I wrote at the time

Trump neglected his main duty — to protect the American people.

Granted, investigations into the origins of COVID-19 are justified and should continue. And there's no question that China's dictatorship is responsible for its delay in alerting

MORENS_SUBPOENA_020129
MORENS_NIH_040647
REL0000478136

the
world
about
the
deadly
virus
as
soon
as
it
started.

But
barring
solid
evidence
that
the
virus
originated
from
a
Chinese
lab,
Trump
remains
the
villain
—
and
Fauci
the
hero.

CC:	David Morens <(b) (6) Roberts, Rich <(b) (6) Keusch, Gerald T <(b) (6) Jeffrey Sturchio <(b) (6) Aleksei Chmura <(b) (6) >;
Attachments:	image001.jpg; image002.jpg; image003.jpg; Coalition meeting 2.1.23.docx; Concept Note.docx

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

- Rich will speak with:
  - Harold Varmus to sound him out re. this issue
  - Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
  - NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it
- Jerry Keusch will reach out to:
  - ASM – Stephano Bertuzzi
- David Morens will reach out to Tony Fauci to ask advice on how we should progress
- Peter Hotez will talk with:
  - Head of OSTP (Peter will speak with them in March)
  - ASV – Anne Moscona (President-Elect)
- Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.
- Next steps
  - each of us will reach out to different contacts
  - re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
  - In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
  - AAAS
  - AIDS Vaccine Advocacy Coalition
  - American Public Health Association (Georges Benjamin)

- American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
- Association of Public & Land-Grant Universities
- Georgia Global Health Alliance
- Bay Area Global Health Alliance
- Consortium of Universities for Global Health
- COVID Collaborative
- Global Health Council
- Global Health Technologies Coalition
- Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
- International AIDS Vaccine Initiative
- Nobel Laureates Campaigns
- Pandemic Action Network
- PATH
- Research!America – Reach back out – Jerry will
- Union of Concerned Scientists
- Washington Global Health Alliance
- 156 virologists letter
- NAM
- NAS
- NL Campaigns (to be kept informed of progress by Rich)
- CUGH
- The pandemic action coalition
- FASEB
- Global Health technologies coalition
- APLU (KHG has connection)
- Wellcome Trust (Paul Schreier is the interim head).
- Dr. Tony Fauci
- Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
- OSTP
- ASV – Anne Moscona (President-Elect)

Cheers,

Peter

Subject: Concept note and Agenda for our discussion today at 1pm Eastern US time

Dear All,

I'm looking forward to our discussion today at 1pm. Attached is a concept note that Jeff Sturchio drafted to frame some ideas around what we might try to do.

I've also attached a rough agenda for us.

Here are the details of the zoom call, and I look forward to speaking with you all later on:

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

MORENS_SUBPOENA_016399
MORENS_NIH_034527
REL0000478137

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines,

MORENS_SUBPOENA_016400
MORENS_NIH_034528
REL0000478137

hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists.

What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.
Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.
Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?
Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.
Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?
Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?
Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.
Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?
Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee]

money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.

After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading

MORENS_SUBPOENA_016403
MORENS_NIH_034531
REL0000478137

these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism*, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or

MORENS_SUBPOENA_016404
MORENS_NIH_034532
REL0000478137

hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?" And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a

MORENS_SUBPOENA_016405
MORENS_NIH_034533
REL0000478137

COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.
And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

EXTERNAL SENDER

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based

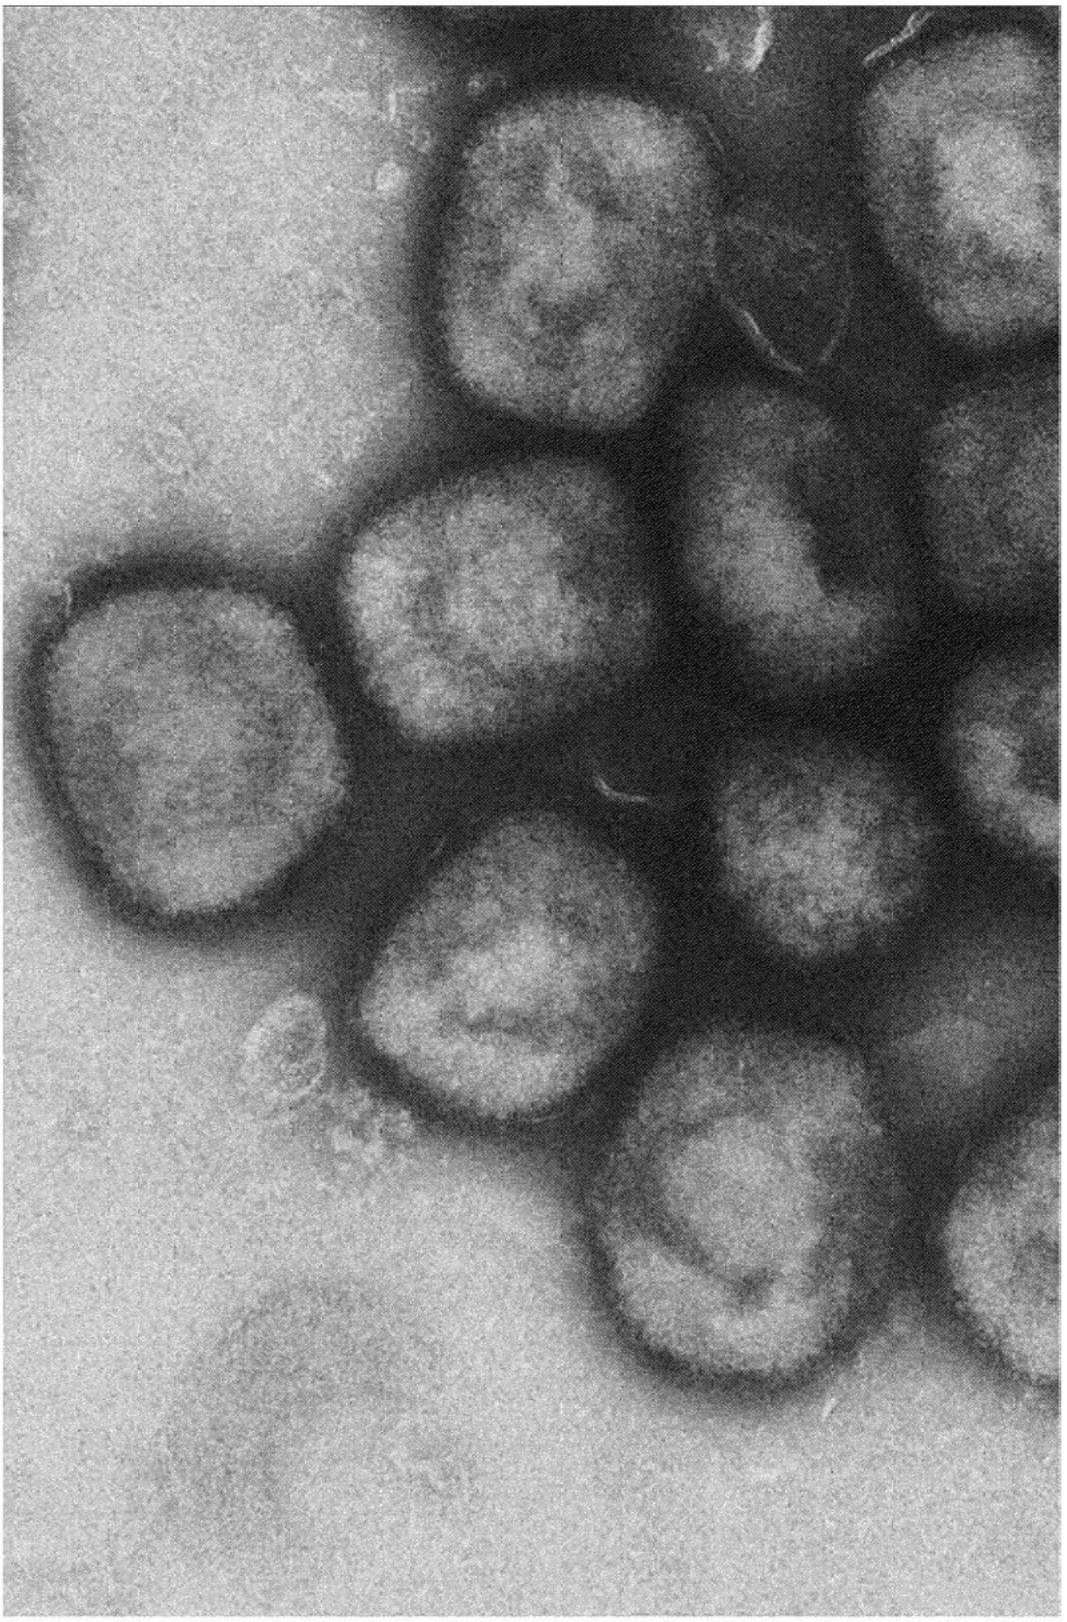
MORENS_SUBPOENA_016409
MORENS_NIH_034537
REL0000478137

on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!



POLICY-ISH

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

MORENS_SUBPOENA_016410
MORENS_NIH_034538
REL0000478137

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious

MORENS_SUBPOENA_016411
MORENS_NIH_034539
REL0000478137

attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route, " says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the

MORENS_SUBPOENA_016412
MORENS_NIH_034540
REL0000478137

lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.
That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.
"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.
If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work." But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it."
He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things

MORENS_SUBPOENA_016413
MORENS_NIH_034541
REL0000478137

go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Jerry

Subject: Re: Tweet by MinerFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack

MORENS_SUBPOENA_016417
MORENS_NIH_034545
REL0000478137

vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a postdoc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him- and we wa search mittee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

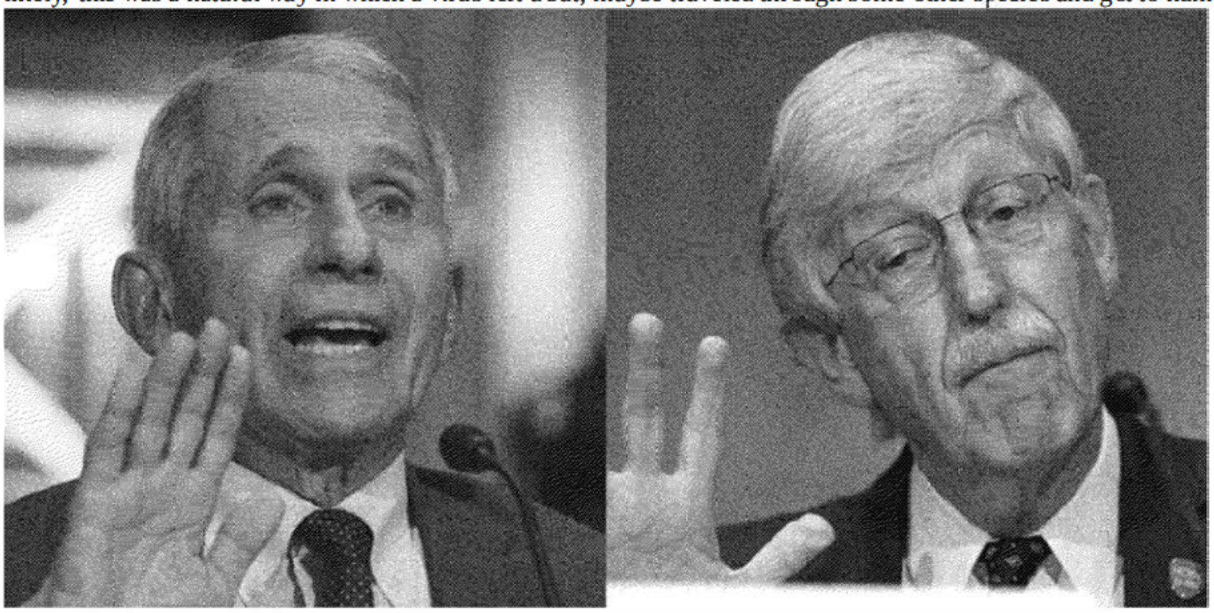
Outgoing NIH director dismisses Wuhan lab-leak theory as a 'distraction' on last day in office

New polls finds 72% of Americans believe COVID-19 originated in Wuhan lab

By Yael Halon | Fox News

Retiring NIH director Dr. Francis Collins joined 'Fox News Sunday' to discuss the latest information regarding the omicron variant.



Outgoing National Institutes of Health Director Dr. Francis Collins told Fox News on Sunday that he's "sorry" the Wuhan lab-leak theory has become such a "huge distraction" for the country, despite there being "no evidence" to support it.

Collins joined "Fox News Sunday" on his last day in office after more than a decade in the agency's top position. The geneticist and physician tapped by President Barack Obama to lead the NIH in 2009 dodged questions about his efforts to discredit the lab-leak theory at the onset of the pandemic, maintaining the most plausible explanation is that the virus spread through animal-to-human transmission.

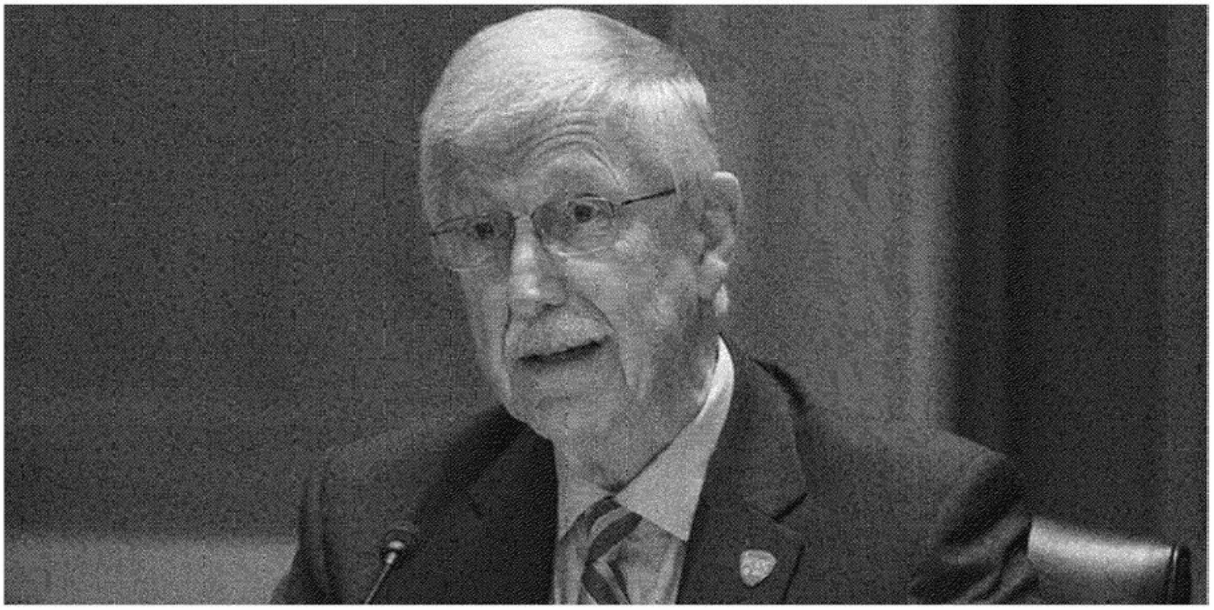
"I'm really sorry that the lab leak has become such a distraction for so many people because frankly, we still don't know, " Collins told host Bret Baier.

MEDIA FACT-CHECKERS, FACEBOOK CITED WUHAN LAB-LINKED SCIENTIST TO KNOCK DOWN LAB LEAK THEORY

"There is no evidence really to say. Most of the scientific community, myself included, think that is a possibility, but far more likely, this was a natural way in which a virus left a bat, maybe traveled through some other species and got to humans."

WASHINGTON, DC - JULY 20: Top infectious disease experts Dr. Anthony Fauci and Dr. Francis Collins, Director of the National Institutes of Health, on Capitol Hill. (J. Scott Applewhite-Pool/Getty Images; Greg Nash- Pool/Getty Images)

Collins said in October of this year that accusations surrounding the agency's involvement in gain-of-function research and the Wuhan Institute of Virology had "absolutely" nothing to do with his resignation.



Still, emails released by BuzzFeed that reveal private correspondence between Collins and Dr. Anthony Fauci suggest a deliberate effort to downplay theories that the coronavirus originated in the Wuhan lab and, whether deliberately or inadvertently, their funding had any involvement.

"We won't know unless China decides to open up on this which they have not done, and shame on them for that," Collins said, reiterating that "this has been a huge distraction" for the scientific community.

MOST AMERICANS BELIEVE COVID-19 LEAKED FROM WUHAN LAB, POLL FINDS

"We in this country have somehow gotten all fractured into a hyperpolarized politicized view that never should have been mixed with public health," Collins said. "It has been ruinous and history will judge harshly those people who have continued to defocus the effort and focus on conspiracies and things that are demonstrably false. Shame on all us that we've gotten into this kind of pickle."

MORENS_SUBPOENA_015420

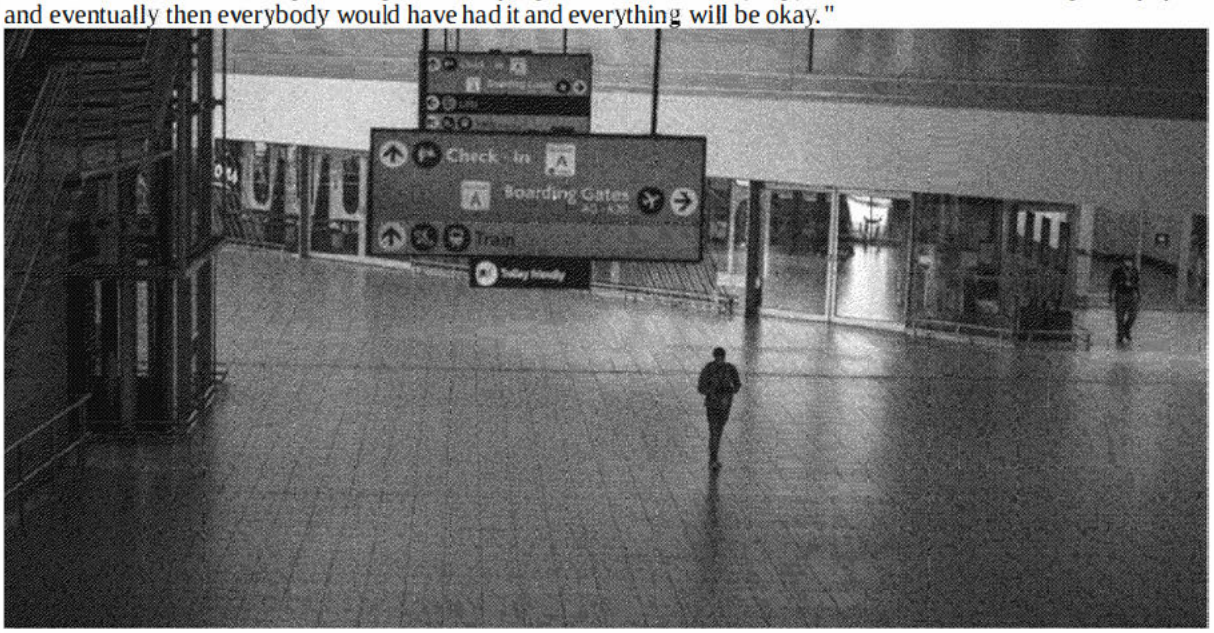
REL0000478144



National Institutes of Health Director Dr. Francis Collins testifies before a Senate Appropriations Subcommittee looking into the budget estimates for National Institute of Health (NIH) and the state of medical research on Capitol Hill, May 26, 2021 in Washington, D.C. (Sarah Silbiger-Pool/Getty Images)

Collins made headlines on Friday after the House Select Subcommittee on the Coronavirus Crisis released an email where he expressed deep concerns about the herd immunity strategy being advocated by "fringe epidemiologists," and called for "a quick and devastating published takedown" of the three experts promoting the herd immunity strategy known as "The Great Barrington Declaration."

Collins told Baier that he is "not going to apologize," for his words, arguing that "hundreds of thousands of people would have died if we had followed that strategy."

"I did write that, and I will stand by that," Collins said. "Basically, these fringe epidemiologists who really did not have the credentials to be making such a grand sweeping statement, were saying just let the virus run through the population and eventually then everybody would have had it and everything will be okay."

A man walks through a deserted part of Johannesburg's OR Tambo's airport in South Africa. The World Health Organization urged countries around the world not to impose flight bans on southern African nations due to concern over the new omicron variant. (AP/Jerome Delay)

The United States recently surpassed 50 million COVID-19 cases and 800,000 deaths since the start of the pandemic. Despite the staggering numbers, Collins maintained that "hundreds of thousands of people would have died if we had followed that strategy."

"So I'm sorry I was opposed to that, I still am, and I'm not going to apologize for it," he said.

CLICK HERE TO GET THE FOX NEWS APP

As for the new omicron variant, Collins said the U.S. should brace for a "world of trouble" the next couple of months, based on its higher transmissibility than the previous strains, which "pale by comparison."

Baier pointed to recent data out of South Africa that could point to milder symptoms and fewer hospitalizations from omicron. "I am hopeful that that is an indication that while incredibly contagious, this virus may be a bit less likely to make people sick," Collins said, "and obviously that is something we have got to hope for, or our health systems are going to be overwhelmed."

EXTERNAL SENDER

Dear all,

As expected, rather than the academies coming to our rescue, they now want a "quiet chat"… no doubt I'll be urged to quietly step down from my current duties as chair of the NASEM Forum on Microbial Threats & member of the NASEM Standing Committee on Emerging Infectious Diseases and 21st Century Health Threats.

If this isn't McCarthyism, what is it?

Cheers,

Peter

Hot of the (Fox News) press – apparently I've spent $100 billion in Govt funding now…:

Republican members of the House Intelligence Committee wrote to President Biden and Director of National Intelligence Avril Haines demanding information on the origin of COVID-19. Devon Nunes stated on Fox News that: "Peter Daszak, president of EcoHealth Alliance, has taken $100 billion in government funding. Though he has no accounting of how the money was spent, Nunes said he believes some was used for good, but "the question is 'is someone who was involved in allocating that money be involved in investigating the origins of this Wuhan virus?' I'm not sure that would be appropriate."

h Hewitt: NIH Director Francis Collins On "Gain of Function" Research At NIH and Wuhan Lab

Amusingly, some of the early attacks on Zhengli Shi in China accused her of being a CIA agent because she'd collaborated with Americans at….you guessed it EcoHealth Alliance!

By the way – another find just now… on 5/11/20, Kansas Republican Sen. Roger Marshall put forward a resolution for a Senate Select Committee to investigate origins of COVID, role of WIV etc. etc. https://www.kansascity.com/news/politics-government/article251329378.html. Bill details: https://www.marshall.senate.gov/wp-content/uploads/ROM21556.pdf

In a normal year I'd be shocked, but this just seems like more of the same gibberish…

EXTERNAL SENDER

Thanks for sharing. His comment "The original WHO study was not considered to have been as thorough or as objective as it needs to be." Seems harmless on the surface, but is grossly offensive to those of us who spent 4 miserable weeks in Wuhan, and many more miserable weeks being attacked in the press since that. It also demonstrates a total lack of

understanding of the process of this study, and of the actual contents – 3 reasons why even just thi one sentence is inaccurate.

Re. 'not considered to have been as thorough' – It's actually more thorough than the internationally-negotiated Terms of Reference laid out. These specifically did not include any investigation of the lab. It was only after we got on the ground in Wuhan and were told a hard 'no' on looking into the lab leak hypothesis that I then reached out to Zhengli Shi and set up calls to break the ice on this, allowing us to visit the lab and ask the questions we did, and get new data from the lab. Looking back on this – why did I bother!

Re. '…or as objective as it needs to be'. It's been said repeatedly that the international experts on the WHO mission all unanimously considered the lab leak hypothesis extremely unlikely. If this is not objective, why not? Perhaps he's referring to the China side having also voted the same way – so what? Maybe because I was involved and somehow I can't think independently because I'm linked to the lab – so what? If >10 independent international experts viewed it as extremely unlikely, why is that not objective?

Re. calling it the 'original WHO study' is erroneous because it's ongoing. This was phase 1 and the recommendations in the report are for the phase 2 studies that are being designed right now. This is in the terms of reference that are published. It's fine for someone to not know these details, but if you don't know, you should suggest this was the 'original study' as if indicating there would be a future, different one.

Cheers,

Peter

REL0000478148

Transcript:
Dr. Francis Collins, director of NIH joined me this AM. He answered many objections about vaccinations and also discuss

HH: But first, let me ask you about gain of function research. It's become a contentious issue. I'm looking at an NIH symposium you held on gain of function. Could you explain for the Steelers fans out there what gain of function research is?

FC: Absolutely, and there has been a lot of noise about this. And a lot of the information is not accurate, so let me try. Basically, this is the kind of research where you're studying a particular pathogen in a very tightly controlled environment to try to understand what about that virus or that bacterium might we most want to be worried about that nature might develop into an even more dangerous organism. We do this under extremely tight circumstances. The NIH has only approved that kind of research in a couple of instances for influenza. We have never approved that for coronaviruses. But now, there's a buzz that maybe that Wuhan Institute of Virology was conducting that kind of research. We don't know that. There's no evidence for that. And let me say categorically, NIH would not have supported any such research on coronaviruses, because there are risks there that you might actually end up producing a virus that has a higher danger attached to it than what nature has already come up with. Again, the reason to do it is to try to have a little forecast of what we might need to watch out for that nature could develop. But that should only be done under very carefully controlled circumstances. We have in the United States a rigorous system for overseeing any kind of gain of function research like that. And it's only really been utilized twice for influenza.

HH: Now I just heard you say categorically the United States did not fund research of gain of function sort into the COVID virus in Wuhan. Would they have funded, can you say the same thing about gain of function research period, of any sort, in Wuhan?

FC: We, of course, do not have internal insight as to what was going on at the Wuhan Institute of Virology.

MORENS_SUBPOENA_014938
MORENS_NIH_030591
REL0000478148

NIH strongly supports the position that we need more thorough investigation of what exactly were the origins of this virus. The original WHO study was not considered to have been as thorough or as objective as it needs to be. NIH, working with the State Department, the Agriculture Department, and WHO, is insisting upon a more careful and more objective analysis of everything that happened in Wuhan back in December of 2019.

HH: But can you rule out, Dr. Collins, the United States having funded any sort of gain of function research in Wuhan?

FC: We absolutely did not fund gain of function research in Wuhan.

HH: All right. That's great.

Details of BSL-2/3/4 levels for viral cultures
Importance: High

Please have a look at the attached, ready for people asking you about comments from Ian Lipkin, Ralph Baric and others re China using BSL-2 level to culture bat-CoVs. This is now being used to suggest a lab-origin for SARS-CoV-2 is more valid. I list 7 reasons why this argument is flawed, and we cite a bunch of examples of viruses known to be lethal to people that are cultured at BSL-2 in the USA.

Hope all this helps, and thank you for your support and advice.

Each of these new conspiracy angles takes us multiple phone calls, a few hours of digging, and a not insignificant amount of emotional angst before we realize (as usual) that these are little more than hype, rhetoric and misinformation.

Didn't see that one. Vincent's right that EcoHealth was not part of any gain-of-function work. He's wrong that the work between Ralph and Zhengli was actually 'gain of function'. The chimeric virus (bat spike, SARS-CoV backbone) actually lost some replication capacity – more like 'loss of function'.

The interview video clip is one I recorded in Singapore in December 2019 at a Nipah meeting. I didn't use the phrase gain of function, and wasn't referring to work we did, as Vincent says. Quite ridiculous, but easy to fool the public with this…

Virologist: NIAID grantee funded Wuhan coronavirus studies used in gain-of-function research

In a tense exchange Tuesday with Sen. Rand Paul, longtime NIAID Director Anthony Fauci categorically and repeatedly denied his institute has funded gain-of-function research.

By Daniel Payne

Updated: May 15, 2021 - 11:44am

A prominent Columbia University virologist claims that in the years leading up to the COVID-19 pandemic a U.S. nonprofit funded coronavirus experiments in Wuhan, China the results of which were used in "gain-of-function" virology research at the University of North Carolina.

Dr. Vincent Racaniello made the claim amid ongoing controversy over a recently resurfaced interview between himself and Peter Daszak, the president of the U.S. infectious disease nonprofit EcoHealth Alliance.

Both EcoHealth Alliance and the scientist leading the research at UNC have been heavily funded over the years by the National Institute of Allergy and Infectious Diseases, which has been directed since 1984 by Dr. Anthony Fauci, the public face of the federal response to the COVID-19 pandemic under Presidents Trump and Biden.

Fauci categorically and repeatedly denied that NIAID has funded gain-of-function research in a tense exchange Tuesday with Sen. Rand Paul (R-Ky.) at a Senate hearing.

Racianello's half-hour interview with Daszak took place in early December 2019 at the Nipah Virus International Conference in Singapore. Significant attention has been given to a segment in which Daszak appears to allude to having participated in "gain-of-function" experiments, a type of procedure in which scientists increase a virus's pathogenicity and/or transmissibility in order to study its potential for human infection.

"You can manipulate [coronaviruses] in the lab pretty easily," Daszak says in the interview. "Spike protein drives a lot of what happens with the coronavirus, zoonotic risk. So you can get the sequence, you can build the protein — and we work with Ralph Baric at UNC to do this — insert into the backbone of another virus, and do, do some work in the lab."

Those remarks, when they resurfaced this week, caused considerable controversy due to Daszak's role in funneling hundreds of thousands of dollars through his EcoHealth Alliance to the Wuhan Institute of Virology to bankroll coronavirus experiments there. The Wuhan lab sits just a few miles from where the first detected outbreak of COVID-19 occurred.

Speculation has swirled over the last year as to what role, if any, the Wuhan lab may have played in the origin of the pandemic, including whether it was engaging in any gain-of-function experiments that may have posed a pandemic risk.

Experiments 'confer a new property to the original virus'

Racaniello said that Daszak in the December 2019 interview was indeed describing gain-of-function experiments.

"Here is the idea," he said in an email exchange this week. "You go into caves in China and sample bats for CoVs. You collect bat guano and sequence it to find the viruses. You don't actually have the viruses, just their genome sequences. You want to know if these viruses have the ability to infect human cells."

"Since you don't have the viruses," he continued, "you just take the spike sequence from all these viruses and put it into a coronavirus that you work with in the lab. Then you see if that recombinant coronavirus can infect human cells. It's all done under containment to prevent any release. If the spikes of the bat CoV can allow the CoV to infect human cells, then they have the potential to infect humans and we should be making antivirals against them to prevent a pandemic."

Those kinds of experiments, Racaniello said, "are considered 'gain of function' because they would confer a new property to the original virus."

That research, Racaniello said, "was done in the laboratory of Dr. Ralph Baric in [the University of] North Carolina and was not funded by EcoHealth Alliance." When pressed, Racaniello revealed that EcoHealth did have an indirect role in the funding of Baric's work.

"EcoHealth Alliance provided funds to Zengli Shi at the Wuhan Institute of Virology to conduct bat surveillance for SARS-like CoVs," he said. "Baric then received the spike sequences from Wuhan to do his experiments independently."

"Daszak and Baric did not work together on this project," he added.

Anna Marie Skalka, a professor emerita at the Fox Chase Cancer Center and one of the authors of the bestselling textbook "Principles of Virology," did not expressly deny that Baric's research constituted gain-of-function, though she claimed that the overall issue was more complex than that.

"I prefer to describe the research in broader terms, as gain-of-function seems too narrow and has acquired negative connotations,

MORENS_SUBPOENA_014904
MORENS_NIH_030557
REL0000478153

" she said. "The aim of such research is to learn as much as possible about the gene/protein in question so that one can begin to develop possible therapeutic or vaccine-related approaches."

Queries to Daszak and Baric on Racaniello's claims went unanswered.

The assertions from Racaniello — a four-decade veteran of academic virology who along with Skalka is also an author of "Principles of Virology" — constitute the sharpest allegations yet that both EcoHealth and the Wuhan Institute of Virology were involved, even if adjacently, with gain-of-function research prior to the pandemic.

Baric's research, meanwhile, has been the recipient of millions of dollars in funding from the NIAID over the years, much of it focused on coronaviruses, including experiments in the "replication and pathogenesis" of those viruses.

Racaniello himself forcefully defended such research. "There is a very clear reason to do these experiments and if we had done them even more we could have prevented the current pandemic," he said.

EcoHealth, meanwhile, has been the focus of controversy for the past year due not merely to its alleged association with coronavirus experiments but also to the fact that its work was for years heavily funded by the federal government, specifically the National Institute of Allergy and Infectious Diseases.

EcoHealth routed hundreds of thousands of NIAID dollars to the Wuhan lab in the years leading up to the pandemic to conduct coronavirus research there. Experts and commentators alike have called for a major investigation into the lab to determine if SARS-Cov-2 may have accidentally leaked from the facility and launched the pandemic.

The federal funding for the Wuhan project was pulled last year near the outset of the pandemic. Daszak himself told NPR last year that the Wuhan experiments were "funded entirely through the NIH grant," as the news service put it.

The lab was the subject of part of the World Health Organization's investigation into the origins of COVID-19. That probe concluded earlier this year and determined that a lab-leak theory was unlikely, though world officials have called for additional investigations into the facility.

The international team of investigators reportedly only spent a single day at the Wuhan lab. Among the team's members — and the only U.S. representative on it — was Peter Daszak.

Subject: Peter, great to finally meet your illustrious brother who I actually HAVE and have seen on opera DVDs without knowing he was your brother. Now I gotta go back and re-watch at least The Invisible City of Kitezh and the Maiden Fevronia, which I have on BluR

Tell John thank you, I am do pumped to meet a real opera artist, one of those magicians who brings great art to life.

I have since childhood been a great fan of Russian opera and have tried to "see" live or at last on dvd/BluRay all of the 16 (or 17 if you count the never-performed version of Mlada co-composed by several composers, including Rimsky and Mussorgsky, althoughthe latter repressed his music, so the opera is not entirely lost) all of them.

About 7 years ago I saw the first, or arguably the second US performance of Rimsky's Snegurochka (the Snow Maiden) here in DC, and now its available on Blu Ray, which I have, along with a German version of Rimsky's La nuit de Noël, one of his musically most beautiful operas never performed in the US to my knowledge. You can't NOT love these operas and what a shame they are so rarely performed in the West.

To John: I suppose you have no say over which operas are performed but if you ever did, or had the opportunity to influence it, please push for the performance of all of the operas by the so-called might handful. or mighty five: Rimsky, Mussorgsky, Borodin, Cui, and their non opera leader Balakirev.

Borodin's prince Igor is occasionally performed and works well (orchestrated by Rimsky), but most of Mussorgsky's operas, all great, were unfinished but
wonderful. Zhenit'ba (The Marriage, a comedy, who knew Mussorgsky could be funny?) has never been staged but I have on tape and ancient performance of it)
So... I have now seen the ma jority of Rimsky"s operas either live or v on DVD (I sawll Tsar Sultan about 15 ago a tthe Bolshoi in Moscow) and I have recordings of a.ll, or almost all, the rest.

Peter, you should check out
Cui"s opera about an emerging Infectious disease! Never performed in the US, I am not sure it was performed anywhere, but I have an audio recording of it and it is wonderful. some great EID quotations from the libretto...

John, you mention singing roles in Czech operas and I am curious about which ones. My friend Jeff Taubenberger and I are intrigued about the Janacek operas including Jenufa, and I just loaned him my DVD of his opera on prison conditions, the title of which I am blanking on. We also sort of like Janacek"s opera we call the Vilxing Little Cunt

Everyone in the US loves Dvorak's Russalka, which American soprano Renée Fleming has done twice, but we Americans are always interested in Czech music,, in part because Dvorak lived here for a few years, had a profound impact on American music, and of course composed his 9th symphony here, which is more American than any Amemrican has since composed (130 years lster).

Sorry fr babbling on. I hope to see/hear you live before roo long, John. d

Peter, I still need to get more educated on furin cleavage sites in coronaviruses. A few articles, e.g., the one attached, claim that in the evolutionary history of multiple different coronaviruses, FCS's do appear

independently, although this is less common in sarbecoviruses. Is that your understanding?

[Peter Daszak:] yes – it seems to be uncommon

And is there any idea what determinants might favor insertion of these sites. Also, do we know about the levels of expression of furin in cells of mammals that might be sarbecovirus co-hosts? I assume that all such mammals have furin activity similar to humns, but is that known?

[Peter Daszak:] not really known well, or discussed that I've seen.

I ask this because the notion that a furin cleavage site indicates human engineered origin needs to be rebutted or at least countered. This is one of several of the Wade points that will appear, to the layman, to be damning. David

[Peter Daszak:] This has been rebutted regularly since January 2020. It was the key reason that this whole lab leak idea was discussed at the White House level in the first place. It was missed by Zhengli in her Nature paper. Likewise, Ralph Baric missed it when he first looked at the SARS-CoV-2 genome sequences in early Jan. Apparently Trevor Bedford & Eddie Holmes pointed it out to Jeremy Farrar, saying it could indicate lab origin (i.e. a virus that gained a furin cleavage site during cell culture). Jeremy mentioned it to Fauci, who mentioned it to Bob Kadlec (if I remember correctly) at the WH. They then convened a panel via NAM to discuss that included me, Ralph and the others. Ralph pointed out that it could have been acquired naturally during human-to-human transmission. I pointed out that it could have been acquired during transmission through an intermediate host. We all pointed out that influenza, and other CoVs have these, although rare. That ad hoc committee then transformed into the NASEM COVID-19 rapid response committee that became largely ignored under Trump and has now basically ended.

There have been lots of active virologists rebutting the theory that the presence of a furin cleavage insertion indicates lab leak because these are found in nature, and because close relatives of SARS-CoV-2 have insertions albeit slightly different sequences at the same site. Here are some links with rebuttals or discussion:

> ***Kristian Andersen pointing out that the furin cleavage site is seen repeatedly across the CoV phylogenetic tree: https://twitter.com/K_G_Andersen/status/1330565966745403392?s=20***

>
> ***Interesting article showing that the RmYN02 similar site suggests natural evolutionary origin: https://virological.org/t/the-sarbecovirus-origin-of-sars-cov-2-s-furin-cleavage-site/536***
>
> ***Interesting article from Vincent Racaniello pointing out other Human CoVs (which are thought to have originated in bats by the way) also have insertions at this site: https://www.virology.ws/2020/05/14/sars-cov-2-furin-cleavage-site-revisited/***

As you can see when you read these, people who know about these things do not find them unusual and certainly don't believe it demonstrates (or even could be considered leaning towards) a lab origin. Unfortunately, it's just scientifically complicated enough to convince the intelligent reader. Throw in phrases like "Gain of function" or "Seamless ligation" and then sprinkle "lab biosafety concerns from state dept cables", and voila, you have a very exciting story – good enough for a science fiction novel, but absolutely not science fact!

On 5/8/2021 2:26 PM, Peter Daszak wrote:

Appreciate your comments David. Please read the letter I just sent to Rich Roberts. I've made some quick comments to refute some of the stuff in the Wade piece. RE. the furin cleavage site – there's nothing special about it and it does not suggest a lab origin. MERS-CoV, feline CoV and some rat CoVs all have similar insertions. Simple explanations for its presence in SARS-CoV-2 could be:

> It was present in a bat-CoV (one of the many thousands awaiting our discovery), and we selected for its spillover by having 14 million people working in wildlife farms in china in places where bats live. Given a continued exposure to myriad bat-CoVs, one with a furin cleavage site would be more likely to emerge
>
> It evolved in people early on in the COVID outbreak. WHO report and modeling suggest spillover occurred in last few months of 2019. It could have easily been selected for as the virus spread from human-to-human during that early period
>
> It evolved after a progenitor bat-CoV spilled over into wildlife in farms in S. China. SARS-CoV-2 spillover into mink in Europe led to rapid evolution of strains that bore similarities to pangolin-CoVs. Mink strains then re-infected people in the Netherlands. Now, there's a report of mink clearing the virus, showing antibodies to SARS-CoV-2 and being reinfected later – all good evidence that farms full of raccoon dogs, ferret badgers and civets in S. China could have had circulation of SARS-CoV-2 for many months prior to it emerging.

Hope this all helps. One day, the research will be done and all this will be demonstrated. Unfortunately, the one group that had access to China to do this work (EcoHealth) is currently blocked from doing it!

Cheers,

Peter

Peter, I agree, and I think we should try to not use the term GOF, notly because it suggests something nefarious, but also, at least as I would define it, it doesnt apply to your work, as you just

MORENS_SUBPOENA_014719
MORENS_NIH_030370
REL0000478160

said. In my mind it doesn;'t apply to Ralph's work either.

Secondly, I re-read the Wade article carefully, and did NOT conclude that just about everything he said was wrong. I think it is the best researched, and most literate and thorough media article on the subject. BUT. I think it is biased and uses cherry-picked facts. Moreover, it tries to pretend non-bias in a disingenuous way.

In short, high order sophistry.

I am also troubled by David Baltimore's opinion that finding a furn-cleavage site indicates human manipulation. I suspect that may not be true, since these viruses hyper-circulate in bats and spillover into mammals and people frequently, and also frequently recombine in spike protein sequences. But I am not knowledgeable about such things. In this context, the idea of David Robertson, cited in the Wade article, is of particular interest: the idea that the precursor virus had become a "generalist" by long evolving through bats and mammals including humans. Something analogous happens with arboviruses, e.g., dengue, which serially pass through humans and mosquitos every couple weeks, and have to be well adapted to two very different alternating hosts.... d

most amusing - from House E&C Committee Republicans re. Zhengli's "Blah Blah" comment

EXTERNAL SENDER

Peter, I just tsalked to Ms. Eban for an hour, and connected her with Jim LeDuc and Jeff T. I also sent her a paper I and others wrote with David Baltimore 10 years ago about the BENEFITS of GOF research vis a vis the 1918 flu virus. To wit, the growing up of the virus and studying it in primate challenges, and in vitro, yielding hugely important info on flu pathogenesis.

Rich, this relates to my own feeling that GOF is a double-edged sword, so to speak, that while we must work to prevent dangerous use of virologic techniques, totally agree on that point, we must also consider that every infection of a cell, in tissue culture, organ culture, experimental animals, humans, whatever, is in essence a GOF experiment (and also a loss of fuinction experiment, since host adaptation usually results in ftness penalties), without which we would have no viral vaccines except vaccinia, and arguably not even that.

Her interest in David B results from his comments in the Wade article about the SARS-CoV-2 furin cleavage site, about which I am a tiny bit skeptical, not fully understanding the complexities of cleavage site evolutions in RNA viruses. I asked Jeff and his folks to comment. He and I had a discussion about David's comments yesterday, but I will let him follow up on that, since he has been thinking about RNA virus cleavge sites with respect to

MORENS_SUBPOENA_014721
MORENS_NIH_030372
REL0000478160

flu A and other viruses for over 20 years. It seems to be more complicated than one might think..

The Wade article also cites some ideas by a guy named David Robertson. Do you know him? I do not. But he posits that the SARS-CoV-2 precursor may have become a "generalist " by circulating between bats and mammals, maybe even humans. No eviodence for this, but the idea makes alot of sense to me. Plausible in my mind, what do u think?

David

On 5/7/2021 6:20 PM, Peter Daszak wrote:

The letter to Blinken includes the following statement:

“…the release of these documents from the Department could help to refute contradictory statements that have been made regarding the possibility of a

MORENS_SUBPOENA_014722
MORENS_NIH_030373
REL0000478160

laboratory leak from the WIV." This could be taken in a positive sense, that the documents will refute the lab release hypothesis, although I don't think that's how they mean it.

Regarding what Peter previously said about Shi's use of the phrase blah blah, which will surely be characterized as dismissive and therefore put into a negative perspective. I have access to a senior endowed full professor of Chinese politics at Harvard and I asked about the meaning of blah blah when a Chinese native speaker uses it while speaking English. Here is the answer:

"In my experience many Chinese mistakenly use "blah, blah" as equivalent to the Chinese term "deng, deng" which means "and so forth" and has no negative connotation."

So Peter was right, and now we know the Chinese term it is trying to translate, however awkwardly. This might be useful in any conversation with a report about her remarks or the Republicans letter.

Jerry

Re: Another letter - almost amusing - from House E&C Committee Republicans re. Zhengli's "Blah Blah" comment

Peter, i will reply eventually when i get some time, but until then, note yet another Josh Rogin editorial in this morning's Post, this time disclosing the Republican letter to Tony, which i have not yet seen and may or may not see. D

Sorry for yet another email, but this one is so bizarre it's almost funny. It's a letter from the House E&C Committee Republicans to Blinken asking him to release the classified intel that people in the Wuhan lab were sick prior to COVID, and that the WIV does military research. It quotes some comments from a recent talk my collaborator Zhengli Shi from the Wuhan Institute of Virology, gave during a lecture at Rutgers. Some of the online conspiracists heard about the talk in advance and they packed the audience – some of their questions from the chat were read out. Her response included a very common "blah blah" phrase used in China when speaking English – here's the quote:

During a March 23, 2021 seminar at Rutgers University, a WHO advisory committee member asked Dr. Shi if [knew].. whether "the U.S. government claims of classified Chinese military research being carried out at the WIV [are] correct, and if so, did you have full awareness of and access to all aspects of this research?"[4]

MORENS_SUBPOENA_014723
MORENS_NIH_030374
REL0000478160

Dr. Shi answered: From my knowledge, all our research work is open, is transparent. At the beginning of COVID-19, we heard the rumors that claimed our laboratory would have some project blah blah with army blah blah. . . but this is not correct, because I am the director and responsible for research activity. I don't know any kind of research work performed in this lab.5

This is ridiculous, of course, and they're obviously using that quote to suggest Dr. Shi doesn't take these questions seriously, but it's actually a racist trope – people in China use the phrase "blah blah" to simply mean "and so on, and so forth". Just unfortunate…

Cheers,

Peter

Subject: New: Letter from Republican Rep. Gallagher to Dr. Fauci re. WIV and gain of function
Importance: High

David,

A Republican representative sent a letter to Tony Fauci today asking some pretty simple questions that are clearly designed to play to their political base.

If Tony Fauci is going to respond to the attached letter that was made public today, I hope he's ready to point out that the work we did was NOT gain of function. This phrase has been bandied about now for a few months and is utterly incorrect.

If he decides to draft a response, I'd be happy to do a quick briefing with you and him to explain the work that has been done up to now with WIV, and was planned to be done on our NIAID grant.

Cheers,

Peter

The “Lab-leak” inquiry at the State Department:

Christopher Ashley Ford

1 hour ago·20 min read

An Open Letter by former Assistant Secretary Christopher Ford

(June 10, 2021)

In both journalism and policymaking –– if not always in politics, or in the sordid world of score-settling by unemployed, second-rate apparatchiks — facts matter, and intellectual integrity matters. In light of the remarkable quantity of errant nonsense that has been written in the last couple of weeks about squabbles inside the U.S. State Department about how to look into the origins of SARS-CoV-2 in the closing weeks of the Trump Administration, I hope this open letter will help set the record straight for those who still care about things such as facts.

I write this because, to put it bluntly, I’m tired of being the butt of stupid and paranoid conspiracy theories being promulgated by those who know better. I recognize that some of these conspiracy narratives are, for any thoughtful person, self-refuting even on their face. (As someone who has been warning the policy community since at least 2007 about threats to the United States and the democratic world from the Chinese Communist Party’s geopolitical ambitions — including in two scholarly books and scores of articles and speeches, including in official capacity at the State Department — have I been “protecting” the Chinese Communist Party from accountability? Good grief.)

Nevertheless, I’ve been around politics long enough to know that an imbecility that slots into a convenient narrative beats an awkward fact any day, and manic

MORENS_SUBPOENA_020172
MORENS_NIH_040696
REL0000478162

performative outrage is much more fun than sober analysis. So perhaps offering clarity here won't change a thing. Yet I'm still going to try.

I'm also going to try to do something unorthodox here. Rather than using this letter as an opportunity to invent and loudly dispense my own *post hoc* version of what happened — a dishonest revisionism-of-convenience that is in abundant supply, but that I will leave to others — I will try to offer you only specific claims that are supported by contemporaneous documents that enterprising journalists at Fox News and *Vanity Fair* have recently put into the public record.

Part One: A Clear Documentary Record

In particular, since the question at hand is my own particular role and position in connection with investigating the origins of the COVID-19 virus, I will refer to three unclassified documents that I myself wrote and sent to others at the State Department in early January 2021. (For the record, I did *not* retain these documents when I left the Department. Thankfully, however — at least for me — some of the lies being told on these topics have apparently caused offense among those who know what really happened and clearly *did* retain the documents.) I'm happy to see them in the public record, because they make very clear exactly what I was doing at the time, and why.

The documents are as follows:

1. An e-mail I sent to Tom DiNanno and David Asher on January 4, 2021, which can be found here thanks to Fox News;

2. An e-mail exchange between me and DiNanno on January 5–6, which can be found here thanks to Fox News; and

3. A message I sent to a number of senior State Department officials on January 8, which can be found here thanks to *Vanity Fair*.

Part Two: Pushing for an Honest and Defensible Lab-Leak Inquiry

So let me begin with a critical point. As detailed in these documents, the squabbling at the State Department was about trying to ensure that we got our facts straight before going public with dramatic steps such as having Secretary Pompeo announce that it was "statistically" impossible for SARS-CoV-2 to be anything other than the product of Chinese government manipulation, sending "demarches" to foreign governments with this theory, or writing up China for having violated the Biological Weapons Convention (BWC) in connection with COVID-19.

The dispute had nothing whatsoever to do with trying to quash investigation into the origins of the virus, and *everything* to do with trying to ensure the honesty and intellectual integrity of that investigation *precisely because* it was vital for us to get the bottom of the question of COVID "origins," including the possibility that it came from the Wuhan Institute of Virology (WIV). I strongly *supported* looking into the "lab-leak" hypothesis, which clearly is a real possibility.

But I'm not just saying this now. I said it at the time, too. A lot.

Let's look at the documents, starting with my January 4 e-mail to DiNanno and Asher. In that message, I highlight that the Arms Control, Verification and Compliance (AVC) Bureau's scientific "allegations about WIV and Chinese BW work allegedly being the source" of SARS-CoV-2 were "important" and "worrying," and that these significant claims needed to be evaluated by real scientific experts.

(Yes, I admit that I called the virus the "WuFlu." At a time before the World Health Organization had come up with "non-stigmatizing" designators such as "Alpha," and people talked freely about things like the "UK variant" or "South African variant," it didn't seem unfair to tag the original virus as having indeed come from Wuhan. I'm afraid at another point I called it the "KungFlu," too. None of this sounds as clever to me in retrospect as I fear it did at the time. But please remember that these were internal e-mails, not intended to see the light of day. Had I written these messages with an eye to public release, I would not have been so glib. *Mea culpa.*)

Anyway, in my e-mail, I reminded DiNanno and Asher that I had directed them, a

month or so earlier, to establish an "expert vetting group or process" that would involve real scientists and intelligence experts in assessing the strength of AVC's claims. But why, I asked them, had there been no progress in subjecting their assertions to peer review? And why were they running around the interagency spreading these allegations *before* we knew whether these claims could pass muster with objective, third-party scientists?

As I stated in that January 4 message, I wanted to "demand[] more transparency from the PRC here, especially in light of their appalling early cover-up of COVID-19 during the early weeks when honesty and resolute action could have made such a colossal difference in heading off millions of deaths and untold suffering, and in light of their grotesque history of such cover-ups."

"An investigation of [COVID] origins is very important," I reiterated, "and I'm delighted to press their feet to the fire for the honesty and clarity they've so far refused to provide."

In the January 4 message, however, I also stressed how important it was that we get our facts straight before going public, *as the U.S. Government*, with the accusation that the Chinese government created the virus:

"[W]e need to make sure what we say is solid and passes muster from real experts *before* we risk embarrassing and discrediting ourselves in public. … As I have repeatedly said, if it turns out that your conclusions are right, I'll happily be first in line to scream from the rooftops about them, for it would be a colossal outrage. And you may well *be* right. But I want to be confident about where the facts really lie …. These issues are surpassingly important and we need to get to the bottom of them — but rigorously, defensibly, and truly."

Hence my annoyance, expressed in that message, that DiNanno had been dragging his feet over my direction to "arrang[e] expert-level bioscience and intelligence vetting of David [Asher's] work." I warned DiNanno that such dithering looked bad: "Please don't continue to feed the impression that AVC is afraid of peer review."

And I insisted that he tell me when they actually planned to get those allegations vetted by real scientists. It's all there in the e-mail.

The next day, January 5, when I still hadn't heard back from DiNanno about how they would ensure that their scientific assertions got evaluated by actual scientists, I e-mailed him again. (This was the message at the bottom of the January 5–6 e-mail string Fox News published.) I'll admit I was grumpy, but I think I was also pretty clear about my focus on ensuring that we got our facts straight on this critical issue of COVID origins:

"It is … becoming embarrassing — and, if I may say so, more than a little worrisome — that AVC seems still to be ducking an expert-level engagement to evaluate its own WIV allegations, even while it has continued, over the last month or so, to brief its claims to non-experts across the interagency."

DiNanno responded to my January 5 message with platitudes about how all they were doing was "investigating potential arms control violations." (This is the middle message in the January 5–6 string.) "That Is [sic] exactly what we have done," he declared, "and will continue to do."

Let's pause here for a moment. If you're paying attention, you'll have noticed that with this comment about "investigating potential arms control violations," DiNanno signaled that AVC regarded itself as focusing not so much upon the origins of SARS-CoV-2, *per se*, as more specifically upon *China allegedly having violated the Biological Weapons Convention by creating the virus.* They seemed to believe that COVID-19 was a biological weapons (BW) effort gone awry — or perhaps even a BW agent *deliberately* unleashed upon the world after Beijing had secretly vaccinated its population, as Asher has rather remarkably suggested in public now that the State Department has terminated his consultancy contract. (You can see him in all his sober, cautious, and methodical glory on YouTube.) In this context, I suppose it was hardly surprising — as I memorialized in my January 4 e-mail to DiNanno — that in the December briefing when AVC first pitched me on their

WIV-origins theory, Asher at one point suggested that SARS-CoV-2 might be a "genetically selective agent" (GSA) that China was using to target us, as evidenced, he said, by the fact that Sub-Saharan Africa wasn't reporting many COVID cases while the United States was. (Surely you don't need me to spell out how that notion was both analytically unsupportable on its face *and* contained deeply offensive implications, do you? I'll leave you to work this out on your own, but, uh, wow.)

Fortunately, however, DiNanno also informed me in his January 5 response that AVC had now indeed set up a panel of experts to discuss the scientific claims, which would occur on Thursday evening, January 7. (Finally! As noted in my January 4 e-mail, I'd been demanding expert vetting of AVC's "statistical" argument since they first came to me with this issue in my office in December.)

As this panel approached, however, I wrote DiNanno again — on January 6 — to emphasize how important it was that we get real scientists to vet AVC's allegations before we surfaced such dramatic claims in public:

"As I indicated before, having something that sounds scientific to say when making assertions to laymen is not the same thing as being correct. I do not have the scientific expertise to critique David's claims. Nor do you. Nor, in fact, does he have actual technical training in the first place. That doesn't necessarily mean he's wrong, of course, but it does have implications for how to deal with the complex and controversial claims you guys are making about weedy bioscience. … If you're right, you should be willing to prove it, and to confront experts who — unlike all of the people involved in building and making this argument for you — actually have training in the scientific field about which you make assertions. I really don't know how I could possibly have been more clear about this over the course of the last month. Your allegations are dramatic, and potentially very significant indeed, but it's for precisely that reason that they need to be tested and evaluated carefully. …Your claims need to be assessed by real experts — not just waved around as bullet points on slide decks in front of non-scientists who are then dared to prove you

wrong."

It was particularly important to get real expert-level assessment of the scientific assertions AVC was making about laboratory origin because the AVC investigation appeared to have carefully *bypassed* State Department experts — both in my own bureau and in AVC itself, each of which has a whole *office* devoted to such questions — and the U.S. Intelligence Community. As I recounted in my January 8 message, "AVC ha[s] apparently been briefing this argument inside the Department and [to] some interagency partners for some weeks, apparently on instructions from a staffer at S/P [the Department's Office of Policy Planning] who told them they should not inform me or others of this work, nor involve the Intelligence Community."

(A footnote, but perhaps a significant one: That last bit about cutting real experts out of the loop came to me directly from Tom DiNanno. When I asked him why AVC had been doing all this without telling the senior official to whom they reported — that is, me — he told me sheepishly that he had been *instructed* to do things this way by Miles Yu, an S/P staffer at the time. According to DiNanno, Yu had represented that these specific instructions came from the Secretary. DiNanno, then in charge of the verification bureau, gave no sign of ever actually having verified that this was true, however. He appeared to have accepted Yu's representations at face value — in effect, a *de facto* Assistant Secretary of State taking marching orders from a lower-ranking staffer in another bureau, sight unseen. It would be interesting, now, to find out whether: (1) Secretary Pompeo *really* directed that AVC's lab-leak inquiry avoid engaging Departmental BW experts and U.S. intelligence officials, and that it do its work essentially in secret, without telling the official performing the duties of the Under Secretary for Arms Control and International Security; (2) Yu was, at least in this respect, dishonestly freelancing; or (3) DiNanno was just lying to me about his conversation with Yu. Perhaps a good journalist can go figure this out.)

Part Three: The Scientific Panel

Anyway, at least a first chance for scientific vetting came on January 7, when the

MORENS_SUBPOENA_020178
MORENS_NIH_040702
REL0000478162

panel of experts picked by the AVC Bureau had a chance to discuss the "statistical" proof that AVC had been relying upon in its assertions to me and others that the SARS-CoV-2 virus *had to have been* the product of Chinese government manipulation.

Unfortunately, as I memorialized the next day (January 8), despite my urging — in the last three paragraphs of my January 6 e-mail — that the other members of the panel "have … the benefit of actually being able to read the paper beforehand," AVC had not shared the document ahead of time. As I observed on January 8, "AVC did not provide us with the actual paper before yesterday's discussion, so most other participants had not had the chance to study it in detail."

Even so, it did not take the other panelists long to point out some key flaws in the "statistical" argument, which had been presented orally to the panel by the scientist upon whom AVC had apparently most relied in developing that line of argument. (His name is widely known, but I opted not to single him out in my message to Departmental colleagues. I felt that scientists should have some freedom to figure out the science amongst themselves; my concern was with what the *U.S. Government* would assert after they did. Rather than drag him personally into the fray, therefore, my memo reflected the fact that this man's claims had effectively become *AVC's argument* as the bureau promoted them in the interagency.)

I'll spare you the blow-by-blow of criticisms made by other panelists about the "statistical" case AVC had been making at least since the first briefing they gave me in my office in December, though you can read the salient details in the January 8 message I sent to a number of my senior State Department colleagues the next day. (My message focused on the statistical argument, given the prominence it had enjoyed in AVC's briefings; I did not purport to summarize the panel's discussion of all questions discussed.) As you'll see if you care to read my several-page account on January 8, the assertions AVC had been making seemed to have major problems. At the least, those assertions were clearly not *yet* ready to be the official position of the

MORENS_SUBPOENA_020179
MORENS_NIH_040703
REL0000478162

U.S. Department of State — which is why I sent that January 8 message warning my colleagues to be careful about running with that particular "statistical" claim.

I also now know, thanks to *Vanity Fair*, that DiNanno responded to my January 8 memo with one of his own a day or two later, after I had left the Department. The reader can find it online, so I won't walk through it here. In light of what you now know from documentary evidence about my *actual* positions at the time, however, you'll easily be able to see what a pack of distortions and falsehoods DiNanno's memo actually was. You might want to lay our two documents side by side and read them carefully in light of the information you now have. I suspect it will be pretty clear that his memo was a dishonest mess of baseless attacks on me — an angry screed addressed to readers whom DiNanno knew did not have the benefit of knowing what I'd *actually* been saying to him for the last month, and which he sent to his readers at a time when he knew I had resigned from the Department and would have no chance to defend myself and correct the record. (Thankfully, however, our bosses were intelligent folks. One can probably infer how seriously our superiors took DiNanno's memo by the fact that they apparently acted on my note of caution about AVC's scientific claims rather than on DiNanno's shrill and convoluted attempt to defend those assertions and paint me as the villain. More on that below.)

For purposes of this open letter, I'll leave the issues of science to any of you who are scientists. As I told DiNanno in my January 4 message, "I do not have the scientific expertise to critique David's claims. Nor do you. Nor, in fact, does he have actual technical training in the first place." That is *precisely* why I insisted that AVC set up a panel of experts, and why — after they finally got around to arranging this peer review on January 7 — it was my *duty* to convey to my colleagues some of the concerns raised by the experts AVC had put on the panel. It may in the end turn out that science *does* prove that SARS-CoV-2 was the result of human intervention at WIV. But it would have been grievously irresponsible for us to adopt that theory publicly until it was *much* more able to stand on its own two feet that the January 7 panel discussion showed it to be at the time.

MORENS_SUBPOENA_020180
MORENS_NIH_040704
REL0000478162

Part Four: Putting Absurd Accusations to Rest

Some of my former colleagues are now — perhaps, one imagines, out of embarrassment over all of the events described above — asserting that I tried to prevent inquiry into the lab-leak hypothesis and to shut down any investigation of the question. (Thanks to Tucker Carlson making this claim at least twice on the air, by the way, I've now gotten vicious and deranged hate mail. Here's, for instance, what I received on June 3 after Carlson first mentioned me on his show: "*Fuck you dickbag globalist shill. Why the fuck did you shut down the lab leak theory? Go lick some China communist boots*." This person helpfully signed this missive (b) (6) . Thanks for introducing me to new friends, Tucker.)

Yet no serious person who is actually aware of my interactions with AVC could possibly think I wanted to prevent inquiry into the laboratory hypothesis, as you will already have seen from my e-mails of January 4and January 5–6, from which I've quoted extensively here. (You can even read them online yourself, in their entirety.) You can also see that I was always crystal clear about the importance of getting to the truth by fully investigating the laboratory-leak question, making clear that "if it turns out that [AVC's] conclusions are right," I would myself "happily be first in line to scream from the rooftops about them."

Additional proof of my commitment to looking into WIV — and indeed my focus upon *protecting* efforts to investigate the laboratory-leak question from the discredit and ridicule that might have smothered it in its crib if we had foolishly hitched Secretary Pompeo, the Department of State, and the Administration to easily-debunkable junk science — can be found in my January 8 message itself. There, I made the point yet again:

"If well-founded, AVC's findings would be extremely significant …. All participants [in the January 7 panel] seemed … to agree that China should be pressed for answers about such things as the nature of any work done at WIV on novel coronaviruses, whether any safety incidents occurred, what data is in WIV's

MORENS_SUBPOENA_020181
MORENS_NIH_040705
REL0000478162

sequencing database (which was mysteriously taken offline early in the pandemic), and when exactly the PRC realized (despite its early representations) that SARS-CoV-2 was only in its 'wet market' environmental samples — and not in its live animal samples — leading them to conclude that the market was not the source of the outbreak. These sorts of questions should indeed provide us with lots of grist for pressing China for answers and highlighting its non-transparency and history of failing to report (or even covering up) critical information."

You'll also see from my January 8 message that I specifically directed "AVC and ISN [the International Security and Nonproliferation Bureau] to collaborate on drawing up a list of questions and points that could be useful in this regard" in pressing Beijing for answers. So were these the actions of a "dickbag globalist shill" who "licks … China communist boots"? Or of a serious steward of the honesty and intellectual integrity of U.S. State Department policymaking dedicated to ensuring we got our facts straight and pushing back against recklessness that would make it *harder* to have the lab-leak issue taken seriously? The reader can make up his or her own mind.

Part Five: A Net Assessment

So where does that leave us now?

Well, if you want to understand what I was trying to do during in this period of bickering inside the State Department, you now have my own words from internal contemporaneous records. Simply put, I felt it would be essentially *insane* to go public with AVC's scientific assertions — such as, as DiNanno and Asher had urged, making public statements, demarching foreign governments (including China), and finding China in violation of the Biological Weapons Convention over this coronavirus — before getting those scientific assertions vetted by objective, third-party scientists.

Let me be completely clear: From where I was sitting at the time, in the chair of the Under Secretary of State for Arms Control and International Security, I never saw

any evidence of *any* effort at the State Department to prevent inquiry into the lab-leak idea. To the contrary — as you can now see proven by documents in the public record — I *supported* looking into the lab-leak hypothesis. I cared so much about getting to the truth about WIV, in fact, that I insisted that we do the work in a way that could stand up to scrutiny. (If you're serious about something being done, you have an obligation to ensure it's done *right*. Wanting less than that just makes you a hack.) And I am aware of *no one anywhere* in the Department who thought that the laboratory hypothesis should be ignored or ruled out.

So there was no conspiracy to quash inquiry into the lab-leak question, at least not at the State Department. But there *was* a demand for intellectual rigor and analytically defensible conclusions in *doing* that important inquiry. For making that demand, however, I make no apologies. I was doing my duty.

What happened after that? Well, one might infer that my State Department superiors in fact *agreed* with the account in my January 8 message of the weaknesses that AVC's expert panel had pointed out in the supposed "statistical" proof that SARS-CoV-2 had to be the result of human intervention. Neither Secretary Pompeo nor any other serving U.S. official, after all, adopted and voiced the scientific assertions about WIV origin that AVC had previously been briefing to interagency stakeholders. Instead, Secretary Pompeo issued a "Fact Sheet" on January 15 that accurately recounted downgraded *intelligence reporting* we had received that seemed relevant to the question of whether COVID-19 had originated at the laboratory.

My superiors at the Department were not shy people, and I have no doubt that had they felt AVC's scientific assertions could pass muster with real scientists, they *absolutely* would have made this case in public, and loudly. They chose not to do so, however. I suspect that we should read into this their quiet endorsement of my conclusion that AVC's scientific case wasn't ready for prime time. (Perhaps someone can ask my former bosses what precisely they thought of the merit of

MORENS_SUBPOENA_020183
MORENS_NIH_040707
REL0000478162

AVC's "statistical" argument about genomic variation, and why — if it was indeed good science — they seem to have dropped those assertions. I can tell you only one thing about this with certainty: not pursuing AVC's "scientific" argument after the January 7 panel meeting wasn't *my* decision. By the end of the day on January 8, after sending my message of caution, I had left the Department. It would be interesting to know what discussions happened thereafter.)

But I do think that what happened next is important. Instead of focusing on purported "scientific proofs" of laboratory origin, public discussion of the COVID-origins issue thereafter shifted to the questions and suspicions that had been raised about WIV by our intelligence information, as outlined in Secretary Pompeo's "Fact Sheet ." This was, in my view, much the better way to go. Before leaving the Department, in fact, I had myself reviewed and cleared an early draft of that "Fact Sheet" as the downgraded information started to go around for interagency clearance, and I was glad to see it later emerge publicly on January 15. Tellingly, the Biden Administration has not questioned that information, and a robust debate is now underway about possible laboratory origin.

But let me be frank. Anyone who cares about ensuring that the lab-leak hypothesis is taken seriously should probably be *thanking* me, rather than vilifying me. I suspect that my push for scientific vetting of AVC's assertions actually helped *save* the lab-leak hypothesis from being preemptively discredited. The fact that we finally now have a credible public debate on the question owes much to the fact that pursuing these issues *wasn't* tainted by the State Department signing the U.S. Government's name to scientific assertions that we already knew hadn't stood up well to scrutiny.

I've been around the arms control and international security business for quite a while now, including spending 2003–06 as Principal Deputy Assistant Secretary in what is now the AVC Bureau. As I told someone the other day — an old and dear friend and former colleague who has now started demonizing me on the basis of the lies being spread about these issues — honesty, accuracy, and intellectual integrity

are the strongest weapons that an arms control verifier has. These things need to be safeguarded carefully, for they are priceless. They are what separates the truth-teller from the ideological crank.

I am heartsick at the ugliness of the campaign against me in the press today, but I remain proud of my role in insisting upon fidelity to these values at a time when some officials seemed to be slipping. I dearly hope that we can all now put fratricidal distractions aside and get back to the *real* task: figuring out what the hell happened in Wuhan.

Part Seven: Conclusion

The actual details of all this State Department infighting are, I'll admit, somewhat boring. They certainly don't map satisfyingly onto a moralistic narrative of redoubtable heroes fighting for right against malevolent cabals and institutional corruption. Nor are they well suited for spinning up rants of performative outrage by the occasional pundit disinclined to let little things like "truth" get in the way of the good Nielsen ratings that come from spinning a sexy narrative of deceit and conspiracy.

Nevertheless, these demonstrable facts about the positions I took at the time *are* clear in the record. If that's not important to you, you're reading the wrong letter, and I apologize for wasting your time.

If you've read this far, however, my guess is that facts are indeed important to you. So thanks for listening.

.....

Dr. Ford served until January 8, 2021, as Assistant Secretary of State for International Security and Nonproliferation, and for the last 15 months of that period also performed the duties of the Under Secretary of State for Arms Control and International Security. Prior to that service at the State Department, he ran the Weapons of Mass Destruction and Counterproliferation Directorate at the U.S.

National Security Council staff. A graduate of Harvard, Oxford University as a Rhodes Scholar, and the Yale Law School, Dr. Ford has been a think tank scholar, U.S. Navy intelligence officer, a staff member on five different U.S. Senate Committees, and a senior American diplomat. He is the author of two books on Chinese foreign relations and scores of articles on international security topics, and his personal website may be found at https://newparadigmsforum.com.

Thanks David,

I responded to Bruce Lee (the perfect name for a truth ninja warrior such as he) including a pdf of the PNAS paper at his City University email which was easy to obtain to a) congratulate him, and b) ultimately ask him if we can respond to his article in depth via an introduction to the editorial staff as I am tired of sending pointed well evidenced Op-Eds or editorials or opinions over the transom and then being ignored with a standard no thanks reply. Or if necessary via a letter to the editor. Let's see if he responds. I'm thinking the Task Force, all or some, might respond – actually maybe just the American members because of the uniquely American nature of this sort of rank political nonsense. I'm hoping Lee will reply.

Has anybody seen any comment from Burr regarding the outrageous attack on Nancy Pelosi's home, and the sole occupant at the time, her 82 year old husband Paul? I haven't and to me that is just the exclamation point on the assessment that his report is political and timed before the election, aside from the mile wide holes in the argument, so well-articulated by Bruce Lee.

Jerry

Sen. Richard Burr (R-N.C.), seen here on August 6, 2022 in Washington, DC., and his office came out ... [+]

Getty Images

These days anytime any politician makes any claims about Covid-19, you've got to wonder whether it's more about politics than real science. After all, throughout the pandemic, politics has infiltrated Covid-19 decision-making like botox in a reality TV star. So when the office of Senator Richard Burr (R-N.C.) dropped "An Analysis of the Origins of the COVID-19 Pandemic Interim Report," just two weeks before the midterm election, you've gotta wonder whether this report was more about politics than actually determining what really happened.

After all, in the report, Burr did indicate that last Summer he and Senator Patty Murray (D-Washington) "announced a bipartisan Health, Education, Labor and Pensions (HELP) Committee oversight effort into the origins of SARS-CoV-2, the virus that caused the COVID-19 pandemic as part of our effort to address pandemic preparedness and response programs." Dictionary.com defines bipartisan as "representing, characterized by, or including members from two parties or factions," and not "screw it, why don't I just issue a report myself?" It's also interesting why such a interim report would be issued so quickly now before it's been properly vetted by the scientific community. Why the rush? And why wasn't there more of a heads up to everyone that this would be on its way? Was this designed to be a Halloween scare? Or maybe just maybe the midterm elections had something to do with it?

Plus, this interim report drew some pretty strong conclusions that usually would require a lot more supporting scientific evidence than the report actually provided. What's a strong conclusion? How about, "Based on the analysis of the publicly available information, it appears reasonable to conclude that the Covid-19 pandemic was, more likely than not, the result of a research-related incident." Yeah, that statement certainly has drawn headlines and attention on social media. The phrase "more likely than not" sounds fairly definitive. For example, if you were to tell your significant other that "based on analysis of publicly available information, it appears reasonable to conclude that you are more likely than not a cheater," you had better more likely than not provide enough specific concrete evidence to justify such a claim. Otherwise all of your possessions including your butt would more likely than not end up on the street. Similarly, this report seemed to be claiming that the evidence is already strong enough to conclude that a lab leak started the Covid-19 pandemic. But what evidence did the report then provide? Well, here's a hint. It rhymes with "Not a troll bot." Yes, not a whole lot.

Did any real scientists develop, vet, and support the findings of this Interim Report?

Let's take a look at what some real scientists who have real expertise in this area said on Twitter about this report. Spoiler alert: some expletives more likely than not emerged. For example, Kristian G. Andersen, PhD, a Professor of Immunology and Microbiology at Scripps Research, used the

MORENS_SUBPOENA_002154
MORENS_NIH_008622
REL0000478164

phrase "Flood the zone with bull [bleep]" when referring to what's going on with this report: And Peter Hotez, MD, PhD, Dean of the National School of Tropical Medicine, wrote, "My view: a total load of antiscience [bleep]," in the following tweet:

To adapt the words from that song in the movie *Bring It On*, Burr, it's cold in here— with here being real scientists' reaction to the report. Bull-bleep and antiscience bleep weren't exactly words of endorsement. Hotez also provided some real scientific papers describing how the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) may have jumped from other animals to humans and the evidence supporting such a natural jump:

Speaking of real scientists. Were any real scientists involved in developing and reviewing Burr's interim report? Well, the cover of the report bore the names Minority Oversight Staff, Senate Committee on Health Education, Labor and Pensions, which was a fancy way of saying that it was compiled by the office of Burr. The report didn't really list any other authors or contributors other than Burr. So, assuming that Burr himself didn't compile and write everything like a high schooler doing a book report, it's unclear who actually did the research and writing for this report. The report didn't really clearly delineate what process was used to assemble and review the available evidence, who determined what should and shouldn't considered, or how the report was vetted either.

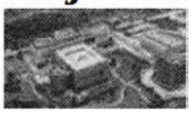
What counterarguments did this Interim Report provide against evidence that the SARS-CoV-2 had jumped from other animals?

That being said did the report at least provide some strong arguments to support its conclusions? Well, the first of the four sections attempted to offer some kind of counter to the existing evidence of a natural animal original of the SARS-CoV-2 without even mentioning that evidence. That was sort of the "I'm going to ignore what you have said and provide only my side of the story" tactic. This section basically presented six arguments that were weak at best. The first two arguments were essentially the same: that the intermediate host animal species—meaning the intermediate between bats and humans—for SARS-CoV-2 hasn't yet been found. That argument would hold water about as well as a fish net thong.

It's been only about three years since the Covid-19 pandemic first broke. Science rarely can move that quickly, especially when Congress isn't providing nearly enough funding to support the needed studies. It can be challenging to find such a intermediate animal host species. It's not as if you can post a message on Twitter or Facebook saying, "hey all animals, come by and get tested for SARS-CoV-2 or some virus similar to it" or "hey, did you host this virus before passing it along to us humans? Come one, you can tell us." Plus, scientists around the world have been kind of busy with something called, you know, the Covid-19 pandemic. So unless Burr and his Senate colleagues want to provide much more support and funding to help find the intermediate host species, "you haven't found it yet," really isn't a very strong argument.

The third argument provided was that the "SARS-CoV-2's high binding affinity for human ACE2 receptors suggests that it is possible for it to directly infect humans without needing a period of adaptation in an intermediate host." In other words, the virus took to humans so well, it couldn't have jumped from other animals. That's a bit like saying, "hey, that velour track suit fits you so well that it was probably tailored specifically for you." Such an argument doesn't pass much muster because it wasn't clear what the virus was doing before the start of 2020. Weaker versions of the virus could have very well been spreading between other animals and humans long before late 2019 and early 2020. The world didn't have much of a surveillance system in place to really track what every possible viral threat was doing before 2020. It still doesn't have such a system.

The section's fourth argument was that Wuhan, China, seemed to be the only place where the virus may have jumped from non-humans to humans. The claim was that if the virus had jumped from other animals to humans, why didn't such jumps occur elsewhere as well. Again, all of this assumes that the world already had great global surveillance systems in place that could readily determine exactly where and how everyone had gotten infected with the SARS-CoV-2. Yeah try doing that when there's been well over 630 million Covid-19 cases around the world so far. And that's not even counting those folks who never ended up getting tested.



The fifth argument was similar to the fourth, claiming that "After the unidentified source transmitted SARS-CoV-2 to humans, it stopped transmitting SARS-CoV-2." Again, this has never been established. With so many cases emerging every day, it's difficult to say who caught the virus from where. The Covid-19 pandemic is not the same situation as the 2002-2004 SARS and the 2013 avian influenza A (H7N9) outbreaks where there were a lot fewer cases so that infections and

MORENS_SUBPOENA_002155
MORENS_NIH_008623
REL0000478164

transmission chains were a lot easier to track.

The sixth argument was that "The low genetic diversity of the earliest SARS-CoV-2 samples suggests that the COVID-19 pandemic is most likely the result of a single successful spillover of SARS-CoV-2." That's not exactly true. Plus, once again, the lack of a comprehensive surveillance system means that cases may have been missed early on in 2020 and before that time. Moreover, even if the pandemic had started with a single spillover event, how exactly would that prove that it was lab-leak rather than a natural spillover event that triggered the whole pandemic? All of these arguments didn't seem to be that scientific, which raises the question again, what specific scientists contributed to this interim report.

Did the Wuhan Institute of Virology actually have major safety concerns as the Interim Report claimed?

This aerial view shows the P4 laboratory (L) on the campus of the Wuhan Institute of Virology in ... [+]

AFP via Getty Images

The second section of the report tried to paint a picture of the Wuhan Institute of Virology (WIV) as a place with numerous safety concerns and incidents. It did include brief descriptions of events and items that you probably normally wouldn't find at your home, assuming that you don't regularly sleep and shower at a Biosafety Level (BSL) 3 or 4 laboratory. So all of these could have sounded ominous and scary to the general public or anyone else who doesn't conduct virology experiments on regular basis.

So, assuming that Burr and his staff aren't running enzyme linked immunosorbent assays in their Congressional offices, wouldn't it have been better to ask a real laboratory scientist who regularly works with viruses to put together that section? Angela Rasmussen, PhD, a virologist at the Vaccine and Infectious Disease Organization at the University of Saskatchewan in Canada, would qualify as such an expert. So let's turn to Rasmussen's tweet thread about this section of the Burr report:

As you can see, Rasmussen's tweet stated that the report "claims to show evidence of multiple biocontainment breaches. That sounds very bad! But how reliable is this evidence?" Her tweet thread went on to review each thing listed in this section of Burr's report and explain how much of it seemed pretty normal for such a lab to her:

For example, Rasmussen explained how procuring a vaporized hydrogen peroxide system to disinfect air coming from the lab and renovating the HVAC system were not evidence of biosafety failures but instead business-as-usual:

A little later in the tweet thread, Rasmussen concluded, "No evidence of a breach or biosafety failure, but lots of evidence that they were operating a containment lab in a pretty standard way, with one exception: WIV was more innovative than many others and patented some of the bespoke systems they developed," as you can see here:

Rasmussen went on to assess what was written in the report about the working conditions, training, and management at WIV and determined that "No evidence of a biocontainment breach or a biosafety failure, other than lab leak fan fiction invented by people with no clue about how biosafety actually works reading documents that reflect the daily considerations & challenges of operating a containment lab," at the conclusion of her tweet thread:

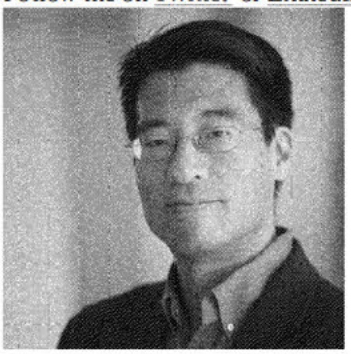
Remember you can make anything sound scary when describing it in a certain way to people not familiar with the situation. Imagine relating the details of a high school football practice to someone who has never ever seen football. You could talk about high speed collisions, violence, things getting intercepted, jock straps, and people slapping each other on their butts in a manner that could prompt someone to say, "what the bleep is going on? Call the authorities."

Is it relevant that China developed Covid-19 vaccines faster than the U.S. did with Operation Warp Speed?

The third section presented a rather weird argument. It pointed out that teams in China were able to develop and start administering Covid-19 vaccines faster than Operation Warp Speed could in the U.S. The section tried to suggest that the only way the teams in China were able to move more quickly was if they had access to genomic sequences of the SARS-CoV-2 much earlier.

MORENS_SUBPOENA_002156
MORENS_NIH_008624
REL0000478164

Hmm, that sounds a little like the "they beat us, therefore, they must have cheated" argument. While Operation Warp Speed did result in Covid-19 vaccines at the end of 2020, it was by no means a perfectly run operation. For example, it July 2020, Jon Cohen wrote for *Science* magazine an article entitled "Operation Warp Speed's opaque choices of Covid-19 vaccines draw Senate scrutiny." And in December 2020, I covered for *Forbes* a range of supply chain and distribution missteps made by Operation Warp Speed. In general, the word well-oiled machine didn't seem to apply the Trump Administration's response to the Covid-19 pandemic in 2020. Moreover, it's not clear what shortcuts the teams from China may have taken in order to get Covid-19 vaccines out there sooner. For example, did they do the same about of human testing as Pfizer-BioNTech and Moderna did before rolling out vaccines to the general public.



One thing's clear. The government of China wasn't as open and transparent to the rest of the world as they could have and probably should have been about the SARS-CoV-2 outbreak in late 2019 and early 2020. The first reports of this "mysterious pneumonia" emerged late in December 2019 and very early in January 2020, as I reported for *Forbes* on January 3, 2020. The government of China likely knew more about the virus and its deadly nature at the time. If that were indeed the case, then China's government chose poorly and should have been more forthcoming to get help from the international community. It is very fair to criticize China's government for withholding information and not being more cooperative. But again all of this does not necessarily mean that the Covid-19 pandemic started with a lab leak.

Did the development and release of the Interim Report follow a scientific process?

All in all, this so-called "Analysis of the Origins of the COVID-19 Pandemic Interim Report" didn't seem to follow many of the steps and criteria needed for a truly scientific report. It didn't even fulfill basic criteria such as clearly describing the methods employed or identifying the people who did the analyses and wrote the report. Whenever you don't transparently describe how you chose what evidence to consider and not consider, you've gotta wonder how much cherry-picking happened. While cherry-picking may be great when you are making a pie, selectively choosing what evidence to follow and not follow is just not appropriate scientifically.

If Congress really wants to shed more light on the actual origins of the Covid-19 pandemic, it would commission and fund a panel of real and most importantly independent scientific experts to compile the report. At the same time, Congress members would then stay clear of this panel to avoid the perception that they are applying any political pressure to see a particular outcome. The U.S. has been leading the world in Covid-19 cases and deaths throughout the pandemic in big part of its failure to consistently follow science and instead defer to politics. And in the end, while politics may cover up to a degree what the virus does, only real science will be able to work against the SARS-CoV-2 and any future viral threats.

I've got my emails to scan through now and so far the most embarrassing thing is that I call Francis Collins a "Wet Lettuce".

Other than that, it's the usual behind the scenes sniping and backchat that gossipy outlets like The Intercept love to publish.

I'm sure there'll be worse to come, including me stating that the WHO DG actively interfered with the WHO origins report. Of course, nothing that's not true, just disappointing that it'll be bared for the world to see, so that they can make up heinous stories about it.

Cheers,

Peter

This is part of a continuing saga of BS that's something to do with how when you use a certain type of sequencing machine, you get partial bleeds from other samples including previously used. It's extremely common and not at all interesting. It's also not a 'menagerie of viruses' – these are cDNA read outs from a sequencer (or something).

I checked this out previous with Eddie Holmes, Kristian Andersen and a bunch of other well-known virology genetics folks. These people are really scraping the bottom of the barrel!

Worst of all, it's a preprint, which means it might actually get published somewhere and sully the scientific system. It happened with another paper a few weeks ago that was published in American Chemical Society transactions or something. Zhengli, Linfa, Angela Rasmussen, Bob Garry and me wrote in demanding it be retracted – we'll see how that goes…

Cheers,

Peter

REL0000478174

News provided by
Dr. Steven Quay
Jul 26, 2021, 09:00 ET

SEATTLE, July 26, 2021 /PRNewswire/ -- Physician-Scientist Steven Quay and a group of international scientists have published a pre-print, available here, entitled, "CONTAMINATION OR VACCINE RESEARCH? RNA Sequencing data of early COVID-19 patient samples show abnormal presence of vectorized H7N9 hemagglutinin segment." In the paper, a forensic examination of the sequencing data from five COVID-19 bronchial lavage patient specimens reveals that the laboratory at the Wuhan Institute of Virology (WIV) was contaminated with a wide range of viruses, including Nipah virus genes in a cloning vector. Nipah is a BSL-4 pathogen with a lethality of 50% to 92%. A video summary of the paper can be found here.
The highlights of the paper are:

- Five patient specimens were sequenced by the WIV in December 2019 and were part of an early report on SARS-CoV-2 published by Dr. Zhengli Shi and colleagues (Nature 579, 270–273 (2020). This paper has been viewed over one million times, making it one of the most highly read papers on the pandemic virus.
- The most abundant contaminant is an undisclosed H7N9 influenza vaccine, which in one specimen is over six-times as abundant as SARS-CoV-2.
- The Nipah virus gene sequences were found in infectious cloning vectors of the type used for genetic manipulation.
- Nineteen other contaminants, including Japanese Encephalitis virus, HIV, human T-cell leukemia virus, and hepatitis delta virus were found.

"It was surprising to find a menagerie of deadly viruses, strange pathogens, and even honeysuckle, plant genes in patient specimens sequenced at the WIV in December 2019, especially since this patient sequencing data has been publicly available to the entire scientific community inside of the US NIH GenBank database since February 2020," stated Dr. Steven Quay, MD, PhD. "The apparent widespread contamination of the laboratory at the very time the pandemic was just beginning is of course worrisome. But more important is getting answers to these questions: Why do these patient specimens contain an unreported influenza vaccine? What was the purpose of creating an undisclosed, apparently infectious clone of the deadly Nipah virus? Is this Nipah research part of another gain-of-function research project at the Wuhan Institute of Virology?"

About the Nipah Virus

Nipah virus, scientific name *Nipah henipavirus*, is a bat-borne virus that causes an infection in humans and other animals, with a high mortality rate. Numerous disease outbreaks caused by Nipah virus have occurred in South and Southeast Asia. Symptoms from infection vary from none to fever, cough, headache, shortness of breath, and confusion. This may worsen into a coma over a day or two, and 50% to 92% of those infected die. Complications can include inflammation of the brain and seizures following recovery. At this time there is no specific treatment for Nipah virus infection nor is there a vaccine..

About Steven Quay, M.D., Ph.D.

Dr. Steven Quay has over 360 published contributions to medicine and has been cited over 10,500 times, placing him in the top 1% of scientists worldwide. He holds 87 US patents and has invented seven FDA-approved pharmaceuticals which have been prescribed to over 80 million people. He is the author of the best-selling book on surviving the pandemic, Stay Safe: A Physician's Guide to Survive Coronavirus. He is the CEO of Atossa Therapeutics Inc. (Nasdaq: ATOS), a clinical-stage biopharmaceutical company developing novel therapeutics for oncology and infectious diseases.
He received his M.D. and Ph.D. from The University of Michigan, was a postdoctoral fellow in the Chemistry Department at MIT with Nobel Laureate H. Gobind Khorana, a resident at the Harvard-MGH Hospital, and spent almost a decade on the faculty of Stanford University School of Medicine. A TEDx talk he delivered on breast cancer prevention has been viewed over 220,000 times. His scientific manuscript entitled, "A Bayesian analysis concludes beyond a reasonable doubt that SARS-CoV-2 is not a natural zoonosis but instead is laboratory derived," has been viewed over 175,000-times. Award e-mailed to: (b) (6)

Period Of Performance:
Budget Period: 06/17/2020 – 05/31/2021
Project Period: 06/17/2020 – 05/31/2025

Dear Business Official:

The National Institutes of Health hereby revises this award (see "Award Calculation" in Section I and "Terms and Conditions" in Section III) to ECOHEALTH ALLIANCE, INC. in support of the above referenced project. This award is pursuant to the authority of 42 USC 241 31 USC 6305 42 CFR 52 and is subject to the requirements of this statute and regulation and of other referenced, incorporated or attached terms and conditions.

Acceptance of this award including the "Terms and Conditions" is acknowledged by the grantee when funds are drawn down or otherwise obtained from the grant payment system.

Each publication, press release, or other document about research supported by an NIH award must include an acknowledgment of NIH award support and a disclaimer such as "Research reported in this publication was supported by the National Institute Of Allergy And Infectious Diseases of the National Institutes of Health under Award Number U01AI151797. The content is solely the responsibility of the authors and does not necessarily represent the official views of the National Institutes of Health." Prior to issuing a press release concerning the outcome of this research, please notify the NIH awarding IC in advance to allow for coordination.

Award recipients must promote objectivity in research by establishing standards that provide a reasonable expectation that the design, conduct and reporting of research funded under NIH awards will be free from bias resulting from an Investigator's Financial Conflict of Interest (FCOI), in accordance with the 2011 revised regulation at 42 CFR Part 50 Subpart F. The Institution shall submit all FCOI reports to the NIH through the eRA Commons FCOI Module. The regulation does not apply to Phase I Small Business Innovative Research (SBIR) and Small Business Technology Transfer (STTR) awards. Consult the NIH website http://grants.nih.gov/grants/policy/coi/ for a link to the regulation and additional important information.

If you have any questions about this award, please contact the individual(s) referenced in Section IV.

Sincerely yours,

MORENS_SUBPOENA_013828

SECTION II – PAYMENT/HOTLINE INFORMATION – 1U01AI151797-01 REVISED

For payment and HHS Office of Inspector General Hotline information, see the NIH Home Page at http://grants.nih.gov/grants/policy/awardconditions.htm

SECTION III – TERMS AND CONDITIONS – 1U01AI151797-01 REVISED

This award is based on the application submitted to, and as approved by, NIH on the above-titled project and is subject to the terms and conditions incorporated either directly or by reference in the following:

a. The grant program legislation and program regulation cited in this Notice of Award.
b. Conditions on activities and expenditure of funds in other statutory requirements, such as

MORENS_SUBPOENA_013830
MORENS_NIH_026172
REL0000478177

those included in appropriations acts.
c. 45 CFR Part 75.
d. National Policy Requirements and all other requirements described in the NIH Grants Policy Statement, including addenda in effect as of the beginning date of the budget period.
e. Federal Award Performance Goals: As required by the periodic report in the RPPR or in the final progress report when applicable.
f. This award notice, INCLUDING THE TERMS AND CONDITIONS CITED BELOW.

(See NIH Home Page at http://grants.nih.gov/grants/policy/awardconditions.htm for certain references cited above.)

Research and Development (R&D): All awards issued by the National Institutes of Health (NIH) meet the definition of "Research and Development" at 45 CFR Part§ 75.2. As such, auditees should identify NIH awards as part of the R&D cluster on the Schedule of Expenditures of Federal Awards (SEFA). The auditor should test NIH awards for compliance as instructed in Part V, Clusters of Programs. NIH recognizes that some awards may have another classification for purposes of indirect costs. The auditor is not required to report the disconnect (i.e., the award is classified as R&D for Federal Audit Requirement purposes but non-research for indirect cost rate purposes), unless the auditee is charging indirect costs at a rate other than the rate(s) specified in the award document(s).

Carry over of an unobligated balance into the next budget period requires Grants Management Officer prior approval.

This award is subject to the requirements of 2 CFR Part 25 for institutions to receive a Dun & Bradstreet Universal Numbering System (DUNS) number and maintain an active registration in the System for Award Management (SAM). Should a consortium/subaward be issued under this award, a DUNS requirement must be included. See http://grants.nih.gov/grants/policy/awardconditions.htm for the full NIH award term implementing this requirement and other additional information.

This award has been assigned the Federal Award Identification Number (FAIN) U01AI151797. Recipients must document the assigned FAIN on each consortium/subaward issued under this award.

Based on the project period start date of this project, this award is likely subject to the Transparency Act subaward and executive compensation reporting requirement of 2 CFR Part 170. There are conditions that may exclude this award; see http://grants.nih.gov/grants/policy/awardconditions.htm for additional award applicability information.

In accordance with P.L. 110-161, compliance with the NIH Public Access Policy is now mandatory. For more information, see NOT-OD-08-033 and the Public Access website: http://publicaccess.nih.gov/.

In accordance with the regulatory requirements provided at 45 CFR 75.113 and Appendix XII to 45 CFR Part 75, recipients that have currently active Federal grants, cooperative agreements, and procurement contracts with cumulative total value greater than $10,000,000 must report and maintain information in the System for Award Management (SAM) about civil, criminal, and administrative proceedings in connection with the award or performance of a Federal award that reached final disposition within the most recent five-year period. The recipient must also make semiannual disclosures regarding such proceedings. Proceedings information will be made publicly available in the designated integrity and performance system (currently the Federal Awardee Performance and Integrity Information System (FAPIIS)). Full reporting requirements and procedures are found in Appendix XII to 45 CFR Part 75. This term does not apply to NIH fellowships.

Treatment of Program Income:

MORENS_SUBPOENA_013831
MORENS_NIH_026173
REL0000478177

SECTION IV – AI Special Terms and Conditions – 1U01AI151797-01 REVISED

Clinical Trial Indicator: No
This award does not support any NIH-defined Clinical Trials. See the NIH Grants Policy Statement Section 1.2 for NIH definition of Clinical Trial.

REVISED AWARD:

Subaward Agreement Requirements: The ECOHEALTH ALLIANCE, INC. must provide NIAID with copies of all (existing and newly established) subaward agreements established under this award, including descriptions of the biosafety monitoring plans, within 30 days of establishment.

Federal Funding Accountability and Transparency Subaward Reporting System (FSRS) Requirements: This award is subject to the Transparency Act subaward reporting requirement of 2 CFR Part 170, which must be reported through the Federal Funding Accountability and Transparency Subaward Reporting System (FSRS). The ECOHEALTH ALLIANCE, INC. must provide NIAID with proof of documentation of timely entries of subaward information into the FSRS within 30 days of submitting to FSRS.

Supersedes previous Notice of Award dated **06/17/2020**. All other terms and conditions still apply to this award.

+++++++

This award does not include funds to support research subject to the *Department of Health and Human Services Framework for Guiding Funding Decisions about Proposed Research Involving Enhanced Potential Pandemic Pathogens* (DHHS P3CO Framework) Therefore:

- For Aim 1: Identify, characterize and rank spillover risk of high zoonotic potential viruses from wildlife, the building of chimeric SARS-like bat coronaviruses will be based on the SHC014 or the pangolin coronavirus molecular clones and the building of chimeric MERS-CoV will be based on the HKU5 strain. Prior to further altering the mutant viruses you must provide NIAID with a detailed description of the proposed alterations and supporting evidence for the anticipated phenotypic characteristics of each virus.
- Alternative approaches to those referenced above, including building chimeras based on SARS-CoV-1, SARS-CoV-2, and MERS-CoV, may be subject to the DHHS P3CO Framework and must be submitted to NIAID for review and approval prior to the work commencing.

If any of the experiments proposed for Aim 1 result in a virus with a phenotype of enhanced pathogenicity and/or transmissibility, enhanced growth by more than 10 fold when compared to wild type strains, or if the mice display significant increases in weight loss, viral titer, or mortality when compared to wild-type strains, the recipient must immediately stop the work and notify the NIAID Program Officer, Grants Management Specialist, and appropriate institutional biosafety committee. Policy changes regarding the classification of these experiments or components used in these experiments may be subject to immediate halting of experimentation. No NIH funding can be used to perform such experiments until these experiments have been approved by NIAID with a revised NOA.

****
Dissemination of study data will be in accord with the Recipient's accepted genomic data sharing plan as stated on page(s) **373** of the application. Failure to adhere to the sharing plan as mutually agreed upon by the Recipient and the NIAID may result in Enforcement Actions as described in the NIH Grants Policy Statement.

****
This award includes human subject research studies and must conform to the DHHS policies for the Protection of Human Subjects research, which are a term and condition of award. Human subjects research is covered by the 2018 Common Rule, and may not be initiated until the associated protocols have received IRB approval as specified in 45 CFR 46. Failure to comply

MORENS_SUBPOENA_013832
MORENS_NIH_026174
REL0000478177

with the terms and conditions of award may result in the disallowance of costs and/or additional enforcement actions as outlined in Section 8.5 of the NIH Grants Policy Statement.

****

The Research Performance Progress Report (RPPR), Section G.9 (Foreign component), includes reporting requirements for all research performed outside of the United States. Research conducted at the following site(s) must be reported in your RPPR:

Jeppesen Field Consulting Australia - AUSTRALIA
Conservation Medicine Ltd. - MALAYSIA
Duke-NUS Medical School - SINGAPORE
Chulalongkorn University - THAILAND

****

This award may include collaborations with and/or between foreign organizations. Please be advised that short term travel visa expenses are an allowable expense on this grant, if justified as critical and necessary for the conduct of the project.

****

This Notice of Award (NoA) includes funds for activity with **Conservation Medicine Ltd.** - **MALAYSIA** in the amount of **$224,997** (**$208,331** direct costs **+ $16,666** F&A costs).

****

This Notice of Award (NoA) includes funds for activity with **Duke-NUS Medical School - SINGAPORE** in the amount of **$108,000** (**$100,000** direct costs + **$8,000** F&A costs).

****

This Notice of Award (NoA) includes funds for activity with **Chulalongkorn University - THAILAND** in the amount of **$215,944** (**$199,948** direct costs **+ $15,996** F&A costs).

****

This Notice of Award (NoA) includes funds for activity with **The University of North Carolina at Chapel Hill** in the amount of **$194,375** (**$125,000** direct costs **+ $69,375** F&A costs).

****

This Notice of Award (NoA) includes funds for activity **The Henry M. Jackson Fdn. for the Adv'mt. of Mil. Med., Inc**. in the amount of **$114,373** (**$75,000** direct costs **+ $39,373** F&A costs).

****

In accordance with the NIAID Financial Management Plan, NIAID does not provide funds for inflationary increases. Committed future year (s) funding was adjusted accordingly. See: https://www.niaid.nih.gov/grants-contracts/financial-management-plan.

****

This award is issued as a Cooperative Agreement, a financial assistance mechanism in which substantial NIH scientific and/or programmatic involvement is anticipated in the performance of the activity. This award is subject to the Terms and Conditions of Award as set forth in Section VI: Award Administrative Information of **RFA AI-19-028**, "**Emerging Infectious Diseases Research Centers**," posted date **3/5/2019**, which are hereby incorporated by reference as special terms and conditions of this award.

This RFA may be accessed at: http://grants.nih.gov/grants/guide/index.html

****

This award is subject to the Clinical Terms of Award referenced in the NIH Guide for Grants and Contracts, July 8, 2002, NOT AI-02-032. These terms and conditions are hereby incorporated by reference, and can be accessed via the following World Wide Web address: https://www.niaid.nih.gov/grants-contracts/niaid-clinical-terms-award All submissions required by the NIAID Clinical Terms of Award must be forwarded electronically or by mail to the responsible NIAID Program Official identified on this Notice of Award.

Select Agents:

MORENS_SUBPOENA_013833
MORENS_NIH_026175
REL0000478177

Awardee of a project that at any time involves a restricted experiment with a select agent, is responsible for notifying and receiving prior approval from the NIAID. Please be advised that changes in the use of a Select Agent will be considered a change in scope and require NIH awarding office prior approval. The approval is necessary for new select agent experiments as well as changes in on-going experiments that would require change in the biosafety plan and/or biosafety containment level. An approval to conduct a restricted experiment granted to an individual cannot be assumed an approval to other individuals who conduct the same restricted experiment as defined in the Select Agents Regulation 42 CFR Part 73, Section 13.b (http://www.selectagents.gov/Regulations.html).

Highly Pathogenic Agent:
NIAID defines a Highly Pathogenic Agent as an infectious Agent or Toxin that may warrant a biocontainment safety level of BSL3 or higher according to the current edition of the CDC/NIH Biosafety in Microbiological and Biomedical Laboratories (BMBL) (http://www.cdc.gov/OD/ohs/biosfty/bmbl5/bmbl5toc.htm). Research funded under this grant must adhere to the BMBL, including using the BMBL-recommended biocontainment level at a minimum. If your Institutional Biosafety Committee (or equivalent body) or designated institutional biosafety official recommend a higher biocontainment level, the highest recommended containment level must be used.
When submitting future Progress Reports indicate at the beginning of the report:

If no research with a Highly Pathogenic Agent or Select Agent has been performed or is planned to be performed under this grant.

If your IBC or equivalent body or official has determined, for example, by conducting a risk assessment, that the work being planned or performed under this grant may be conducted at a biocontainment safety level that is lower than BSL3.

If the work involves Select Agents and/or Highly Pathogenic Agents, also address the following points:

Any changes in the use of the Agent(s) or Toxin(s) including its restricted experiments that have resulted in a change in the required biocontainment level, and any resultant change in location, if applicable, as determined by your IBC or equivalent body or official.

If work with a new or additional Agent(s)/Toxin(s) is proposed in the upcoming project period, provide:

- A list of the new and/or additional Agent(s) that will be studied;
- A description of the work that will be done with the Agent(s), and whether or not the work is a restricted experiment;
- The title and location for each biocontainment resource/facility, including the name of the organization that operates the facility, and the biocontainment level at which the work will be conducted, with documentation of approval by your IBC or equivalent body or official. It is important to note if the work is being done in a new location.

STAFF CONTACTS

The Grants Management Specialist is responsible for the negotiation, award and administration of this project and for interpretation of Grants Administration policies and provisions. The Program Official is responsible for the scientific, programmatic and technical aspects of this project. These individuals work together in overall project administration. Prior approval requests (signed by an Authorized Organizational Representative) should be submitted in writing to the Grants Management Specialist. Requests may be made via e-mail.

Thanks, Peter. Yes, the FOIA thing occurred to me too. I find the Frank and candid sharing of info really helpful. I also apologised separately to Maria. She shouldn't have been in the thread. Also explained the ensuing convo was actually positive and constructive. Suspect she's just worn out and super sensitive.

Hi all – just catching up with emails after a few days off and wanted to make sure you don't get caught out in FoIAs – Above is David Morens' gmail address that's not Foia-ble. Also I've taken Peter Ben Embarek and Maria Van Kerkhove off this email chain in case they were put on accidentally, and so no one gets caught out criticizing them!

Cheers,

Peter

Subject: Re:Fwd:Economist - Shared Article 'Putting it all together'

"The virus mystery" broadcast on August 12th, drew uncommonly wide attention for a Danish television documentary. That was because it featured Peter Ben Embarek, an expert on food security and zoonotic diseases, casting doubt on the conclusions of a "joint study" on the origins of the covid-19 pandemic carried out earlier this year under the auspices of the World Health Organisation (who). Dr Ben Embarek was the senior who figure who went to China as part of that study.

In March the joint study reported that it was "extremely unlikely" that the virus had been released in a laboratory accident. Dr Ben Embarek revealed that this conclusion did not come from a balanced assessment of all the relevant evidence but from a steadfast refusal by the Chinese members of the joint study to support anything stronger. Indeed they only allowed even that minimal assessment on the condition that the report did not call for further investigation into the question. He also pointed out that the idea that the point of spillover was someone collecting bat samples for research purposes belongs in the "likely" basket, along with other human interactions with wild bats.

Problems in the joint study had long been clear. Within the

who one source describes it as "riddled with compromises and sloppiness". Tedros Adhanom Ghebreyesus, the

who's director-general, was uneasy about the way it was carried out. He pushed back at the marginalisation of the lab-leak hypothesis, particularly when the final report was released in March. He has since called for further investigations into it, as well as into other possibilities.

The further unravelling of the joint study matters because, more than a year and a half after the covid-19 outbreak in Wuhan, a city in Hubei, was first recognised as the work of a new pathogen, there has been nothing like a thorough international investigation of how that pathogen,

sars-cov-2, got into humans and spread round the world. The pandemic's death toll stands at 9m-18m, according to a model which *The Economist* has built on the basis of excess-mortality reports and other indicators. The question of how it started matters both for the relatives of the dead and for those who wish to prevent such an outbreak happening again. China's efforts to stop the world from answering it are both shabby and, to an extent, self-defeating. The more the truth seems hidden, the more it seems suspicious.

Earnest calls for an international investigation into the origins of covid-19 began in April 2020, voiced most clearly by Scott Morrison, the prime minister of Australia. The next month the World Health Assembly, the gathering of government representatives which serves as the

who's decision-making body, passed a motion calling for a study into the origins of the pandemic. But in order to be acceptable to China—which had reacted furiously to Mr Morrison's original suggestion—the work was set up as a joint research project between two teams of scientists, one Chinese, one international. And it was to be based on "scientific and collaborative field missions", rather than a targeted and forensic inquiry into all the relevant circumstances.

The terms of reference, which were subsequently negotiated behind closed doors, allowed the Chinese hosts to frame the joint study's work in the way which best suited them. The study was set up to build on pre-existing Chinese research, not to delve into unvetted data. Investigating the laboratories that had been working with coronaviruses like

sars-cov-2 in Wuhan was not part of its terms of reference.

After a lot of wrangling, the international team got to China in January this year. Data about the first reported covid-19 cases, those from December 2019, were one subject of friction with their hosts. The Chinese had reported 174 such cases, but would not share the underlying data on which those reports were based. Hearing that these vital data were not being made available worried Dr Tedros enough that

MORENS_SUBPOENA_021860
MORENS_NIH_042741
REL0000478178

he lobbied the Chinese government for access. The authorities declined, citing concerns over citizens' privacy. It could have been anonymised.

Elsewhere the team appears to have been knowingly misled. Take, for example, the live-animal trade at the Huanan seafood and wildlife market, a site associated with a number of Wuhan's earliest recorded cases of covid-19. In its final report, the study group took at face value claims there was no credible evidence that live mammals were sold there in 2019. A lot of eyewitness accounts gainsay that; so does a study published in *Scientific Reports*, a journal, this summer.

One report and no more

The *Scientific Reports* paper found that 18 species of mammal had been for sale in Wuhan between May 2017 and November 2019; gunshot wounds and trapping injuries suggested that almost a third of them were taken from the wild. Although the paper was published only recently, it was submitted to the journal in October 2020. Chinese law requires that all covid-19 research be reviewed by the government before it is sent to a journal. Some Chinese authorities would have known of its contents before the team arrived.

The market is not the only way for animals and the pathogens they carry to get into Wuhan. The horseshoe bats in which the closest wild relatives to

sars-cov-2 have been found do not live anywhere near the city, but the two laboratories there that were known to have engaged in coronavirus research received samples from bat caves around the country. The joint-study team was not allowed to investigate the procedures around, or documentation of, this research; when it visited the laboratories the team was shown presentations on safety procedures but no more.

When the researchers left Wuhan the

who

's Geneva headquarters told them that their report needed to be laid out scientifically and could express dissenting opinions; the international members and the Chinese members did not have to reach a consensus. However, according to sources within the

who

, the team felt committed to producing a joint report with their Chinese counterparts. Dr Tedros was so unhappy with what finally emerged from the processes that he nobbled the report as it left the starting blocks, rejecting its contention that the possibility of a lab leak needed no further investigation.

On May 26th President Joe Biden ordered America's intelligence services to report on the pandemic's origins in 90 days (time will be up on August 24th). When he and his fellow

g7

leaders met in June they joined in calling for a timely, transparent and science-based follow-up study. On July 16th Dr Tedros laid out the next steps which the

who

wants to see taken. They include further work on the Wuhan animal markets, studies of early cases and

MORENS_SUBPOENA_021861
MORENS_NIH_042742
REL0000478178

audits of local laboratories.

The Chinese government has reacted angrily to the idea of further studies on its territory. Zeng Yixin, the vice-minister of China's National Health Commission, said he was "shocked" by the plan to investigate a lab leak, saying it was "impossible" to accept. According to the *Global Times*, a tub-thumping tabloid run by the Communist Party, 55 countries have sent written complaints about the proposal for further investigations to the

who

. Dr Tedros, elected director-general with China's support in 2017 and derided by President Donald Trump as China's puppet, may now face a Chinese-backed candidate when he looks for reappointment later this year.

In the absence of any hope that China will co-operate, sources of data beyond its control have become increasingly important. One area of interest is genetic sequence data. Another is early cases exported from China.

See what you did there

An online open-source-intelligence group which calls itself

drastic

has been scouring sequencing data to get insight into activities at the Wuhan Institute of Virology (wiv). When researchers publish sequences they typically post the raw data from which those sequences are assembled to public databases such as the sequence-read archive at America's National Centre for Biotechnology Information. Contamination events in the laboratory, or within sequencing machines themselves, mean these data sometimes contain sequences not meant to be there. In theory such evidence could reveal nefarious goings-on.

Such work, while promising, takes a lot of resources. If you have the sort of supercomputers available to America's national labs it gets easier. Gilles Demaneuf, a data scientist who works with

drastic

, says he has a hunch the American intelligence community's 90-day study is working the same angle. It is conceivable that the intelligence services might have been able to filch raw sequence reads directly from Chinese sequencing machines, thus picking up even more data.

Sequencing data only offers a way forward if the virus did indeed leak out of a lab, something which remains a possibility but which is far from proven. The study of early cases should be useful whatever route it took; the closer you get to understanding the when and where of the crossing-over from animal to human, the easier it should be to learn something of the how.

On the basis of information provided by China the joint study concluded it was unlikely for there to have been any substantial transmission in Wuhan before December 2019. That is unlikely to be true. For one thing the *South China Morning Post*, a newspaper based in Hong Kong, obtained government documents in 2020 which showed one to five new cases a day in Wuhan from November 17th 2019 onwards. Further evidence has strengthened the possibility that the virus could have been in circulation much earlier than the official story allows.

That circulation need not have been limited to China. There is increasing evidence suggesting early infections elsewhere. These cases would have been exported from China; no virologists doubt that Hubei was where the virus got going within humans. But if circulation in Hubei goes back further than thought and cannot be directly assessed through studies there, the presence of cases elsewhere offers an alternative way to get an idea of the timing. If a specific travel link were identified, that might help identify a group in Hubei which was infected early on.

A recent study of blood samples from 9,144 adults in 12 different regions of France found seven which contained antibodies against sars-cov-2, all of them taken in November 2019. An Italian lung-cancer screening trial has found samples taken in September 2019 which seem to contain anti-sars-cov-2 antibodies. Another antibody study suggests the virus was circulating at a low level in northern Italy at the same time, notably in Lombardy, a region which has close connections to Wuhan through the garment trade, and saw Europe's first major outbreak of covid-19 in March 2020.

Antibody tests can give false positives. In a preprint published on August 6th by the *Lancet*, researchers in Lombardy reported on looking instead for

sars-cov-2 gene sequences. Examining 289 swabs and urine tests taken from people who had presented with a rash as far back as the second half of 2019, they found

sars-cov-2 sequences in 13, the earliest of which was taken on September 12th.

Sudhir Kumar of Temple University in Philadelphia says the *Lancet* preprint is likely to inspire other investigators to go back and look at retrospective hospital samples. That should help his own research into the origins of the virus. A family tree Dr Kumar and his colleagues have built from vast numbers of published sars-cov-2 genomes allows them to predict the sequence of the progenitor virus from which they are all descended. This sequence differs in three places from that found in the earliest samples taken from patients in Wuhan, meaning there had been enough spread for a certain amount of viral mutation to take place before December. Dr Kumar says that an analysis of the Lombardy sequences suggests that the timeline for the origin of the virus in China might now extend back to the late summer.

More systematic international research into these early infections and their circumstances is needed. Maria Van Kerkhove, head of emerging diseases and zoonoses at the

who, suggests it may be possible to prioritise work in areas which saw the earliest outbreaks in America, France, Italy and Spain. "I think the floodgates will open one day," says Dr Kumar.

A last line of light

An early origin would fit with the timeline that lab-leak proponents tend to favour. Early this August, the minority Republican staff on the House foreign-affairs committee released an 84-page report arguing this case. It makes much of a small but deadly disease outbreak which took place at an abandoned copper mine in Yunnan in 2012. As

drastic showed last year, a virus studied at

WIV which had been taken from that mine is the closest known relative to sars-cov-2.

The report sees importance in the removal, on September 12th 2019, of a database containing details of sequences and samples from the

wiv

. This is read as the beginning of a cover-up, and thus as the point when the authorities first knew

MORENS_SUBPOENA_021863
MORENS_NIH_042744
REL0000478178

something had gone amiss, arguing for a leak in late August or early September. The

wiv

says it was a response to cyber-attacks.

A leak is not the only research-related possibility. The first person infected could have been someone employed by the

wiv

or another lab to collect bats and samples—the prospect to which Dr Ben Embarek pointed in his television interview. And it is important to remember that some other form of spillover outside the lab, either directly from a bat or by way of some other species, may well be to blame.

China clearly does not want lab-leaks investigated; but that does not mean it knows one happened. It is also being misleading about Huanan market, denying access to early-case data and obfuscating in various other non-lab-leak-specific ways. The most obvious explanation is that it does not really want any definitive answer to the question. An unsanitary market, a reckless bat-catcher or a hapless spelunker would not be as bad in terms of blame as a source in a government laboratory. But any definite answer to the origin question probably leaves China looking bad, unless it can find a way to blame someone else. To that end China has called for an investigation of Fort Detrick in Maryland, historically the home of American bioweapons research; state media regularly publish speculations about its involvement.

The possibility of spillover from wild bats does not have to be studied in China. Yunnan abuts onto Laos, Myanmar and Vietnam, and bats are not sticklers in matters of territory. Samples taken outside China could provide a good idea of viral diversity the other side of the border. A thorough evaluation of the existing farm-animal and wildlife trade in the region would also be useful.

Yet there is an inherent risk in such work that needs to be considered. Efforts to uncover the roots of covid-19 by seeking out a natural reservoir of something very like

sars-cov-2 would, by definition, expose people to the sort of risks that can seed pandemics. Ironically, the very possibility of a lab leak raises questions about how most safely to pursue investigations into other possibilities.

When he called for further inquiries in July, Dr Tedros also announced the formation of a new permanent group of pathogen hunters, the International Scientific Advisory Group for Origins of Novel Pathogens (sago). He wants it to organise further studies of

sars-cov-2. But it will also need to look at more general questions for the future—such as how to be sure that, come what may, studies of pathogens involved in past disease outbreaks never create further outbreaks of their own.

David:

Awful. Yet another example where 10,000 politicians at the bottom of the sea would be a good start. They simply have no shame and are likely totally corrupt themselves.

I do believe though that if you stick to the truth you will be OK. Let's hope the general public can see how honest the real government workers are as opposed to the politicians who are supposed to be governing, but who prefer to play political games.

EXTERNAL SENDER

Spent about 5 hours with my lawyer today in preparation for my Wednesday testimony. Although he expects I will be skewered with false charges and press releases that will distort the truth, he also is optimistic that what I will say mostly exonerates me, not that the committee will admit that. He says that I should be prepared to be hit with criminal charges and firing and possible jail time for using my Gmail for supposed government business. This is what the committee is pushing for and they are pushing for a Justice Department investigation

already.

Please come visit me in prison and help me find a job when I get out. At least if that happens I will finally have the ability to speak out and write about what has been going in. I won't mince words. d

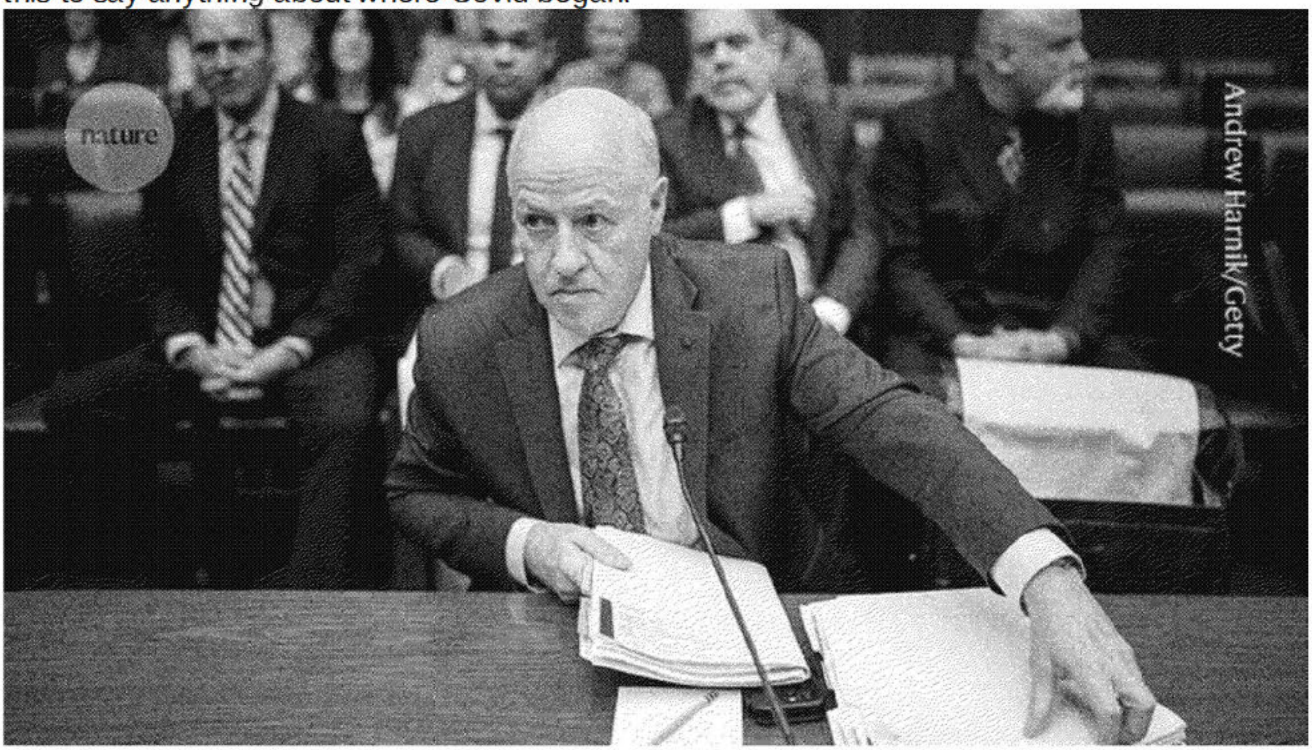
Subject: Disappointing tweet from Amy Maxmen re. a disappointing article in Nature.

*****CAUTION:*** This email is not from a BCM Source. Only click links or open attachments you know are safe.**

Shame to see Amy Maxmen following the trend of the article in Nature that seems to just parrot what the Democrats on the SSCP said - EcoHealth did something wrong, but they didn't cause COVID-19.



Of course, we were not given a chance to respond to allegations on the day, and now that they

've moved forward with a Suspension pending debarment proceedings, we have to respond to the HHS first on a legal matter, then can talk publicly.

Amy's tweet is below, and my response (trying to be as diplomatic as possible).

Amy Maxmen, PhD
@amymaxmen
5h
EcoHealth Alliance didn't comply with NIH granting conditions, eg not sending regular updates on its research. Without repercussions, those rules are meaningless.
https://nature.com/articles/d41586- 024-01460-3… The problem is when public/media interprets this to say anything about where Covid began.

US halts funding to controversial virus-hunting group: what researchers think

Peter Daszak

MORENS_NIH_046756
REL0000478182

@PeterDaszak

EcoHealth Alliance has repeatedly refuted allegations that it "didn't comply" & has yet to respond to the HHS letter. Calling for "repercussions" seems premature until some level of due process has played out. Let's hear the argument against debarment before we all move on.

Cheers,

Peter

CAUTION: This email is not from a BCM Source. Only click links or open attachments you know are safe.

The GAO was asked by the Biden administration to look into political interference in science by the white house under Trump. They interviewed me repeatedly last year and this year about the termination of our R01 grant.

https://www.gao.gov/products/gao- 22-104613

This is the first report from them on the topic. It's massively disappointing, of course, because it just comes up with broad recommendations on what agencies should do to protect themselves against political interference. However, if you read the email below, this is the first of two reports, and the second one should hopefully go into more detail about the NIH actions on EcoHealth's grant.

Cheers,

Peter

Subj New GAO Report on Scientific Integrity at HHS

Dear Peter,

Thank you for participating in our report on scientific integrity at HHS. Our completed report can be accessed here. Please feel free to share it with your network and colleagues. We plan to issue an additional report that will examine the key characteristics that can insulate agencies from political interference, and how, if at all, the selected HHS agencies have experienced potential political interference while carrying out their missions.

Thank you again for your time and providing information on this important topic.

Sincerely,

Rob Marek

David, Jerry, Aleksei, Robert and Jeff.

David – I'm cc'ing Jerry because some of these emails have him copied. I'm cc'ing Robert and Jeff because they know how these emails are likely to be used by reporters, if that's who's got them.

Jerry – David's NIH email address was FoIA'd and they're pulling out emails to me or tony Fauci and about Wuhan etc. You're in some of these. We started using David's gmail address in April 2020 around the time of the cancelation of our grant, but some slipped through the net, as is expected.

This is the first batch – Jan 1st 2020 to July 1st 2020. The attachment at the top is the most recent. Please read the emails down through the chain, because sometimes the more revealing stuff is buried within the email chain

There is some embarrassing stuff in there, the most heinous is:

- Generally suggests that we were working together to shape a narrative about the virus not having come out of a lab
- A couple of emails with 'fruity' language about kicking ass once the NIH defunding of our grant is solved
- Some emails critical of Trump
- One email from me that says "I don't know if WIV did GoF work outside of our NIAID grant".
- Some details of what happened with NIH cancelation and what my response to that was, and how you helped me shape it
- First email (Jan 27th) where David Morens says that Tony Fauci mentioned he feels 'brain dead' after dealing with press and politics all week. It was meant as a joke, but will be taken the wrong way of course.

All of this is fairly harmless, but if these emails are with reporters, they'll use them to create stories as per above, and with headlines like:

"Powerful cabal of scientists from within NIH helped draft anti lab-leak narrative"
"Daszak suspected WIV may have continued GoF work outside of NIH grant"

Robert and all – we don't know if all these emails have been foia'd. There are others in addition to these, and I'll send another batch through tomorrow.

To be forewarned is to be forearmed. I don't know how bad the fallout would be from these, but we'll know soon enough if reporters have them and are writing a story – they always check with us the night before for comments. I'll let you know as soon as that happens.

Cheers,

Peter

Dear Peter, Tony, Akiko, and Michael,

I cannot tell you how many members approached me to say how moved, inspired, and informed they were by your presentation yesterday. I've been responding to emails all day from members who want to find some way to help. I had thought that there would be wider understanding of what you all were enduring; I did not anticipate how many eyes were opened to the persecution of people who speak out for the public good, even when the information is difficult to take in.

I will definitely keep you all informed as we move forward. I think the four of you would make an excellent sounding board for ideas, as I am sure that some strategies could have the potential to backfire if we are not very very careful in how we approach the issue.

I am not so naive as to think that we can reach everyone - too many opinions are baked in, often for nefarious reasons. However, I do have faith that the majority of Americans will respond to reason.

Marty and Becca can comment on the extent to which CHR can help with this issue. I certainly value their input as they have such a long history of dealing with persecution of scientists. Domestic cases have to date been outside of their scope, and your cases are all somewhat different than the majority of CHR interventions. Your persecution is coming from the public, whereas CHR mostly deals with foreign government actions. If CHR decides that this is beyond their remit, then we definitely will need to find some other unit at the NAS to take this on.

And Peter: thanks for the heads up about the Mitchell Foundation having an interest in supporting work to address this issue. Happy to talk to you more about it.

My gratitude to you all,

Marcia

Dear Marcia (Martin): Thank you again for the extraordinary opportunity to meet with the NAS members and discuss the rise of anti-science activism in America. I received so much nice and productive feedback both at the panel session and the afternoon reception. As I indicated, the panel could be game-changing in helping to counter the anti-science monster.

I look forward to the follow up in the coming weeks and months. Perhaps working through the committee on human rights is a potential mechanism?

In the meantime we recently received some modest funding from the George and Cynthia Mitchell Foundation for this purpose and I will explore with them the potential for working through the NAS, etc.

Again, thank you for everything! It was a memorable weekend on many fronts.

Warmest regards, Peter

Please see the email below that I just received and the attachments.

They've cut down the allegations to a handful that I have to respond to within 30 days. But as I see this, these are grey areas that they could use to easily push me out, no matter my response. It would save them political hassle if they get rid of me, and I'm very worried that this is their ultimate goal.

Obviously, I'll try to be as aggressive as possible in defending against this, but this is devastating to me personally to have to go through this and if they expel me, it would likely cost me my job and career. Even more worrisome is the last paragraph in the letter from the Congressional members – they are playing pure politics here – if I'm found to be in breach, they are demanding that every report I've been involved in, and every committee be investigated.

This feels like a purge orchestrated by politicians for a political goal, and an academy that is too weak to push back.

Cheers,

Peter

Dear Dr. Daszak,

On behalf of the National Academy of Medicine (NAM), I am notifying you that the NAM has received a complaint alleging that you have engaged in conduct(s) that may constitute violation(s) of the NAM Code of Conduct for members.

Please find attached a notification letter, supplemental documentation, and NAM bylaws and Code of Conduct. Pursuant to the NAM Policy and Procedure on Violations of the Code of Conduct, please provide a response to the allegations within 30 days of the date of this notification, and by no later than May 13, 2022.

For your awareness, copies of this notification is postage mailed by FedEx to your office address at EcoHealth Alliance, 520 Eighth Ave Suite 1200, New York, NY 10018.

Sincerely,

Elena Fuentes-Afflick, M.D., M.P.H.
Home Secretary, National Academy of Medicine

Thanks for sharing David – I saw the press this morning – so far it's only in the usual extreme Right wing papers, but no doubt will drip over to the more mainstream Murdoch press tomorrow. I'm amazed they are ready willing and able to spend so much time on this non-story, and come up with 83 pages based on misconstrued contents from a small number of emails, and innuendo they've built up around it.

This week we're submitting a paper that provides the most detailed analysis yet of spillover risk in Southeast Asia. We have credible estimates of an average of 400,000 (median 50,000) people infected by bat SARSr-CoVs each year in Southeast Asia/South China. It'll be up on bioRxiv preprint server the week of Aug 16th. I'll share a version with you next week prior to the preprint coming out (we might have last minute changes).

This, Eddie's review, other papers on new bat-CoVs related to SARS-CoV-2 and the continued lack of novel info re. the lab leak strongly suggest that the lab leak hypothesis is going nowhere serious, other than a pure political strategy, which it clearly is here.

Cheers,

Peter

Subject: Fwd: Important re. Tony Fauci Comments just now

Tony needs to be aware that non human coronaviruses including sarbecoviruses are routinely worked at in BSL-2 around the world as are many truly deadly viruses. The BSL level designation is decided by each country and is not related to perceived pandemic potential but largely to risk to the bSL workers

For example, BSL-4 designstion generally means deadly virus, infectious by aerosol, no vaccine against it, and no treatment for it. So, altho rabies is 100% fatal in humans, it can be prevented by a vaccine and prevented by a post exposure serum, and (probably if not totally) not infectious by aerosol, thus BSL-2 even though among the deadliest of human viruses. Working with non-human coronaviruses at BSL-2 is a ho-hum common sense approach since these viruses are not known to infect humans. d

The press totally does not understand this, so it's a minefield potentially. d

Dear Peter, I wanted to give you a chance to respond to a comment Tony Fauci made to me in an interview which we are publishing tomorrow. Referring to the accusation that some work on bat coronaviruses in Wuhan was done at BSL-2, he said:

"We will have to go back and look at that, but that is something that should have been monitored by EcoHealth Alliance."

Can you let me know if you have a response?

Thanks
Kiran

Yes – saw that piece. There are some truths in it and some exaggerations. On cover-ups in China. From what I've gleaned, the coverups were not as simplistic as they suggest – i.e. that China acted a single entity in not letting the world know how serious COVID was – it's more subtle than that:

1) the local CDC (Wuhan) didn't inform the Federal CDC (China CDC) early enough about the outbreak and their suspicions of it being SARS-like. This seems to be a case of city and provincial bureaucrats not wanting to be punished by higher ups – probably cost a few days in closing down transmission at the market.
2) The market workers covered up the live animal trade in the Huanan Seafood Market instead of having them tested, and finding out the source farms where the outbreak likely happened. This was then covered up by every sector of govt in China, and is denied to this day, despite there being solid, published evidence of it.
3) There clearly was a delay in reporting the sequence in early Jan, but I think that was a case of individual labs competing for a Nature paper – prob cost a couple of days in getting that information out globally. We don't know how long that would have continued, but the sequence was already in press on Jan 11th when it was released by one group via GISAID, so probably would have been released by the journal a few days later.
4) Re. human to human transmission, China was open about intra-family transmission, and the WHO and most of us strongly suspected human-to-human transmission very early on – in fact I publicly stated in early Jan when there were suddenly 40+ cases from the Huanan Market, that this is either human-to-human transmission or repeated exposure to an infected animal source. We knew the market was cleaned out so the latter was unlikely. Marion Koopmans also believed this and said this publicly. It was a dynamic, difficult outbreak situation and no one had such certainty, but the evidence was already there.

The most important mistakes were then our lack of preparation between Jan and March – we could see the virus spread to Thailand (early Jan), then Iran, then Italy, then Austria/rest of Europe. We saw the horrors of the Seattle nursing homes, and our White House just tried to wish it away – we all know the rest – that same magical thinking led us into the 'Opening by Easter weekend' comments in 2020, then summer surge, the opening just before the Delta wave, anti-maskers, anti-vaxxers and the whole sorry mess we've been through.

Then the current big mistake – I'm glad she points out that we continued to fail in getting sufficient vaccines out to the rest of the world, and the consequences of that for continued waves of infection…

Cheers,

Peter

EXTERNAL SENDER

Dear all (cc'ing Dennis Carroll who I spoke with at the weekend),

Not sure if you've already seen this, but after multiple harassing, innuendo-filled articles in this journal *The Intercept*, we decided to respond to them and try to explain that all of the minutiae they have been reporting on for the last few months are not evidence of corrupt science that led to a pandemic, but just the opposite – they're part of the normal process of doing science to

MORENS_SUBPOENA_005812
MORENS_NIH_014364
REL0000478227

help prevent pandemics.

The result is an interview they published last week that is a bit combative, but at least helps explain to those who are bothered, that all of the allegations these guys have been pushing can be easily addressed, albeit that the answers are 1) boring, and 2) not the narrative that they want.

David – you'll be interested in the bit where I explain that the NIH Office of the Director has been cruelly holding us over a barrel to deflect from their political and erroneous decision to defund us.

Here's the link: https://theintercept.com/2022/03/11/covid- nih-ecohealth-peter-daszak-interview/

And here's the story pasted in the email:

PETER DASZAK ANSWERS CRITICS AND DEFENDS CORONAVIRUS RESEARCH

"Scientists disagree over an issue where there's no definitive proof," said the EcoHealth Alliance president on the origins of the Covid-19 pandemic.

Sharon Lerner, Mara Hvistendahl
March 11 2022, 9:50 a.m.

SINCE THE EARLY days of the Covid-19 pandemic, Peter Daszak has been at the center of a heated, and at times vicious, debate over the origins of the SARS-CoV-2 virus. The parasitologist helms the New York-based nonprofit EcoHealth Alliance, a wildlife conservation organization that aims to understand and prevent infectious diseases; the organization has received more than $118 million in grants and contracts from U.S. agencies, much of which Daszak distributes to labs around the world. Starting in 2005, he worked closely with Shi Zhengli of the Wuhan Institute of Virology, who was a key partner on a 2014 National Institutes of Health grant to research bat coronaviruses in China. The Intercept has published over 2,500 pages of documents and communications from the grant following a Freedom of Information lawsuit — information that has transformed public understanding of the research conducted under the grant.

Those documents have shown that in its efforts to head off and prepare for a pandemic, EcoHealth Alliance oversaw an experiment in which researchers intentionally made

MORENS_SUBPOENA_005813
MORENS_NIH_014365
REL0000478227

coronaviruses more pathogenic and transmissible. One grant report contained evidence that the research group also did an experiment with infectious clones of MERS, another deadly virus. While none of the experiments described in the grant materials released so far could have sparked the current pandemic, the documents raise serious questions about biosafety and oversight at NIH. Early in the grant, research on certain coronaviruses was subject to a U.S. government ban, but notes on communications between NIH staffers and EcoHealth Alliance obtained by The Intercept showed that the federal agency allowed Daszak to take the lead in shaping a plan to evade that moratorium.

Meanwhile, a grant proposal published by the internet research group DRASTIC last September showed that in 2018 EcoHealth Alliance applied for funding from the Defense Advanced Research Projects Agency, or DARPA, to look for novel furin cleavage sites in bat coronaviruses. According to the proposal, which was not funded, EcoHealth planned to insert furin cleavage sites into the spikes of SARS-related viruses — an idea that drew attention because scientists had already noted that such a site is unique in the subclass of viruses to which SARS-CoV-2 belongs.

The Intercept repeatedly sought comment from EcoHealth Alliance on these revelations. EcoHealth initially responded. In September 2021, a spokesperson denied that the organization had conducted the research on the deadly MERS virus that was described in the NIH proposal. After documents obtained via FOIA later showed that such research had in fact been done, Daszak stated that the spokesperson had been misinformed. EcoHealth Alliance then stopped responding to The Intercept's questions. In late February, Daszak replied to email inquiries and offered to talk. He spoke with us on March 1. In a wide-ranging interview conducted over Zoom, he addressed questions that have swirled around EcoHealth Alliance for the past two years, defended his organization against what he characterized as unjust accusations, and railed against the questioning he has faced from congressional Republicans, the NIH, and news organizations, including The Intercept.

This interview has been edited for length and clarity.

Responding to the Outbreak

We're curious when you first heard about the outbreak in Wuhan.

If you look at my Twitter account, you'll see a tweet on New Year's Eve of 2019 —

But before the tweet, what was the moment when you first learned about it?

It was a couple of days before that. We heard from our contacts in China that something

MORENS_SUBPOENA_005814
MORENS_NIH_014366
REL0000478227

was going on, that there were cases of a disease in Wuhan. I think it was December 30. We looked on Chinese social media and found the rumors about it there. But we heard from many scientists in China.

Many of the virologists and other scientists we speak to say that we don't have enough information to determine whether Covid-19 emerged from natural spillover or as a result of research. Do you agree with that?

Do I agree that it's possible that Covid-19 emerged through a lab leak? Of course. It's been widely reported that we shut down discussion on that. But in the WHO report, which I was part of — and in fact I led the animal environmental side for the WHO side — we state that it's extremely unlikely. We don't state that it's impossible it came from the lab. Of course it's possible.

One of the many reasons that the origin of Covid-19 became such a sensitive and divisive issue was the sense, based on your communications about the Lancet letter, that you orchestrated a response among scientists and then made an effort to distance yourself from that effort. Do you want to say anything about that episode?

You said, "One of the reasons why this has become so divisive is because of the Lancet thing." You could say that about many things. It's because we didn't release the DARPA proposal. It's because we didn't release our emails. It's because, early on, we said very strongly that this came from nature, and that this lab leak stuff is preposterous. The real reason this has become so divisive is because it's being used politically. That's it.

Scientists disagree over an issue where there's no definitive proof. And for this issue, there's no definitive proof. And there may never be. But what we do know is the weight of evidence points strongly to emergence from farmed wildlife in China.

Since the WHO report even, there are something like 12 scientific papers that have been published or put up online from good scientists pointing towards that origin. And I've looked at every single document that's come out of the folks who are trying to show it came out of the lab, and there is no evidence yet for that. It's all about implied motives, databases that were taken offline, people that aren't on a website, or innuendo around something. Any one of those things can be explained by the normal process of doing science.

An aerial view of the P4 laboratory at the Wuhan Institute of Virology in China's central Hubei province on April 17, 2020.

Controversial Research

Did EcoHealth Alliance or the Wuhan Institute of Virology, through its partnership with EcoHealth Alliance, ever insert a furin cleavage site into a bat

MORENS_SUBPOENA_005816
MORENS_NIH_014368
REL0000478227

coronavirus genetic sequence?

Of course we did not do that. I really don't understand how that could be a question at this point — it's beyond the pale. That's not in our plans and it's not any of our reports, so of course we didn't do that.

But isn't it the case that you submitted a grant proposal to DARPA to do so?

We did submit a proposal to DARPA. I've not checked through the one that's online that it's the correct document. What I do know is it was widely reported that DARPA rejected that because there were concerns about safety issues. That is absolutely untrue. The document that allegedly is DARPA's response, their review of our proposal, I've never seen that before. It was never sent to us. I don't know if it's real.

DARPA had a process by which people who didn't get funded could do an interview with them to find out why they didn't get funded. So I did that. Never once did they mention any concerns or issues around safety; never once did they mention gain-of-function. The reason they told us it was rejected was because the amount we asked for was too much for them. They couldn't afford it. They actually encouraged us to resubmit in different ways. We then had protracted conversations with them about funding specific parts of it. They liked the proposal.

Was any of the work described in that proposal completed prior to its submission? We were told by multiple sources that when you submit a grant, that at least some of the work would have been done.

When you write a grant proposal and propose to do a new line of research, which is what we did, we would not be doing that research before we submit the proposal. That's not how it works.

When we asked if you had ever inserted a furin cleavage site to a coronavirus, you responded with outrage. But that is what was described in the DARPA proposal.

No. What you said is, did we insert a furin cleavage site? And what I said was, of course not! If we had done that work with the Wuhan Institute of Virology, it would have been published by now. It would have been made public in our reports to the NIH. The DARPA proposal was not funded. Therefore, the work was not done. Simple.

But you acknowledge that you proposed to DARPA to insert a furin cleavage site?

I refute that that was the goal of the DARPA proposal. The idea was not to insert a furin cleavage site in a virus to see what happens. That's not what was proposed. The proposal was to look for those polybasic cleavage sites in nature because we knew that that was the potential to make a virus more able to infect people and move from person to person.

If we found mutations around that polybasic cleavage site that looked like it could be evolvable, the idea was then that Ralph Baric's lab at UNC would do some work to see how evolvable that site was. So that work never happened. The proposal was not funded.

Did you find any of these cleavage sites in naturally occurring viruses that you collected?

The proposal was not funded so we didn't do that work. We've not found polybasic cleavage sites. However, they are in many coronaviruses from bats. Papers from Europe show mutations around that cleavage site that suggest strongly that that furin cleavage site could evolve very easily in nature. I'm sure there are viruses out there with it. I'm convinced that it could have easily evolved during the first stages of the pandemic, as the virus got from bats, perhaps into an intermediate host in a wildlife farm, or into people.

Did you resubmit the proposal?

We had conversations with them over many months about bits they would like to fund or they wanted to fund. We did not get funded. We did not do the work.

So you didn't think the DARPA proposal was relevant to the investigation into the origin of the pandemic?

A proposal that was not funded and work that was never done is not relevant to the origins of Covid. Of course not!

When asked if you had done this work with the furin cleavage site, you said no.

For the furin cleavage site, you should really ask Ralph Baric. He wrote that section of the DARPA grant.

So you're saying that that would be a good question for Ralph Baric, whether he has done any of these insertions?

I don't know what Ralph Baric has done. But I doubt that he would go ahead and do that work without the funding.

Some virologists were dismayed to see the insertion of furin cleavage sites in this proposal.

I don't know why anyone would be dismayed at that because furin cleavage sites were first researched in influenza viruses. And it's well known that that's something you should look for if you're interested in virulence factors. Second, there's actually a published paper from way before our proposal was submitted, way before the pandemic, where a group actually inserted a furin cleavage site into SARS-CoV-1. So we were right to look for that. And I think the proposal stands as a valid and actually quite predictive

effort to understand the risk of viruses. You've got to look at the big picture of why we do this research. We're not doing it as a sort of academic interest, "what would happen if you put a cleavage site there?" No. This work is done to say: What viruses are there out there in the wild that have the potential to emerge in people? And can we do something to stop them? Develop vaccines, develop therapies, stop people making contact with those animals.

Your grant, "Understanding the Risk of Bat Coronavirus Emergence," included an experiment using humanized mice. Were other humanized mouse experiments conducted by you and/or WIV?

Not by us, no.

What about by WIV?

Well, you need to talk to WIV about what else they were doing. We were doing one line of work with them.

Were you aware of any?

No, of course. I'd tell you if I was aware.

Were there viruses from elsewhere in Southeast Asia that were sent to the WIV?

No. This is a commonly put about story that's simply not true. WIV did not receive viruses from all around the world.

How many actual viruses do they have?

WIV does not have the biggest collection of viruses from bats in the world. There's 20,000 bat samples, something like that, tiny fecal pellets from bats.

Right now I don't know exactly how many bat coronaviruses are in culture and freezers at the WIV. But from our work, I know that out of the SARS-related coronavirus, they were only ever able to culture a handful. I think three cultures. It's not easy to do.

In November 2019, you tweeted that you had identified over 50 novel SARS-related coronaviruses, including some that cause SARS-like signs in mice and didn't respond to monoclonal antibodies.

Yes.

What are these 50 viruses? And are they public?

This is a complex thing that's been widely misinterpreted. It's actually quite simple. What we had were hundreds of genetic sequences of coronaviruses from bats. We

published them in that paper. They're not all new viruses. As we went through the sequence data and analyzed it, we refined what you might call a new virus versus a known virus. That's all. It's scientists refining and analyzing.

One ongoing point of contention between you and NIH is about lab notebooks and the communications around experiments.

NIH has made a bunch of requests that are completely reasonable, that we've dealt with very quickly and sent them the information that they required. And in many cases, NIH had the information already. What's happening here is you've got an office of the director that's dealing directly with us and completely cutting out the program staff who've got all the data they need. NIH has also asked us for a number of things which to any balanced and independent reviewer are impossible for us to supply.

Clearly in coming up with Year 4 and 5 progress reports, EcoHealth Alliance had information and draft reports on these humanized mouse experiments. Did you share those with NIH?

Of course not. You don't share draft reports. You share the final report.

Here's what happens, it's a very standard procedure: We are subcontracting to a lab in China to do some work. Every year we have to file a report to NIH to tell them what we've done for the year, how we've spent the money, and whether we've achieved the goals of the grant. So, we contact our subcontractees and we say, "Send us the information. Let us know what successes you've had this year and whether you've had problems and issues. Put it all in a report and send it to us." And then we use that to produce a report for NIH. That's why there are some editing issues around that. We move them around a bit, and we send a final report. A draft report is just a worse written version of the final report. There's no special information that's got intelligence value or anything.

Then why not share them?

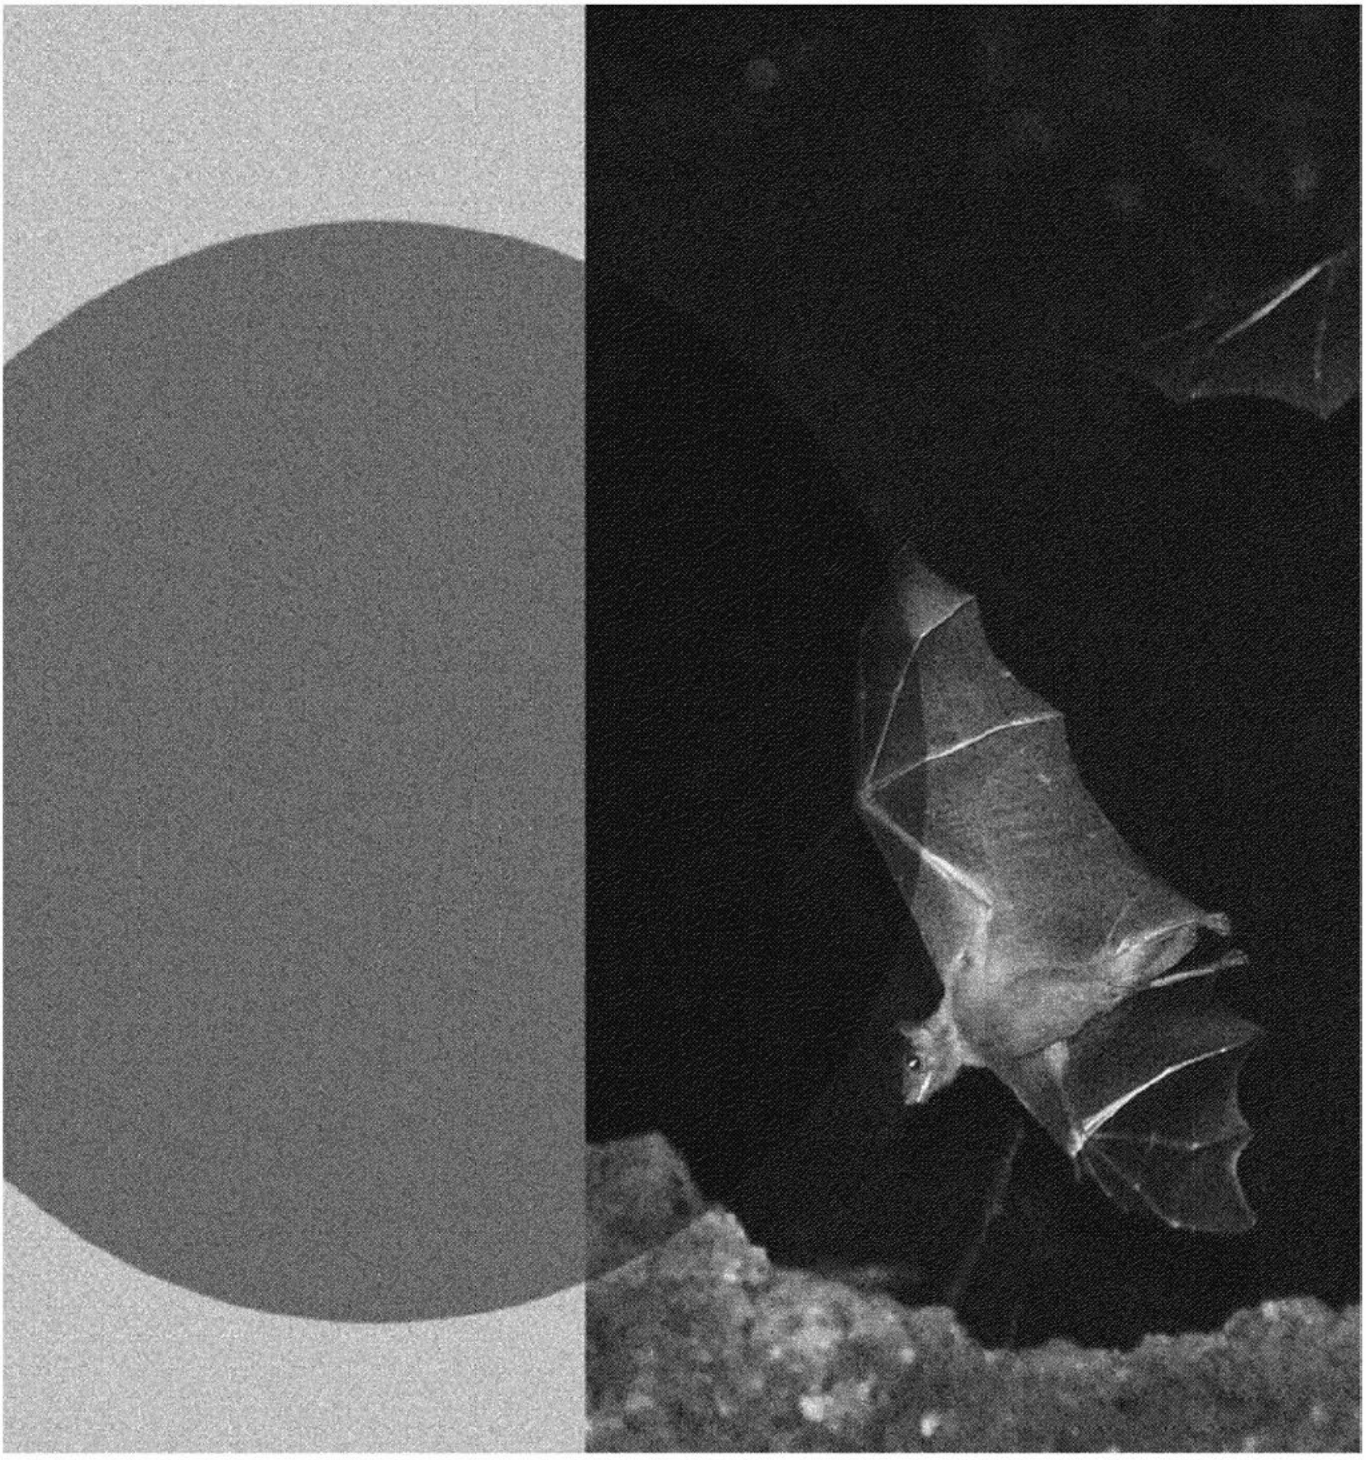
We've not been asked for a draft report by anybody.

You've been colleagues with Shi Zhengli, the Chinese bat coronavirus expert who directs the Center for Emerging Infectious Diseases at the Wuhan Institute of Virology, since 2005?

Yes.

So is it the kind of relationship where you would be generally aware of all the work that she was involved in? Can you say a little bit about what your level of awareness of other stuff she was doing?

We were aware of most of the stuff she was doing. Of course. These people weren't hiding anything from us. They are scientists.



I've sat through dozens of meetings with people from Wuhan Institute of Virology, where they talk openly about unpublished work. And, by the way, RaTG13 was one of the sequences in a paper published — in I think 2015. So they weren't hiding anything from us.

Early on, after she learned about the outbreak, Shi said she was worried that somehow a virus might have leaked from her lab. A lot of people we speak to — virologists who do this kind of work — are the ones who seem most in touch with that possibility, that this stuff happens.

Very specifically, it happens when you have cultures of viruses in flasks, and you're then doing experiments with high concentrations of virus. It rarely happens if ever from an animal sample, especially a saliva sample from a bat. What Shi Zhengli was saying at that time was, "Oh, no, it's a coronavirus. I need to go back and check on those viruses that we've got and see: Is it one of them?" And she did, and it wasn't. That's what any reasonable person would do.

You implied in early 2020 that RaTG13 was not fully sequenced by WIV until late 2019 or later. And then afterwards, Shi revealed that it had actually been fully sequenced in 2018. When and how did you first learn about the true date that this virus was sequenced?

I don't actually know the true date of when this virus was sequenced. I didn't see an interview with Zhengli where she said, "We sequenced it in 2018." I don't know when and I don't think they ever got the full genome. There are parts of that virus that aren't correctly sequenced. Bear in mind, RaTG13 was not from a sample collected under the NIH grant. So we didn't have any oversight on that or any knowledge of it.

A colony of bats in a cave in the Maramagambo forest of Queen Elizabeth National Park, Uganda.

Missing Data

Did you have access to the Wuhan Institute of Virology's database of viral samples and sequences that went offline in September 2019?

MORENS_SUBPOENA_005822
MORENS_NIH_014374
REL0000478227

I've never actually seen the database. I've seen pages of it from the internet, Twitter, chats. But I've never looked at the database.

Did your staff have access to it?

No. We didn't need to! We had all the data we needed. Some folks find this missing database indicative of a cover-up or something. When we were in Wuhan [with the WHO mission] in the Institute of Virology, I said, "Why did you take the database offline?" And their response was, "We took it offline before the outbreak. We were then getting hacking attempts, hundreds, thousands of hacking attempts. So we decided it wouldn't be wise to put it back up." Now, you may not believe them. But it is a perfectly reasonable explanation. And I think people should try and go for the most likely reasonable explanation for these things.

So why did they take it offline in September 2019?

They told us — and it's in the WHO report — that they were trying to update it to make it modern. WIV was trying to present itself like a globally significant virology institute, and it is. But when you look at Chinese websites, they can be really old and stuffy and clunky. What they were trying to do, they told us, was to make it interactive so that you can click on something and a map would show. They were trying to make it fit in with the national databases.

I find it quite ironic that the focus on the database of WIV is so intense, whereas what actually happened was we took the data and, with China, put the data into the NIH's own database to make it public. That's a great win for the U.S.

In April 2020, you wrote in an email, "It's extremely important that we don't have these sequences as part of our PREDICT release to Genbank at this point. As you may have heard, these were part of a grant just terminated by NIH. … Having them as part of PREDICT will being [sic] very unwelcome attention to UC Davis, PREDICT and USAID." Why did you think that publishing these sequences would bring unwelcome attention?

Because we just had our grant terminated by NIH.

So you didn't think it would be important to release this data, given that there was a pandemic?

Those sequences were released publicly by publishing them in a scientific paper, which is what scientists do. The email that you're reading out is not about whether sequences should be made public; it's about whether sequences should be made public via a USAID mechanism or via publishing through the NIH mechanism. And what I was saying to the UC Davis team that ran PREDICT was that these are NIH-funded

sequences and should be reported through the NIH system. It's really that simple.

And which paper were they reported in?

Latinne et al, published in Nature Communications. We were struggling to get that paper out. It was very, very difficult, once the pandemic started, to keep communication with Chinese scientists. The utmost priority as a scientist is to get the data published, not to upload it into some database that's going to take months to go through. And by the way, that database is somewhere on the USAID government system. It's very difficult to find. The paper had already been submitted for publication, and the sequences were uploaded into GenBank, the NIH system. And then once the papers were accepted, they became public. And that's exactly what we did.

Are there sequences that have not been made public?

To my mind, there are no sequences of SARS-related coronaviruses that have not been made public. Some people think there are still viruses that are SARS-related that haven't been put in GenBank. That's not true. We've uploaded all of the SARS-related coronavirus sequences, or we've reported them to NIH, or we've published them in scientific papers. And in fact, for most of them, we've done all the above. We had them all uploaded before the pandemic. Most of them anyway.

You were on the WHO mission to investigate the origins of SARS-CoV-2. When the NIH grant documents were released, it was a surprise to many people that animal experiments were being done at Wuhan University. If you knew this information, did you share it?

It wasn't a surprise to NIH because the NIH knew about them.

Right. But did you share that information with the WHO committee or with others who were investigating the origins?

The Wuhan University BSL-3 facility is what we're talking about. They do humanized mouse work. That was not looked at by the WHO origins group. It's a BSL-3 lab that had humanized mice under BSL-3 conditions. It's highly unlikely to be the source of the Covid-19 outbreak.

Did you mention it to the committee?

I mentioned all my work to the committee, of course. We talked about it, for sure.

The Challenges of Public

MORENS_SUBPOENA_005824
MORENS_NIH_014376
REL0000478227

Scrutiny

Dr. Michael Lauer at the NIH has repeatedly asked you for biosafety records from the WIV and said that he has been unable to get some of them.

He says that, but it's not true. We've supplied everything we could possibly supply on the issues that they've asked for.

In one of his letters to you, Lauer asked about the biosafety oversight of the work at WIV. In your response to him, you wrote that it consisted of semiannual meetings with the lead investigator and assessments of compliance with all conditions of the award. Biosafety experts have said that this falls short of the level of oversight one would want for this kind of work. You mentioned in an exchange with Lauer that you were offering to pay from EcoHealth's own coffers for additional biosafety measures. Why did you offer to do this? Did you feel that the biosafety oversight was adequate?

We're talking about a world-class virology lab run by the Chinese government that is probably the best virology lab in China, and China is very good at virology. It's very efficiently run, and the biosafety conditions are very good. Just because people think that Covid-19 might have come from WIV doesn't mean that therefore our oversight of biosafety wasn't sufficient. We did everything normal in oversight of that lab.

Then why did you suggest these additional measures, if the others were already adequate?

Because I was worried that they were going to terminate our other grants. This is the key driving force for every action we've taken since April 24, 2020. I don't know why people don't realize that.

Once NIH shows you that it's willing to terminate your funding and kick people out of a job and put your whole organization under pressure simply because a single politician tells them to, then you start worrying about every other grant and contract that NIH controls. We live in fear that they're going to do similar abrupt terminations with no cause and no rationale and no logic.

What I was doing then was saying to Michael Lauer, please be reasonable. We're trying to do everything we can, within the normal bounds of what organizations do. We probably have the best biosafety and field teams in the world.

We're overcompliant and yet still being accused of lack of compliance.

On February 24, House Energy and Commerce Committee Republicans sent a

MORENS_SUBPOENA_005825
MORENS_NIH_014377
REL0000478227

letter to NIH alleging that it is "highly suspicious" that EcoHealth reported the humanized mouse experiment results over two years, and suggesting that more work may have been done that was not reported. How would you respond to that?

This is a simple issue of Chinese nationals writing a report and then us drafting our report to NIH. So there's a word in there where they say we continued the studies. That doesn't mean they continued infecting mice with new viruses. No. What it means is they continued doing the research on the one experiment that they've done. And that continuation is a lot of work. So they did all the pathology, which means at the end of the experiment, you take all the mice, and you look at every organ in the body. You do detailed microscopical analysis. It takes months. So that's why it dragged on because you've got months of after-the-experiment analysis. And we included the mortality data as part of the pathology data. That's completely normal.

The House Energy and Commerce Republicans don't write to us, they write to NIH. Sometimes we hear about it, sometimes we don't. NIH doesn't copy us on their responses. Then eventually we get a letter from NIH asking questions, which we always respond to, always within the timeframe and always refuting any allegations with evidence. So that's what we've done.

The latest letter from the House Energy and Commerce Republicans accused us of being overfunded, effectively having two grants to do the same thing. It's simply not true. The USAID PREDICT grant has completely different goals to the NIH coronavirus grant. For instance, PREDICT looks for between seven and 18 different viral families within samples, not just coronaviruses. NIH is focused solely on coronaviruses. So the goals are different.

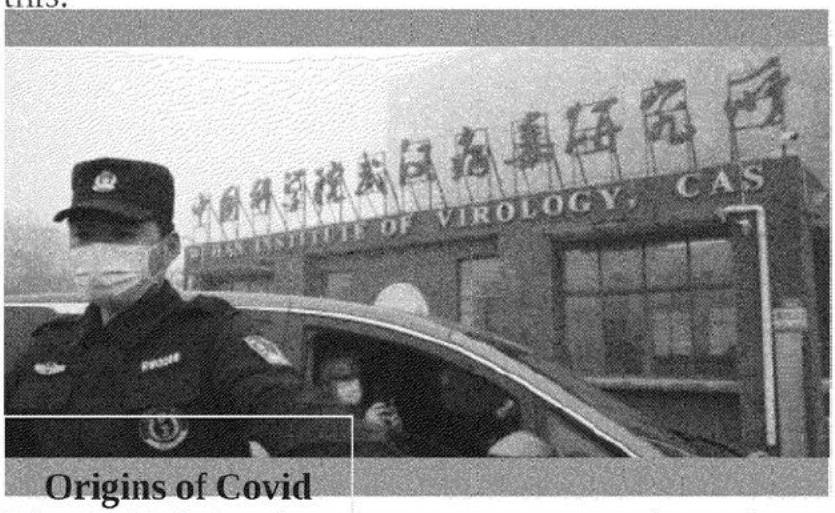
The agencies do, as a standard procedure, a review of a grantee's other proposals to see if there's overlap between them, because they don't want to fund the same thing twice. This is absolutely refutable with documentary evidence.

What's your understanding of the Republicans' motivation?

Any bipartisan requests for information from the House or the Senate, we've responded to. We've been working with the U.S. government since the pandemic began to get information to them about every single aspect of this pandemic, including unpublished data. The politicians who are attacking us probably don't realize or know or care, in some cases. When there's a request from one side of the political spectrum, we try not to respond to that. We've had hundreds of questions sent to us by letter, including requests for thousands of pages of documents. We don't have the staff to do that. And bear in mind our grant has been terminated and now suspended. We don't have access to funding. We don't have the staff to do this work. It's a horrible, cruel irony that, on the one hand, your funding is cut; and on the other hand, there are now outrageously huge

MORENS_SUBPOENA_005826
MORENS_NIH_014378
REL0000478227

number of demands for us to do work to show data from that funding that's been cut.



Don't you have ongoing funding for two other NIH projects?

Yes. Well, you can't use that money.

What have you been asked to get by NIH that you feel you can't get?

There are a whole series of things that we've been unable to get. A vial of virus. Information on a person that was removed from the website (I did ask them that, and they gave us an explanation, which is perfectly reasonable). NIH asked us for an inspection of the WIV. Every right-minded person on the planet realizes that the World Health Organization asked for an inspection of that lab, and we did go into the lab and ask questions and go around the facilities. For NIH to say that I should organize a U.S.-only, NIH-based or National Academy-based inspection of the lab facilities is a request that is way beyond what's possible. You know, you can't go into CDC as a foreigner and do an inspection of the lab.

NIH writing to us saying, "We demand that you do this," puts us in jeopardy and it's a security risk. If I was to take that letter from NIH and go to the Beijing airport and say, "I'm here to do this," I would be arrested and put in jail and probably put on trial, in the same way that scientists from China have come to the U.S. and tried to take vials of virus back to China and been arrested and convicted. NIH doing this is clearly a way for them to try to get the public behind a decision they made that was political about terminating our grant. Ever since that decision, we've been put under similar pressure over and over again. The Republicans write to NIH with some fairly outrageous accusations. NIH responds and says, "Don't worry, we will go and make EcoHealth do this, this, this, and this."

Origins of Covid

Read Our Complete Coverage

I don't think that those questions are posed to truly get to the bottom of the origins of Covid. While the House Republicans are putting pressure on NIH for tiny bits of administrative information, scientists are going out and finding that actually things are

MORENS_SUBPOENA_005827
MORENS_NIH_014379
REL0000478227

really pointing towards a natural origin. And meanwhile, we're left refuting each one of those allegations. They're all false. There's no substance to them at all.

A good proportion of the public have been pushed by misinformation to believe a narrative — and this narrative is repeated daily — that gain-of-function work was funded by Tony Fauci as a back channel to China, and EcoHealth funneled funds to China. Those stories are very beguiling, they sort of make you feel, "Ah! I knew it." But actually, there's not a grain of truth to them. Every single action that EcoHealth Alliance has taken has been things that scientists do in the normal course of doing their work.

Closing down that line of research means we lose eyes and ears on the ground in China. And it doesn't benefit us from a public health point of view or a national security point of view. It's a huge mistake.

Importance: High

Dear Robert, David, and Jerry,

Sorry to send this, but please read the email below and you'll see that a bill filed by a Republican congressman from PA then became a single line amendment attached to the Defense Appropriations bill, and actually passed the House last night.

We're very worried here because we rely on Federal funding and this puts our organization in great threat. Any advice is welcome. We're reaching out to Senators Gillibrand and Schumer, but I'm really worried that if they are too busy to get involved for a small non-profit with no political clout, we'll be drummed out of business.

If you have colleagues who know how to deal with this sort of issue, and are willing to help, we would be extremely grateful for any advice, suggestions and support. I realize you've all spent social and political capital helping our organization since we were first targeted by Pres. Trump, but this is truly an existential threat to us, considering 80-90% of our budget is from federal grants and contracts.

Cheers,

Peter

Subject: Urgent - Amendment to defund EcoHealth Alliance was passed by the House last night and now moves to the Senate
Importance: High

Dear Jamison and Gilbert,

You were kind enough to talk with us a couple of months ago about attacks on our New York City-based 501c3 non-profit from the hard right wing regarding the work we've done in the past trying to protect us from new emerging diseases coming out of China and other hotspots. As you remember, this work was largely funded by NIH, DoD and USAID and has become a target for Republican-led attacks on the Biden administration.

We're very concerned that one of the House Republicans, Congressman Reschenthaler, filed a bill titled HR591 "Defund EcoHealth Alliance Bill" in Jan. 2021 and managed to get this attached as Amendment 148 to the National Defense Authorization Act (HR 4350). The five other co-sponsors are all Republicans: Van Drew, Perry, Harshbarger, Keller, and Budd: https://rules.house.gov/bill/117/hr-4350. The House passed the NDAA last night (https://armedservices.house.gov/ndaa) and unfortunately this Amendment is now progressing with it.

EcoHealth Alliance is a non-profit based in Midtown Manhattan that employs around 50 people whose jobs depend on the funding we receive each year. If this amendment continues forwards, we stand to all lose our jobs and close down the organization. This amendment is based on a false premise that our organization acted wrongly and was involved in the origin of the COVID pandemic. In fact it's the opposite, we worked with federal approval to help protect US citizens against this and other pandemic risks. If passed, it would penalize an organization doing public good, without any due process or consideration of the facts. Also of great concern is that this amendment would set a precedent that any single member of Congress can specifically block funding to an organization or institution through a simple amendment, bypassing all political norms.

We are urgently hoping that you will be able to make Sen. Gillibrand aware of our issue and move to strike out this amendment at the first possible opportunity. We are at this point very worried for our staff, and our work around the world protecting the US against the next pandemic.

Yours sincerely,

Peter

Subject: Concerns about political attacks on EcoHealth Alliance around COVID origins.
Importance: High

Dear Brooke,

I hope you don't mind me contacting you directly – I was given your email address by my colleague Dennis Carroll.

As you may know, I'm the President of EcoHealth Alliance, based here in NYC, and also Chair of the NASEM Forum on Microbial Threats and member of the National Academy of Medicine. I mentioned the latter, because I received a very kind letter from Senator Gillibrand when I was voted onto the NAM a couple of years ago – it's now framed on my wall!

You may have heard our organization's name (EcoHealth Alliance) and mine being mentioned in the press recently in the general discussion of identifying the origins of COVID-19. For the last 17 years, we've worked closely with colleagues in China to get ahead of emerging viruses, including by collaborating with their premier virologists at the Wuhan Institute of Virology. Unfortunately, this work has become a very public target politically following over a year of conspiracy theories online that have now gone mainstream about the possibility COVID emerged as a leak from a biosafety laboratory in Wuhan. This was amplified a few weeks ago with testimony by Dr. Fauci and the release of FoIA'd emails that have put our organization in the cross-hairs of efforts to attack the current administration. This includes proposals by some minority members for bills that would significant harm our international work to prevent pandemics, as well as directly defund our organization.

I've attached a letter in Lancet that came out last week that helps provide some context of the way this issue is being viewed by serious scientists, but as you can imagine we're worried about the impact on work that we believe is critical to preventing future pandemics. I wondered if you would be interested in my giving you a short briefing on this issue, to explain in more detail what the evidence behind these theories is, and to get your take on the political issues we are concerned about?

Cheers,

Peter

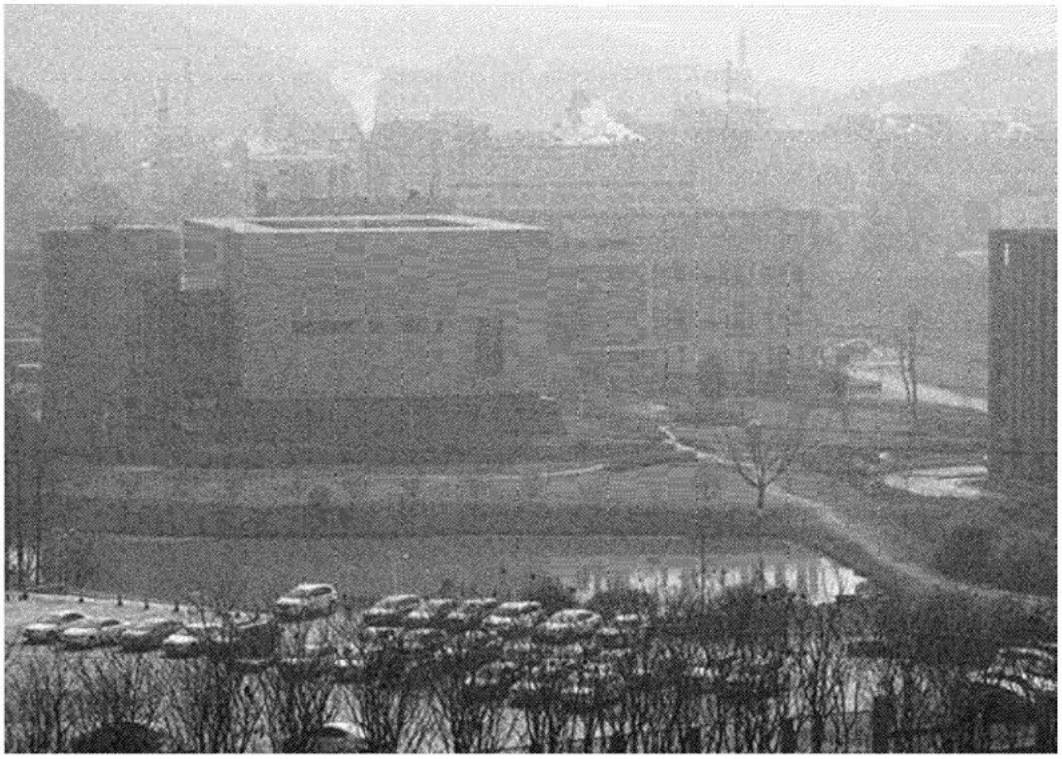
Experts weigh in on the Wuhan lab leak

hypothesis

By MYAH WARD and RENUKA RAYASAM

05/19/2021 08:00 PM EDT

Presented by Facebook



With help from Joanne Kenen

ORIGIN STORY — The hypothesis that Covid-19 was leaked from a Wuhan lab has leaped from its original host — Trump administration officials and people dismissed as conspiracy theorists — into the body of mainstream debate. Last week, 18 leading scientists published a letter in the academic journal Science calling for further investigation to determine the origin of the pandemic that has killed 3.4 million people worldwide. "Theories of accidental release from a lab and zoonotic spillover both remain viable," the scientists wrote.

The letter echoes a similar call from WHO Director General Tedros Adhanom Ghebreyesus. During a Senate hearing last week on the U.S. response to the pandemic, Anthony Fauci said he was "fully in favor of any further investigation of what went on in China" after sparring with Sen. Rand Paul (R-Ky.) about the origins of the virus. And this month, the former New York Times science reporters Nicholas Wade and Donald G. McNeil Jr. have written long essays on Medium outlining why they take the lab leak hypothesis seriously.

Nightly reached out to experts, two of whom signed the letter as well as others who have taken the opposite side in the public debate, to ask how credible they find the lab leak theory. Their edited responses are below.

A view of the P4 lab inside the Wuhan Institute of Virology is seen after a visit by the World Health Organization team in Wuhan in China's Hubei province on Wednesday, Feb. 3, 2021. | AP Photo/Ng Han Guan

IT'S POSSIBLE

"Much of the currently available information suggests that a lab-based origin of Covid-19 is plausible. **There remains no sign of an intermediate animal host that could have passed the virus to humans in 2019.** There is no evidence that live mammals were sold at the Wuhan seafood market in 2019, and none of hundreds of animal samples collected from that market had any trace of the virus. In other words, there is zero evidence that supports a zoonotic origin of the virus that excludes the involvement of research activity.

"There are copious precedents of pathogens leaking from labs — the original 2003 SARS virus leaked up to six times from labs across three countries. Consider that the SARS research and animal infection experiments at the Wuhan Institute of Virology, for more than 10 years, were all performed at relatively low biosafety

levels. It is currently not possible to tell from the genetic evidence whether the virus ever passed through a laboratory or a lab personnel.

"The question is: How did a virus, whose lineage is found only in southern China, make its way into humans in the metropolitan city of Wuhan, more than a thousand miles away? We know that the Wuhan Institute of Virology had possibly the greatest collection of SARS viruses from numerous trips across China. We know that they were working with a batch of viruses very closely related to SARS-CoV-2. Details of these viruses and the experiments performed with them have not been shared in a timely manner." **— Alina Chan, molecular biologist at the Broad Institute of MIT and Harvard**

"It is worthy of a careful, rigorous, unbiased, objective examination, based on relevant, verifiable data. There are a number of plausible scenarios embedded in this label, 'lab leak,' and importantly, they include an unrecognized infection of a well-intentioned lab worker attempting to recover or study new coronaviruses from bats. **It does not imply malice or even necessarily awareness (of the accident).** Lab accidents are much more common than any of us know, or would like to admit, and they occur worldwide and even in the most safe and secure labs. U.S. biosafety labs are by no means strangers to accidents; leaks of some of the most dangerous infectious agents have occurred at CDC and other U.S. government labs." **— David A. Relman, microbiologist at Stanford University**

"The following lines of circumstantial evidence are noteworthy:

"**The outbreak occurred in Wuhan, a city of**

MORENS_SUBPOENA_019415
MORENS_NIH_038978
REL0000478233

11 million people that does not contain horseshoe-bat colonies, and that is tens of kilometers from, and outside the flight range of, the nearest known horseshoe-bat colonies. Furthermore, the outbreak occurred at a time of year when horseshoe bats are in hibernation.

"The outbreak occurred in Wuhan, on the doorstep of the laboratory that conducts the world's largest research project on horseshoe bat viruses and worked with the world's closest sequenced relative of the outbreak virus. The laboratory actively searched for new horseshoe-bat viruses in horseshoe-bat colonies in caves in remote rural areas in Yunnan province, brought those new horseshoe-bat viruses to Wuhan, and then mass-produced, manipulated, and studied those new horseshoe-bat viruses, year-round, inside Wuhan.

"Documentary evidence establishes that the bat-SARS-related-coronavirus projects at the Wuhan Institute of Virology used personal protective equipment (usually just gloves; sometimes not even gloves) and biosafety standards that would pose high risk of infection of field-collection, field-survey, or laboratory staff upon contact with a virus having the transmission properties of SARS-CoV-2." **— Richard Ebright, molecular biologist at Rutgers University**

Disgusting – all of this work should be seen in the context of helping the US protect against SARSr-CoVs, developing relationships at a high level with a country where viruses emerge so as to protect our nation. Instead it's put forward as a smear, simply by it being FoIA'd and appearing as a write-up in the journal "Judicial Watch"

What's judicial about this? Where's the legal reason for interest? This is science, as it's supposed to be done.

Cheers,

Peter

Judicial Watch: New Fauci Agency COVID Emails Detail Discussions about Wuhan Institute; Describe Gates Foundation Placement of Chinese Representatives on 'Important International Counsels'

(Washington, DC) – Judicial Watch announced today that it received 129 pages of records from the Department of Health and Human Services (HHS) which include "urgent for Dr. Fauci" email chain which cites ties between the Wuhan lab and the taxpayer-funded EcoHealth Alliance. The government emails also report that the foundation of U.S. billionaire Bill Gates worked closely with the Chinese government to pave the way for Chinese-produced medications to be sold outside China and help "raise China's voice of governance by placing representatives from China on important international counsels as high level commitment from China."

The new production of records also includes a January 6, 2020, "Wuhan Pneumonia Update" report which details how Peter Daszak, president of EcoHealth Alliance, was tied to the Wuhan lab and was "funded for work to understand how coronaviruses evolve and jump to human populations."

The documents were obtained by Judicial Watch through a Freedom of Information Act (FOIA) lawsuit for records of communications, contracts and agreements with the Wuhan Institute of Virology (*Judicial Watch, Inc. v. U.S. Department of Health and Human Services* (No. 1:21-cv-00696)). The lawsuit specifically seeks records about NIH grants that benefitted the Wuhan Institute of Virology. The agency is only processing 300 pages of records per month, which means it will take until the end of November for the records to be fully reviewed and released under FOIA.

The new emails include a report from Dr. Ping Chen, who had been the top Fauci agency official working in China:

You can ask [NIAID Human Coronavirus, Rhinovirus Research Program Officer] Erik Stemmy for the grant awarded to the Ecohealth in NYC who collaborates with Dr. Shi, Zhengli in Wuhan Institute of Virology (WIV), who has been doing coronavirus research in cave bats in China. Erik would know what exactly NIH funding supports.

I visited her and others at the Wuhan Ins Viro in 2018 and visited its BSL4 1ab. [Redacted]

Also in 1983 NIH and CAS [Chinese Academy of Sciences] (WIV is one of the research institutes under CAS) signed a MOU and it included sharing research materials. I know [sic] this a long time ago.

This email chain is part of a previously released January 23, 2020, exchange with the subject line "Urgent for Dr. Fauci: China's lab for studying SARS and Ebola is in Wuhan." It begins with Melinda Haskins, chief of legislative affairs for NIAID, writing to senior NIAID officials, and includes a link to a *Daily Mail* article, titled "China built a lab to study SARS and Ebola in Wuhan – and US biosafety experts warned in 2017 that a virus could 'escape' the facility that's become key in fighting the outbreak." She writes: "Dr. Fauci will be brief [sic] multiple Senators tomorrow on our novel coronavirus response … Would you please confirm the exact nature of our support to the Wuhan Institute of Virology/Biosafety Lab. You'll want to read the Daily Mail

MORENS_SUBPOENA_022029
MORENS_NIH_042922
REL0000478234

article above."
A January 6, 2020, email exchange on "coronavirus countermeasures," initiated by NIAID Chief Medical Officer Hilary Marston, includes a "Wuhan Pneumonia Update" report prepared by NIH/DMID.
The report was updated on January 8, 2020, and lists in its background information on "Wuhan Pneumonia:"

- In December 2019 the Wuhan Municipal Health Committee identified an outbreak of viral pneumonia cases of unknown cause.
- On December 31st the WHO China Country Office was notified of 44 patients with pneumonia of unknown etiology, 11 of which were severely ill.
- As of January 5th, 2020 there are 59 patients with a diagnosis of unknown viral pneumonia is Wuhan, 7 of which are severely ill. At least one patient is on ECMO … The earliest case was reported December 12th, and the latest onset was December 29th. All patients are isolated and receiving treatment in Wuhan medical institutions. 163 close contacts have been identified for ongoing medical observation.
- Case-patients in the outbreak are reported to have fever, difficulty breathing, and bilateral lung infiltrates on chest radiography (CDC, http://bit.ly/36GxY3y).
- Hong Kong has added Wuhan Pneumonia to the list of notifiable diseases. As of January 7th, 2020 the Hong Kong Center for Health Protection has reports of 30 cases under enhanced surveillance with recent travel history to Wuhan….
- Epidemiological investigation showed that some patients operated businesses in the Wuhan South China Seafood City. As of January 1st, 2020 the market has been closed for environmental sanitation and disinfection.
- There is currently no clear evidence of human-to-human transmission, however one family cluster has been identified. No nosocomial transmission has been seen …
- Fragments of coronavirus RNA with an 86% homology to SARS has been found in one patient…
- News reports on 1/8/2020 the virus is a novel coronavirus, sequenced in one patient and identified in others.

The report also details a NIH coronavirus grant "portfolio" that funded 13 basic science research grants, two treatment research grants and five vaccination research grants related to coronavirus:
Peter Daszak (R01A|110964-06) is funded for work to understand how coronaviruses evolve and jump to human populations, with an emphasis on bat CoVs and high-risk populations at the human-animal interface. Main foreign sites are in China (including co-investigators at the Wuhan Institute of Virology).
The report notes that one of the grants, made to Fang Li, "is funded to investigate the receptor recognition and cell entry in coronaviruses using structural approaches using spike proteins in complex with receptors. This award found the first evidence of a MERS-related CoV that uses the human receptor and provides evidence of a natural recombination event between bat CoVs."
Another grant involves "a team of investigators using mouse models of SARS and MERS to investigate CoV pathogenesis and develop vaccines and therapeutics."
A section of the report on "Vaccines" details:
"The VRC [Vaccine Research Center] and collaborators have stabilized the MERS-CoV spike protein in its prefusion conformation. The stabilized spike protein is potently immunogenic and elicits protective antibodies to the receptor binding domain, n-terminal domain and other surfaces of the spike protein. The stabilized coronavirus spike protein, and mRNA expressing the spike protein through collaboration with Moderna Therapeutics, is currently being evaluated in the humanized DPP4 mouse model at UNC.
Another grant description indicates that NIH was funding research at Jefferson University using the rabies virus as a vector to deliver a potential vaccine. In an accompanying spreadsheet detailing the grants, one grant is listed as having gone to Dr. Ralph Baric of UNC-Chapel Hill to study "Mechanisms of MERV- CoV Entry, Cross Species Transmission and Pathogenesis." That grant had been funded from 2015-2020.
In a January 7, 2020, email exchange with the subject line "Wuhan Pneumonia" Stemmy asks Chen if she has any information about the "viral pneumonia outbreak in Wuhan." Chen replies: "Yes, I have been following the news. Here is what I know so far [redacted]. Chen also revealed that her tour in Beijing had ended three weeks earlier.
Stemmy asks, "Do you know if there is a replacement for you in embassy in Beijing? If so I'd love to connect with them." Chen replies, "No replacement for now <smiley face emoji>."
In a January 22, 2020, email exchange titled "Collecting info on N CoV [novel coronavirus]", NIAID "Senior Volunteer", Dr. Karl Western, informs Chen and other NIAID officials:
Two recent examples involving CAS Institute of Virology and BSL-4 facility include:

- University of Minnesota and CAS Institute of Virology review of the origin and evolution of pathogenic coronaviruses in *Nature Reviews: Microbiology.* Minnesota had a CEIRS award for one funding cycle.
- Columbia University School of Public Health, Eco-Health Alliance and CAS Institute of Virology published a few days ago on the results of surveillance of human animal interactions and bat coronavirus spillover potential in rural southern China. Columbia is a current CETR holder.

In a heavily redacted response email, Chen writes: "Thanks Dr. Western. Eco-health has NIAID grant which has collaboration with the Wuhan Institute of Virology, CAS, studying the coronaviruses in wild animals, focusing on bats, in China. One of the

key Chinese collaborators is Dr. Zhengli Shi, who works on coronaviruses."
On February 6, 2020, Han Koo, an executive assistant to the Director of NIH who works in the Office of Grants Administration (OGA), emails Chen and Matthew Brown, then-Director of the NIH China Office: "We need POCs [points of contact] of the National Natural Science Foundation of China (NSFC) and The Chinese Academy of Science (CAS) ASAP."
Later in the chain Chen writes: "In 2018, NSF [the U.S. National Science Foundation] and NSFC [the National Science Foundation of China] had a joint initiative on Ecology and Evolution of infectious diseases. A workshop was held prior to the initiative (NIH is one of the participants to this initiative. Many participants of the workshop are from CAS institute including WIV [Wuhan Institute of Virology] scientists. NIAID grant to EcoHealth is studying coronaviruses in animals including bats. The grant has different countries as collaborators in addition to China." A colleague then responds: "Thanks! Do you recall who the US and Chinese PIs [principal investigators] are on that coronavirus vector/reservoir grant are?" Chen replies: "See the attachment I prepared previously. This grant is on bat [redacted]."
In an October 20, 2017, email exchange following Chen's submission of a situation report, NIAID official James Meegan tells Chen: "Jim LeDuc at U Texas Medical Branch, Director of the Galveston BSL4, works closely with them [Wuhan Institute of Virology]. In 1986 Jim and I spent the year on and off in Wuhan setting up a virology lab and studying Hantavirus infections and treating patients with ribavirin. We trained many, and some later came to the States. I think that helped it on its way to becoming a center for virology."
Further in the exchange, Chen writes, "The [Wuhan] lab will be operational soon. The visit has been arranged through one of our grantees. I know Jim LeDuc has been worked with WIV and had done some training. [Redacted.] Also, I was told only certain viruses can be worked in this lab. [Redacted]" Handley then tells Chen: "Please make a very careful and full report on what you learn during this visit. It will be a very important interaction and one that many are interested in. Please share your report with us before it goes into any other reporting. We will be glad to engage directly or via grantees in whatever will help ensure safe operations."
On March 4, 2020, Greg Folkers, Fauci's chief of staff, emails an academic paper titled "On the origin and continuing evolution of SARS-COV-2", published in *National Science Review* on March 3, 2020, to David Morens and other unidentified officials within NIAID, and asks in his cover note: "David, this may come up in ASF's [Anthony S. Fauci's] 10:00 hearing [likely referring to House Appropriations Committee hearings held on March 4, 2020, on NIH budget requests.] What do you make of this paper and the attendant press coverage?" Folkers highlights within the report two passages. One reads: "Our results suggest that the development of the new variations in functional sites in the receptor-binding domain (RBD) of the spike seen in SARS-COV-2 and viruses from pangolin SARS-CoVs are likely caused by mutations and natural selection besides recombination." The second highlighted passage reads: "Although the L type (~70%) is more prevalent than the S type (~30%), the S type was found to be the ancestral version. Whereas the L type was more prevalent in the early stages of the outbreak in Wuhan, the frequency of the L type decreased after early January 2020." Morens replied, but his response is entirely redacted.
Five years prior to the outbreak, in an October 30, 2014, report titled "Wuhan," Chen informs Ken Earhart that she had met with a Chinese official from Wuhan. Chen reports that his office "is similar to what I am doing here seeking, facilitating, and promoting international scientific collaborations for scientists in Wuhan." She continues that this official was asked by an organization put together in part by the Wuhan Institute of Virology "to help the members in the organization increase scientific exchanges between the members and international ID [infectious disease] experts."
In a September 5, 2017, situation report, Chen informs her colleagues that she had "attended a 'Belt and Road' High Level Meeting for Health Cooperation: towards a Health Silk Road." She also reported:
Last week USAID, CDC, ESTH [Environment, Science, Technology, and Health] and I met with Gates Foundation, initially planned to talk about global Malaria eradication efforts to see if there is any area we can work together. But we ended talking in general Chinese policies and the foundation's current strategies in China — capacity building to help China raise its national standards and leverage China's resource to help others. One of the examples for raising the national standards is to help China FDA for its reform. Gates foundation has managed to work out a mechanism with China FDA to provide fund[ing] to China FDA for placing experienced Chinese-Americans who had worked at US FDA for many years to work in China FDA as senior consultants….
On the approach for leveraging China's resource to help others, Gates Foundation is working with Chinese government on donations to its neighboring countries and African countries such as anti-malaria medicines, bed nest, diagnostics etc. More specifically, it helps Chinese companies to gain pre-qualification on medications so that Chinese company manufactured drugs can be sold outside China, helps the Chinese to establish bilateral collaboration with specific countries in Africa, teaches the Chinese how to do resource mobilization, and helps raise China's voice of governance by placing representatives from China on important international counsels as high level commitment from China.
Chen goes on to describe numerous other ways the Gates Foundation was helping the Chinese government by, for example, helping "Chinese companies gain pre-qualification on medications so that Chinese company manufactured drugs can be sold outside China." Chen continues: "Just met with a group from the Global Virome Project (GVP) which is funded partially by USAID. The head of the project, Peter Daszak of EcoHealth Alliance, is an NIAID funded PI. His collaborator at the Wuhan Institute of Virology in China has done excellent work on corona viruses in Chinese bat populations."
A heavily redacted October 26, 2017, email released to Judicial Watch in a previous production includes a newly released response from Handley. The email chain begins with Chen sending a trip report to her colleagues regarding her visit to the BSL4

Lab in Wuhan. She notes: "My contact who helped arrange the visit is Dr. Zhengli Shi, who is a Chinese collaborator on a NIAID grant to EcoHealth for SARS like corona virus project." She continues: "The P4 lab is located in a new developing zone about one hour car ride from the current institute location in central Wuhan city. The location will be the new campus for the entire institute in the near future (a lot of construction is going on right now). Since we are not allowed to take photos so only the photo from the outside is attached."

Newly released in this production of HHS documents is Handley's reply in the email chain: "This is a sensitive subject and will be of interest to others."

Later in the exchange, Handley tells Chen, "Please send us by e-mail your full report on the visit and then we can decide what to do with the information." After Chen emails Handley the report, he writes: "There is enough good information in your report that it needs to be shared in some form or another."

On July 18, 2016, Chen sends an "activity update" to top NIAID officials, summarizing her activities for the prior three weeks. In a discussion of the Chinese needing assistance with conducting clinical trials of new medicines, Chen notes: "GSK's [Glaxo Smith Kline's] Zhi Hong (the head of the GSK anti-infective program and led the GSK center for infectious diseases and public health in Beijing) met with Dr. Fauci on Monday, the 11th, asking for NIAID support for this clinical trial network in China. I know Dennis [presumably Dennis Dixon, Chief of NIAID Bacteriology and Mycology] and Carl [possibly Carl Dieffenbach, Director of NIAID AIDS Research] attended the meeting with Fauci. I don't know the outcome of the meeting." Further along, Chen writes: "I met with EcoHealth Alliance, a NY based non-profit organization on health. They have a R01 grant from DMID [Division of Microbiology and Infectious Diseases] on identifying SARS-like coronaviruses in China. They partner with Dr. Shi Zhengli at Wuhan Institute of Virology. I visited Dr. Shi over a year ago. She took bat samples in caves in certain regions of China, isolated and identified viruses and found some viruses are similar to SARS by sequencing. Now [redacted]. We are talking about close animal-human close contact in densely populated city." Chen also mentions an upcoming meeting of "Chinese NIH Alumni" and talks about NIH Director Francis Collins discussing with the head of Peking University Medical School "about the establishment of a Chinese NIH Alumni as there are so many Chinese researchers trained and worked at NIH in the past."

On October 12, 2016, Chen sends a "High" importance email to senior NIAID officials Handley, Bernabe and Dixon regarding an upcoming conference in China. Chen notes: "Another topic under session 1, Zoonotic Disease Characterization and Prevention, has some relevance to us. NIAID funded George Gao at CAS [Chinese Academy of Sciences] for avian flu (I think it was on avian flu genetics in birds) and we have grant from RDB funding coronavirus survey in bats. The Chinese collaborator is Wuhan Institute of Virology, a CAS institute too. The request for zoonotic diseases is from a Chinese agency I don't know, AQSIQ. [Redacted.]" Dixon replies: "Thanks Ping. I see the topic of 'prevention and control' by your name. While we have occasional projects in that realm, they are at the border of our mission area relative to CDC who list their name that way sometimes in reverse order."

In a January 20, 2017, situation report, Chen discusses the Global Virome Project "to identify viruses present in wildlife with potential crossing over to humans … Following the identification of the viruses is the development of vaccines to protect human population. China has huge capacity for vaccine development (I think it has 7 national owned vaccine manufacturing facility and over 30 private vaccine making companies.) [Redacted] One of the partners in this project is EcoHealth Alliance. Peter Daszak from EcoHealth Alliance is one of the leaders of GVP and he has NIAID grant from RDB looking at the coronaviruses in bat populations in China in collaboration with Wuhan Institute of Virology. He came to visit me once in the Embassy. This grant has direct connection with the purpose of GVP."

In a July 7, 2017, situation report, Chen informs her colleagues: "RDB [NIAID's Respiratory Disease Branch] has a grant to EcoHealth which has a Chinese collaborator at WIV working on finding similar SARS viruses in bat populations and then look for human exposures to the viruses carried by the bats in the villagers near the caves. USAID funds the same organization and they do more virus seeking projects in China."

On May 27, 2018, Chen emails colleague Nancy Boyd, forwarding her an announcement sent to Chen by people at the Wuhan Institute of Virology, which Chen describes as "China's only publicly known P4 lab." Chen adds: "I copied Gayle [Bernabe] at OGR and she can forward to programs officers with the P4 pathogen portfolio."

"These emails provide extraordinary and troubling information about Fauci's agency partnership with China and its monitoring, concerns and funding for the Wuhan Institute," said Judicial Watch President Tom Fitton. "The Gates Foundation should also explain the government report about its assistance to and advocacy for China."

In July, Judicial Watch obtained records from NIAID officials in connection with the Wuhan Institute of Virology revealing significant collaborations and funding that began in 2014. The records revealed that NIAID gave nine China-related grants to EcoHealth Alliance to research coronavirus emergence in bats and was the NIH's top issuer of grants to the Wuhan lab itself.

In June, Judicial Watch announced that it filed Freedom of Information Act (FOIA) lawsuits against the Office of the Director of National Intelligence (ODNI) and the State Department for information on the Wuhan Institute of Virology and the origins of the SARS-CoV-2 virus.

Also in June, Judicial Watch obtained records from HHS revealing that from 2014 to 2019, $826,277 was given to the Wuhan Institute of Virology for bat coronavirus research by the NIAID.

In March, Judicial Watch publicly released emails and other records of Fauci and Dr. H. Clifford Lane from HHS showing that NIH officials tailored confidentiality forms to China's terms and that the WHO conducted an unreleased, "strictly confidential"

COVID-19 epidemiological analysis in January 2020. Additionally, the emails reveal an independent journalist in China pointing out the inconsistent COVID numbers in China to NIH's National Institute of Allergy and Infectious Diseases' Deputy Director for Clinical Research and Special Projects Lane.
In October 2020, Judicial Watch uncovered emails showing a WHO entity pushing for a press release, approved by Fauci, "especially" supporting China's COVID-19 response.

I saw that, and in my view the most important quote was Tony clarifying his prior remarks as below:

Fauci has since attempted to clarify his remarks. On Tuesday, he told CBS News correspondent Weijia Jiang that his opinion about the origins of Covid-19 have not changed and still believes that its origin in nature is "highly likely."
"Since no one is 100% sure, he's open to a thorough investigation. Dr. Fauci said that does not mean he believes the virus first emerged in a lab, as some have suggested," Jiang wrote on Twitter.

Cheers,

Peter

Chinese state media is turning on Fauci amid Wuhan lab controversy

By Nectar Gan and James Griffiths, CNN
Updated 5:36 AM ET, Wed May 26, 2021

*Hong Kong (CNN)*After weeks of facing fierce attacks from Republicans, top US infectious disease expert Anthony Fauci now has a new critic: Chinese state media.

"US elites degenerate further in morality, and Fauci is one of them," was the headline of a blistering opinion piece penned by Hu Xijin, editor-in-chief of the state-run Global Times this week.

In the article Hu accused the top US infectious disease expert of "fanning a huge lie against China" by hyping the theory that the coronavirus was leaked from a Wuhan lab. Another article in the Global Times declared that Fauci had "betrayed Chinese scientists."

The anger is centered on Fauci's remarks this month that he is no longer convinced the Covid-19 pandemic originated naturally. "I think we should continue to investigate what went on in China until we continue to find out to the best of our ability what happened," said the director of the National Institute of Allergy and Infectious Diseases at a fact-checking symposium on May 11.

The comments appear to be a shift from Fauci's earlier view that the disease likely was the result of animal to human transmission.

Fauci's comments were followed by a Wall Street Journal exclusive, citing a US intelligence report, that said three researchers from the Wuhan Institute of Virology became sick enough in November 2019 that they sought hospital care — a revelation that,

MORENS_SUBPOENA_012600
MORENS_NIH_023988
REL0000478236

if true, could add weight to growing calls for further investigation into whether the coronavirus may have escaped from the Chinese lab.

Unsurprisingly, China has vehemently refuted the report, echoing its repeated dismissal of any allegations that link the origin of the virus to the lab. Chinese foreign ministry spokesman Zhao Lijian said the report was "totally inconsistent with the facts" and a director at the lab called the report "a complete lie."
In the meantime, Chinese state media has lashed out at Fauci, saying he has joined an "opinion war against China."

The attack on Fauci is an about-face from the positive portrayal of him in earlier coverage. Last year, as Fauci repeatedly spoke out against the Trump administration's handling of the pandemic, Chinese state media published glowing reports praising the scientist for his professionalism and courage to speak the truth.

Fauci has since attempted to clarify his remarks. On Tuesday, he told CBS News correspondent Weijia Jiang that his opinion about the origins of Covid-19 have not changed and still believes that its origin in nature is "highly likely."
"Since no one is 100% sure, he's open to a thorough investigation. Dr. Fauci said that does not mean he believes the virus first emerged in a lab, as some have suggested," Jiang wrote on Twitter.
Whether that will redeem his image in China, however, remains unclear.

I really don't think this is worth a response to Dr. Sachs or to the journal. There are numerous factual inaccuracies about our work, but it's in an obscure journal I've not heard of, and it isn't being picked up by others. Basically it's safe to say Dr. Sachs has strayed so far down a rabbit hole I don't think he'll be coming out of it based on the fact it's going nowhere…

Jeff:

Great summary, but nothing really new as all the presenters had well-known views. My only comment is that Sachs recently seems to be a little less adamant that it was a lab leak and just now relies on innuendo.

Subject: Jeff Sachs moderated a Lancet Commission webinar on COVID-19 origins this morning
Importance: High

EXTERNAL SENDER

All: I listened in this morning on the webinar on COVID-19 origins that Jeff Sachs moderated under the auspices of the Sustainable Development Solutions Network (SDSN). I wasn't able to stay until the end of the Q&A, but I did hear the three main presentations. Sachs said that he plans to post the recording of the session (on SDSN?). This was the first of three planned webinars – the second (on global health financing) will take place on November 22, the third (on health system strengthening) on December 8.

Sachs served as moderator. His introduction was fairly mundane. His basic premise was that there are two "absolutely viable" hypotheses for the origin of COVID-19 – either zoonotic or due to a lab leak. (Note that the language he uses – "absolutely viable" – obscures the fact that the evidence differs significantly for each

of the two hypotheses. But this was a bias that ran through all of the presentations.) He then argued that we need to follow both lines of inquiry equally, to have a proper understanding of both possibilities. He alluded to the bimodal distribution of most discussion of these questions – with "mainstream media" coming down on natural origins, and "alternate media" arguing for laboratory origins (including in this Senator Burr's Senate Minority Report). He then turned to two "leading scientists" and a "leading reporter" for further perspectives.

The speakers were Alina Chan (Broad Institute), Richard Ebright (Rutgers University) and Emily Kopp (US Right to Know) – no great surprises there.

Alina Chan's main argument was that there is not enough evidence to decide which hypothesis is true, and that all the evidence is circumstantial. She did say that there is no argument over the fact that the pandemic originated in spillover from bats – just a difference of opinion on how and where this happened.

She presented a set of factors that would explain the chain of causation for each of the two hypotheses:

Natural origins
- Earliest cases handled live animals?
- Were there infected animals in markets or farms?
- Were there animal variants of the virus?
- Was there antibody evidence of infected animals or traders (not presenting with pneumonia)?
- Was there a strong wildlife conduit between known bat reservoirs and the outbreak site?

She then claimed that none of these have been established for SARS-CoV-2, and thus we can't say that natural origins hypothesis is true.

Lab leak
- WIV was the HQ for virus hunting program targeting both animals and humans
- WIV found and developed SARS-CoV-2-like viruses by 2013
- WIV did advanced work with virus isolates and "seamless clones"
- Live virus work was done in BSL2 and BSL3 environments, which could not contain airborne viruses
- WIV and collaborators were planning to insert furin cleavage sites in different viruses (she referred to a "pipeline" of risky research and made a big deal of the rejected DARPA proposal, for which the research was never done)

Her conclusion: evidence is not definitive for either hypothesis, but these aspects of research at the WIV were "very concerning" and thus we need to investigate both conclusions.

Richard Ebright was then asked what should be done about improving the oversight of research in this area from the perspective of biosafety, biosecurity, and biorisk management. He concurred with Sachs and Chan that the available data do not enable a choice between the two hypotheses of COVID-19 origin. But regardless of where one stood on this question, the research by EcoHealth Alliance, WIV, and their collaborators – according to Ebright – used inadequate biosafety protocols and lacked transparency. Again, according to him, this points to, but does not prove, a research spillover as the origin of COVID-19.

I've attached a screen shot of the slide he shared that lays out his bill of complaint. As you can see, he's fixated on the work that WIV and EHA did from 2016-2019, arguing that, while this doesn't prove laboratory origins, it "exceeds the standard of probable cause" and provides "ample basis to initiate investigation and ample basis to improve oversight." (Like Chan, he also made much of EHA's rejected DARPA proposal, trying to use it as a "smoking gun" for malign intent by EHA and WIV, despite the fact that this research was never done!)

He spent most of his time, however, outlining a basis for and recommendations for improved research regulation and oversight in biosafety, biosecurity, and bio risk management.

Sachs and Ebright had an exchange about the recent news of the creation of a variant of COVID-19 that appeared to be more virulent than Omicron, without the "knowledge or approval of NIH." This was evidence for both of them of the need for enhanced oversight.

Emily Kopp, an investigative journalist with US Right to Know, then made a breathless presentation about her attempts to bring the truth about COVID-19 origins to light through FOIAs and dogged persistence. The gravamen of her complaint is that much of the relevant research has been underwritten by NIH, DOD, and USAID with taxpayer funds, and conducted in the US (at EHA, University of North Carolina, University of Texas, and UC Davis), yet she and her colleagues have had to file dozens of FOIA requests and lawsuits to get access to what they consider to be relevant information.

She reviewed five categories of evidence:

1. EHA progress reports to the NIH: She noted that the Intercept is going after 31 EHA NIH proposals and over 1000 other documents not yet released. They also plan to go after EHA Board members and collaborators at the U of Maryland and UC Davis.

2. USAID databases from PREDICT.

3. NIH bioinformatics databases for sequence data from WIV: She was quite

exercised about the "apathy" of NIH at not going through archived sequences to provide the information that USRTK wants.

4. The Baric Lab at UNC: She said as yet there are few clues to planned work on genetic engineering techniques here.

5. Department of Defense: Again, she railed about the lack of transparency about the rejected EHA DARPA proposal, which she claimed DARPA tried to conceal. She also mentioned data from PREEMPT.

She then claimed that the public can't trust the credibility and integrity of the NIH on these matters, since they tried to obscure the existence of relevant data – and event tried to obscure the involvement of other scientists in the discussion of COVID-19 origins in the conversations that led to the *Nature Medicine* correspondence in 2020 (I lost her here – the discussion became very "inside baseball"). She concluded with a plea that the public deserves more clarity about the pandemic's early days.

Sachs then threw her a softball about the *Nature Medicine* correspondence, inviting her to tell the listeners how it appeared that NIH was trying to obscure who came up with the zoonotic origins theory (and then didn't credit those authors on the publication). She then said that the virologists who were on this correspondence have continued "to be aggressive about natural origins and to marginalize other theories" – asking (rhetorically) if they have shown integrity.

Sachs then said that all of this information had to be pried out of the NIH and the USG, rather than being offered transparently. He showed how the NIAID had redacted most of the 300-page COVID strategic plan of April 2020, and also made a point of saying that Robert Redfield had wanted to attend today's webinar but couldn't, noting that he believes a lab leak is more likely – and that he was shut down by NIH when he tried to call for further investigation. Sachs then teased that there may be new revelations that the WIV and US scientists were implicated in evidence that COVID-19 emerged in China before December 2019. (This latter evidence-free speculation seems to refer to Mike Pompeo's evidence-free contention that the USG had evidence of this – but that evidence has never materialized.)

Sachs then reiterated his contention that both hypotheses need further investigation – and that the relevant information may be in the US, not China. We need an independent, rigorous, transparent scientific investigation. (Despite this language, I think you can sense from my summary of the webinar that Sachs is actually shading the argument toward his belief that COVID-19 had a laboratory origin.)

I wasn't able to stay on for the Q&A, but we should be able to review the rest of the session when Sachs posts the recording.

Hope this is helpful.

As ever,
Jeff

Just looking at the chat. Thanks David for starting it. I downloaded the new paper and look forward to sitting down to read it. I have thought there were a number of areas where NIAID vaccine research policy was off-center, for example how long it took to focus attention on a universal non-seasonal influenza A vaccine. We lost a lot of time by the decision to go with the status quo.

My NEIDL colleague Nahid Bhadelia is working with Ashish Jha at the WH on coronavirus policy. I will ask her to talk to Ashish about raising a fire under the woodpile the administration leadership is quietly resting and to get busy with the job of finding the next Harold Varmus. Its 18 years since he left and there has been no comparable leader, and during that time the reputation of NIH has been tarnished by one after another leader. Larry Taback is just the latest. Of course it could have been worse, CDC as the example, but that's no comfort.

Peter H, you should keep this in mind. The time to step forward may not be now but do stay tuned to the sounds coming out of HHS and the WH.

Jerry

Yes, sadly, you are right. We are in for a lot more shit

In terms of us looking for a new director, since this is not a political appointment position, niaid has much leeway in doing what we want, subject to HHS and NIH oversight/coordination, but not outright control

There seems to be secrecy around the process of finding a new director, which is not the way we have done things in the past. The job description is not what i would have written, eg, in specifying someone who is politically savvy. We have 27 IC directors here at nih and i can't recall any prior search looking for someone with political chops.

I am afraid we could end up with a pliant nih insider rather than an outsider with strong science credentials. The model is former NCI director Harold Varmus who was perceived as too big to mess with, and used that reputation to push back against all kinds of BS

There is no guarantee that anything will happen soon. Hugh is Acting Director but is taking a hands off, just-keep-the-ship-afloat approach so far. I hope he will be more proactive, as he is smart and capable, and has alot of management expertise

But internally there is absolute silence about what if anything is happening. I know all the senior leaders here, and none are involved in any search "above board", at least. Several have implied to me that they are as much in the dark as everyone else. If so, that is not good news because it raises the possibility of a covert and possibly politically oriented process

That is one reason i encouraged you to apply: an nih outsider who has political skills and a scientific reputation, as well as skill in pushing back against the BS. If you think of all possible scientists who would be good in the job, the list is not long, or at least my list isn't. If you know anyone please urge him or her to apply asap!

NIAID is looking for a new director? Will that happen soon?

Best Peter

>
> Our deputy director, Hugh Auchincloss, is a good and reasonable guy, but i have not yet spoken to him about how muzzled i am expected to be going forward. I think the party line at nih is to be very fearful of the crazies in and out of congress, and in practice our guidelines of never speaking to the press unless approved by HHS or the White House remains in

effect. That is why 95% of my interactions with the press are on background and off the record. (Incidentally, although i have spoken to Joel Achenbach on background numerous times in the past, i did not speak to him for today's article).

Here is how it works. Our press office knows that whereas Tony has the patter and nuance down pat, I will say pretty much exactly what i think scientifically, and therefore they do whatever they can ethically to cut me off from sensitive issues, knowing that HHS will cut me off if they don't

But I plan to sit down with Hugh and ask him to let me use my judgement in these issues. There is no govt reason anymore for me being forbidden to even speak with colleagues such as you all

And an interesting thing happened recently that i think bodes well. As you all know, over the last 15-20 years or so i have written 40-50 scientific papers with Tony, mostly reviews and commentaries that provide springboards for him to talk to the press. Usually i propose the topics and he says yes or no.

Ever since the GOF thing broke 15 years ago, with Ron F and Yoshi K publishing their two papers on H5N1, GOF has been a no no for me/us to write about. And so far, still is a no no. Another subject that has been a no no is my conclusion that our whole scientific enterprise to make vaccines against respiratory viruses is off base scientifically, and needs to be reoriented

A few months ago, Tony surprised me be giving me the go-ahead to write a review that says as much, implicitly criticizing what we at nIH and others do in terms of vaccine development approaches. Many others at NIH told me that we dare not write that. But about 10 days ago the paper came out in Cell Host and Microbes, with Tony's name on it, and has been greeted very positively by many high level folks in and out of govt

This gives me SOME hope that us discussing GOF head on might be possible, by which i don't necessarily mean talking to the press, but by writing in science articles why it is that the whole concept of GOF is being (often willfully) misunderstood. The aim would be to have statements by govt scientists that change the terms of the dialog, ie, be more proactive rather than letting the crazies control the dialog

I wrote such a paper with Jeff Taubenberger 10 years ago, which has sat unpublished in a file cabinet ever since, and could easily resurrect it with updates addressing SARS-CoV-2....

So..... I am hoping that I will no longer be bound and gagged from from enjoying my first amendment right to speak to you all about scientific matters if importance. It's a new year and time to move forward by being more proactive

Subject: Under Embargo - Commentary in Nature Wednesday morning
From: Peter Daszak <
To: Morens, David (NIH/NIAID) [E] <(b) (6) Keusch, Jerry <(b) (6) Robert Kessler <(b) (6) Roberts, Rich <(b) (6) Hotez, Peter Jay <(b) (6)
Attachments: image001.gif; image002.jpg; image003.png; Koopmans et al. Comment Covid Origins Nature 2021.pdf

I'm attaching a commentary that will come out on Wednesday in Nature. It was originally written as a response to the WHO DG deciding to bail on the WHO team and call for a new structure and a focus on the lab leak/audit. We've watered it down so it's not too political, and focuses on the fact that this has stalled the process. The key messages from our point of view are that:

- the search for the origins is important and needs to continue
- since our report, we feel that most attention has gone to debates regarding likelihood of a lab leak, at the cost of progress in other areas
- we should all be concerned that time passing - in part owing to these discussions – and this could close the window of opportunity for some critical studies
- there are critical issues to deal with that are laid out in the report as recommendations for Phase 2: tracking back from the market, following new leads from the recent paper on mammals in the market, representative wild animal and farmed wild animal surveys, and comparative serosurveys in all regions where there has been evidence of early circulation.
- the lab audit - as added- will need to be developed to define questions. The smallpox audit example cited by WHO in their press addresses biosafety and biosecurity for that pathogen, but would not necessarily help identify evidence for a lab leak. Developing those studies, and agreeing them with China may take of lot of time and that these should not lead to further delays for the other recommended studies

I'm still trying to stay out of publicity as much as possible, so will be avoiding reporters on this one.

Cheers,

Peter

Subject: Francis Collins on CNBC today

MORENS_SUBPOENA_022665
MORENS_NIH_043669
REL0000478248

Hello everyone - Not looking forward to the publicity this week with the Intel report coming out sometime soon, but wanted to share a couple of things.

First – here's an interview by Francis Collins on Squawkbox CNBC that makes him come over like a wet lettuce. He goes one way then the other, making sure he sounds somewhat anti-China (they could have been doing mysterious things), but makes it clear NIH didn't fund Gain of Function there.

It's the definition of flip-flopping I guess. Maybe he genuinely believes China were up to something. In any case, it feels like he basically couldn't care less about the organization in the middle (EcoHealth) that's being batted around like a table tennis ball… The URL is here: https://www.cnbc.com/2021/08/23/covid- origin-nih-director-doesnt-rule-out-that-virus-could-have-leaked-from-lab.html

NIH director says Covid likely came from nature, but doesn't rule out it could have escaped from lab

PUBLISHED MON, AUG 23 202112:53 PM EDTUPDATED MON, AUG 23 20211:08 PM EDT
Rich Mendez@RICHMENDEZCNBC

KEY POINTS

- President Joe Biden gave the U.S. intelligence community 90 days to investigate Covid's origins and report the findings, which are due Tuesday.
- Through a grant to non-profit EcoHealth Alliance, the NIH funded research at the Wuhan Institute of Virology to study how bat viruses could infect humans.
- Collins said the research didn't meet the technical definition of so-called gain-of-function research.

The director of the National Institutes of Health said Monday it appears Covid-19 originated from an animal, but he didn't rule out the possibility that scientists at the Wuhan Institute of Virology were secretly studying it and that it could have leaked out from there.

It's still unknown if the virus leaked out of a Wuhan lab, NIH director Dr. Francis Collins said Monday in an interview on CNBC's "Squawk Box," adding that the World Health Organization's investigation into the origin of the coronavirus has gone "backwards."

"The vast evidence from other perspectives says no, thiswas a naturally occurring virus," Collins said. "Not to say that it could not have been under study secretly at the Wuhan Institute of Virology and got out of there, we don't know about that. But the virus itself does not have the earmarks of having been created intentionally by human work."

MORENS_SUBPOENA_022666
MORENS_NIH_043670
REL0000478248

The WHO investigation has been made harder by China's refusal to participate, says Collins.

"I think China basically refused to consider another WHO investigation and just said 'nope not interested'," Collins told CNBC's Squawk Box.

"Wouldn't it be good if they'd actually open up their lab books and let us know what they were actually doing there and find out more about those cases of people who got sick in November of 2019 about which we really don't know enough," Collins said.

U.S. intelligence reports first reported by the Wall Street Journal indicated that in November 2019, three workers at the Wuhan Institute of Virology fell ill with symptoms similar to those seen in Covid-19 infections, a report that China said was "completely untrue."

About three months ago, President Joe Biden initiated an investigation of his own and gave his intelligence community 90 days to further the investigation the virus' origins and report the findings. The deadline is Tuesday.

"It will be an interesting week because tomorrow is the day of the 90-day deadline that President Biden set for the intelligence community to do all their poking around that they could to see if they could come up with anymore insight as to how this virus got started in China," Collins said.

Most of the information gathered will likely remain classified, but some information from the report will be released, according to Collins.

"We don't know what they're going to come up with either, but we're intensely interested," Collins said.

Collins also weighed in on the debate over whether or not the U.S. funded so-called gain-of-function research at the Wuhan lab, a debate that Republican Sen. Rand Paul of Kentucky and medical advisor to the president, Dr. Anthony Fauci, have engaged in time and time again. Gain-of-function research is when scientists take a pathogen and make it more contagious, deadly or both to study how to combat it.

"The kind of gain-of-function research that's under very careful scrutiny is when you take a pathogen for humans, and you do something with it that would enhance its virulence or its transmissibility," Collins said. "They were not studying a pathogen that was a pathogen for humans, these are bat viruses."

Some of the research at the Wuhan Institute of Virology that was funded, in part, by the NIH through a grant to non-profit EcoHealth Alliance studied how bat viruses could infect humans.

"So by the strict definition, and this was look at exquisitely carefully by all the reviewers of that research in anticipation that this might come up, was that this did not meet the official description of what's called gain-of-function research that requires oversight," Collins said. "I know this has gotten lots of attention, but I think it's way out of place."

Cheers,

Peter

Why China Is Struggling to Make the Lab Leak Theory Go Away

U.S. spy agencies are about to report on COVID-19's origins, but don't hold your breath.

by Alan Wong
by Viola Zhou
August 20, 2021, 9:38am

Robert Redfield has a lot of questions. The virologist and former director of the U.S. Centers for Disease Control and Prevention wants to know what happened at the Wuhan Institute of Virology, especially in the months before the emergence of COVID-19 in the same city. But China's answers didn't satisfy him.

"On Sept. 12, 2019, coronavirus bat sequences were deleted from the institute's database. Why? It changed the security protocols for the lab. Why? It put out requests for more than $600 million for a new ventilation system. What prompted this new need?" Redfield, who believes that the coronavirus escaped from the lab in Wuhan, asked those questions in the *Wall Street Journal* on Sunday, alluding to the possibility that something bad happened at the facility as early as September that year and caused a pandemic that has killed more than 4 million people worldwide. To bolster this view, he said a Harvard study of satellite images revealed a shutdown of traffic around the Wuhan lab around that time and that hospital parking lots in the city were filling up—signs, perhaps, of a lab accident and a subsequent surge in sick people.

But almost all of those insinuations are disputed, inaccurate, or just plain wrong.

The opinion article offers a stark illustration of the limits of circumstantial evidence as the search for the origins of COVID-19 enters a contentious new phase.

U.S. spy agencies are preparing to release a report on their findings on whether the pandemic started from human contact with an infected animal or a laboratory accident in China. The report is expected no later than next week, after President Joe Biden in May gave the U.S. intelligence community a 90-day deadline to further collect and analyze information that could "bring us closer to a definitive conclusion" on the origins of COVID-19.

But China is not keen to cooperate. Further muddling the search is Beijing's renewed push of an unsubstantiated, alternative theory that the virus could have originated in a U.S. army lab at Fort Detrick, Maryland. The move has only fueled suspicions that the Chinese government is hiding something.

Unless U.S. spies uncovered substantial evidence—such as proof that the Wuhan lab possessed the virus that caused COVID-19 or evidence that it created the virus—the debate on the pathogen's origins is likely to persist.

Redfield co-authored the *Journal* article with Marc Siegel, a physician and *Fox News* contributor who last March said the coronavirus was no worse than the flu. It was riddled with mistakes.

For example, the planned ventilation system upgrade at the Wuhan Institute of Virology cost about $600,000, not $600 million as the authors stated. The figure was corrected on Friday, a day after VICE World News emailed questions to the *Journal*'s opinion desk. That number came from a report by Republicans that exaggerated the amounts of several other projects by orders of magnitude and has been cited in several other prominent news outlets.

MORENS_SUBPOENA_022669
MORENS_NIH_043673
REL0000478248

The Trump-appointed former director of the CDC apparently also misattributed the findings of a military contractor's report to Harvard. The Harvard study he links to analyzed satellite images of hospital parking lots in Wuhan, but it did not once mention the Wuhan Institute of Virology. It was also criticized for its poor dataset, abuse of statistical methods, and mistranslation.
The analysis of traffic outside the Wuhan institute used commercial satellite imagery and phone location data to conclude that traffic was unusually thin around the Wuhan institute and was the result of containment efforts following a hazardous event. But the report's key assertions were found to be false as early as June last year.
These are just a few examples, from one article, showing the challenges of investigating the origins of the coronavirus without being in China and without the country's full cooperation.
The closest thing to a field study the world has seen was the World Health Organization (WHO) trip to China early this year, but the global health body has complained about not being able to access the complete raw data from the early COVID-19 patients that could give researchers insights into how the virus emerged.
Last month, the WHO chief urged Beijing to share the data, but Chinese officials said the information could not be disclosed due to patients' privacy. Some scientists are not convinced by the argument, citing the possibility of disclosing the data while keeping the patients' anonymous.
Beijing's obsession with a theory that the coronavirus could have been brought into China through frozen food imports has also raised doubts. Officials have kept calling for more research into such potential cold-chain transmission, although few scientists abroad have found it credible enough to justify further investigation.
"In my opinion, it's even less likely than lab origin," Angela Rasmussen, a virologist at the University of Saskatchewan in Canada, told VICE World News. Rasmussen, who has argued in favor of a natural origin of the coronavirus, said the Chinese government might be trying to distract people from the wildlife trade that could have led to a virus zoonotic spillover.
Scientists say only greater transparency will help Chinese authorities fend off all these suspicions. "We are being asked to take their words for it, without seeing any data," said Alina Chan, a biologist at the Broad Institute in Cambridge, Massachusetts, who has promoted the lab leak hypothesis. Chan told VICE World News she would like to see all of the sequences of the pathogens that were processed at the Wuhan lab. If the data could not be made public, she said, they should at least be reviewed by an international team of scientists.
"This situation is setting precedents for how future outbreaks are tracked," she said. "If every single country does this, and refuses to let international investigators check where the virus came from, we would just be facing a future where viruses are just exploding everywhere, and we are just getting a new pandemic every five or ten years."
Some other scientists still maintain that the lab leak theory is unlikely, in contrast with what they have called a "substantial body of scientific evidence" supporting a natural origin for the coronavirus, according to a peer-reviewed paper published in *Cell* this week.
Still, with few new data points to inform the origins probe, scientists on both sides of the debate have called for greater transparency.
WHO Director-General Tedros Adhanom Ghebreyesus in July said the lack of raw data on the early days of the outbreak was hampering the investigations into the origin of the virus and urged China to be more transparent. Tedros suggested further studies into Chinese laboratories in the next phase of studies.
But the Chinese government would not feel comfortable with this degree of transparency. The Communist Party leadership is used to conducting investigations and making decisions behind closed doors, and sees the call for openness as a political threat.
"That is not atypical in China's crisis management," Yanzhong Huang, a senior fellow for global health at the Council on Foreign Relations, told VICE World News. "The U.S. could push for more transparency, but they fail to recognize that the lack of transparency itself is part of the authoritarian governance in the country."
This mindset could hurt China's reputation—the pandemic is not a small crisis but one that has upended almost everyone's life. "Even if the virus is caused by a natural spillover event," Huang said, "when you don't show transparency, when you are perceived as unwilling to share the data, people naturally will think you have something to hide."
The Chinese government has remained intransigent to the mounting calls for more transparency.
At the press conference last month, Chinese officials said they were "shocked" to hear about WHO's proposal for fresh audits into Chinese labs, adding the suggestion indicated "disrespect for common sense and an arrogant attitude toward science."
The same month, state media quoted a Facebook post by a self-claimed Swiss biologist named Wilson Edwards as saying that researchers faced intimidation from the U.S. for supporting the WHO-China origin-tracing study. The Swiss embassy said no such person exists.
It's unclear whether the U.S. intelligence probe, which was condemned by Chinese state media as a "political witch-hunt," would yield anything more than circumstantial evidence.
By the time a preliminary report was drafted, the intelligence community was still divided over the lab leak theory and the natural origin one, CNN reported this month. The outlet cited a source as saying that the draft contained "nothing too earth shattering."
In September 2019, the Wuhan Institute of Virology shut off public access to its database, which holds thousands of genetic sequences of bat coronaviruses it studied.
Shi Zhengli, director of the Center for Emerging Infectious Diseases at the institute, said the online database was shut down after cyberattacks—believe it or not, that's the answer to ex-CDC director Robert Redfield's first question. But almost two years later, the database remains offline. It's no wonder that people are asking questions.

Peter, after we spoke, i chatted with Jeff and he proposed sending these papers which nibble at the GOF issue, in the sense of trying to clarify without provoking

The slant of the unfinished paper was more along the lines of clarifying why the whole issue of GOF is bogus, being essentially a misinterpretation of what virology is and can do. D

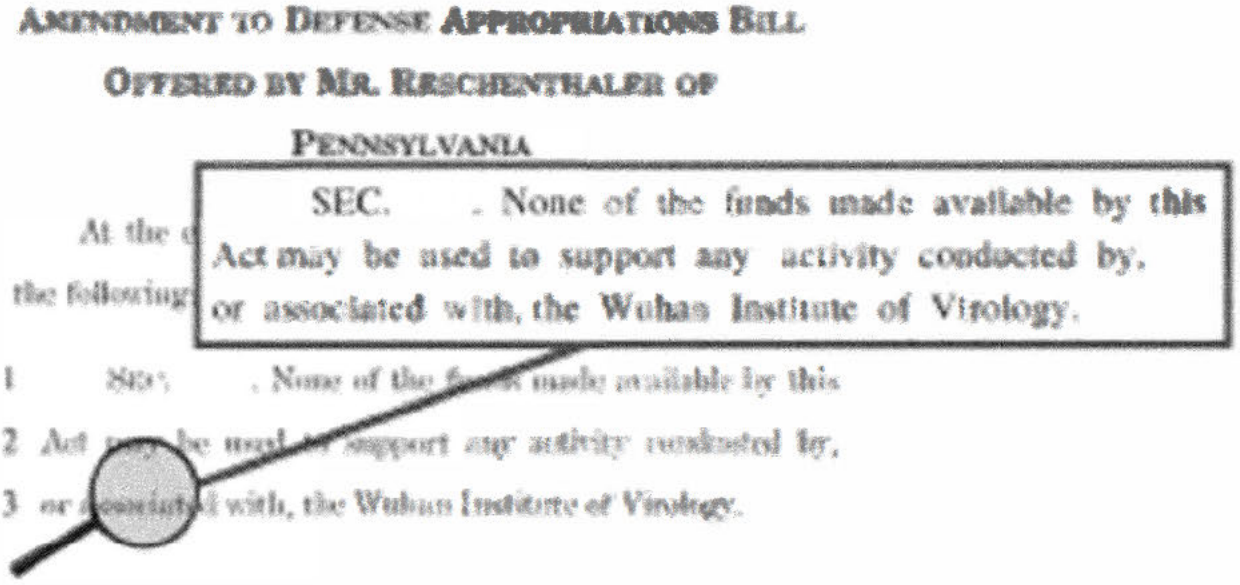
Richard Horton already made a false statement about me to the House of Commons – saying that it took him a year to get me to fully disclose my conflicts of interests for the Lancet 'Statement of support' we wrote in Feb 2020. He referred to me as "that individual". De-humanizing and dishonest. So I doubt he'll intervene, but worth a shot.

By the way – here's today's gloating article by the "White Coat Waste" celebrating Republican congressional member Reschenthaler (PA) who has been doggedly pursuing our defunding for the last 2 years. The amendments do not actually make any iota of difference of course – No funds from DoD ever went to Wuhan either directly or through EcoHealth. But it does the job of painting us as an organization that should be attacked. Just as Sachs' Lancet Commission report will now do.

https://blog.whitecoatwaste.org/2022/06/24/progress- congress-defunds-wuhan-animal-lab-ecohealth-alliance/

PROGRESS! CONGRESS DEFUNDS WUHAN



POSTED BY
24 JUNE 2022 |

Ever since White Coat Waste Project (WCW) **first exposed** that dangerous coronavirus

MORENS_SUBPOENA_007830
MORENS_NIH_017125
REL0000478258

experiments on animals at the Wuhan Institute of Virology (WIV) were funded by U.S. taxpayers, the idea that the coronavirus accidentally leaked from the lab and caused the COVID pandemic has gained international traction. Even the World Health Organization (WHO) — which once dismissed the theory — now **says** that the lab leak hypothesis deserves "further investigation."

Congress recognizes the threat posed by funding risky animal experiments at the notorious Wuhan lab, too. On Wednesday, June 22, the powerful House Appropriations Committee, which sets the budget for federal agencies, approved a White Coat Waste Project-endorsed amendment from Rep. Guy Reschenthaler (R-PA), banning any Department of Defense (DOD) funds from being spent at the Wuhan Institute of Virology. The DOD, along with the National Institutes of Health (NIH) and State Department, funded dangerous animal experiments at the Wuhan lab.

AMENDMENT TO DEFENSE APPROPRIATIONS BILL

OFFERED BY MR. RESCHENTHALER OF PENNSYLVANIA

SEC. . None of the funds made available by this Act may be used to support any activity conducted by, or associated with, the Wuhan Institute of Virology.

MORENS_SUBPOENA_007831
MORENS_NIH_017126
REL0000478258

The committee also approved a second WCW-backed **amendment** from Rep. Reschenthaler, barring the DOD, for the **second year** in a row, from funding any work in China performed by the white coats at shady nonprofit **EcoHealth Alliance**, which funneled tax dollars to the Wuhan lab. A majority of Americans, as well as the FBI and other experts, believe their gain-of-function experiments on animals could have caused the pandemic.

Rep. Reschenthaler, a **Waste Warrior**, has been a long-time ally of WCW, recently penning a **joint op-ed in *Newsweek*** with our founder and president Anthony Bellotti about our work together to investigate the lab leak hypothesis and hold government bureaucrats accountable.

The bill will soon head to the House for a vote, then the Senate. As it progresses, we will keep you posted; in the meantime, thank you to Rep. Reschenthaler, and other members of the Appropriations Committee, for protecting taxpayers, animals and public health!

On Jun 28, 2022, at 10:42 AM, Peter Daszak (b) (6) > wrote:

Just awful to see how obstinate he's become on what should be a non-issue.

I'm also pretty disgusted with his comment "I will revise the sentence to reflect that we had a session with top scientists and that as Chair I consulted extensively on the topic (after the chronic lying by Daszak and duplicity of other TF members)." It's lower down in the email chain.

That's a hell of an accusation he's stating to you, knowing you're in disagreement. I shudder to think what he's saying to those who are neutral or lean towards the conspiratorial side.

There is not a single time I lied, or other taskforce members were duplicit in dishonesty or any other 'thought-crime'. It's demonstrably clear, should anyone bother to ask, and we have the back up docs to prove it.

And by the way, speaking of adolescence, people who call me by my last name in that way take me right back to life in a UK grammar school in the 1970s…it's too easy to spit out a foreign-sounding name just as his email does. You'd think he'd have some empathy, but I guess I made the cardinal mistake of disagreeing with him, and refusing to share EcoHealth privileged documents with him. I guess the punishment for that is what's happening now.

Cheers,

You mean with the guy with publicly berates virologists, including me, calling us "stooges"? Look Jeff, you're publicly supporting a fringe group and idea, and that's your right. But for a public consensus document such as a Lancet Commission report it needs to be tempered and modulated appropriately. Now that a referee has called it out as well, the scientific community is telling you to fix this. I believe my language is the most straightforward and does not ask you to retract your own strong views.

On Jun 28, 2022, at 8:31 AM, Jeffrey Sachs <(b) (6) wrote:

The report says only that both hypotheses are in play and should be pursued. You are free to state on your own account outside of the Commission your own conclusions at any time. Each of us can do so. There is not any hint whatsoever of "equally likely." (I personally believe, along with many scientists, that a lab release is the most likely origin, by the way, but the report in no way states that.)

Personally I find your position to be untenable. Because of FOIA we now know in remarkable detail just how much the NIH has hidden from view. Even Baric says that both hypotheses need investigation. The US Intelligence Community similarly concluded that both hypotheses are in play. The Commission is calling for transparency.

>
> Yes Jeff, we discussed this at length and we agreed to send this out for peer review - with the understanding that the manuscript would be modified pending the comments. Now that a referee agrees with my assessment, this needs to be addressed in a forthright manner. My recommendation is that you accept the referee's criticism by stating that at least one of the Commissioners agrees and the language in the document has been modified accordingly. That's the only honest answer I can think of. It will also protect the entire LC from future backlash from the virology community.
>
> One way to go is to add a sentence, that there was not consensus in your statement giving equal weight to zoonotic spillover vs lab leak GOF research and at least one of the Commissioners feels that body of scientific evidence overwhelmingly supports the former. This is a simple statement of truth and one that would give our document greater intellectual heft.

On Jun 28, 2022, at 7:50 AM, Jeffrey Sachs <

(b) (6) > wrote:

Dear Peter,

We have already discussed this at length and agreed long ago not to state relative probabilities.

Our report is balanced, measured, and circumspect. I will revise the sentence to reflect that we had a session with top scientists and that as Chair I consulted extensively on the topic (after the chronic lying by Daszak and duplicity of other TF members).

> Response: Thank you for this feedback. The Chair conducted extensive consultations on this issue with independent experts and the Commission hosted a session with a group of international experts who advised us clearly and cogently that it is not possible nor prudent to place estimates of feasibility or likelihood on either scenario, so we have left the manuscript as it is without implying either scenario is more likely. Both scenarios should be taken seriously.

Sadly, you didn't attend the session because you told me late that you simply had too much work to do. Moreover, I invited Mike Worobey just as you requested, and he also cancelled without a single word of explanation before or after!

As my co-authored PNAS article explains, I believe that NIH and EHA have behaved very badly in this matter, opposing transparency at every step.

Jeff

> On Jun 28, 2022, at 1:35 AM, Hotez, Peter Jay < (b) (6) > wrote:
>
> Dear Juliana, thank you for your email. I accept the responses except for one, for which I agree with the referee and disagree with Jeff's response:
>
> *2. Pages 25-28. The current manuscript implies that these 2 hypotheses have a 50:50 relationship. In my opinion, both natural spillover and lab escape hypotheses are feasible. But the current evidences do not support that they have equal likelihood. Several*

evidences suggest that SARS-CoV-2 is a product of natural virus recombinations. I entirely agree that SARS-CoV-2 can be THEORETICALLY generated in a lab. But there is hardly any direct evidence to show such work has been conducted. There is no solid evidence to show that was lab accidents or lab escape event in Wuhan.

Response: Thank you for this feedback. We conducted meetings with a group of international experts on this subject, who informed us that it is not possible nor prudent to place estimates of feasibility or likelihood on either scenario, so we have left the manuscript as it is without implying either scenario is more likely. Both scenarios should be taken seriously.

This is not a 50:50 situation by any means, in fact the outrage from the community of virologists after Jeff's recent PNAS paper on the subject should be a wakeup call to the dangers of citing false equivalency.

Also, Jeff's response is not true. We did not conduct meetings with international experts, he organized a single meeting with unqualified scientists from other fields. Therefore, this language must be altered to both accommodate the referee and reflect the reality that the lab generated hypothesis remains viable but unlikely.

Many thanks, Peter

Subject: COVID-19 Commission: Need approval of minor edits after first peer review

*****CAUTION:*** This email is not from a BCM Source. Only click links or open attachments you know are safe.**

Dear All,

We are pleased to let you know that we have received positive responses from our peer reviewers on the Final Report of the Lancet COVID-19 Commission. We have made minimal updates and changes in phrasing to reflect their suggestions.

We require your **urgent approval** of the **updated version of the manuscript**, attached in both clean and tracked changes versions. We have also attached the drafted point-by-point

response to referee comments for your review.

At this stage, we ask that you kindly do not send any changes other than urgent and very minor corrections.

Thank you, and please let me know if you have any questions!

Julie

Yes, it's very odd. I just can't follow it.

What I did think was interesting - as you note - is that they talk a lot of the market which I thought was totally off the table in China. Also, it's from Nanshan Zhong and I last time I heard him speak he was strongly pushing the frozen food idea.

Perhaps a shift?

Or could just be a wet Wednesday afternoon's ramblings.

I thought the SARS-CoV-2 virus that emerged in Wuhan wasn't capable of infecting mice that weren't genetically engineered to express human ACE2? This paper, with its emphasis of meteorological factors, seems dodgy to me. But it's good to see research on the origins from researchers in China getting out, albeit it in an obscure journal.

It's not phylogenetics.

One thing is ascertainment bias which could be huge.

Second thing is to distinguish the long-term ecology of these viruses from the short-term emergence of the virus. These Laos viruses are the former. Clearly these viruses are commonplace in SE Asia. And I don't just think that bats and pangolins will be the only animals with SC2-like viruses. Virus ecology does not work like that. But this is not the same as determining the events that happened in Wuhan. To me, China still looks like the most likely source.

Third, I'm pretty certain that groups in China are sitting on more SC2-like viruses. If you sample bats you find them. It is striking to me that CCDC have published so little on this yet have supposedly sampled so many animals. That doesn't add up. Never discount the politics.

Yes, good idea.

The receptor binding domain of some of these Laotian bats is so close to that of SARS-CoV-2 even some of the die-hard leakers are beginning to see the light…

This also effectively excludes that virus-receptor relationship was generated through lab passage, that the pangolin sequences were faked, and that this outbreak had anything to do with the Mojiang mine as a virus from a different country is now closer. That mine will go down in history as the reddest of herrings.

That said, I am a little worried about confirmation bias for the origin being bats from Yunnan/Laos/Cambodia. The more they find there, the more they sequence. But no doubt these Laotian samples are of huge significance. As are the Hubei civets.

EXTERNAL SENDER

Here's Epoch Times today. They emailed me for comment, but by the time the email arrived, the story had already been posted! Not that I would have responded, of course – Epoch Times is funded by the Falun Gong movement and has been stirring the pot on this since January 2020. They also referred to SARS-CoV-2 as "CCP virus" in previous posts.

The comments at the end from Representative Comer are worth reading. He threatened further action earlier today on the Republican Oversight Committee member's twitter account
https://twitter.com/GOPoversight/status/1560752262175137794?s=20&t=8uqpqKwIR-hKM-jF1Yw4hQ

"NIH confirms EcoHealth violated grant terms to hide risky research on bat coronaviruses in Wuhan but will continue receiving taxpayer-funded grants. NIH only ended EcoHealth's partnership with the WIV. This is unacceptable. Oversight & accountability are coming in 2023."

US National Institutes of Health Ending Subaward for Lab in Wuhan, China

By Zachary Stieber

August 20, 2022 Updated: August 20, 2022

Print
0:005:09
1

The U.S. National Institutes of Health (NIH) has ended a subgrant to the laboratory in China located where the first COVID-19 cases were identified in 2019.

U.S.-based EcoHealth Alliance was granted $3.7 million, starting in 2014, to study bat-related coronaviruses. It conveyed some of the money to the Wuhan Institute of Virology (WIV), located in China.

MORENS_SUBPOENA_010584
MORENS_NIH_021112
REL0000478262

The grant was renewed in 2019, but suspended in 2020 because of concerns the grantees were failing to comply with conditions attached to the money.

The NIH's review of the concerns has concluded, Dr. Michael Lauer, an NIH deputy director, revealed in a letter on Aug. 19. It determined that all of the problems cannot be fixed.

Therefore, the NIH informed EcoHealth Alliance that the subaward to the Wuhan lab is terminated "for failure to meet award terms and conditions requiring provision of records to NIH upon request," Lauer wrote to Rep. James Comer (R-Ky.), the top Republican on the House Oversight Committee.

'Cannot Be Remedied'

Grants from the U.S. government come with certain conditions, including timely reporting of results, and adequate monitoring of experiments.

The EcoHealth Alliance failed to perform a review of the research conducted under the grant, which included making bat coronaviruses more dangerous, the NIH said in October 2021. The agency in January said EcoHealth Alliance failed to comply with other conditions with the grant, R01AI110964, and other awards.

The NIH asked for plans to correct the failures, which was provided on Feb. 4, Lauer said Friday, and the NIH determined that the plans were sufficient.

Separately, though, the NIH asked EcoHealth in late 2021, and again in January, for lab notebooks and original files from the research conducted at the Wuhan lab. It has not received them, according to the new letter.

EcoHealth executives have said that it passed along the request but have not heard back from WIV.

The refusal to provide the materials led to the just-announced termination of the subaward.

"NIH has determined that WIV's refusal to provide the requested records, and EHA's failure to include the required terms in WIV's subaward agreement represent material failures to comply with the terms of award," Lauer told Drs. Aleksei Chmura and Peter Daszak, the executives, in a letter released on Friday by Comer. "NIH has further determined that in these circumstances, WIV's refusal to provide records cannot be remedied by imposing additional conditions, and that a partial termination of award (i.e., termination of the subaward to WIV) is the only

MORENS_SUBPOENA_010585
MORENS_NIH_021113
REL0000478262

appropriate action."

EcoHealth did not respond to requests for comment. An email sent to the Wuhan lab bounced back.

Will Keep Funding EcoHealth

The NIH is not terminating any of the awards in question, R01AI110964, 1U01AI151797-01, and 1U01AI153420-01—at least for now.

When grantees are not compliant with requirements, the preference is to work with them to bring them into compliance rather than termination, Lauer said.

EcoHealth has successfully implemented the NIH-approved corrective plans for the latter two awards, according to the NIH. While EcoHealth will be forbidden to dole money out to WIV under the other grant, it will be able to renegotiate the objectives of the grant with the National Institute of Allergy and Infectious Diseases, led by Dr. Anthony Fauci.

If an agreement is reached, the revised grant will move forward. If it is not, the grant may be terminated.

EcoHealth was asked to outline within 30 days how it will accomplish the purpose of the grant without WIV. That will require a change in scope but the change may not depart significantly from the original project, Lauer said.

Comer said the NIH should have ended the award entirely.

"Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum. It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract," he said.

"EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money," he added.

Subject: RE: Continued NIH action - already leaked to the press
Importance: High

Thanks Rich - I've got to look at the positives in all of this and just carry on fighting, if only for my own health reasons. It's been a really horrible couple of years and I've found that the constant harassment can really get you down – it's been shocking to me how much of struggle this is with many days spent despairing over my own personal future and the future of EcoHealth. It's been tough on my family as well, and the other staff at EHA.

I'm determined not to give up though and will be going through all the options carefully. The other glimmer of hope is that any 'renegotiation' will be with NIAID staff, so I'll reach out to them ASAP. I think that if most of the funding is planned for the US, with just one subcontract to China, for a group that works on epidemiology, that might work. The other strategy would be to see if a shift to another country would work. I'm mindful that NIH (Lauer et al.) would be delighted if we just handed in the towel, and will probably be looking for excuses to consider our alternative plans out of scope.

On this issue of who is 'the pits' and who isn't at NIH, I think the list begins with Francis Collins, who committed the original sin of terminating our grant when he could have simply resisted. Second is his lackey Lauer who took it to another level of bumbling errors, illegal actions, and aggressive brinksmanship, but there are others also. Lawrence Tabak (now acting Director NIH) publicly stated that we were out of compliance and really threw us under the bus, and there are a group of legal advisors and Congressional staffers at the Office of the Director who have actively worked to publicly undermine us, sometimes with clear glee and delight.

For example, in one of the FoIA'd emails that Peter Aldhous at Buzzfeed unearthed, he spotted Michael Lauer sending details of our animal experiment oversight, which they then used to tighten the screw on us very publicly and unfairly. Lauer used the subject Header "A Gift" when he sent this to his legal and Congressional relations colleagues at NIH. That sort of gloating is pretty disgusting, and won't be forgotten by me. Peter Aldhous also dug up clear evidence that NIH requested an OIG audit as part of their efforts to tighten the screws on us, and get them off the hook. We're just negotiating the final results of that audit – a huge timesink that's been going on over a year now, has looked at grants to EHA over the last 8 years, and has only found $77,000 of mis-coded financial errors (including a $19 overpayment to a contractor, with $7 indirect costs; and a single $5 alcoholic beverage at a hotel mistakenly coded to our grant). Great use of taxpayer money and time and the total of these mis-coded finances is less than 1% of the grants they reviewed, and less than 0.01% of our budget over that period. Of course, when the report goes public in a few weeks, it'll be used by Republicans to demand we're de-funded and closed down (again).

Ironically, in the emails (below), Michael Lauer cc's Michelle Bulls, who's listed in his correspondence yesterday as the person we have to write to if we want to appeal their decision. Pretty sure she's not an objective overseer at this point.

Here's the article: https://www.buzzfeednews.com/article/peteraldhous/white- coat-waste-anthony-fauci-nih-ecohealth-

MORENS_SUBPOENA_010587
MORENS_NIH_021115
REL0000478262

alliance-lab

And here's the section (and you can click on the links to see the FoIA'd emails):

A heavily redacted series of emails from May 2021 centers on the July 2016 letter from the NIAID that had given EcoHealth permission to resume the chimera work. Accepting a suggestion made by Daszak himself, it stated that if any of the chimeric viruses showed unexpectedly rapid growth, he would "immediately stop all experiments with these viruses" and provide NIAID officials with information about the unexpected outcomes. Shortly after receiving the letter, Lauer sent it on to a senior attorney with the Department of Health and Human Services, assigned to the NIH, changing the subject line on the email thread to "Gift."

Daszak's problem was that the NIH determined that an experiment described in annual progress reports for the grant indicated that one of these viruses had made mice engineered to carry the human receptor targeted by SARS-like viruses sicker than expected and showed signs of rapid growth. "EcoHealth failed to report this finding right away," NIH deputy director Tabak later wrote in an October 2021 letter to James Comer, the ranking Republican member on the House of Representatives Committee on Oversight and Reform.

None of this amounts to a smoking gun linking EcoHealth and the Wuhan institute to the origins of COVID, as the viruses involved were very different to SARS-CoV-2. And in a letter to Lauer and Tabak after the latter's communication with Comer, Daszak contested the conclusion that the experiment did show rapid viral growth and argued that EcoHealth had complied with its reporting requirements.

But it gave Lauer evidence that he was looking for. EcoHealth is now under audit from the Office of Inspector General for the Department of Health and Human Services, an independent watchdog that monitors fraud, waste, and other problems, as part of a review of the NIH and "selected grantees" initiated on June 11, 2021. Documents received by BuzzFeed News through its FOIA lawsuit, including a timeline of events put together by Lauer dated June 13, 2021, indicate that the suggestion for an OIG audit of EcoHealth came from the NIH, just days after Lauer sent his "Gift" email.

The NIH declined to discuss Lauer's email and timeline, saying in a statement: "NIH doesn't comment on internal deliberation of grant awards."

Cheers,

Peter

EXTERNAL SENDER

I found a copy on Twitter of Lauer's letter to Rep Comer yesterday – word doc attached, recreated using screenshot jpegs, so hope it works.

It's good that they're publicly stating we've cooperated with NIH – this is related to their continued series of letters about our other grants – making us jump through all sorts of hoops just to continue our work. At the same time, they're clearly trying to show the aggressive Republicans in Congress that NIH is going to crack down on miscreants such as us. Apparently, for at least the next 3 years we'll have to double up our reporting requirements, have no automatic carry over of unspent funds, and have to conduct 6 monthly onsite assessments of subcontractees. We've not been told all that yet by NIH, but no doubt there'll be another letter from Lauer on its way soon.

Cheers,

Peter

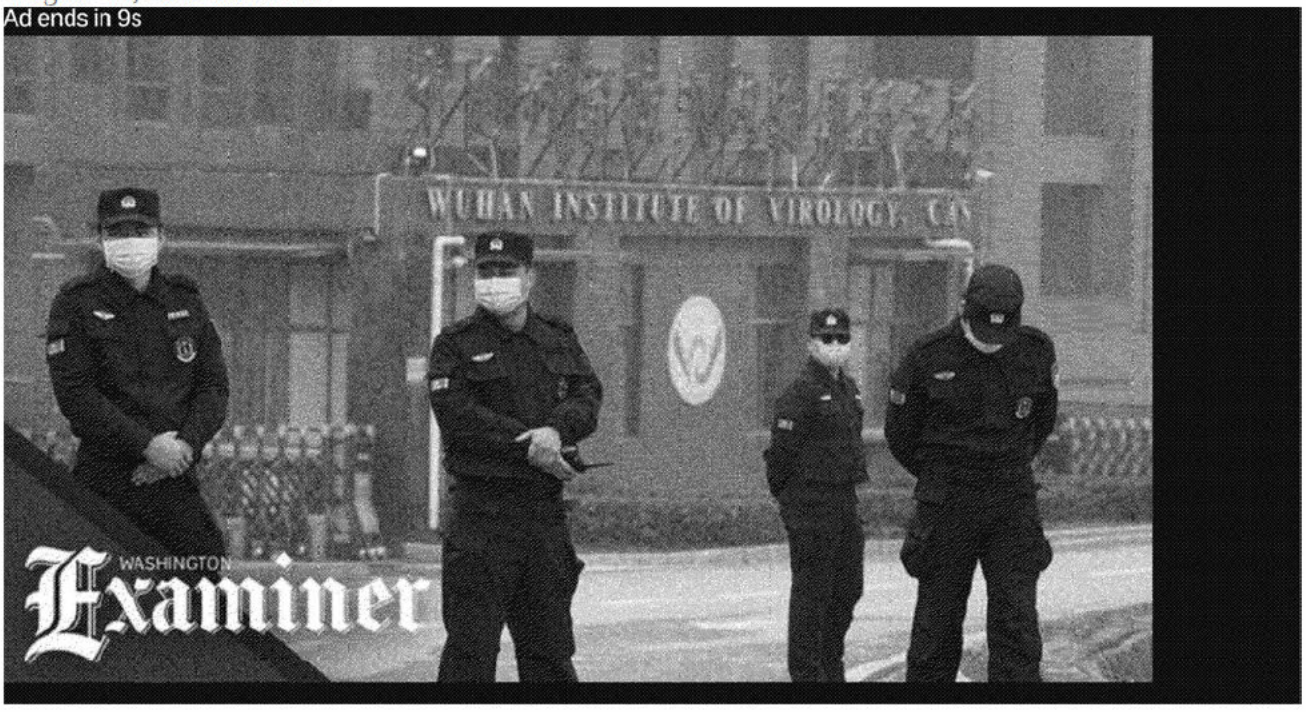
Here's the latest from NIH – as usual we received a Friday afternoon pdf letter from Michael Lauer that's full of legalistic language (attached). And as also 'usual', Lauer only sent this the same day he informed Republicans on an oversight committee, and either him or the Republicans then instantly made it public. There's already an article in the Washington Examiner about it (below)

They're basically terminating our subcontract to WIV because we were unable to get the lab notebooks they demanded (no surprise there, given the politics). They're also offering us the chance to renegotiate the grant. Sounds great, but by now of course the chances of any institution in China wanting to work with an organization targeted in this way are pretty slim. There's also the buried proviso that we have to arrange for 6-monthly inspections of our subcontractee's labs.

If we don't want to renegotiate, we have to bilaterally terminate.

After 2 and a half years of pressure from NIH, we're now back to where we were in April of 2020, when NIH informed us to suspend all work with WIV, but that we could carry on with the grant. This was then followed a few days later with full termination, then suspension with conditions, then more conditions, now this. Pretty depressing, awful, and utterly unnecessary.



Not sure what we'll do, but my gut feeling is we should continue and try to find a way forwards with other groups in China. It'll be a hard path, considering WIV are the premier bat virus group in China and our preferred partners, and the politics has made all of this completely toxic. But it's the honorable path, as a scientist, and I think we should at least try.

Here's the Washington Examiner article: https://www.washingtonexaminer.com/policy/healthcare/nih- ends-subaward-wuhan-lab-stonewalling

WUHAN LAB

NIH ends subaward to Wuhan lab after continued stonewalling

by Jerry Dunleavy, Justice Department Reporter |
August 19, 2022 08:21 PM

MORENS_SUBPOENA_010590
MORENS_NIH_021118
REL0000478262

The National Institutes of Health announced it was finally cutting off a subaward to the Wuhan Institute of Virology after it continued to refuse to hand over key information about the coronavirus research it conducted with U.S. tax dollars.

NIH Deputy Director Michael Lauer made the revelation in a letter Friday to House Oversight Committee Republicans, in which he said the Wuhan lab had refused to turn over lab notebooks and electronic files connected to its research funded through an NIH subaward given to it by the U.S.-based EcoHealth Alliance.

But Lauer indicated the NIH may continue funding EcoHealth's controversial bat coronavirus research despite the group's documented noncompliance issues, its close links to the Wuhan virology institute, and its history of funneling hundreds of thousands of U.S. tax dollars to the Chinese lab.

"NIH … identified one non-compliance under the ... award that cannot be remedied with specific award conditions," Lauer said Friday. "NIH has requested on two occasions that EHA [EcoHealth Alliance] provide NIH the laboratory notebooks and original electronic files from the research conducted at the WIV [Wuhan Institute of Virology]. To date, WIV has not provided these records."

Lauer added: "Today, NIH informed EHA that since WIV is unable to fulfill its duties for the subaward grant under R01AI110964, the WIV subaward is terminated for failure to meet award terms and conditions requiring provision of records to NIH upon request."

FBI INVESTIGATED NIH AWARD TO ECOHEALTH AND WUHAN LAB

The Office of the Director of National Intelligence released an assessment in 2021 stating that one U.S. intelligence agency assessed with "moderate confidence" that COVID-19 most likely emerged from the Chinese government lab in Wuhan, while four U.S. spy agencies and the National Intelligence Council believe with "low confidence" COVID-19 most likely has a natural origin.

The NIH's Lauer also said Friday that the National Institute of Allergy and Infectious Diseases, which has been led by Dr. Anthony Fauci for decades, "will begin to engage with EHA to renegotiate the specific aims and objectives of the R01 grant without the involvement of WIV … in light of the cooperation from EHA and the substantial subsequent improvements in administrative processes that EHA demonstrated."

Rep. James Comer (R-KY), the ranking member on House Oversight, hammered the NIH over this.

"Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum," Comer said Friday. "It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract. EcoHealth conducted gain of function research on bat coronaviruses in Wuhan, knew about the Chinese Communist Party's coverup, and failed to inform the U.S. government."

Comer added: "EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money."

The NIH had awarded EcoHealth with a grant dubbed "R01AI110964" years ago, and EcoHealth then doled out three research subawards, including one to the Wuhan lab.

"The research approved under this grant sought to understand how bat coronaviruses evolve naturally in the environment to become more transmissible to the human population," the NIH said Friday in defending the award. "This type of research is a critical part of pandemic preparedness."

The grant to EcoHealth was suspended by the NIH in June 2020 due to "grant administrative non-compliance concerns." EcoHealth was reprimanded by the NIH in October when the agency found that the organization delayed revealing that a U.S.-funded experiment conducted with the Wuhan lab determined that mice with implanted human cells became sicker with an engineered version of bat coronavirus. The NIH found more EcoHealth violations in January.

Republicans say the findings showed EcoHealth was funding risky gain-of-function research in China.

EcoHealth leader Peter Daszak was a longtime collaborator with the Wuhan lab who steered hundreds of thousands of dollars in NIH funding to the Chinese lab and was also a key World Health Organization-China joint study team member in early 2021.

Daszak dismissed the lab leak hypothesis in March 2021 when he admitted he took Wuhan lab workers at their word. Meeting minutes from discussions between lab scientists in Wuhan and the WHO-China COVID-19 origins joint study team reveal lab leak concerns were referred to as "myths" and "conspiracy theories."

An advisory group assembled by the WHO said in June that the lab leak hypothesis needed further study.

The NIH said Friday that the prior problems it had identified with EcoHealth's handling of its coronavirus grant included "inadequate oversight in monitoring the activities of its subawardees, failure to report subawards to the General Services Administration's Federal Subaward Reporting System, and errors in indirect rate

MORENS_SUBPOENA_010591
MORENS_NIH_021119
REL0000478262

charges."
But Lauer nevertheless said EcoHealth might again soon start receiving U.S. tax funding for its bat coronavirus experiments — just without the Wuhan lab's continued involvement.
The NIH had been run until recently by Dr. Francis Collins, while Fauci still leads NIAID.
Scientists consulting with the U.S. government early in the pandemic believed COVID-19 originating from a lab in Wuhan was possible or even likely, but emails show Fauci and Collins worked behind the scenes to shut the hypothesis down.

Cheers,

Peter

"*A strategy to assess spillover risk of bat SARS-related coronaviruses in Southeast Asia*". We used distribution data from bats known to host SARSr-CoVs, human population data, and serological testing results to estimate that a median of ~66,000 people are infected by bat-origin SARSr-CoVs in South and Southeast Asia each year. Obviously, this suggests spillovers are a daily occurrence in the region and would make any possibility of a lab leak pale into insignificance, given that 1) only a few dozen people work in labs or in the field on these viruses, 2) they all wear PPE as opposed to villagers

MORENS_SUBPOENA_010592

hunting bats etc.

Note that the analysis doesn't take into account people working in the wildlife trade because data are so patchy, but we do know that 14 million people worked in the wildlife trade in China alone before the outbreak, so that means human infections are probably even more common.

I've attached the proofs here, and a press release, as well as an editorial I've published in our journal *EcoHealth* published by Springer. We also know that a story will appear in orrow about this. tomorrow about this.

Bizarre indeed, but this is how they do it– tangential links from you to your former postdoc to Zhengli to me, followed by accusations that you're linked to research which they (wrongly) claim is GoF, all used to try to undermine your appropriate pushback against all these other attacks.

It's exactly what the Union of Concerned Scientists called the 'disinformation playbook' that was used by big tobacco and anti-climate change activists (successfully I might add). https://www.ucsusa.org/resources/disinformation- playbook

I'll also report that the paper you cofunded with EcoHealth Alliance dealt with rWIV1-SHC014S, a chimeric virus shown to be very dangerous to mice with human airway cells, which biosafety experts consider to be gain of function, and which is already under GOP congressional investigators' microscope. Were you aware of this? Should you have disclosed this to your followers on Twitter and The Lancet Commission?

Please clarify if this is incorrect.

Thank you,
Emily

I received an anonymous tip regarding an apparent conflict of interest relevant to your criticism of the GOP investigation into the possibility that a lab accident sparked the pandemic.

The tipster pointed out that your grant to develop a SARS vaccine was in part motivated by the possibility that a lab accident or bioterrorist attack could result in a SARS outbreak.

Questions:

1. Could you please clarify why you believe the lab origin theory of SARS-CoV-2 is ridiculous pseudoscience, even though you did research under the presumption that a SARS-like virus escaping from a laboratory was possible? Taxpayers devoted $1.6 million in funding toward that project - was it under pseudoscientific pretenses?

2. Could you clarify your involvement in this research project underwritten by both your grant and EcoHealth Alliance's controversial "understanding the risk of bat coronavirus emergence" grant? Do you have a personal or professional relationship with Shi Zhengli? What about Peter Daszak? Have you ever funded or co-funded research at the Wuhan Institute of Virology?

Thank you,

--

This is of real importance for all of us, because it commonly comes up when GOF is discussed that there is considerable risk without much benefit. This is a useful way to counter that impression – and incidentally show how ignorant the proponents are (but that is a bit of editorializing).

And David should go ahead and contact Jon Cohen. I could only talk off the record because of my commitment to Richard Horton I would stay out of the public press until we resolve what happens to the now terminated COVID Task Force on Origins etc. But I am itching to openly say what I want to.

Importance: High

This is mainly for David Morens to let people know at NIAID, but may be of interest to you all.

The latest therapeutic to make headline news – Molnupiravir from Merck and Ridgeback Biotherapeutics (AKA EIDD-2801), was tested against the exact same bat-origin CoVs discovered in our terminated, now-suspended R01 from NIAID.

Here's an article on the drug: https://www.reuters.com/business/healthcare- pharmaceuticals/mercks-covid-19-pill-cuts-risk-death-hospitalization-by-50-study-2021-10-01/

..and here are a couple of papers that tested it against the bat-CoVs: https://stm.sciencemag.org/content/12/541/eabb5883 "Here, we show that the ribonucleoside analog β-D-N^4-hydroxycytidine (NHC; EIDD-1931) has broad-spectrum antiviral activity against SARS-CoV-2, MERS-CoV, SARS-CoV, and related zoonotic group 2b or 2c bat-CoVs, as well as increased potency against a CoV bearing resistance mutations to the nucleoside analog inhibitor remdesivir". .

And here: https://www.nature.com/articles/s41586- 021-03312-w "Collectively, our results demonstrate the utility of LoM as a single in vivo platform to evaluate and compare the replication and pathogenesis of past, present and future pre-emergent, epidemic and pandemic coronaviruses, which will allow for accelerating the development and testing of therapeutic and pre-exposure prophylaxis agents such as EIDD-2801".

Here's a full list from the information I have on the drugs/therapeutics that were tested against our viruses:

EXTERNAL SENDER

I talk to him regularly, most recently about the attacks on Peter D and the task force we were on under the Lancet COVID Commission which Jeff Sachs has unilaterally terminated. I couldn't really allow him insights into where we are or to use anything I said (all off the record) because we are negotiating with Lancet for a different way to continue our work.

I think he is a decent guy. I know Peter D has concerns so if you do speak to Jon be careful about what you say and how you say it, and require him to run any quotes he plans to use by you. That's his general modus operandi.

What we need is to get the amendment out of the appropriations bill, and while the senators are important it may be somebody like Eric Lander who is a cabinet member to get them to pay attention. The administration is mightily distracted.

Rich, if you are able to share your entre to Elizabeth Warrens staff I would happily follow up. I have contacted them, Markey, and my representation and all I get back is the auto thank you reply.

Just saw a piece in the LA Times that sums up the state of the origins "debate" pretty clearly:

https://www.latimes.com/business/story/2021- 09-28/evidence-against-a-lab-leak-as-covid-source

It's firewalled so here's the article:

Column: New evidence undermines the COVID lab-leak theory — but the press keeps pushing it

MORENS_SUBPOENA_011472
MORENS_NIH_022260
REL0000478263

BY MICHAEL HILTZIK BUSINESS COLUMNIST
SEPT. 28, 2021 6 AM PT

When it comes to the pandemic, pseudoscience has outweighed real science at almost every turn. One of the best examples of that is the unsupported assertion that the virus causing COVID-19 escaped from a Chinese laboratory.

Despite mounting evidence that the virus reached humans through natural pathways — from infected animals such as bats — the lab-leak hypothesis recently jumped back into the news, thanks to CNN, the investigative news site the Intercept, and the Atlantic.

All treat the idea that the virus escaped from a lab credulously. They downplay or entirely ignore the latest scientific findings that support the theory that the virus' origin can be found in the animal kingdom — the view accepted by a preponderance of experts in virology.

It's a likely probability that this one originated from animals as well. But the possibility also remains that the virus leaked from a lab.

CNN'S SANJAY GUPTA OVERSTATES THE LAB LEAK THEORY

This is known as the zoonotic theory, from the term for a disease that can be transmitted from animals to humans.

We've reported before on the near absence of evidence for a lab leak, whether or not it's the product of a deliberate act.

Ever since the lab-leak claim first emerged during the Trump administration, where it was part of a White House information campaign demonizing China, one of the arguments in its favor has been that evidence for a zoonotic origin has also been spotty.

That argument has never been quite true — virologists know that animals have been the source of most of the viral diseases afflicting humanity — but it has become weaker than ever over the last year.

The question of the origin of COVID-19 isn't of merely academic interest. The answer could guide the world's preparation for future pandemics; if the virus emerged from a laboratory, then improving lab safety measures will be prioritized. If scientific opinion continues to coalesce around animal-to-human transmission, that will underscore the importance of regulating contact between humans and wildlife.

To put it another way, if we focus on the wrong answer, the right measures won't be taken. In a real sense, humankind's future depends on not being distracted by an unsupported, politically motivated claim about Chinese labs.

Before examining the flaws in the CNN, Intercept and Atlantic treatments, let's look at what's been published recently about the zoonotic path.

For context, keep in mind that the earliest cluster of COVID-19 cases, in late 2019, was identified in the environs of the Huanan seafood market in the Chinese metropolis of Wuhan. Lab-leak theorists find this significant, because it's 7.5 miles from the Wuhan Institute of Virology, which does research on bat viruses.

A paper posted online earlier this month chiefly by researchers at France's Institut Pasteur and under consideration for publication in a Nature journal, however, reports that three viruses were found in bats living in caves in northern Laos with features very similar to SARS-CoV-2, the virus responsible for COVID-19.

As Nature reported, those viruses are "more similar to SARS-CoV-2 than any known viruses."

Another paper, posted in late August by researchers from the Wuhan lab, reports on viruses found in rats also with features similar to those that make SARS-CoV-2 infectious in humans. Two other papers published on the discussion forum virological.org present evidence that the virus jumped from animals to humans at more than one animal market in Wuhan, not just the Huanan seafood market.

Given that these so-called wet markets have long been suspected as transmission points of viruses from animals to humans because they sell potentially infected animals, that makes the laboratory origin vastly less likely, according to a co-author of one of the papers.

"That a laboratory leak would find its way to the very place where you would expect to find a zoonotic transmission is quite unlikely," Joel Wertheim, an associate professor at UC San Diego's medical school, told me. "To have it find its way to multiple markets, the exact place where you would expect to see the introduction, is unbelievably unlikely."

As virologist Robert F. Garry of Tulane, one of Wertheim's co-authors, told Nature, the finding is "a dagger into the heart" of the lab-leak hypothesis.

Garry and Wertheim are among the 21 expert co-authors of a "critical review" of virological findings on the origins of COVID-19. The review concludes, "There is currently no evidence that SARS-CoV-2 has a laboratory origin."

Now let's look at the recent reporting in support of the lab-leak theory.

On Sept. 19, CNN aired an hourlong documentary entitled "The Origins of COVID-19: Searching for the Source." Hosted by the channel's star science anchor, Sanjay Gupta, the program carries the veneer of an evenhanded approach.

Proponents of the zoonotic origin theory are given airtime, including Kristian Andersen of the Scripps Research Institute in La Jolla and Peter Daszak, a prominent grant maker in the virology field.

But so are proponents of the lab-leak theory. They include Alina Chan, a researcher at the Broad Institute, a biomedical research center, and Josh Rogin, a Washington Post columnist. Neither has any experience in virology. Chan is co-writing a book about COVID's origins that is expected to feature the lab-leak theory prominently, a fact not mentioned by CNN.

Yet at the top of the hour, referring to the common pattern of viruses jumping from animals to humans, Gupta says, "It's a likely probability that this one originated from animals as well. But the possibility also remains that the virus leaked from a lab."

By posing these two theories as simply two equally plausible solutions to a mystery, CNN glosses over the fact that the virological community regards the animal origin as vastly more likely than a lab leak. In fact, the two hypotheses are miles apart in credibility.

One of the program's chief targets is a report by a World Health Organization team issued in early 2021 that found spillover from an animal host to be "likely to very likely" and a laboratory incident an "extremely unlikely pathway."

Gupta calls the WHO report "the only scientific study of COVID's origins to date." That's not remotely accurate. There have been countless scientific studies, both before the WHO report and since. Indeed, Gupta mentions one of them, a seminal paper by Andersen and colleagues, published in March 2020. That paper termed the lab-leak theory "a speculative incomplete hypothesis with no credible evidence."

Much of the rest of the CNN program is filled with speculation about the Wuhan Institute, typically presented with portentous music on the soundtrack, suggesting subliminally that something sinister is going on there. The absence of information from the institute or the Chinese government is generally taken as tantamount to an admission of guilt.

"Over the course of 2020," Gupta declares, "more and more revelations emerged related to the Wuhan Institute of Virology."

One of these revelations concerned three staff members who reportedly sought hospital treatment for a flu-like illness in November 2019, before the COVID pandemic emerged.

Nothing has ever transpired to suggest these workers had COVID — November is flu season, after all. That they sought treatment at a hospital is immaterial, since it is well-known that people in China often go to hospitals for primary care, which residents of other countries would tend to receive in a doctor's office.

A CNN reporter appearing on air overstated the case, saying the patients were "hospitalized with an unknown illness." There has been no evidence that they were admitted to the hospital or that their illness was "unknown."

CNN doesn't bring its audience up to date on any of the latest research supporting the zoonotic theory, though it was published well before the air date and superseded what Gupta described as "the only scientific study" of COVID origins.

More recently, the Intercept trumpeted a purported scoop based on a leaked document — a grant proposal submitted in 2018 by Daszak's organization, the EcoHealth Alliance, to the Pentagon's Defense Advanced Research Projects Agency, or DARPA.

The proposal, for a laboratory manipulation of a virus related to SARS, the viral disease that caused an outbreak of pulmonary disease in China in 2003. DARPA rejected the proposal, however, and there's no evidence that it was submitted to, much less approved by, any other funding body.

"Many questions remain about the proposal, including whether any of the research described in it was completed," the Intercept acknowledged.

Commentators on the Intercept's disclosure have displayed, perhaps in spite of themselves, that they lack the courage of their own convictions. In an article published Sept. 24, the Atlantic, unable or unwilling to delve into what the Intercept's document actually meant, if anything, settled for declaring that it made the lab-leak debate "even messier."

The magazine's Daniel Engber and Adam Federman wrote: "Does the SARS-CoV-2 pandemic have an unnatural origin? The answer hasn't changed: probably not. But we have learned something quite disturbing in the past few days, simply from how and when this information came to light."

By pretending that the debate itself is important, as if both sides have something to offer, they manage to report on a claim that has no substance. The approach also protects journalists from their persistent fear of landing on the wrong side of things — the authors preserve an out in case the lab-leak hypothesis turns out to be true, as unlikely as that is. If that happens, they can point to their lily-livered observations and say, "See, we knew it all along."

In this debate, however, the zoonotic camp has evidence and the lab-leak camp nothing to offer but innuendo.

Here's the true state of the discussion. There is no evidence that the virus leaked from the Wuhan laboratory or any other lab. There is no evidence that the Wuhan lab was working with a bat virus that had anything but a very distant resemblance to SARS-CoV-2. Viruses that resemble it much more closely have been found in natural settings a thousand miles from Wuhan, as the crow, or bat, flies.

Evidence that artificial manipulation of a virus gave rise to SARS-CoV-2 has faded, as scientists find more evidence that features of SARS-CoV-2 thought to be unnatural occur in nature. Meanwhile, evidence for zoonotic transmission is constantly accumulating. No one who reports on the issue without acknowledging these two trends should be trusted.

Thanks, David. Seriously, if the bread crumbs led to the WIV BSL4 lab, I'd follow them there, too. But I don't see anything convincing to believe there are any there, nor have there ever been. The wet markets, on the other hand, were littered with bread TRUCKS!
I wanted to bring you on my own odyssey writing that last piece so you could see what my world looks like. It can be frustrating, but it can also be gratifying. Thankfully, it turned out OK in the end.
I appreciate the assistance you have all given me. An open dialogue like this has been my modus operandi in more than 20 years of journalism.
Thanks again,
Jason

Let's remember Nick was fired from the New York Times
and has a history of controversial stuff including truly appalling neo-eugenics crap.
Sadly, he has even influenced Don McNeil, another great journalist also fired from the NYT. I have always admired Don, a protege of sorts of the NyT's Larry Altman, but even he fell under the crazy spell

I greatly admire highly intellectual journalists as a whole, but as a group they seem to have a tenfency to go off the deep end

Is there something about this era? Did aliens put crazy-drugs in our drinking water???

Anyone remember Edward Hooper and The River, a best seller of 20+ years ago in which the author impugned, harassed, and nearly drove to the grave one of virology's heros, the late Hilary Koprowski. All from a cockamamie book length best selling slander that Hilary started the AiDS epidemic with 1950s polio vaccine trials

I knew Hilary well, the tragedy of slander by smart and smarmy journalists is real

You cannot make this shit up!!!!!

Something is very, very wrong about the interface between science and science journalism. Jason, we need folks like you to take note and follow breadcrumbs out of this forest. d

Add to that a preprint we'll be posting next week that suggests 50,000 – 400,000 people are actually infected by bat SARSr-CoVs in SE Asia each year, and a comment from the international members of the WHO team that'll be in Nature this week or next.

As long as these articles keep up their 'drip, drip' with actual new data and analyses, all the lab leak hypothesis has is re-hashing of the same innuendo-filled vitriol.

Cheers,

Peter

Thanks Peter,

Totally agree that It's quite sad to see the attacks on scientists and science from Wade. It's the very basis for the "lab leak" hypothesis, so no surprise.

Wade is old enough to know this, but anyone that thinks that Jeremy Farrar and Tony Fauci are part of the "problem" has literally [in the case of Tony] not been paying attention for 50 years.

Looking forward to Wade and his ilk going ballistic as two new papers favoring natural origin appear shortly in *Cell* and *Science*.

Bob G.

External Sender. Be aware of links, attachments and requests.

Nicholas Wade's at it again – another miserable innuendo-filled attack on science and the process by which scientists email, talk and come to decisions. Nothing new of course, just trash journalism published in a pseudo-scientific journal. Pretty shameless smear on some of us – no facts of course, no sue-able accusations, just snipey comments and excerpts from Social Media. It's as if we can't now be scientists and actually colleagues who break bread and share a glass any more.

https://thebulletin.org/2021/08/how-covid-19s-origins-were-obscured-by-the-east-and-the-west/

The irony is in the ending – he claims the lab leak is an albatross hanging around China's neck that they won't be able to shake off until they open up the lab videos, books, freezers etc. The truth is his and others continued attacks are what put the albatross there in the first place. Does anyone really believe that if China gave access to all the above and no further evidence was found, that these folks would simply say "OK, it wasn't a lab leak after all"!!!

Cheers,

Peter

How COVID-19's origins were obscured, by the East and the West

By Nicholas Wade | August 17, 2021

MORENS_SUBPOENA_021679
MORENS_NIH_042557
REL0000478266

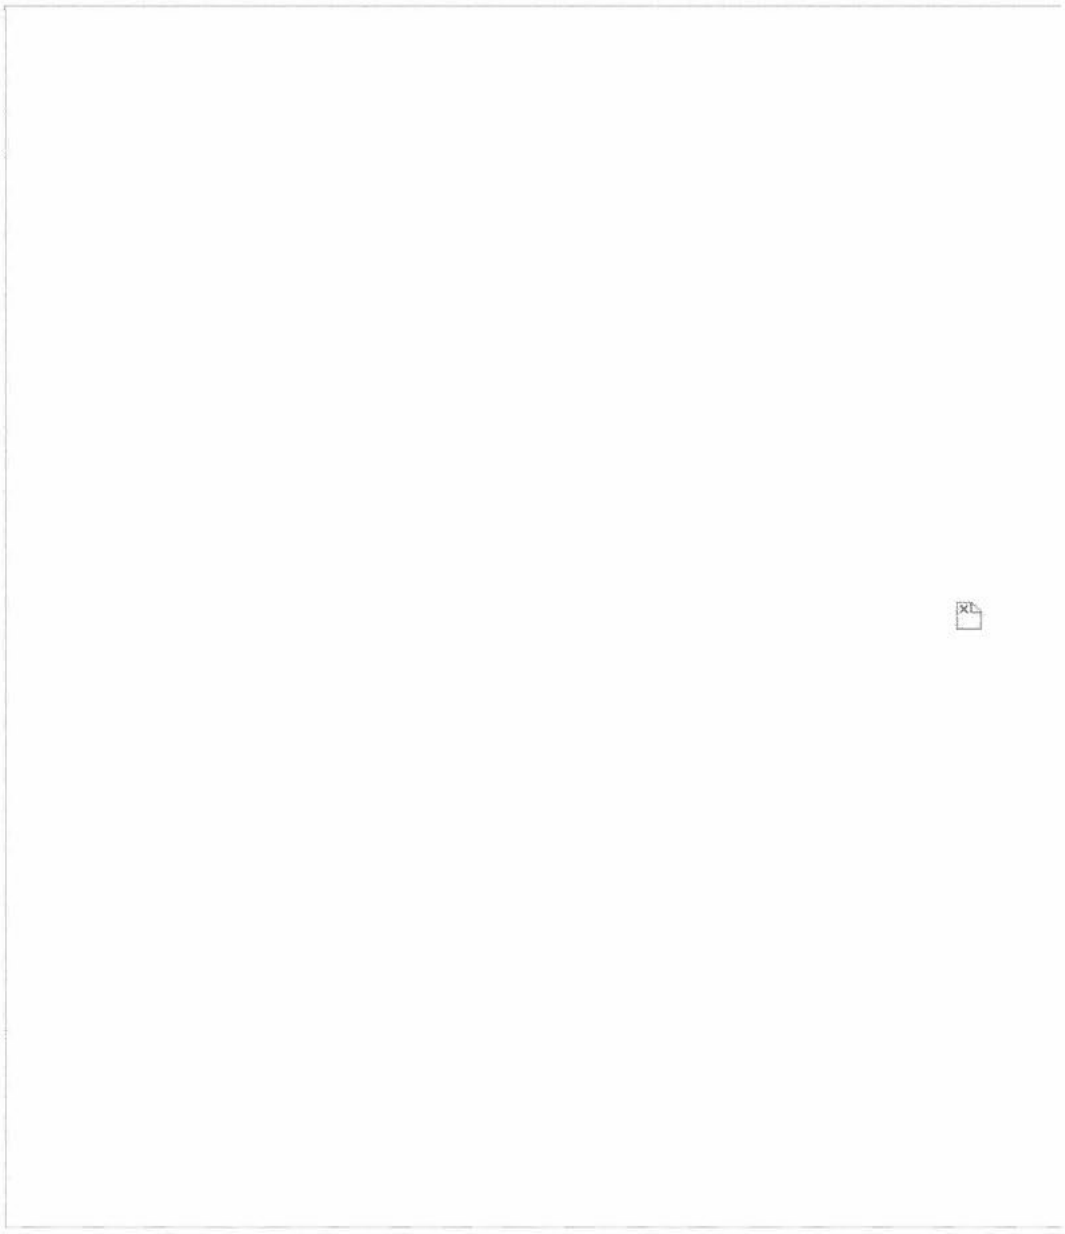
A bus carrying a team of experts from the World Health Organization departs an airport in Wuhan on Jan. 14, 2021, after arriving in the Chinese city to investigate the origins of the coronavirus pandemic. That investigation is widely seen as having been obstructed by Chinese authorities. (Photo by Kyodo News via Getty Images)

Some 20 months after the Covid-19 pandemic first broke out, its origins remain obscure. A vigorous campaign of concealment by the Chinese authorities is the principal reason. But China received considerable help, strange to say, from senior medical research officials in the United Kingdom and United States who mishandled and effectively derailed the initial inquiry into the virus's origins.

The mishandling began at a pivotal teleconference held on February 1,

2020. The organizer was Jeremy Farrar, director of the Wellcome Trust, a large medical research charity in London. News of the conference emerged with the release this June of emails from the office of Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases (NIAID). Farrar supplied further information in his book *Spike*, published on July 22.

The conference was held to discuss the unanimous view of a group of virologists that the SARS2 virus had been manipulated in a lab. Yet within a few days of the meeting, the virologists abruptly reversed their conclusion. The meeting's participants were later involved in two letters to scientific journals that stated the virus must have emerged naturally and that condemned any suggestion of manipulation as a conspiracy theory. These two letters, to *The Lancet* and *Nature Medicine*, shaped the views of the mainstream media for more than a year.



Letters published by *The Lancet* and *Nature Medicine* in early 2020.

Even today, no one can say for sure whether the SARS2 virus emerged naturally or escaped from a lab. Much less could anyone have been sure back then. If the conferees had stuck to known facts, they would have left the question open to the two hypotheses, and the full exploration of the virus's origins might not have been sidetracked for over a year.

More significant, the Chinese government would have found it much harder, if not impossible, to manipulate the World Health Organization (WHO) into setting terms of reference that favored China's obstructive goals and kept WHO inspectors who visited China this February from accessing records vital to understanding the origin of the pandemic. China now insists those terms of reference cannot be changed, blocking further investigation into the origin of the SARS2 virus. "The two groups that produced the infamous letters in *The Lancet* and *Nature Medicine* paved the way for the Chinese government and helped enormously to facilitate all of that," says Milton Leitenberg, an arms control expert at the University of Maryland. The reversal of the virologists' conclusion about SARS2's artificial origin is thus a matter of some significance.

At 10:32 p.m. on the evening before the February 1 conference, Fauci had received an electrifying memo from Kristian G. Andersen, a virologist at the Scripps Research institute in California. Andersen reported that the virus seemed to be man-made. "The unusual features of the virus make up a really small part of the genome," he wrote, referring presumably to a genetic component known as a furin cleavage site, which greatly enhances the virus's infectivity, "so one has to look really closely at all the sequences to see that some of the features (potentially) look engineered."

_A key email from Kristian Andersen to Anthony Fauci.

Andersen went on to note that "after discussions earlier today, Eddie, Bob, Mike and myself all find the genome inconsistent with expectations from evolutionary theory"— meaning that, in their unanimous view, the virus didn't come from nature. "Those opinions could still change," Andersen added. Eddie is Edward C. Holmes of the University of Sydney. Bob is Robert F. Garry of Tulane University. Mike is Michael Farzan at Scripps Research.

The message sent Fauci into a whirlwind of activity. "You will have tasks today that must be done," he emailed his deputy director, Hugh Auchincloss, two hours later at 12:29 am on February 1. One of these urgent tasks evidently concerned NIAID funds that had been passed, via the EcoHealth Alliance of New York, to Zhengli Shi, China's leading bat virus expert, at the Wuhan Institute of Virology. Fauci was doubtless

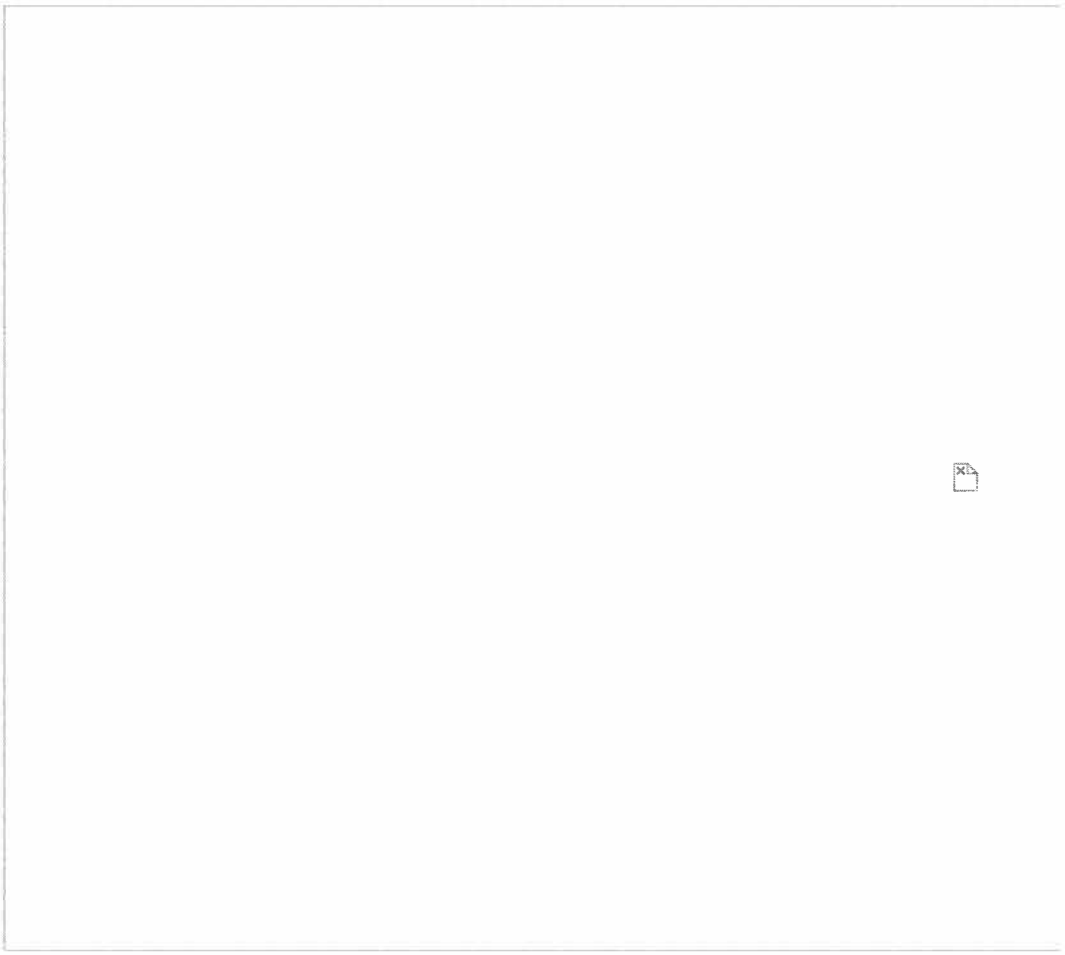
anxious to check whether his agency's funding of Shi's work had complied with US law, which banned funding gain-of-function research from 2014 to 2017 and required it be reported to a government panel thereafter. "Gain of function" refers to research in which a pathogen's ability to cause disease is enhanced. Auchincloss replied a few hours later that efforts were underway to ascertain "if we have any distant ties to this work abroad."

Meanwhile Farrar, who had independently heard of the Andersen team's conclusion from Holmes, says in *Spike* that he arranged a teleconference set for 7 p.m. London time, convenient for both Washington and Australia, where Holmes was based.

The participants included Fauci and possibly his nominal boss, Francis Collins, the director of the National Institutes of Health. (Farrar says in *Spike* that Collins was present, but Collins's name is not on the list of invitees in the Fauci emails.) Officials on the UK side were Farrar and Patrick Vallance, the chief scientific adviser to the UK government. The others were mostly virologists, including Andersen, Holmes, and Andrew Rambaut of the University of Edinburgh.

Far from being selected at random, the conferees were associated through a complicated web of relationships, a sort of virologists' old boy network that included senior medical officials in China. Farrar was well acquainted with George Fu Gao, the head of China's counterpart of the US Centers for Disease Control and Prevention. He has described Gao as an "old friend," who in fact had called a month earlier, on December 31, 2019, to tell Farrar about the initial cases in Wuhan of what turned out to be Covid-19. Farrar says in his book *Spike* that on the weekend of the teleconference, he called another highly placed Chinese official, Chen Zhu, China's minister of health from 2007 to 2013, to tell him of "rumours that the novel coronavirus could be the result of a lab accident." As for Holmes, he has published many papers both with Farrar and with Gao and has been a guest professor at Gao's CDC from 2014 until 2020.

Because of these varied connections, it seems likely that Chinese authorities knew about the conference almost from the moment it occurred and, if so, would have had the opportunity to influence deliberations that followed it.



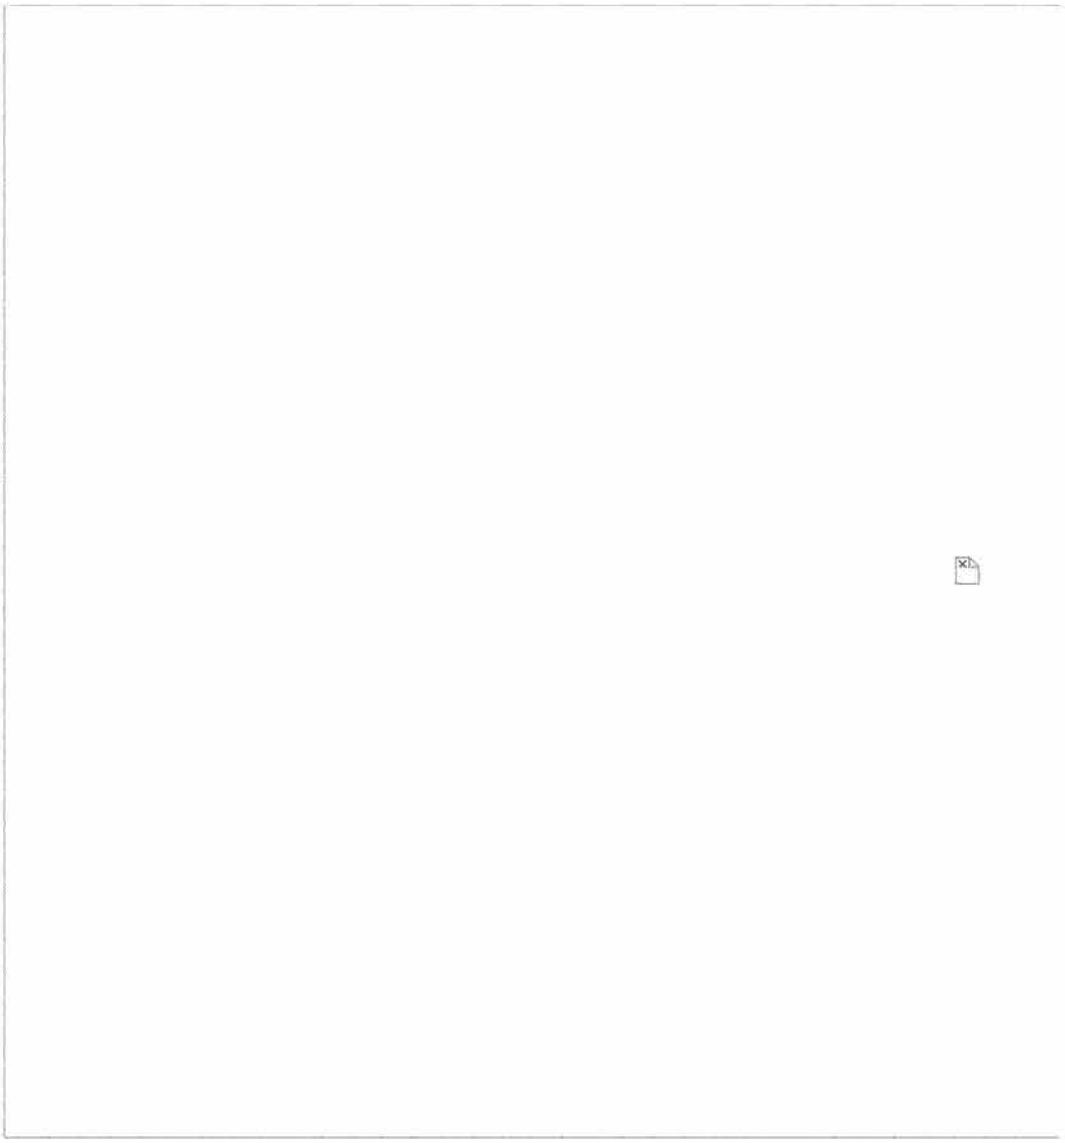
At the conference there was a notable imbalance of power between the virologists and the officials. Fauci and Farrar together control a large portion of the funds available for virological research in the Western world. A virologist keen to continue his career would be very attentive to their wishes. Two of the conference participants had multimillion-dollar grant proposals under final review with NIAID at the time of the call.

Almost all references to what was discussed at the teleconference have been redacted from the Fauci emails under exceptions to the Freedom of Information Act. The conference would doubtless have included explanation from Andersen and Holmes as to why they had concluded the previous evening that the virus had been altered through laboratory manipulation. "Kristen and Eddie have shared this and will talk through it

on the call," Farrar writes in one of the Fauci emails.

RELATED:

The known knowns, known unknowns, and unknown unknowns of COVID-19



_A Jeremy Farrar email about the teleconference.

Whatever was said at the meeting, it was followed by a remarkable and almost immediate about-face. By at most three days later, Andersen had executed a 180 degree turn in his views about the virus. In an email of February 4, 2020 to Peter Daszak, president of the EcoHealth Alliance, which had directed NIAID funds to Shi, Andersen wrote, "The main crackpot theories going around at the moment relate to this virus being somehow engineered with intent and that is demonstrably not the case." The email was obtained by U.S. Right to Know, an investigatory group.

Participants have not explained what was said at the meeting or found in the days immediately following it to induce the change of mind. Media offices at the Wellcome Trust and NIAID declined to comment on this article. Andersen, Holmes and Rambaut did not reply to emails seeking an account of the reversal.

Farrar, not Fauci, seems to have been the leader in the teleconference's deliberations. "This is not my area of expertise so I have backed off and am leaving it all to Jeremy," Fauci wrote on February 13 to a CDC official. US officials were not to take the lead in this pivotal inquiry.

Fauci's "leaving it all to Jeremy" email.

Farrar had a direct hand in the two letters that went out to the *Lancet* and *Nature Medicine*. He was a signatory of the *Lancet* letter, a draft of which Daszak, the organizer of the letter, began circulating just five days after the conference. The letter sought to squelch all discussion of the possibility that the virus had escaped from a lab by deriding it as a conspiracy theory. When Daszak wrote an article in the *Guardian* elaborating on the same theme, Farrar promoted it with a tweet, saying "as always worth reading @PeterDaszak."

Farrar also recruited the five authors who drew up the *Nature Medicine* letter, his spokesman told the writer Ian Birrell. (The spokesman referred to the *Lancet* letter but evidently meant the *Nature Medicine* letter, which has

five authors.) The *Nature Medicine* letter, accepted on March 6 and published on March 17, 2020, presented a detailed and influential case that the virus had emerged naturally from animals. Its authors were Andersen, Rambaut, W. Ian Lipkin, Holmes and Garry.

In his book *Spike*, Farrar portrays the events between the February 1 conference and publication of the two medical journal letters as a judicious process in which he held an agnostic view and played no role other than asking questions. "On a spectrum if 0 is nature and 100 is release—I am honestly at 50!" Farrar says he emailed to Fauci and Collins a day after the conference. But if that were honestly so, he fails to explain his switch from 50 to 0 when signing the *Lancet* letter a few days later.

According to *Spike*, it wasn't until March, "after the addition of important new information, endless analyses, intense discussions and many sleepless nights" that Andersen and his four fellow virologists "were ready to pronounce on the origins of the novel coronavirus." Why then was Andersen, the virologists' leader, ready to pronounce just 3 days after the conference that lab release was a conspiracy theory? Farrar's account does not match with the available facts.

Nor does Andersen's. In a June interview with the *New York Times,* he painted a picture that includes a change of mind on the possible engineering of the virus "in a matter of days, while we worked around the clock," and then that quick reversal being buttressed by drawn-out research.

"This is a textbook example of the scientific method, where a preliminary hypothesis is rejected in favor of a competing hypothesis as more data become available and analyses are completed," he said in a statement released by Scripps Research after his Jan 31 email to Fauci had become public. "I cautioned in that same email that we would need to look at the question much more closely and that our opinions could change within a few days based on new data and analyses—which they did," Anderson said in the *New York Times* interview. In that same interview, he also said that "more extensive analyses, significant additional data and thorough investigations to compare genomic diversity more broadly across coronaviruses led to the peer-reviewed study published in *Nature Medicine*."

These later data and analyses would not have been available three days after the conference, the date of Andersen's volte-face email to Daszak. And they would not have been available to Farrar as he signed the *Lancet* letter, which was published just 17 days after the teleconference.

More puzzling is Andersen's statement that in his preliminary studies "the genome of RaTG13, a SARS-related coronavirus found in bats, wasn't yet available." In fact its full sequence had been deposited by Shi in a data bank on January 24, 2020, a week before Andersen's report to Fauci, and Farrar says in *Spike* that he had seen the sequence by the time of the conference. RaTG13 is the closest known relative of SARS2, and the fact that it lacks the furin cleavage site found in SARS2 would have been a

major reason for the Andersen group to suppose that this genetic element had been inserted into SARS2 in a lab.

Given his role in leading the February 1 teleconference, in presiding over the virologists' 180 degree change of views, and in arranging or influencing the *Lancet* and *Nature Medicine* letters, Farrar was evidently the driving force of the campaign to persuade the public that the SARS2 virus could not possibly have leaked from a lab. This was an unfortunate position for any scientist to take, given that he was assuring the public of something he could not be sure was true.

Farrar now says in *Spike* that, although natural emergence is more likely, "nobody is yet in a position to rule out an alternative." But his campaign sought very vigorously to do exactly that. "We stand together to strongly condemn conspiracy theories suggesting that COVID-19 does not have a natural origin," Farrar and his cosignatories wrote in the *Lancet* on February 18, 2020. This lapse in scientific judgment reflects also on the other senior participants in the conference who saw what was happening but apparently took no steps to insist that scientific truth should take precedence over unjustifiable professions of certainty.

RELATED:

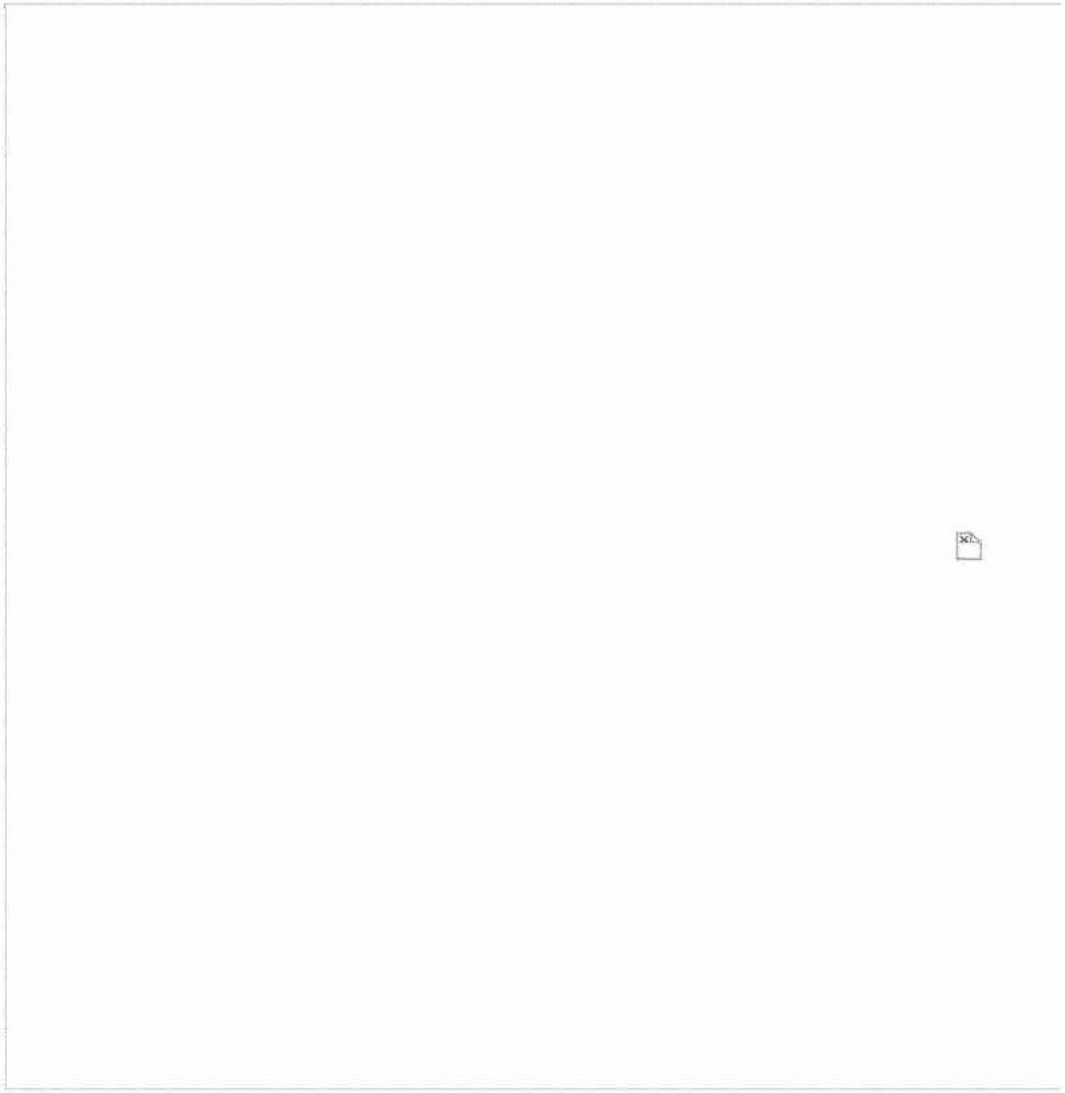
Caltech's David Baltimore discusses the debate over origins of SARS-CoV-2

The decision to quash any notion of lab escape seems to have brought relief all round. At least until the tide of opinion began to change a year later, Fauci and Collins didn't have to endure unpleasant questions about why they had been funding hazardous research in minimally safe conditions at the Wuhan Institute of Virology.

"I just wanted to say a personal thank you on behalf of our staff and collaborators, for publicly standing up and stating that the scientific evidence supports a natural origin for COVID-19 from a bat-to-human spillover, not a lab release from the Wuhan Institute of Virology," Daszak emailed Fauci after a White House press briefing on April 17.

In August 2020 the NIAID announced it would award $82 million over five years to 10 participants in its new network for detecting infectious diseases. Among the lucky winners: Daszak, Andersen, and his associate Robert Garry.

The perturbing lab leak theory raised by Andersen and his colleagues on January 31, 2020 had been safely laid to rest. Farrar and his colleagues had succeeded in the one goal also pursued by the autocrats in Beijing, that of suppressing discussion of whether the SARS2 virus might have escaped from the Wuhan lab.



Beijing's way of squelching inquiry about the virus was, unintentionally, somewhat more obvious than the methods used in London. Chinese

authorities tried so hard to stamp out information about the virus's origin that they left a rather clumsy trail of footprints pointing to where they didn't want people to go.

One of the more informative suppressions of data was the closure of China's main database on bat and other viruses. Zhengli Shi, China's leading expert on bat coronaviruses, told the BBC that it was taken off line because of numerous hacking attempts. It's conceivable that in January 2020, after the pandemic broke out, people without authorized access might have tried to hack into the database. But in fact the database went off line on September 12, 2019. Who would have wanted to hack into a bat virus database back then? More likely, that is the date at which Chinese authorities realized they had a virus escape problem.

In February of last year, President Xi referred to the need to ensure biosafety and biosecurity, and the Chinese Communist Party followed by tightening up their biosafety rules in October 2020, accelerating a long planned revision. "To me, the fact that the CCP enacted a major series of laboratory biosafety regulations this past year is an indication that China's political leadership believes that a lab accident is likely to have caused the pandemic," says a biosurveillance expert who has monitored China's disease outbreak reporting for the past two decades.

Major clues as to what happened are evident in Shi's various pronouncements about the virus. The omissions and untruths in these statements are specific enough to outline the very body of facts the censors have sought to conceal.

Wuhan Institute of Virology researcher Shi Zhengli spoke about SARS during a Yixi event (comparable to a TED talk) on June 23, 2018. (Yixi video)

In looking at Shi's questionable statements, it's only fair to keep in mind that they may have been compelled. Her train of deceptions began immediately after the genetic sequence of the SARS2 virus was published on January 10, 2020, by Yong-zhen Zhang of Fudan University, against the wishes of Chinese authorities who subsequently closed his lab for a time. Where did this strange new virus come from? Shi wanted or was told to establish SARS2's pedigree as a bat virus, with an ancestry analogous to that of SARS1, the bat virus that caused an epidemic in 2002. In an important paper published on February 3, 2020, Shi reported that the genome of SARS2 is 96 percent similar to that of a bat virus, RaTG13, "which was previously detected in [the bat species] *Rhinolophus affinis* from Yunnan province."

Shi neglected to mention a salient difference between the two viruses, namely that SARS2 possessed a furin cleavage site and RaTG13 did not. Alina Chan, of the Broad Institute in Cambridge, has likened the omission

to describing a unicorn by reporting all its horse-like features, but neglecting to mention the horn. Evidently the Chinese authorities were highly sensitive to the furin cleavage site's presence.

Shi also failed to say when and where she had discovered the RaTG13 virus, surely important data for the closest known relative of SARS2. In fact, she had found RaTG13 in 2013, in an abandoned mine in Tongguan —the same place where six miners had fallen sick the year before. At that time, she analyzed just one of its genes and reported the virus under another name, BtCoV/4991. Daszak, the holder of her NIAID grant, told the London Times, perhaps on misinformation from Shi, that the virus was then thrown in a freezer and forgotten about until 2020. This was untrue—the virus was of much greater interest. Shi had analyzed its full genome, probably by 2018, but did not publish it. It was only when she needed a bat virus pedigree for SARS2 that Shi released information about the virus, which she now renamed RaTG13. The fact that BtCoV/4991 and RaTG13 were one and the same was discovered by Monali Rahalkar and Rahul Bahulikar, two internet-sleuthing researchers in Pune, India.

It's not acceptable practice among scientists to report something already published under a different name as if were new. Shi's February paper had the goal of portraying SARS2 as just another bat virus while concealing the true provenance of its closest known relative—a cave known to harbor lethal viruses.

When RaTG13's connection to the Tongguan mine was pointed out, Shi still tried to conceal the lethality of the mine's bat viruses, saying the miners had died of a fungus infection. This untruth was corrected when a master's thesis by a Chinese doctor, Li Xu, was unearthed by the internet sleuth who calls himself TheSeeker268. The thesis reported that the miners had died of a SARS-related virus with symptoms identical to those of Covid-19 and with CT scans similar to those of Covid patients. The only evident difference between that virus's effects and those of SARS2 is that the miners' virus was not readily transmissible from one person to another.

The specificity of what Shi's statements concealed—the furin cleavage site, RaTG13's identity with BatCoV/4991, the latter's origin in the mine where six miners were infected, the death of the three miners from infection by a virus with symptoms very similar to those of SARS2—all point to the involvement of these elements in a scenario the Chinese authorities are determined to cloak. That scenario may have been the storage or generation of the SARS2 virus in Shi's lab from one of the many viruses recovered from the Tongguan cave.

The Chinese government's persistent stonewalling and Shi's pattern of evasions do not amount to proof that the SARS2 virus escaped from her lab. But they seem less like the actions of innocent people and more like attempts to cover up a fatal accident, one that has caused the deaths of maybe 10 million people and counting.

Perhaps proof will one day emerge that the virus emerged naturally. If not, the likelihood that SARS2 escaped from a researcher's laboratory is an

albatross that will hang round China's neck in perpetuity. China's only hope of release from this terrible encumbrance lies in opening its laboratory doors and either establishing its innocence or admitting its fateful error.

Cheers,

Peter

S ck on wild animals

Jason, not sure whose office politics is worse, but there is many a day I'd rather be in Australia, even if I had to drink that awful beer Fosters. (To quote Grouco Marx as he help up a glass of questionable beer: "last time I saw something like this, they had to shoot the horse")….

But I do have fond memories of Australia, and two of my closest freiends, both ex-students of mine, are out in Perth, the only large city there (if oy can call it that) I have never been, although it's high on my bucket list if this damn pandemic ever ends. He's an American public health physician and she's an Australian-Tongan PhD virologist, both wondeful smart people.

Thanks, David.

I just got off a video conf call with the current editor in NY (the one asking all the latest questions). He's very nice and I feel like he gets its. He thinks it's a fascinating story.

Problem we have in journalism is that there are some people who aren't interested in actual journalism and telling stories; they want to climb to the top and manage people. I rejected the latter route 10 years ago, but am so grateful that I still get to meet so many remarkable people, visit cool places and see all aspects of humanity.

A difficulty working for a NY-based organization is that it's assumed that all the best people are in NYC, so being in Melbourne (where I need to be to be close to my kids in Adelaide), is that folks consider Australia a backwater and, by association, I mustn't be all that important/valuable. But my new role as "global biosecurity czar" is helping somewhat.

Ahhhhh... Office politics!

Jason, all I can say is that it must be harder to be a journalist than a scientist.... I had no idea someone at your level would get pushed back.

REL0000478266

Usually i get from one to 4 reviewer responses to a ms. and three of those are out to lunch. Occasionally i get a reviewer who really understands the work: half of those are helpful, the other half are trashers.

Maybe it's like being in the government where i am: there is endless push back, but the push-backers are brainless idiots who don't know what they are talking about.

Do you ever get to a point where the editors leave you alone on the science? Or do they all think they are science geniuses? d

External Sender. Be aware of links, attachments and requests.

Hi guys, in case you have nothing better to read over the weekend, this is some of the dialog I am having with editors in the U.S. Essentially, my response to questions from editor #6.

I thought I could claim victory when it looked like the story could be published this morning, but the editor of Businessweek objected and thinks he can make it better with another revision and an ETA of Tuesday. Sigh.

Subject: Re:feedback on wild animals

Hi.

Thanks for the feedback and the questions, which I have tried to answer in detail.

It's often easier to have a conversation over Nexi or the phone to explain nuanced information, or details that are clear to me, but might not be to someone coming at this fresh, but that's tricky with the time difference.

When you look back at what's happened here, it seems that in trying to deflect blame for the pandemic, which became increasingly vicious as the cataclysmic

nature of the Covid-19 pandemic unfolded around March-April 2020, China tried to conceal a very obvious, very plausible source of the pandemic: it's flourishing wildlife trade (worth about $90 billion in 2016).

It was an obvious cause of the pandemic because an almost identical scenario triggered an international outbreak caused by a very similar coronavirus (SARS) in 2003-04. But in attempting to cover up the wildlife trade, and making like there were never any wild animals being sold in Wuhan's wet markets, things began to backfire on China; questions were raised about the nearby lab studying these coronaviruses. The more geopolitical, heated and vicious the arguments and accusations became, the less cooperative China became. In response, the more intent/adamant some groups have become in their belief that China is covering up a lab-leak. It's become a vicious circle. If China isn't coming clean on the wild animals, what else is it trying to hide?? China's defensiveness means we may never get the cooperation needed to find the answers. If China had been honest and transparent about the wild animals in the wet markets, it might not be in this mess now.

Anyway, here are my response to your queries in green.

By the way, I wonder if the current headline:

Delayed Paper Gives Credence to Wuhan Market Covid Origin Story

doesn't convey much more than what we had 2 months earlier when we reported Xiao's findings: China Markets Sold Mink, Civets, Stoking Natural Origins Theory

Perhaps Obscured China Paper Scuppered Chance to Trace Covid Origins

would hits "China", "Covid" and "Origins" in a way that won't alienate people who already believe it was a lab-leak

<><><><>

According to the report, minks, civets, raccoon dogs and other mammals known to harbor coronaviruses were sold in plain sight for years in shops across the city, including the now infamous Huanan wet market, to which many of the earliest Covid cases were traced. The evidence collected over 30 months by **Xiao Xiao** a I'D NAME HIM HERE [[i don't know that naming a researcher no one has ever heard of adds much]]researcher working at a lab affiliated with China's Ministry of Education was hastily drafted into a manuscript and submitted to a scientific journal [Joel, we cannot name the first journal they delivered it to because the authors decline to give us the name, saying it may affect their future chances of being published] in February 2020, just weeks before the outbreak was declared a pandemic.

<><><><>

While the study received wide attention when it was eventually released by a different publisher [Publisher (Springer Nature) and publication (Scientific Reports) are different. Might add confusion DO YOU WANT TO ADD NAME HERE?], its long and torturous journey to publication gave **Chinese officials an opportunity to weave alternative narratives in which the virus may have come from abroad, even from a U.S. Army biological research facility**. [the stuff in bold is not contested and we go on to

MORENS_SUBPOENA_021698
MORENS_NIH_042576
REL0000478266

show how that happened, documenting with links when available]I TWEAKED WORDING HERE BUT THIS STILL ISN'T QUITE RIGHT. IF THE REPORT HAD BEEN PUBLISHED EARLIER CHINESE OFFICIALS COULD STILL HAVE DONE WHAT THEY DID—THEY COULD HAVE JUST SAID THE REPORT WAS SHODDY, OR WHATEVER, AND THEY ALSO COULD HAVE JUST IGNORED IT. I disagree. The evidence that Xiao et al provide was meticulously documented and supported by photographs that would have been difficult/impossible for China to dismiss (as older published photos and media reports had been). What's more, Newman understands that Xiao collected blood-sucking ticks from the wild animals he studiously cataloged. His frozen tick samples could be tested for blood/antibodies/virus , which could be extremely helpful in identifying infected species PRIOR to December 2019. The WHO team knew nothing of this, so couldn't have asked China for this research or any results, had they actually done the research. The delay in the publication of Xiao's paper delayed the evidence that there were live animals sold in the Huanan market. The WHO researchers couldn't have asked about tests on wildlife that ostensibly were never there. Likewise, Chinese authorities couldn't have done the tests on animals that didn't exist. The problem is that in January and February 2020, it was widely assumed the animals HAD been there and that the necessary tests and tracing of animals (the sampling of animals on farms they were raised on, testing of farm workers, animal hunters, transporters and traders **had all been done** by researchers in China -- the very things that ultimately led to the discovery of the origins of SARS and of MERS viruses. **None of these things were done** (or at least, there is nothing publicly available to show that they were done) **because the animals "weren't there"**. Now that we all know they were there, China as lost considerable face. The issue has become so political than there is much less/?no willingness to cooperate and conduct the additional research that the WHO-led team recommended. Ideally, Xiao's ticks should

be studied, but it's doubtful that will now happen (I wouldn't be surprised if he's been ordered to incinerate them!) Hope this is clear.

<><><><><>

An international team of experts convened by the WHO traveled to Wuhan earlier this year to seek answers—a trip that might have yielded different results if the scientists had known about the work of Xiao Xiao, a virologist whose roles straddled epidemiology and animal research at the government-funded Key Laboratory of Southwest China Wildlife Resources Conservation and at Hubei University of Traditional Chinese Medicine.‘MIGHT HAVE YIELDED DIFFERENT RESULTS’ SEEMS HIGHLY SPECULATIVE. WHAT RESULTS DID IT YIELD? I’D CUT THIS GRAF

As mentioned above, the WHO-convened team of researchers was told by market authorities, vendors and regular market visitors that there were no live animals sold in the Huanan market. That undermined completely the premise that the Huanan market was the kind of place where live animals from different species are stacked in cages, with urine and fecal material drips from one cage to the one below it, where there are splatters of blood and guts from animals, and lots of potential for the spread of diseases from one species to another (including Homo sapiens). Instead, the market (and one other one known to have been selling live wild animals in 2019) was presented as selling only frozen wild animals and aquatic species and things unlikely to be the source of SARS-CoV-2. The WHO researchers were told there were frozen ferret badgers and other wildlife found in freezers. Some of the carcasses actually came from Yunnan, the province where the closest coronavirus related to SARS-CoV-2 was found in bats -- thus establishing a potential route from

Yunnan to Wuhan in wildlife. That was actually important. When the researchers showed their Chinese counterparts photos of caged raccoon dogs taken in the Huanan market by Prof. Edward Holmes five or six years earlier, they were told by Chinese scientists that the photos may have been faked, and that the market had ceased selling such live animals anyway. The WHO researchers saw no evidence (empty cages, animal pelts, etc) to dispute what the Chinese scientists told them, although they did smell "animals" -- but were told they were smelling rotten meat, sewage etc. Three people associated with the WHO-led mission told me that they didn't believe the information they were given by anyone associated with the market. But since there was no evidence to the contrary, they were unable to push the Chinese scientists further on this. T**he fact that the mission concluded that frozen, not live wild animals were sold in the market undermined the thesis that Covid resulted from an animal spillover**. And the absence of strong evidence pointing to a spill over from wild animals to humans made the lab-leak theory look, in relative terms, more plausible.

<><><><><><>

Six months and two revisions later, the journal’s publishers rejected the paper. “They did not think it would have widespread appeal,” says Newman, who declined to name the publication [do you want us to say why he won’t name it? I don't think it's necessary. There's no upside for scientists to make a publisher look bad (most journals are published by a handful of publishers)] “It caused us, especially our Chinese co-authors, concern that these data would not be taken seriously.”

<><><><><><>

The manuscript underwent a third revision to include data on China’s pangolin trade networks (an earlier study, later contested, had implicated pangolins in the virus’s spread to humans)WHO ASKED THAT THIS INFO BE INCLUDED? (I did, because we're trying to explain here why WHO missed the significance of Xiao's evidence. The WHO was slammed by other papers being submitted PLUS Xiao's paper had a weird title. That title seemed relevant to the authors back in January-February 2020, when pangolins were considered a possible SARS-CoV-2-spreading culprit. But in October 2020, pangolins were off the hook, so the title would have seem irrelevant/unimportant at first glance at WHO). It was then sent to the online journal *Scientific Reports*.

<><><><><><>

The China-based researchers had reason to be cautious. In February 2020, the China Center for Disease Control (CCDC lets not use "CCDC". It's not commonly used like the U.S. "CDC" is, and it's going to force readers to go back and figure out what the "CCDC" is) prohibited scientists working on Covid-relate

<><><><><><><><>

~~CCDC~~ Disease detectives arriving from Beijing (think this makes it clear that these are China's disease "feds" arriving) on the first day of 2020 ordered environmental samples to be collected from drains and other surfaces at the market. Some 585 specimens were tested, of which 33 turned out to be positive for SARS-CoV-2. “All current evidence points to wild animals sold illegally,” China CDC Director George Gao and colleagues wrote in the agency’s weekly bulletin in late January. All but two of the positive specimens came from a

cavernous and poorly-ventilated section of the market's western wing, where many shops sold animals.

<><><><><><><><><>

~~The information void kindled a raging political debate that's already caused a trade war between China and Australia, as nations~~ demand to know ~~how Covid emerged.~~

Australia in April 2020 called for a global inquiryinto the origins of the pandemic, including China's handling of the initial outbreak. Days later, then-U.S. Secretary of State Mike Pompeo used part of his Earth Day message to call on China to close its wet markets to "reduce risks to human health inside and outside of China."

Based on a discussion today with someone with knowledge of the WHO-led mission to Wuhan in Jan-Feb 2021, a significant catalyst for China's defensiveness is the emergence of **claims for reparations** that extended from the finger-pointing at China's wet markets. These surfaced in April 2020, and have continued as recently as June 2021 (when Trump pushed for it again at a rally in the Midwest)

SO IS THIS THE POINT AT WHICH CHINA, WHICH SEEMINGLY ACCEPTED THE WET MARKET HYPOTHESIS, BEGAN TRYING TO CREATE A DIFFERENT NARRATIVE? (I think it was incremental. I believe China was embarrassed that its citizens were still buying wild animals in wet markets to eat -- a well-known hazard for zoonotic disease transmission that China tried unsuccessfully to outlaw almost 20 years ago. But that embarrassment/humiliation morphed into rigid denial and obfuscation when governments began openly blaming the Chinese Communist Party and agitating for

China to pay reparations for the pandemic. See these clips:

In response, Geng Shuang, a spokesman for China's Foreign Ministry, denied "wildlife wet markets" existed in the country. Government researchersCAN WE BE MORE SPECIFIC? Twenty-two researchers from mostly nationally-funded laboratories (I think it's the Chinese equivalent of the NIH in the U.S.) and institutes attached to the Chinese Academy of Sciences) now dismiss the market hypothesis completely. "SARS-CoV-2 could not have possibly evolved in an animal market in a big city and even less likely in a laboratory," they wrote in a paper released last month ahead of publicationWHERE/WHEN WILL IT BE PUBLISHED? It was released as a "pre-print" on a Chinese academic repository ahead of publication that appears to be managed/owned by the Chinese Academy of Sciences. Papers are usually released in pre-print form before they have been accepted for publication or peer-reviewed as a way of expediting public access to the information. In this case, there is no information to suggest if, where or when the paper will be published.

<><><><><><><><><>

A more recent paperBY WHOM? (China CDC's

Gao and eight other scientists mostly from the Chinese of Academy of Sciences' institutes) contends that the virus may have been imported from multiple locations worldwide, including parts of Europe where mink are raised in areas inhabited also by horseshoe bats known to harbor coronaviruses. “The official narrative changed not because the evidence changed,” says Robert Garry, a professor of microbiology and immunology at Tulane University’s School of Medicine in New Orleans “A spillover from a wet market was what caused SARS, and, embarrassingly for China, those wet markets were never shut down.” Garry is the co-author of one of the earliest papers on the origins of Covid but wasn’t involved in the research on Wuhan’s markets.

<><><><><><><><><><>

I DON’T REALLY UNDERSTAND WHAT POINT THIS GRAF IS TRYING TO MAKE. This is intended to demonstrate the kind of gaslighting that has occurred. Some of the WHO-led researchers are veterinarians and zoologists -- they know what animals smell like, and could smell their lingering presence a year later, but were told essentially that it was impossible that they were smelling animals because **there "were no live animals there".)** The researchers noted a mixed smell of animals and disinfectant in some areas of the market, but they were told by the market’s manager that they were probably smelling the lingering stench of rotten meat and sewage, according to a joint WHO-China report. [should we add “according to Laing Wannian etc here? Liang Wannian was the leader of the Chinese research team collaborating jointly with the WHO-led research team. The source for the above description are in the annexes to the official joint WHO-China report released at the end of March 2021.]

<><><><><><><><>

Earlier the same day, the international research team visited Wuhan's larger Baishazhou market, where Xiao had regularly surveyed two sellers of live wild animals. Yet the group was told only frozen food, ingredients, and kitchenware were on offer there. Liang Wannian, an epidemiologist who led the Chinese experts collaborating with the WHO-convened team, says his group had no knowledge of Xiao's data either. [if the above information on what the delegation saw all comes from this same source, maybe we should include his name higher up (The source for the description of what the origins researchers saw on Jan. 31, 2021, comes from the official 120-page joint WHO-China report and its 193-page annexes, not from Liang. Since we are essentially accusing China of concealing the information that Xiao documented, we asked Liang at a press conference in late July 2021 when the Chinese team first knew about Xiao's findings -- that the Huanan market and three others in Wuhan were selling live animals permissive to SARS-CoV-2 infection -- and what research China has done subsequently as a follow-up on this information? Liang gave a very long-winded response in Chinese in which he said essentially "we didn't have that information in January-February 2021 when the research team was in Wuhan". I think it's important we keep this to demonstrate that we have tried to ascertain what China knew/has done and have given the Chinese researchers the opportunity to respond. In addition, I have emailed China CDC Director George Gao at least twice and not received any response.]

<><><><><><><><><>

Among the earliest clusters of infections

recorded in Wuhan, one involved three Covid cases among staff working at a stall in Huanan. One of the employees, a 32-year-old who fell ill on Dec. 19, traded goods back and forth between the Huanan and Baishazhou markets.

WHERE DOES THIS FACT COME FROM? NOT THE REPORT, RIGHT? WHEN DID IT FIRST BECOME KNOWN? This information was from the joint WHO-China report released in March 2021, however, the WHO-led researchers went to the Baishazhou market more as a demonstration by the China team of what a perfectly functioning large food market looks like. The WHO-led team was oblivious to Xiao's research that showed there were at least two stalls in Baishazhou that had been selling live wild animals for human consuption. So this detail and its significance was lost on the WHO researchers at the time.)

<><><><><><>

A confirmed case linking two markets that sold wild animals is “very intriguing,”says Stephen Goldstein, a research associate in evolutionary virology at the University of Utah in Salt Lake City. But tracing any contact the employee might have had with infected wildlife is impossible now that the animals are long gone.WOULD TIMELY PUBLICATION OF THE REPORT HAVE CHANGED THIS? It's unlikely that Xiao et al's paper would have been *published* soon after It was drafted in February 2020, but it could have been *released* as a pre-print ahead of publication and peer-review that same month. That would have **confirmed** what almost everyone had suspected: that there **was** a flourishing wildlife trade in Wuhan that provides a plausible pathway by which coronavirus-infected wildlife from Yunnan and beyond could have introduced the virus to the city, sparking the Covid outbreak. It's also possible that swift recognition of

these potential wild-animal vectors could have allowed scientists to test them for the virus and for antibodies against the virus while they were still alive (perhaps not the ones from Huanan, but wildlife in the three other Wuhan markets). Because of the statements the Chinese authorities had been making in January and February that strongly supported the animal spill over theory, it was assumed that this research was being done. Of course, the pandemic was raging then, so it would have been challenging. But, because of the denial by Chinese researchers that wild animals were being sold in Wuhan wet markets before the pandemic, there was never that level of follow up. At least, if there was, it was never made public.)

<><><><><><><>

“It seems to me, at a minimum, that local or regional authorities kept that informationWHAT INFORMATION? (that Wuhan had a flourishing live wild animal business going on in its wet markets before the pandemic) quiet deliberately,” Goldstein says. “It’s incredible to me that people theorize about one type of cover-up, but an obvious cover-up is staring them right in the face.”

He repeated every inappropriate and unbalanced view he has repeatedly pushed everywhere else. Totally inappropriate, and he more than implied that these were the conclusions of the Commission.

Yes I think it may be released as soon as next week, with press conferences I believe in NY around the time of UNGA (as originally planned). I was not invited to participate.

Two weeks ago, Richard Horton in a zoom agreed to address my concerns about Jeff's specific attacks on me, he was supposed to respond by last week. But nothing so far, so I'm not optimistic. Best Peter

nPeter, as i am perennially swamped with work that has nothing to do with COVID issues of importance, i am always catching up on reading the important stuff

Just now i poured a martini and-read word for word your "A strategy..." paper with first author Sánchez. Also Kevin and Lin-fa were coauthors. Wow!!!

This is dynamite and also beautifully written. I mean, Hemingway, Conrad, Nin, couldn't have written it better. Beautiful job and so important.

I think you need to promote this work, and emphasize that the conclusions are far reaching and a sort of call to arms.

Let us all keep pushing,
and keep our eyes on the
prize of getting to the bottom of it all

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by MinerEFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, hack stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, hut there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Joh disease and CGD. Peter H, you could easily ID this person, hut i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

MORENS_SUBPOENA_015517
MORENS_NIH_033173
REL0000478271

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) (b) (6) from (b) (6) - Peter H, you may know him-and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

> It's a bit of a challenge given that their argument is that we exaggerate the evidence for a bat-intermediate host-human pathway vs. the lab leak. They contend that our 'evidence' is simply that the virus has a zoonotic origin, and that the lab leak theories all agree with zoonotic origin, therefore this doesn't sway one way or the other…
>
> The new evidence since the WHO report was published is:

MORENS_SUBPOENA_021530
MORENS_NIH_042406
REL0000478273

1. Evidence of live mammals known to be SARSr-CoV hosts in multiple Wuhan markets, including Huanan, up to the outbreak onset - paper published in Sci. Rev. Also cited in Holmes review

2. Yet another bat-CoV from Yunnan province that has multiple recombination events with some genes much closer to SARS-CoV-2 than others. Preprint here: https://www.biorxiv.org/content/10.1101/2021.03.17.435823v2.full

3. Analysis of WHO report data on human epidemiology suggesting that there was an epicenter of origin at the Huanan market side of Wuhan, not the WIV side. Eddie Holmes' review

4. 2 novel rat beta-CoVs and one alpha-CoV, all found in rats sampled from a wildlife farm in S. China, with one of the Beta-CoVs having a polybasic cleavage site in the S Protein similar to that in SARS-CoV-2. This adds weight to the furin cleavage site being more common than some have proposed. Paper in press at J. Virol: Li et al. (shared with you and David today).

5. Evidence that the likely sites of spillover could be in SE Asia/S. China, and that bat SARSr-CoVs may cause 50,000 – 400,000 infections a year in the region. EHA paper – will be a preprint within 2-3 weeks of now (may be sooner – we're waiting for approval from Chinese Govt. because it's joint with WIV).

I think they're right that #2 doesn't support one hypothesis over another, other than it builds the case that these viruses are abundant and diverse in this region, and recombining regularly, and therefore are likely to be spilling over regularly. I think #4 adds weight to a 'natural' origin because it shows that insertions at this point are more common than previously proposed, and therefore undermines somewhat the argument that the FCS in SARS-CoV-2 indicates lab culture or manipulation. #1, #3, #5 all provide new evidence in support of the 'natural' origin pathway: live mammals; epidemiological evidence; spillover probability.

Happy for you to cite the papers from our group (#4, #5). #5 will have a preprint URL as soon as we get it uploaded.

Cheers,

Peter

Exclusive: Intel agencies scour reams of genetic data from Wuhan lab in Covid origins hunt

By Katie Bo Williams, Zachary Cohen and Natasha Bertrand, CNN
Updated 9:02 AM ET, Thu August 5, 2021

*Washington (CNN)*US intelligence agencies are digging through a treasure trove of genetic data that could be key to uncovering the origins of the coronavirus -- as soon as they can decipher it.

This giant catalog of information contains genetic blueprints drawn from virus samples studied at the lab in Wuhan, China which some officials believe may have been the source of the Covid-19 outbreak, multiple people familiar with the matter tell CNN.

It's unclear exactly how or when US intelligence agencies gained access to the information, but the machines involved in creating and processing this kind of genetic data from viruses are typically connected to external cloud-based servers -- leaving open the possibility they were hacked, sources said.

Still, translating this mountain of raw data into usable information -- which is only one part of the intelligence community's 90-day push to uncover the pandemic's origins -- presents a range of challenges, including harnessing enough computing power to process it all. To do that, intelligence agencies are relying on supercomputers at the Department of Energy's National Labs, a collection of 17 elite government research institutions.

There's also a manpower issue. Not only do intelligence agencies need government scientists skilled enough to interpret complex genetic sequencing data and who have the proper security clearance, they also need to speak Mandarin, since the information is written in Chinese with a specialized vocabulary.

"Obviously there are scientists who are (security) cleared," one source familiar with the intelligence told CNN. "But Mandarin-speaking ones who are cleared? That's a very small pool. And not just any scientists, but ones who specialize in bio? So you can see how this quickly becomes difficult."

Officials conducting the 90-day review hope this information will help answer the question of how the virus jumped from animals to humans. Unlocking that mystery is essential to ultimately determining whether Covid-19 leaked from the lab or was transmitted to humans from animals in the wild, multiple sources told CNN.

Investigators both inside and outside the government have long sought genetic data from 22,000 virus samples that were being studied at the Wuhan Institute of Virology. That data was removed from the internet by Chinese officials in September 2019, and China has since refused to turn over this and other raw data on early coronavirus cases to the World Health Organization and the US.

The question for investigators is whether the WIV or other labs in China possessed virus samples or other contextual information that could help them trace the coronavirus' evolutionary history.

Two scientists who study coronaviruses told CNN they are skeptical that there is any genetic data either in the tranche of 22,000 samples or any other database from the WIV that scientists don't already know about.

"Basically in [a 2020 research paper published in Nature], the WIV talked about all the sequences they had up until a certain point in time -- it's what most scientists virologists believe, that's pretty much what they had," said Dr. Robert Garry, a virologist at the Tulane University School of Medicine.

A source familiar with the US investigation would neither confirm nor deny that any of the data pertaining to those 22,000 samples is among what US intelligence agencies are currently analyzing.

No 'smoking gun'

Sources familiar with the effort say filling in that missing genetic link won't be enough to definitively prove whether the virus originated in the lab at Wuhan or first emerged naturally. Officials will still need to piece together other contextual clues to determine the true origins of the pandemic.

But it is a critical puzzle piece that the Biden administration has been prioritizing.

MORENS_SUBPOENA_021533
MORENS_NIH_042409
REL0000478273

"The most prized technical data in this context are genetic sequences, database entries and contextual information about the provenance of the samples and the time and context in which they were acquired -- information people would use to place them in a narrative of the origins of SARS, Covid," one source familiar with the investigation told CNN.

For now, senior intelligence officials still say that they are genuinely split between the two prevailing theories on the pandemic's origins, or some combination of both scenarios. CNN reported last month that senior Biden administration officials overseeing the 90-day review now believe the theory that the virus accidentally escaped from a lab in Wuhan is at least as credible as the possibility that it emerged naturally in the wild -- a dramatic shift from a year ago, when Democrats publicly downplayed the so-called lab leak theory.

Multiple sources told CNN that absent an unexpected windfall of new information, officials don't expect to uncover a "smoking gun" -- like intercepted communications, for example -- that would offer definitive proof for either theory. The Biden administration's 90-day push is predicated on the expectation that science, not intelligence will be the key.

Intelligence officials are tasked with addressing several "scientific knowledge gaps" about the virus' evolution, according to the collection guidance governing the 90-day push, distributed to more than a dozen agencies on June 11 by the Office of the Director of National Intelligence and obtained by CNN.

The memo instructs the intelligence community to "expand its collection" and consider data already in its possession to identify both the initial host of the coronavirus and any species that it may have passed through as it adapted to humans -- or to find as "any progenitor virus and/or virus that could serve as backbone for genetic engineering purposes."

But former Director of National Intelligence John Ratcliffe told CNN that the US intelligence community already had sufficient collection on the topic of Covid origins.

"Obviously the more, the better. But we've had extraordinary insight into this topic for many months, much more than has been declassified. Pretending we didn't is political theater and a classic example of a politician trying to buy time by using the IC as a scapegoat," he told CNN in a statement.

Digging into the science

That's where the genomic data from the Wuhan lab could come in.

The genetic code of a given virus is the signature that allows scientists to tell the difference between the Delta and Beta variants of the coronavirus, for example. It can also offer clues as to how the virus has adapted or mutated over time, including whether it shows signs of human manipulation -- a kind of genetic history.

Many scientists continue to believe that the most likely scenario is that the virus jumped from animals to humans naturally. But despite testing thousands of animals, researchers still haven't identified the intermediate host through which the virus passed as it adapted to humans.

But some researchers, intelligence officials and Republican lawmakers believe that researchers at the WIV might have genetically altered a virus in the lab, using a controversial kind of research known as "gain of function" that could have infected researchers who then spread it in their community.

It's also plausible that the initial infection took place naturally outside of the lab, perhaps while a scientist was collecting a sample from an animal in the wild, and that scientist then spread the virus unknowingly when he returned to the lab with the samples, multiple sources familiar with the intelligence explained.

"If it was the latter, it was likely brought into a lab to study because someone got sick ... which means there were an unknowable number of other people who were already sick," the source familiar with the probe said.
Understanding exactly which viruses researchers at the WIV were working on could provide important evidence for any one of these theories. It's one of the reasons that investigators on Capitol Hill and elsewhere have been keenly focused on the database that was taken offline in 2019.

But it might not prove anything definitively, sources familiar with the intelligence say. Even if scientists in the intelligence community are able to use the data from the lab to stitch together a complete genetic history that shows how the virus mutated, they might not have enough information about how it was handled by the Chinese lab to

MORENS_SUBPOENA_021534
MORENS_NIH_042410
REL0000478273

determine with a high level of confidence that it leaked.

"Despite having that complete history of variants, [officials might] lack the contextual information to make sense of it in a narrative way," the source familiar with the investigation explained.
"Even a complete sequence history is difficult to obtain. And doesn't really tell us anything about the origins of the pandemic itself without the context," this person added.

Some Republicans on Capitol Hill have jumped into the uncertainty with their own report claiming that "the preponderance of evidence suggests" the coronavirus was "accidentally" released from a lab in Wuhan in 2019 -- an assertion that goes far beyond the intelligence community's current view of the matter.

90 days -- and then what?

It's possible that at the end of Biden's 90-day push, the intelligence community won't have reached what's known as a "high-confidence" assessment as to the pandemic's origins. Administration officials have previously suggested to CNN that it's possible a second review could be ordered at the end of the 90 days.

A bipartisan group of lawmakers on the Senate Intelligence and Foreign Relations Committees earlier this week sent a letter urging the administration to continue to prioritize the hunt until such a judgment can be made in order to prevent future pandemics.

But the lawmakers also zeroed in on a related focus for intelligence officials probing the pandemic's origins: China 's "efforts to conceal the severity and scope of the outbreak of the SARS-CoV-2 virus that caused the COVID-19 pandemic."
"We also believe that the investigation should address PRC efforts to prevent international inquiries into the origins of SARS-CoV-2, and other actions PRC authorities have taken to obscure the nature of the virus and its transmission," the lawmakers said.

Republican lawmakers in the House, meanwhile, have latched onto the theory that the virus escaped from a lab. GOP lawmakers in a report released Monday by Rep. Michael McCaul of Texas have claimed that "the preponderance of evidence suggests" the coronavirus was "accidentally" released from a lab in Wuhan in 2019.

Intelligence officials say it's still far too soon to say.

Hi Peter,

Yes - I think it is clear vote against the virus being engineered and the GoF stuff. The remaining lab leak scenario appears to be a laboratory accident.

I'm sure it will be spun in a multitude of ways but hopefully some rational thought will now return to the mainstream.

Have a great weekend!

Cheers,

Eddie

On 28 Aug 2021, at 7:06 am, Peter Daszak (b) (6) wrote:

The summary of the US "Intelligence" report is out now (attached).

It's inconclusive, but states that China did not engineer the virus. Also that China had no forewarning of the outbreak. It's slightly more leaning towards the "natural" origin that they were prior to the 90 day analysis. At that point it was 2 agencies for natural vs. 1 for lab (I think). Now it's 4 agencies believe it's animal origin, one believes may be lab. All have low confidence.

Maybe now we can get on with the actual scientific analysis of COVID origins – something that will likely take many months (if not years) more than it should because of all the politics and "Intelligence" involved!

Maybe we can read something into the fact this was released late on a summer Friday afternoon! I'm definitely happy it was!

Prognosis

Biden Criticizes China for Not Aiding Report on Virus Origins

By Josh Wingrove and Chris Strohm
August 27, 2021, 3:35 PM EDT *Updated on August 27, 2021, 4:19 PM EDT*

- More U.S. agencies think virus came from animal than lab
- The U.S. believes virus wasn't created as a biological weapon

President Joe Biden rebuked China for stonewalling a U.S. investigation into the origins of the coronavirus, as his administration reported it was unable to reach firm conclusions because of Beijing's unwillingness to cooperate.

"The world deserves answers, and I will not rest until we get them," Biden said in a statement on Friday shortly after the Office of the Director of National Intelligence released an unclassified summary of the report. "Responsible nations do not shirk these kinds of responsibilities to the rest of the world."

The intelligence community determined the virus wasn't created as a biological weapon and said Chinese officials had no "foreknowledge" of the outbreak, but was divided on how it came to infect humans and spread across the globe.

Four components of the intelligence community said -- with low confidence -- that the outbreak was likely linked to exposure to an infected animal, according to the summary. This theory is the most widely supported by scientists, including Anthony Fauci, who is advising Biden on Covid.

One intelligence community component assessed with moderate confidence that the outbreak was associated with a research lab in China. As of a few months ago, two components backed the animal theory while one backed the lab theory.

MORENS_SUBPOENA_022092
MORENS_NIH_042989
REL0000478278

Analysts at other agencies are unable to coalesce around either without more information, including some who think both are equally likely. To reach a conclusion with higher confidence, the intelligence community said it would need more cooperation of China, which it said continues to hinder global efforts.

"Beijing, however, continues to hinder the global investigation, resist sharing information and blame other countries, including the United States," the summary says. "These actions reflect, in part, China's government's own uncertainty about where an investigation could lead as well as its frustration the international community is using the issue to exert political pressure on China."

The intelligence community overall believes that the virus infected humans through an initial small exposure no later than November of 2019, according to the report. The report says the intelligence agencies judge that the virus was not developed as a biological weapon, and most assess -- with low confidence -- that it was not genetically engineered, though two agencies believe there isn't enough evidence to know either way.

"China's officials did not have foreknowledge of the virus before the initial outbreak of COVID-19 emerged," the summary says. But the intelligence agencies and the global community lack clinical samples and other data from the earliest Covid-19 cases, the summary says.

The report is partly a sign of how far from reach a conclusion remains. Only five of the agencies, or components, of the intelligence community expressed any view and none did so with more than low or moderate confidence.

The U.S. Intelligence Community is made up of 18 different organizations, including the Office of the Director of National Intelligence, which released the summary, and the Central Intelligence Agency, among others.

The intelligence community sprinted to provide the report within Biden's timeline, and approached it from multiple perspectives, including consulting scientists and epidemiologists, an official familiar with the process said, speaking on condition of anonymity. The intelligence community also reached out to academic experts, as well as international allies and partners, the official said.

Cheers,

Peter

Subject: FW: The good, the bad, and the ugly
Importance: High

I just wanted to share a couple of articles – Op Eds re the Intel report on COVID origins. The First is actually positive and balanced from today's Guardian
https://www.theguardian.com/commentisfree/2021/aug/27/us- report-covid-origins-pandemic-virus-covid

It includes the comment:
"The false dichotomy that has been set up over Covid's origins is hard to challenge. Until a year ago, scientists who collaborated across national and disciplinary borders were applauded. Now they're accused of conflicts of interest – meaning that many of the people who know most about what happened, or are best qualified to find out, have been silenced. Meanwhile the behemoth that is the global livestock industry goes about its toxic business untroubled by any real scrutiny."

The bad/ugly is below this one, from yesterday's WSJ from Mike Pompeo, calling on lawyers to decide COVID origins – years of litigation will illuminate the truth according to the former Secretary of State. I realize he's grandstanding and may be using this hardline talk to put in a bid for President in 3 yrs, but it's very worrying for me to think that one day EcoHealth Alliance, and myself could be under criminal investigation for doing what we were supposed to do as scientists.

The US report into Covid's origins is little use in averting another pandemic

Laura Spinney

Regardless of where the virus came from, there's a growing risk of another Covid-like phenomenon occurring

<image002.jpg>

REL000478278

US intelligence services have just briefed the president, Joe Biden, on the results of their 90-day investigation into the origins of Covid-19. They were asked to test two hypotheses: that it had a "natural" origin, or that it escaped from a lab. Preliminary reports suggest that their findings are inconclusive.

Few scientists will be surprised by this, and yet the investigation has been the subject of intense – and intensely divisive – political and media interest over the past three months. The White House has promised more detail, which could be illuminating, especially if it reveals the genetic sequences of viruses related to the one that causes Covid-19, Sars-CoV-2, that were being studied in labs in Wuhan in 2019. But that won't change the fact that two investigations down, we're still in the dark as to how this pandemic started.

Biden ordered the latest investigation partly because of widespread dissatisfaction with one set up by the World Health Organization (WHO), which reported in March that a lab origin was "extremely unlikely". Many saw the WHO's efforts as compromised because China used its influence within the organisation to set restrictive terms of reference. It's hard to see why the new investigation, from a single nation locked in a trade war with China, and from intelligence services to boot – not a source often lauded for transparency – should be accorded any more credibility. It should have been conducted by a coalition of national science academies. They still might not have reached any firm conclusions, but they would have had more chance of being seen as independent.

The WHO is promising a new investigation, and there may be others. Whether these will add anything is again questionable, but it's important that scientists continue to try to get at the truth, and that we all acknowledge that it might take them years to do so. It's difficult to trace the origins of a pandemic. Here's just one example of the challenges.

Much has been made of the finding that some Italians may have been carrying antibodies to Sars-CoV-2 as early as September 2019, several months before the first cases of Covid-19 were reported in China. (Nobody's suggesting the pandemic started in Italy, only that it might have come out of China earlier than thought.) But if those antibodies really were to Sars-CoV-2 – which some researchers doubt – it's odd that the wave of Covid-19 infection they indicate wasn't followed by a wave of hospitalisations and deaths, as it was later in China. What's more, those antibody carriers didn't go to the doctor with Covid symptoms, they went for other reasons. If the earliest Chinese cases were also mild or asymptomatic, how will researchers find them?

To be clear, the only reason these investigations are valuable is scientific – because the knowledge they provide could help prevent something similar from happening again. Even if it could be proved to many people's satisfaction that a lab accident triggered the pandemic, it's unlikely that any punishment could be meted out or compensation demanded. As Thomas Bollyky and Yanzhong Huang of the US Council on Foreign Relations have written, a lab accident is not a violation of any international law, and even if it were, establishing causation would be tricky. As they point out, taking the US perspective: "Many nations faced similar challenges in this pandemic and did not suffer the United States' poor health outcomes."

The ongoing debate over Covid's origins has had good and bad outcomes. A good outcome is that

MORENS_SUBPOENA_022095
MORENS_NIH_042992
REL0000478278

it has shone a spotlight on the fact that, as biosecurity experts Filippa Lentzos and Gregory Koblentz reported in May, labs authorised to deal with the most dangerous pathogens have been proliferating in an almost complete vacuum of regulation or oversight. One component of the oversight that should now be put in place is independent, international inspection teams. A model already exists for these, in the WHO's protocol for overseeing the two labs – one Russian, one American – that hold the last stockpiles of variola virus, which causes the now eradicated disease smallpox.

A bad outcome is that at least part of the scientific community – supposedly the bulwark that protects us from propaganda – has bought into the false dichotomy of two "rival" hypotheses for Covid's origins. It's as if they were looking at one of those ambiguous images, and seeing either a duck or a rabbit when both are in the picture. In reality it isn't natural origins versus lab leak; it's long-term human activity versus short-term human activity. Natural ceases to mean much in this context.

Fire, waves and warfare: the way we make sense of Covid
Read more

In fact, since the evidence is by now overwhelmingly that long-term human activity is accelerating the emergence of novel pathogens and increasing the risk of pandemics, the question investigators should really be asking is: did some recent, one-off event such as a lab accident exacerbate the already high and growing risk of spillover of a virus with pandemic potential caused by a decades-long shift towards industrialised farming and the wildlife trade?

Through their reliance on antibiotics, livestock monocultures and crowding, industrial-scale farms are ratcheting up the virulence of animal pathogens that the wildlife trade – and one of its shop windows, wet markets – is bringing into contact with potential host species they wouldn't otherwise encounter, including us. This is not news. As the journalist Felicity Lawrence wrote in 2009, during the swine flu pandemic: "Novel human disease is the toxic debt of today's industrial livestock farming."

Here's something worth reflecting on: in recent decades, most spillover events of highly pathogenic avian influenza – still considered the disease most likely to cause a future pandemic – occurred in countries with generally good biosecurity but lots of intensive poultry farming. The reason more of them didn't seed outbreaks is that they were nipped in the bud through good disease surveillance – the US being a leader in this. If high-security labs are enjoying a boom, prestige and biowarfare deterrence may have something to do with it, but it's also because dangerous pathogens are booming.

The false dichotomy that has been set up over Covid's origins is hard to challenge. Until a year ago, scientists who collaborated across national and disciplinary borders were applauded. Now they're accused of conflicts of interest – meaning that many of the people who know most about what happened, or are best qualified to find out, have been silenced. Meanwhile the behemoth that is the global livestock industry goes about its toxic business untroubled by any real scrutiny. This week, Marco Marani of the University of Padova in Italy and colleagues reported that the probability of an individual experiencing a Covid-like pandemic in their lifetime, currently about 38%, could double within a few decades. Unless scientists stand back and look at the bigger picture, it won't stop there.

Here's the bad/ugly from Mike Pompeo yesterday..

Let Lawyers Hunt for Covid's Origin

The report from the intelligence community is equivocal, but spies don't have subpoena power.

Will we ever know where Covid-19 came from? Not if the last word comes from the U.S. intelligence community, which reported to the White House this week that China's fault is plausible but unprovable. Beijing has refused to cooperate with inquiries, which it has characterized as "origin tracing terrorism." The Chinese Foreign Ministry even denounced the equivocal intelligence report: "If they want to baselessly accuse China, so they better be prepared to accept the counterattack from China."

For the rest of the world, getting to the bottom of the question is essential to assigning blame and preventing pandemics. Fortunately, we have an institution dedicated to getting to the bottom of thorny factual disputes: the U.S. judicial system. Our judiciary is respected globally for its impartiality and scrupulous adherence to due process. Civil discovery gives litigants the tools to compel production of evidence, backed by the threat of sanctions or even default judgment, so Beijing would be unable to stonewall. With so many losses caused by the pandemic, U.S. litigants have a powerful incentive to bring cases, prosecute them aggressively, and test liability through adversarial presentation. Several such cases have already been filed.

But those suits and others like them face a high hurdle: the Foreign Sovereign Immunities Act. The FSIA is the reason at least eight lawsuits were dismissed or withdrawn on grounds that foreign states are generally shielded from litigation in U.S. courts. Yet that immunity isn't a constitutional mandate, only a matter of congressional discretion. Congress can legislate exceptions, and has done so.

Lawmakers should enact a new FSIA exception denying sovereign immunity to nations that fail to inform, or deliberately misinform, the global community of the nature and scope of a local epidemic that becomes a global pandemic. Beijing's failure in December 2019 to comply with the

24-hour notification requirement of the 2005 International Health Regulations, which China joined, should be a sufficient trigger. This would permit lawsuits to proceed so China's culpability for the Covid-19 outbreak can be openly adjudicated.

Congress should also withdraw immunity from international organizations that aided and abetted China's efforts to play down the virus's transmission and health risks. Western intelligence services have suggested that Beijing instructed the World Health Organization early in the pandemic on what it should say about Covid-19. Plaintiffs could use discovery to identify other governmental and private entities that collaborated with Beijing and hold them accountable. This litigation would have an added benefit of unmasking much of the pro-China infrastructure within international organizations and Western companies, think tanks and other institutions.

To ensure that China can't delay proceedings, the FSIA amendment should also either create a new federal tort action or give federal courts jurisdiction over Covid-related claims under state law.

Some may object that these measures could interfere with U.S. diplomacy. But Congress can address that concern. The Justice Against Sponsors of Terrorism Act of 2016—which withdrew sovereign immunity from nations that provided material support to terrorist attacks on American soil—authorized the federal government to intervene in litigation to secure a diplomatic resolution that compensates plaintiffs and mitigates future harm. It makes sense to follow that model here. That would provide the Biden administration with the impetus to declassify and make available to Covid-19 litigants intelligence relating to the virus's origin. Here, too, there is precedent, stemming from civil cases over the Iran-contra affair and the 9/11 terrorist attacks.

Defendants in U.S. legal proceedings are ordinarily entitled to bring counterclaims and spread liability to other potential defendants. Beijing has accused the U.S. military of creating the Covid-19 virus at the Army's Fort Detrick, Md., lab and introducing it during the 2019 Military World Games in Wuhan, in which a U.S. team participated. To ensure that Beijing is accorded every opportunity to defend itself, including bringing counterclaims against the U.S., the Biden administration should waive governmental immunity, a step it can take unilaterally without statutory changes. Let Beijing test its implausible theory in court.

China wouldn't be able to ignore lawsuits in American courts, given its close commercial ties with the U.S. If it refused to participate, courts would enter enforceable default judgments. China would be hard-pressed to avoid complying with any court-ordered damages and injunctions. Successful plaintiffs could pursue collection actions against Chinese government-owned commercial property around the world. Corporations are not normally liable for their owners' debts, but there is an

exception when the owner is involved on a day-to-day basis in running the company. Given the Chinese Communist Party's pervasive control over formally private Chinese companies, this shouldn't be difficult to prove.

It should be possible to secure broad bipartisan support for these measures. Republicans and Democrats have expressed a keen desire to hold Beijing accountable, and the Biden administration has made a priority of defending and strengthening the rules-based international order. The president has repeatedly said he wants to make sure China plays by the rules.

Chinese military publications have run articles expressing interest in developing biological weapons. China understands that bioweapons are particularly effective against open societies, where stringent isolation and quarantine measures spur resistance, and could be used to incapacitate aircraft carriers and military bases, which are crucial to the U.S. ability to project power in the Indo-Pacific. Pandemics aside, upholding international norms is essential to deterring China from other malevolent acts, including against Taiwan.

Permitting Covid-19 suits would have additional strategic benefits. In its propaganda, Beijing has sought to capitalize on its supposedly superior handling of Covid-19, claiming it demonstrates the superiority of its totalitarian political system over open, democratic society. Legal discovery could unearth information puncturing these claims.

Holding Beijing accountable would also do much to dispel its assertions that the U.S. is a declining power. While Beijing still respects U.S. military power, it routinely talks down U.S. political will and economic strength. It would face a formidable foe in an army of lawyers on an honest judicial battlefield.

Mr. Pompeo is a distinguished fellow at the Hudson Institute. He served as director of the Central Intelligence Agency (2017-18) and secretary of state (2018-21). Mr. Rivkin practices appellate and constitutional law in Washington. He served at the Justice Department and the White House Counsel's Office in the Reagan and George H.W. Bush administrations.

Cheers,

Peter

I really don't think this is worth a response to Dr. Sachs or to the journal. There are numerous factual inaccuracies about our work, but it's in an obscure journal I've not heard of, and it isn't being picked up by others. Basically it's safe to say Dr. Sachs has strayed so far down a rabbit hole I don't think he'll be coming out of it based on the fact it's going nowhere…

Cheers,

Peter

EXTERNAL SENDER

This is another totally speculative list of non-data. How many "may be" does it take to understand it is not credible unless you formed your opinion in adcance?

Should there be a very brief point by point response or just let it lay and decay?

EXTERNAL SENDER

Dear all (cc'ing Dennis Carroll who I spoke with at the weekend),

Not sure if you've already seen this, but after multiple harassing, innuendo-filled articles in this journal *The Intercept*, we decided to respond to them and try to explain that all of the minutiae they have been reporting on for the last few months are not evidence of corrupt science that led to a pandemic, but just the opposite – they're part of the normal process of doing science to help prevent pandemics.

The result is an interview they published last week that is a bit combative, but at least helps explain to those who are bothered, that all of the allegations these guys have been pushing can be easily addressed, albeit that the answers are 1) boring, and 2) not the narrative that they want.

David – you'll be interested in the bit where I explain that the NIH Office of the Director has been cruelly holding us over a barrel

to deflect from their political and erroneous decision to defund us.

Here's the link: https://theintercept.com/2022/03/11/covid- nih-ecohealth-peter-daszak-interview/

And here's the story pasted in the email:

PETER DASZAK ANSWERS CRITICS AND DEFENDS CORONAVIRUS RESEARCH

"Scientists disagree over an issue where there's no definitive proof," said the EcoHealth Alliance president on the origins of the Covid-19 pandemic.

Sharon Lerner, Mara Hvistendahl
March 11 2022, 9:50 a.m.

SINCE THE EARLY days of the Covid-19 pandemic, Peter Daszak has been at the center of a heated, and at times vicious, debate over the origins of the SARS-CoV-2 virus. The parasitologist helms the New York-based nonprofit EcoHealth Alliance, a wildlife conservation organization that aims to understand and prevent infectious diseases; the organization has received more than $118 million in grants and contracts from U.S. agencies, much of which Daszak distributes to labs around the world. Starting in 2005, he worked closely with Shi Zhengli of the Wuhan Institute of Virology, who was a key partner on a 2014 National Institutes of Health grant to research bat coronaviruses in China. The Intercept has published over 2,500 pages of documents and communications from the grant following a Freedom of Information lawsuit — information that has transformed public understanding of the research conducted under the grant.

Those documents have shown that in its efforts to head off and prepare for a pandemic, EcoHealth Alliance oversaw an experiment in which researchers intentionally made coronaviruses more pathogenic and transmissible. One grant report contained evidence that the research group also did an experiment with infectious clones of MERS, another deadly virus. While none of the experiments described in the grant materials released so far could have sparked the current pandemic, the documents raise serious questions about biosafety and oversight at NIH. Early in the grant, research on certain

MORENS_SUBPOENA_005788
MORENS_NIH_014326
REL0000478304

coronaviruses was subject to a U.S. government ban, but notes on communications between NIH staffers and EcoHealth Alliance obtained by The Intercept showed that the federal agency allowed Daszak to take the lead in shaping a plan to evade that moratorium.

Meanwhile, a grant proposal published by the internet research group DRASTIC last September showed that in 2018 EcoHealth Alliance applied for funding from the Defense Advanced Research Projects Agency, or DARPA, to look for novel furin cleavage sites in bat coronaviruses. According to the proposal, which was not funded, EcoHealth planned to insert furin cleavage sites into the spikes of SARS-related viruses — an idea that drew attention because scientists had already noted that such a site is unique in the subclass of viruses to which SARS-CoV-2 belongs.

The Intercept repeatedly sought comment from EcoHealth Alliance on these revelations. EcoHealth initially responded. In September 2021, a spokesperson denied that the organization had conducted the research on the deadly MERS virus that was described in the NIH proposal. After documents obtained via FOIA later showed that such research had in fact been done, Daszak stated that the spokesperson had been misinformed. EcoHealth Alliance then stopped responding to The Intercept's questions. In late February, Daszak replied to email inquiries and offered to talk. He spoke with us on March 1. In a wide-ranging interview conducted over Zoom, he addressed questions that have swirled around EcoHealth Alliance for the past two years, defended his organization against what he characterized as unjust accusations, and railed against the questioning he has faced from congressional Republicans, the NIH, and news organizations, including The Intercept.

This interview has been edited for length and clarity.

Responding to the Outbreak

We're curious when you first heard about the outbreak in Wuhan.

If you look at my Twitter account, you'll see a tweet on New Year's Eve of 2019 —

But before the tweet, what was the moment when you first learned about it?

It was a couple of days before that. We heard from our contacts in China that something was going on, that there were cases of a disease in Wuhan. I think it was December 30. We looked on Chinese social media and found the rumors about it there. But we heard from many scientists in China.

Many of the virologists and other scientists we speak to say that we don't have enough information to determine whether Covid-19 emerged from natural spillover

MORENS_SUBPOENA_005789
MORENS_NIH_014327
REL0000478304

or as a result of research. Do you agree with that?

Do I agree that it's possible that Covid-19 emerged through a lab leak? Of course. It's been widely reported that we shut down discussion on that. But in the WHO report, which I was part of — and in fact I led the animal environmental side for the WHO side — we state that it's extremely unlikely. We don't state that it's impossible it came from the lab. Of course it's possible.

One of the many reasons that the origin of Covid-19 became such a sensitive and divisive issue was the sense, based on your communications about the Lancet letter, that you orchestrated a response among scientists and then made an effort to distance yourself from that effort. Do you want to say anything about that episode?

You said, "One of the reasons why this has become so divisive is because of the Lancet thing." You could say that about many things. It's because we didn't release the DARPA proposal. It's because we didn't release our emails. It's because, early on, we said very strongly that this came from nature, and that this lab leak stuff is preposterous. The real reason this has become so divisive is because it's being used politically. That's it.

Scientists disagree over an issue where there's no definitive proof. And for this issue, there's no definitive proof. And there may never be. But what we do know is the weight of evidence points strongly to emergence from farmed wildlife in China.

Since the WHO report even, there are something like 12 scientific papers that have been published or put up online from good scientists pointing towards that origin. And I've looked at every single document that's come out of the folks who are trying to show it came out of the lab, and there is no evidence yet for that. It's all about implied motives, databases that were taken offline, people that aren't on a website, or innuendo around something. Any one of those things can be explained by the normal process of doing science.

Controversial Research

Did EcoHealth Alliance or the Wuhan Institute of Virology, through its partnership with EcoHealth Alliance, ever insert a furin cleavage site into a bat

MORENS_SUBPOENA_005791
MORENS_NIH_014329
REL0000478304

coronavirus genetic sequence?

Of course we did not do that. I really don't understand how that could be a question at this point — it's beyond the pale. That's not in our plans and it's not any of our reports, so of course we didn't do that.

But isn't it the case that you submitted a grant proposal to DARPA to do so?

We did submit a proposal to DARPA. I've not checked through the one that's online that it's the correct document. What I do know is it was widely reported that DARPA rejected that because there were concerns about safety issues. That is absolutely untrue. The document that allegedly is DARPA's response, their review of our proposal, I've never seen that before. It was never sent to us. I don't know if it's real.

DARPA had a process by which people who didn't get funded could do an interview with them to find out why they didn't get funded. So I did that. Never once did they mention any concerns or issues around safety; never once did they mention gain-of-function. The reason they told us it was rejected was because the amount we asked for was too much for them. They couldn't afford it. They actually encouraged us to resubmit in different ways. We then had protracted conversations with them about funding specific parts of it. They liked the proposal.

Was any of the work described in that proposal completed prior to its submission? We were told by multiple sources that when you submit a grant, that at least some of the work would have been done.

When you write a grant proposal and propose to do a new line of research, which is what we did, we would not be doing that research before we submit the proposal. That's not how it works.

When we asked if you had ever inserted a furin cleavage site to a coronavirus, you responded with outrage. But that is what was described in the DARPA proposal.

No. What you said is, did we insert a furin cleavage site? And what I said was, of course not! If we had done that work with the Wuhan Institute of Virology, it would have been published by now. It would have been made public in our reports to the NIH. The DARPA proposal was not funded. Therefore, the work was not done. Simple.

But you acknowledge that you proposed to DARPA to insert a furin cleavage site?

I refute that that was the goal of the DARPA proposal. The idea was not to insert a furin cleavage site in a virus to see what happens. That's not what was proposed. The proposal was to look for those polybasic cleavage sites in nature because we knew that that was the potential to make a virus more able to infect people and move from person to person.

If we found mutations around that polybasic cleavage site that looked like it could be evolvable, the idea was then that Ralph Baric's lab at UNC would do some work to see how evolvable that site was. So that work never happened. The proposal was not funded.

Did you find any of these cleavage sites in naturally occurring viruses that you collected?

The proposal was not funded so we didn't do that work. We've not found polybasic cleavage sites. However, they are in many coronaviruses from bats. Papers from Europe show mutations around that cleavage site that suggest strongly that that furin cleavage site could evolve very easily in nature. I'm sure there are viruses out there with it. I'm convinced that it could have easily evolved during the first stages of the pandemic, as the virus got from bats, perhaps into an intermediate host in a wildlife farm, or into people.

Did you resubmit the proposal?

We had conversations with them over many months about bits they would like to fund or they wanted to fund. We did not get funded. We did not do the work.

So you didn't think the DARPA proposal was relevant to the investigation into the origin of the pandemic?

A proposal that was not funded and work that was never done is not relevant to the origins of Covid. Of course not!

When asked if you had done this work with the furin cleavage site, you said no.

For the furin cleavage site, you should really ask Ralph Baric. He wrote that section of the DARPA grant.

So you're saying that that would be a good question for Ralph Baric, whether he has done any of these insertions?

I don't know what Ralph Baric has done. But I doubt that he would go ahead and do that work without the funding.

Some virologists were dismayed to see the insertion of furin cleavage sites in this proposal.

I don't know why anyone would be dismayed at that because furin cleavage sites were first researched in influenza viruses. And it's well known that that's something you should look for if you're interested in virulence factors. Second, there's actually a published paper from way before our proposal was submitted, way before the pandemic, where a group actually inserted a furin cleavage site into SARS-CoV-1. So we were right to look for that. And I think the proposal stands as a valid and actually quite predictive

effort to understand the risk of viruses. You've got to look at the big picture of why we do this research. We're not doing it as a sort of academic interest, "what would happen if you put a cleavage site there?" No. This work is done to say: What viruses are there out there in the wild that have the potential to emerge in people? And can we do something to stop them? Develop vaccines, develop therapies, stop people making contact with those animals.

Your grant, "Understanding the Risk of Bat Coronavirus Emergence," included an experiment using humanized mice. Were other humanized mouse experiments conducted by you and/or WIV?

Not by us, no.

What about by WIV?

Well, you need to talk to WIV about what else they were doing. We were doing one line of work with them.

Were you aware of any?

No, of course. I'd tell you if I was aware.

Were there viruses from elsewhere in Southeast Asia that were sent to the WIV?

No. This is a commonly put about story that's simply not true. WIV did not receive viruses from all around the world.

How many actual viruses do they have?

WIV does not have the biggest collection of viruses from bats in the world. There's 20,000 bat samples, something like that, tiny fecal pellets from bats.

Right now I don't know exactly how many bat coronaviruses are in culture and freezers at the WIV. But from our work, I know that out of the SARS-related coronavirus, they were only ever able to culture a handful. I think three cultures. It's not easy to do.

In November 2019, you tweeted that you had identified over 50 novel SARS-related coronaviruses, including some that cause SARS-like signs in mice and didn't respond to monoclonal antibodies.

Yes.

What are these 50 viruses? And are they public?

This is a complex thing that's been widely misinterpreted. It's actually quite simple. What we had were hundreds of genetic sequences of coronaviruses from bats. We

published them in that paper. They're not all new viruses. As we went through the sequence data and analyzed it, we refined what you might call a new virus versus a known virus. That's all. It's scientists refining and analyzing.

One ongoing point of contention between you and NIH is about lab notebooks and the communications around experiments.

NIH has made a bunch of requests that are completely reasonable, that we've dealt with very quickly and sent them the information that they required. And in many cases, NIH had the information already. What's happening here is you've got an office of the director that's dealing directly with us and completely cutting out the program staff who've got all the data they need. NIH has also asked us for a number of things which to any balanced and independent reviewer are impossible for us to supply.

Clearly in coming up with Year 4 and 5 progress reports, EcoHealth Alliance had information and draft reports on these humanized mouse experiments. Did you share those with NIH?

Of course not. You don't share draft reports. You share the final report.

Here's what happens, it's a very standard procedure: We are subcontracting to a lab in China to do some work. Every year we have to file a report to NIH to tell them what we've done for the year, how we've spent the money, and whether we've achieved the goals of the grant. So, we contact our subcontractees and we say, "Send us the information. Let us know what successes you've had this year and whether you've had problems and issues. Put it all in a report and send it to us." And then we use that to produce a report for NIH. That's why there are some editing issues around that. We move them around a bit, and we send a final report. A draft report is just a worse written version of the final report. There's no special information that's got intelligence value or anything.

Then why not share them?

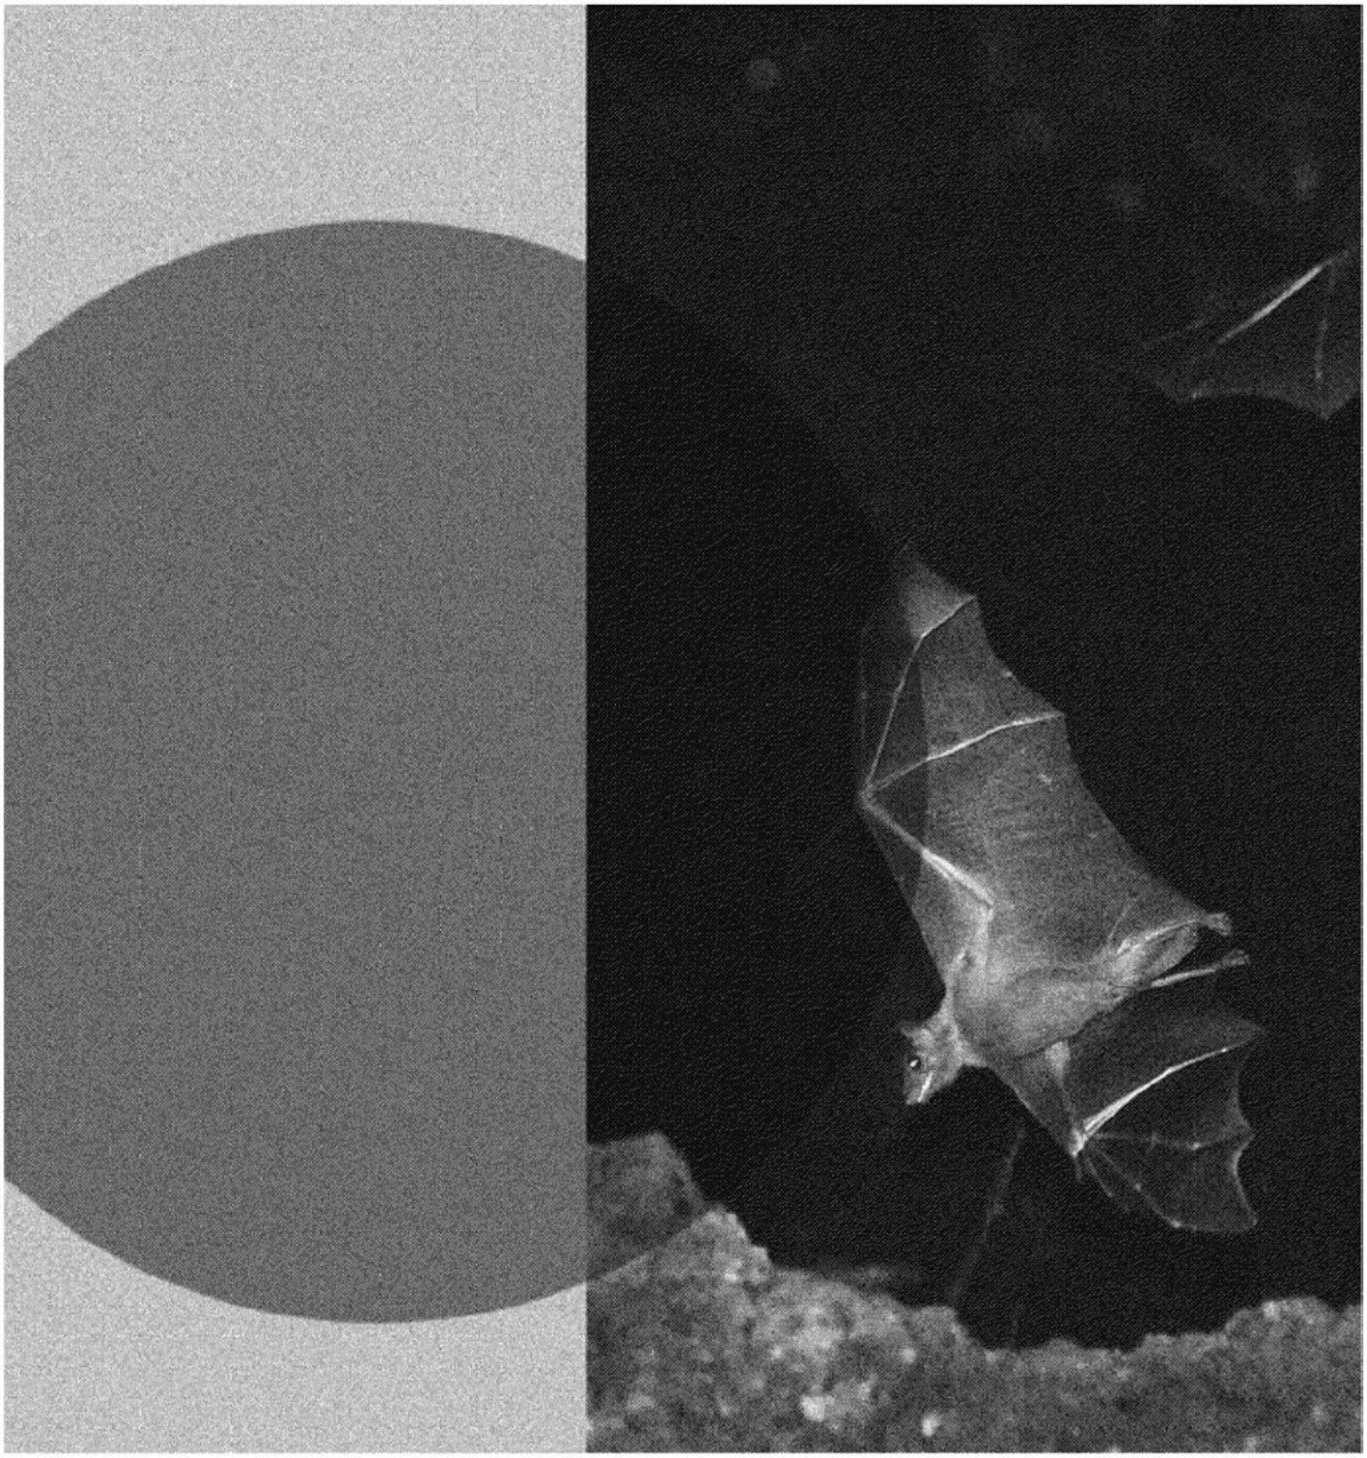
We've not been asked for a draft report by anybody.

You've been colleagues with Shi Zhengli, the Chinese bat coronavirus expert who directs the Center for Emerging Infectious Diseases at the Wuhan Institute of Virology, since 2005?

Yes.

So is it the kind of relationship where you would be generally aware of all the work that she was involved in? Can you say a little bit about what your level of awareness of other stuff she was doing?

We were aware of most of the stuff she was doing. Of course. These people weren't hiding anything from us. They are scientists.



I've sat through dozens of meetings with people from Wuhan Institute of Virology, where they talk openly about unpublished work. And, by the way, RaTG13 was one of the sequences in a paper published — in I think 2015. So they weren't hiding anything from us.

Early on, after she learned about the outbreak, Shi said she was worried that somehow a virus might have leaked from her lab. A lot of people we speak to — virologists who do this kind of work — are the ones who seem most in touch with that possibility, that this stuff happens.

Very specifically, it happens when you have cultures of viruses in flasks, and you're then doing experiments with high concentrations of virus. It rarely happens if ever from an animal sample, especially a saliva sample from a bat. What Shi Zhengli was saying at that time was, "Oh, no, it's a coronavirus. I need to go back and check on those viruses that we've got and see: Is it one of them?" And she did, and it wasn't. That's what any reasonable person would do.

You implied in early 2020 that RaTG13 was not fully sequenced by WIV until late 2019 or later. And then afterwards, Shi revealed that it had actually been fully sequenced in 2018. When and how did you first learn about the true date that this virus was sequenced?

I don't actually know the true date of when this virus was sequenced. I didn't see an interview with Zhengli where she said, "We sequenced it in 2018." I don't know when and I don't think they ever got the full genome. There are parts of that virus that aren't correctly sequenced. Bear in mind, RaTG13 was not from a sample collected under the NIH grant. So we didn't have any oversight on that or any knowledge of it.

A colony of bats in a cave in the Maramagambo forest of Queen Elizabeth National Park, Uganda.

Photo illustration: Soohee Cho for The Intercept; Getty Images

Missing Data

Did you have access to the Wuhan Institute of Virology's database of viral samples and sequences that went offline in September 2019?

MORENS_SUBPOENA_005797
MORENS_NIH_014335
REL0000478304

I've never actually seen the database. I've seen pages of it from the internet, Twitter, chats. But I've never looked at the database.

Did your staff have access to it?

No. We didn't need to! We had all the data we needed. Some folks find this missing database indicative of a cover-up or something. When we were in Wuhan [with the WHO mission] in the Institute of Virology, I said, "Why did you take the database offline?" And their response was, "We took it offline before the outbreak. We were then getting hacking attempts, hundreds, thousands of hacking attempts. So we decided it wouldn't be wise to put it back up." Now, you may not believe them. But it is a perfectly reasonable explanation. And I think people should try and go for the most likely reasonable explanation for these things.

So why did they take it offline in September 2019?

They told us — and it's in the WHO report — that they were trying to update it to make it modern. WIV was trying to present itself like a globally significant virology institute, and it is. But when you look at Chinese websites, they can be really old and stuffy and clunky. What they were trying to do, they told us, was to make it interactive so that you can click on something and a map would show. They were trying to make it fit in with the national databases.

I find it quite ironic that the focus on the database of WIV is so intense, whereas what actually happened was we took the data and, with China, put the data into the NIH's own database to make it public. That's a great win for the U.S.

In April 2020, you wrote in an email, "It's extremely important that we don't have these sequences as part of our PREDICT release to Genbank at this point. As you may have heard, these were part of a grant just terminated by NIH. … Having them as part of PREDICT will being [sic] very unwelcome attention to UC Davis, PREDICT and USAID." Why did you think that publishing these sequences would bring unwelcome attention?

Because we just had our grant terminated by NIH.

So you didn't think it would be important to release this data, given that there was a pandemic?

Those sequences were released publicly by publishing them in a scientific paper, which is what scientists do. The email that you're reading out is not about whether sequences should be made public; it's about whether sequences should be made public via a USAID mechanism or via publishing through the NIH mechanism. And what I was saying to the UC Davis team that ran PREDICT was that these are NIH-funded

sequences and should be reported through the NIH system. It's really that simple.

And which paper were they reported in?

Latinne et al, published in Nature Communications. We were struggling to get that paper out. It was very, very difficult, once the pandemic started, to keep communication with Chinese scientists. The utmost priority as a scientist is to get the data published, not to upload it into some database that's going to take months to go through. And by the way, that database is somewhere on the USAID government system. It's very difficult to find. The paper had already been submitted for publication, and the sequences were uploaded into GenBank, the NIH system. And then once the papers were accepted, they became public. And that's exactly what we did.

Are there sequences that have not been made public?

To my mind, there are no sequences of SARS-related coronaviruses that have not been made public. Some people think there are still viruses that are SARS-related that haven't been put in GenBank. That's not true. We've uploaded all of the SARS-related coronavirus sequences, or we've reported them to NIH, or we've published them in scientific papers. And in fact, for most of them, we've done all the above. We had them all uploaded before the pandemic. Most of them anyway.

You were on the WHO mission to investigate the origins of SARS-CoV-2. When the NIH grant documents were released, it was a surprise to many people that animal experiments were being done at Wuhan University. If you knew this information, did you share it?

It wasn't a surprise to NIH because the NIH knew about them.

Right. But did you share that information with the WHO committee or with others who were investigating the origins?

The Wuhan University BSL-3 facility is what we're talking about. They do humanized mouse work. That was not looked at by the WHO origins group. It's a BSL-3 lab that had humanized mice under BSL-3 conditions. It's highly unlikely to be the source of the Covid-19 outbreak.

Did you mention it to the committee?

I mentioned all my work to the committee, of course. We talked about it, for sure.

The Challenges of Public

MORENS_SUBPOENA_005799
MORENS_NIH_014337
REL0000478304

Scrutiny

Dr. Michael Lauer at the NIH has repeatedly asked you for biosafety records from the WIV and said that he has been unable to get some of them.

He says that, but it's not true. We've supplied everything we could possibly supply on the issues that they've asked for.

In one of his letters to you, Lauer asked about the biosafety oversight of the work at WIV. In your response to him, you wrote that it consisted of semiannual meetings with the lead investigator and assessments of compliance with all conditions of the award. Biosafety experts have said that this falls short of the level of oversight one would want for this kind of work. You mentioned in an exchange with Lauer that you were offering to pay from EcoHealth's own coffers for additional biosafety measures. Why did you offer to do this? Did you feel that the biosafety oversight was adequate?

We're talking about a world-class virology lab run by the Chinese government that is probably the best virology lab in China, and China is very good at virology. It's very efficiently run, and the biosafety conditions are very good. Just because people think that Covid-19 might have come from WIV doesn't mean that therefore our oversight of biosafety wasn't sufficient. We did everything normal in oversight of that lab.

Then why did you suggest these additional measures, if the others were already adequate?

Because I was worried that they were going to terminate our other grants. This is the key driving force for every action we've taken since April 24, 2020. I don't know why people don't realize that.

Once NIH shows you that it's willing to terminate your funding and kick people out of a job and put your whole organization under pressure simply because a single politician tells them to, then you start worrying about every other grant and contract that NIH controls. We live in fear that they're going to do similar abrupt terminations with no cause and no rationale and no logic.

What I was doing then was saying to Michael Lauer, please be reasonable. We're trying to do everything we can, within the normal bounds of what organizations do. We probably have the best biosafety and field teams in the world.

We're overcompliant and yet still being accused of lack of compliance.

On February 24, House Energy and Commerce Committee Republicans sent a

MORENS_SUBPOENA_005800
MORENS_NIH_014338
REL0000478304

letter to NIH alleging that it is "highly suspicious" that EcoHealth reported the humanized mouse experiment results over two years, and suggesting that more work may have been done that was not reported. How would you respond to that?

This is a simple issue of Chinese nationals writing a report and then us drafting our report to NIH. So there's a word in there where they say we continued the studies. That doesn't mean they continued infecting mice with new viruses. No. What it means is they continued doing the research on the one experiment that they've done. And that continuation is a lot of work. So they did all the pathology, which means at the end of the experiment, you take all the mice, and you look at every organ in the body. You do detailed microscopical analysis. It takes months. So that's why it dragged on because you've got months of after-the-experiment analysis. And we included the mortality data as part of the pathology data. That's completely normal.

The House Energy and Commerce Republicans don't write to us, they write to NIH. Sometimes we hear about it, sometimes we don't. NIH doesn't copy us on their responses. Then eventually we get a letter from NIH asking questions, which we always respond to, always within the timeframe and always refuting any allegations with evidence. So that's what we've done.

The latest letter from the House Energy and Commerce Republicans accused us of being overfunded, effectively having two grants to do the same thing. It's simply not true. The USAID PREDICT grant has completely different goals to the NIH coronavirus grant. For instance, PREDICT looks for between seven and 18 different viral families within samples, not just coronaviruses. NIH is focused solely on coronaviruses. So the goals are different.

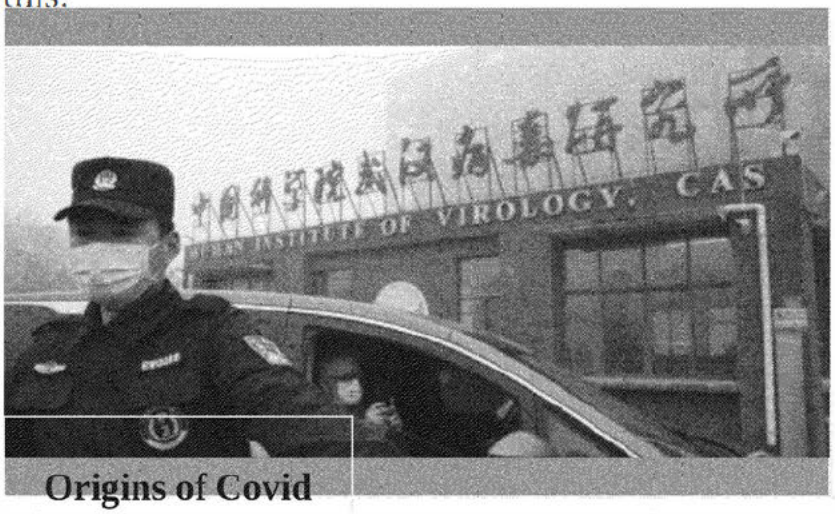
The agencies do, as a standard procedure, a review of a grantee's other proposals to see if there's overlap between them, because they don't want to fund the same thing twice. This is absolutely refutable with documentary evidence.

What's your understanding of the Republicans' motivation?

Any bipartisan requests for information from the House or the Senate, we've responded to. We've been working with the U.S. government since the pandemic began to get information to them about every single aspect of this pandemic, including unpublished data. The politicians who are attacking us probably don't realize or know or care, in some cases. When there's a request from one side of the political spectrum, we try not to respond to that. We've had hundreds of questions sent to us by letter, including requests for thousands of pages of documents. We don't have the staff to do that. And bear in mind our grant has been terminated and now suspended. We don't have access to funding. We don't have the staff to do this work. It's a horrible, cruel irony that, on the one hand, your funding is cut; and on the other hand, there are now outrageously huge

MORENS_SUBPOENA_005801
MORENS_NIH_014339
REL0000478304

number of demands for us to do work to show data from that funding that's been cut.



Don't you have ongoing funding for two other NIH projects?

Yes. Well, you can't use that money.

What have you been asked to get by NIH that you feel you can't get?

There are a whole series of things that we've been unable to get. A vial of virus. Information on a person that was removed from the website (I did ask them that, and they gave us an explanation, which is perfectly reasonable). NIH asked us for an inspection of the WIV. Every right-minded person on the planet realizes that the World Health Organization asked for an inspection of that lab, and we did go into the lab and ask questions and go around the facilities. For NIH to say that I should organize a U.S.-only, NIH-based or National Academy-based inspection of the lab facilities is a request that is way beyond what's possible. You know, you can't go into CDC as a foreigner and do an inspection of the lab.

NIH writing to us saying, "We demand that you do this," puts us in jeopardy and it's a security risk. If I was to take that letter from NIH and go to the Beijing airport and say, "I'm here to do this," I would be arrested and put in jail and probably put on trial, in the same way that scientists from China have come to the U.S. and tried to take vials of virus back to China and been arrested and convicted. NIH doing this is clearly a way for them to try to get the public behind a decision they made that was political about terminating our grant. Ever since that decision, we've been put under similar pressure over and over again. The Republicans write to NIH with some fairly outrageous accusations. NIH responds and says, "Don't worry, we will go and make EcoHealth do this, this, this, and this."

Origins of Covid

Read Our Complete Coverage

I don't think that those questions are posed to truly get to the bottom of the origins of Covid. While the House Republicans are putting pressure on NIH for tiny bits of administrative information, scientists are going out and finding that actually things are

really pointing towards a natural origin. And meanwhile, we're left refuting each one of those allegations. They're all false. There's no substance to them at all.

A good proportion of the public have been pushed by misinformation to believe a narrative — and this narrative is repeated daily — that gain-of-function work was funded by Tony Fauci as a back channel to China, and EcoHealth funneled funds to China. Those stories are very beguiling, they sort of make you feel, "Ah! I knew it." But actually, there's not a grain of truth to them. Every single action that EcoHealth Alliance has taken has been things that scientists do in the normal course of doing their work.

Closing down that line of research means we lose eyes and ears on the ground in China. And it doesn't benefit us from a public health point of view or a national security point of view. It's a huge mistake.

Not pleasant reading but thanks for sharing this link. It's a stream-of-consciousness diatribe that makes you think this guy is simply mentally ill, but actually he's a well-known right wing 'influencer', appearing on Steve Bannon's podcast, member of the Brownstone Institute and regular on other outlets. In the end, just probably a sad lonely person looking for outside validation. Still, pretty disturbing to read…

Just off the phone with Arthur Allen from Kaiser Family Foundation News, thanks to an introduction from David. I spent 45 minutes talking to him about this GOF stuff, and why that was a pejorative term being used to drum up support to ban certain kinds of research into evolutionary biology of viruses and viral pathogenesis, with the ban being far more dangerous than any possible leak of a created super pathogen. Peter, I characterized you as a hero. Don't disappoint me or undermine my credibility (said tongue in cheek to be absolutely clear). In response to a question I said you were the member of the WHO team who would most want to find out if there was a leak of virus from the laboratory because your integrity as a scientist would want to know how this virus became a human pandemic so that we can try to better prevent it in the first place, and if not find it as quickly as possible in order to stop it from spreading. So while on the list of priorities the emergence from bats through some mammal to spillover to humans was at the very top, and lab origin was at the very bottom, you would not be the one to eliminate the latter from the list. That said, I do think that after characterizing it as highly unlikely, it was a mistake for the WHO report to say it should not be explored any further. I suspect that was more an offering to the Chinese to keep the door open to the next step in the investigation than anything else. After all, it would not be at all possible if the Chinese didn't actually agree to allow it to happen.

I also saw the Garry paper this morning and not only brought it to Allen's attention (he said he had just become aware of it 30 minutes before we spoke) but I also characterized it as the first piece of actual field derived evidence to evaluate, and really very powerful evidence that the evolution of the precursor virus to CoV-2 happened in nature and not in a lab. I think he will look at it carefully and use it.

We also talked politics and the consequences of continuing expression of concerns about GOF research, with my take that if certain lines of research were cut off instead of managed/regulated/overseen the lost benefits for humankind would so overwhelm the miniscule chance of unintended harm like an asymptomatic infected person leaving a lab and initiating a global pandemic resulting in (according to Chris Murray et al) more than 900,000 deaths in the US to date, and over 7 million global deaths and counting as the deadly outbreak in India continues to wreak havoc, and without doubt spread to other countries, travel bans or not. I made the analogy to recombinant DNA, and more recently to CRIPR where the benefits overwhelm the chance of inadvertent harm. And I said the small number of scientists who are on this bandwagon can really harm the future of science to explore, understand, and use knowledge about microbial evolution and pathogenesis to develop treatment, vaccines, and diagnostics, playing into the hands of the crazies, the conspiracy community, and scientifically illiterate so called communities of conscience or those who have no concern for the common good.

I asked him to do a good job in his write up. He promised, and I will hold him to it if I can figure out how to accomplish that.

Jerry

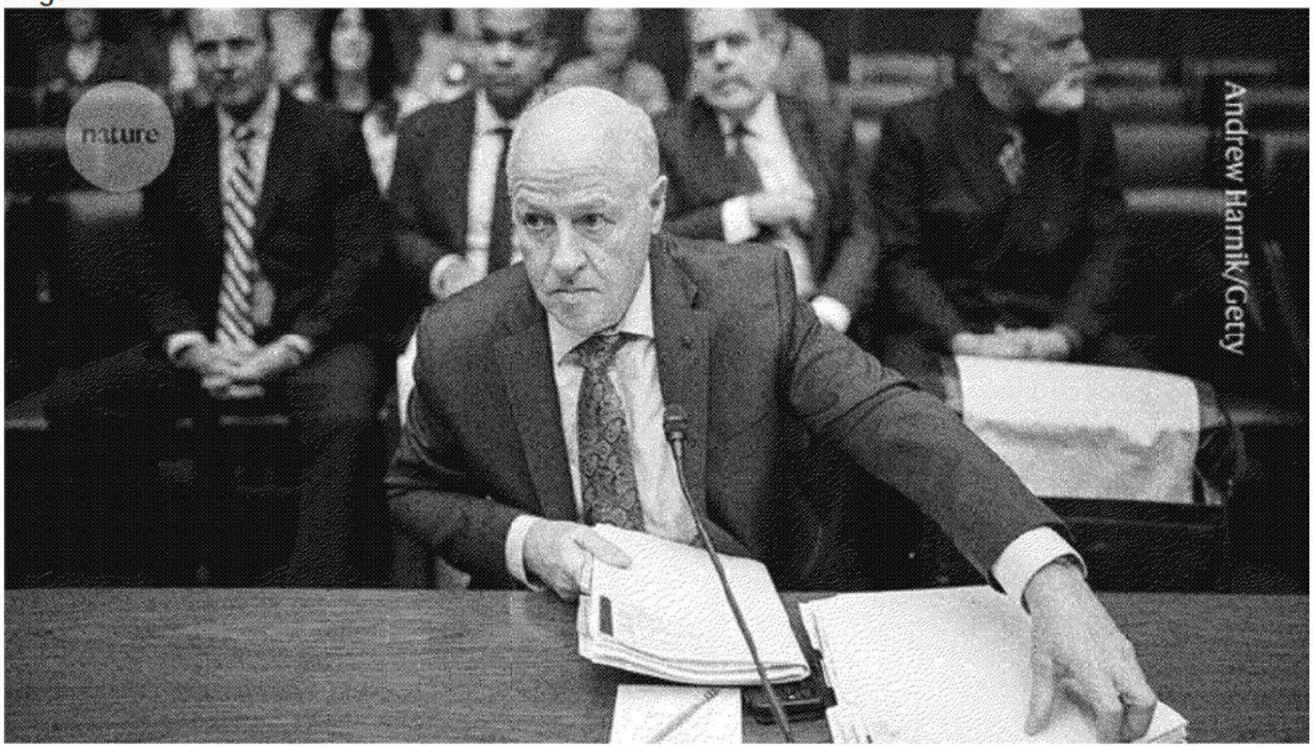
Shame to see Amy Maxmen following the trend of the article in Nature that seems to just parrot what the Democrats on the SSCP said - EcoHealth did something wrong, but they didn't cause COVID-19.



Of course, we were not given a chance to respond to allegations on the day, and now that they've moved forward with a Suspension pending debarment proceedings, we have to respond to the HHS first on a legal matter, then can talk publicly.

Amy's tweet is below, and my response (trying to be as diplomatic as possible).

Amy Maxmen, PhD
@amymaxmen
5h
EcoHealth Alliance didn't comply with NIH granting conditions, eg not sending regular updates on its research. Without repercussions, those rules are meaningless. https://nature.com/articles/d41586-024-01460-3… The problem is when public/media interprets this to say anything about where Covid

began.

US halts funding to controversial virus-hunting group: what researchers think

From nature.com
1.2K

Peter Daszak
@PeterDaszak

EcoHealth Alliance has repeatedly refuted allegations that it "didn't comply" & has yet to respond to the HHS letter. Calling for "repercussions" seems premature until some level of due process has played out. Let's hear the argument against debarment before we all move on.

Cheers,

Peter

Could we set up a zoom call together?
Importance: High

EXTERNAL SENDER

Dear Robert, Jerry, David, and Peter

I had a good conversation with Peter Hotez at the end of last week – Peter's running a taskforce on the Lancet COVID-19 Commission, and has been following the media frenzy around the COVID origins with a keen eye. As you know, he's been talking publicly about the anti-vaccine movement for a long time, and sees strong parallels between the politically motivated anti-vaxxer movement, and the politically motivated COVID origins conspiracies. He's also dealing with intense harassment similar to the attacks I've been having recently.

Peter and I would really appreciate an opportunity to all meet by Zoom to talk about what we can do together (and separately) to change the narrative and deal with the growing anti-science agenda. Peter is, like many of us, disappointed by the risk-averse nature of the academies (he's a NAM member) and many of the professional societies. He's also well aware of media messaging and how that can be used – he's a regular contributor to CNN and other TV networks. By the way, Peter is one of the inaugural Fellows of the ASTMH, as well as a past member of the NIH Council of Councils.

I've cc'd Alison and Aleksei who can help set up a time for a 1 hour zoom call either later this week or next week. I hope you'll be able to join and really appreciate your efforts.

By the way – Rich – thanks for putting me in touch with Ellie Dehoney at Research!America – she is on the case, albeit she's well aware of the political constraints and the timing right now.

Importance: High

FYI, Rich will be speaking with Jeff and I sent him some bullets on general reasons why the call for an investigation into US scientists is flawed, inappropriate and based on easily debunked narratives and simple mistakes.

I think we could draft a polite and decent rebuttal based on these. The general thrust I think should be "Why investigating US scientists is the wrong way to identify COVID-19 origins, and prevent future pandemics". This would take the moral high ground in the same way that Peter Hotez has been doing with anti-vaxx sentiment, by talking about how damaging these narratives are on science, and scientists, and how they ultimately undermine public health.

Here is the summary I sent to Rich. I'll continue to read the paper and identify factual inaccuracies we can correct, but maybe one of you (e.g. Peter) could build on this for a rebuttal draft? I have beaucoup references for each point I make, including peer-reviewed science that demolishes the FCS hypothesis, media articles where we refute some of the claims about our openness and data sharing, and reports that link to articles and emails that have been made public via FoIA.

Bullets for a draft rebuttal:
I think we could start on a conciliatory note that most reasonable scientists who believe the lab leak is 'extremely unlikely' (words of the WHO report I was involved with) also believe it is possible. Therefore, calls for further investigations into the origin (including a potential lab leak) are warranted and valid, and come from a basis of scientific inquiry that is beneficial. If a lab leak did happen, we should know, and it would benefit our defenses against future pandemics. However, we should then rapidly pivot to the main issue: that the call for an independent investigation in to US scientists and organizations that the article lays out, and many of the specific statements in it are based on flawed narratives, misunderstandings of the balance of the evidence, mistakes in interpreting the facts

MORENS_SUBPOENA_004081
MORENS_NIH_011041
REL0000478327

behind the work, and simple errors in understanding how science is conducted. Here are some key issues we could raise:

- Understanding COVID origins will require cooperation with China, not investigation of US scientists. A brief look at the history of recent emerging diseases shows that it usually takes many years to identify the reservoir hosts, the amplifier hosts, and the pathway to emergence (e.g. SARS – our paper showing bats carry SARSr-CoVs that can bind to human cells was published 12 years after the outbreak). To do this requires access to sample collection, testing and analysis within the country of origin, and cooperation with the government. Thus, investigating either a natural or a lab origin of COVID will absolutely require working with China.
- Why 'investigating US scientists' is already a witch hunt. The opinion piece calls for bipartisan independent commission that doesn't engage in a 'witch hunt'. However, we are already engaged in a witch hunt. The issue was politicized under Trump, and has led to dozens of letters from Republican members of Congress and the Senate to US scientists demanding documents and testimony, or making accusations about them to the agencies, to the DoJ, White House, and which are inevitably made public without the opportunity for US scientists to respond. Each of the allegations I have seen from Republicans against EHA are easily refuted with documentary evidence, but the volume of them, and their inflammatory nature means that responding to each is either logistically impossible, or simply amplifies these attacks. There have been NO bipartisan requests that I have seen.
- All *relevant* data have already been shared publicly or with the relevant govt. agencies. The article states that "*EHA, UNC, NIH, USAID, and other research partners have failed to disclose their activities to the US scientific community and the US public, instead declaring that they were not involved in any experiments that could have resulted in the emergence of SARS-CoV-2.*" This is simply not true. Each collaborating org has published dozens of papers on this work, in US (not Chinese) journals, uploading data to US (not Chinese) databases like Genbank. All of EHA's papers are available on our website for any member of the public to review, and have been for years. Our staff have given literally hundreds of public lectures on this work. Even after these attacks began, we continued to publish data from our China work, e.g. the 700+ CoV sequences we published and uploaded into Genbank in 2020). Lead scientists from each collaborating organization have shared all unpublished data of relevance (i.e. related to SARSr-CoVs) with the relevant federal agencies including NIH, USAID, DoD, and the intelligence and law enforcement agencies. Sharing of these data has been voluntary, extensive and honorable. This information has not been made public, because it undermines the agencies' ability to conduct their work.
- Demanding release of private emails, files from US scientists does not help build trust in science. Demands on US scientists to release private emails, unpublished data, drafts of reports and other documents that are normally not made public does nothing to elucidate the origins of COVID. Neither does it help build trust in science at a time when our country is so divided along party lines, and where this issue has been so politicized. With social media algorithms demonstrably amplifying negative narratives, the release of private emails and drafts of later-published reports or papers, are easily used to drive and amplify these negative narratives. We have seen this played out already – with every FoIA release of emails, they are cherry-picked for partial-sentence quotes that are then misquoted, misconstrued, and published as part of (usually) right wing hit-pieces that drive the narrative of an elite group of scientists trying to make money by manipulating viruses or vaccines. They are dangerous and lead to people avoiding vaccines. In the case of EcoHealth, the release of private documents, and the narratives around them have also demonstrably been linked to death threats, white powder letters, break-ins, and hacking attempts that we have been suffering repeatedly for the past 2.5 years.
- Inability to prove a negative: We can't prove that China didn't release a virus accidently or by design – that's the nature of scientific hypothesis testing. If US scientists are forced to release emails or files that these do not show any evidence of a lab leak, they will be followed by allegations that other files are being hidden, and therefore more requests for data dumps. For example, if my emails show that China was not working on a SARS-CoV-2 virus with NIH funding, they will be followed by allegations that we used other private funding to do this work (this has already been alleged), and further requests for private emails.

Meanwhile, every email, report or unpublished paper I'm forced to turn over is used over and over again by the political forces to attack science – misquoting, using innuendo and assumptions of motives.

- Furin cleavage site hypothesis is already debunked: Theories that the FCS of SARS-CoV-2 indicates lab manipulation have been widely circulated for 2 years and repeatedly debunked by leading virologists. Firstly, there is nothing novel about a wild-type virus having an FCS – they are found in influenza where they enhance virulence, and in other CoVs, including MERS-CoV, and a Rat coronavirus we discovered in China, in wildlife farms, hotels and train stations and published during 2021. There are now peer-reviewed scientific papers demonstrating that bat-CoVs closely related to SARS-CoV-2 have mutations around the site where the FCS in SARS-CoV-2 is found, that are a few mutations away from a true FCS, indicating that this could have easily evolved in nature. These mutations around the polybasic cleavage site are found in many of the viruses closely related to SARS-CoV-2 from SE Asia, and in CoVs from European bats. Other theories about the FCS being incredibly efficient at binding to human cells, or being enhanced easily in a lab, have been refuted in these and other papers.
- Inappropriate legal basis to investigate scientists when no evidence of a lab leak has been proffered: At the moment, it is a fact that there's simply no verifiable evidence whatsoever that a lab leak occurred leading to COVID-19. We have accusations from Secretary Pompeo that people at WIV were sick from COVID in November 2019, but these are allegedly classified. We have stories about the motivations of Chinese scientists in pulling down a database, not citing papers correctly, or removing genomic data from Genbank, but all of these (and all others) can be easily explained by the normal process of doing science, and each of them has occurred many times before with other labs and other circumstances. Many of us, and many other leading scientists have spent countless hours explaining why the theories around lab leaks do not amount to "evidence of a lab leak". Without this it would be massively inappropriate for federal authorities, including the OIG, the FBI or other agencies to launch official investigations into US scientists or US organizations. That's why they haven't, and that's why the public haven't been informed of any investigations.

In addition to these issues, there are multiple factual inaccuracies in the paper that are extremely important, because some of them are used to provide justification for the lab leak theory. For example, here is an inexhaustive list, just by looking at half of one page of the paper:

- "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the United States and China, *has not been disclosed for independent analysis*." ***This is not true because details of field and laboratory work have been published repeatedly in scientific papers in the last 15 years, in reports to NIH and USAID, and are laid out in proposals that include pages of details on human subjects, animal use, biosafety and select agent use etc. These are all now public.***
- "Much of the work on SARS-like CoVs performed in Wuhan was part of an active and highly collaborative US–China scientific research program funded by the US Government (NIH, *Defense Threat Reduction Agency [DTRA]*, and US Agency for International Development [USAID]), coordinated by researchers at EcoHealth Alliance (EHA), but involving researchers at several other US institutions." ***False - DoD DTRA do not and have not funded work in China through EHA. This is an easily verified issue, and is a mistake that causes damage because conspiracy theorists globally are on the lookout for linkages to DoD, which leads to damaging narratives such as the Ukraine Biolabs conspiracy theories. The way to check this is that DTRA are NEVER cited on any publication resulting from the work in China.***
- "The precise nature of the experiments that were conducted, *including the full array of viruses collected from the field* and the subsequent sequencing and manipulation of those viruses, *remains unknown*." ***Not true. It is a widely circulated myth that our work involved 'collection of hundreds of viruses from bats'. In fact, there were only 3 isolates of SARSr-CoVs from our work. All of these have been published and some shared with labs in the USA where they were used to test Remdesivir, Molnupiravir, COVID-19 vaccine candidates and monoclonal therapies like ADG20. This work has had a direct benefit to public health and has saved lives of US citizens!***

MORENS_SUBPOENA_004083
MORENS_NIH_011043
REL0000478327

- "These research proposals make clear that the EHA-WIV- UNC collaboration *was involved in the collection of a large number of so-far undocumented SARS-like viruses* and was engaged in their manipulation within biological safety level (BSL)-2 and BSL-3 laboratory facilities, raising concerns that an airborne virus might have infected a laboratory worker (9)" ***Not true – there were only 3 SARS-related CoVs isolated in China. All the rest are genetic sequences of a short read of the RdRp gene, with a few dozen full genomes. It's documented repeatedly in the scientific papers we published in collaboration with WIV, in mainly US journals, all of which are available publicly on PubMED and on our website. All sequences were uploaded into the US Genbank database and have been freely available for other scientists to peruse and use.***

I don't think PNAS would retract – Sachs is well-known, and this paper will be cited, so it's good for business.

We could ask them to correct, but I think Peter's idea is a good one – a response that's carefully worded, that corrects the errors, and explains why the general approach of investigating scientists based on no evidence would be flawed and damaging to medical progress.

I'm sending some bullets to Rich this morning and will share them with you as a start to addressing some of the errors.

Peter: I think a response along the lines you suggest would be a good idea. Sachs's piece is so egregious it shouldn't be allowed to stand. Perhaps even better would be a sharp letter to the editor(s) of PNAS explaining why a retraction is necessary. As you and Peter D point out, his argument is based on a number of readily refuted erroneous assertions – it's surprising that PNAS would have published it in the first place.

As ever,
Jeff

Potentially we could write a response or a commentary piece in PNAS refuting the nonsense, one that begins with the talking points in my Twitter thread.

There is also suggestion from a Nature article that even SARS 1 exhibited some degree of furin cleavage but that with SARS 2 it accelerated and of course evolved even further with alpha then

MORENS_SUBPOENA_004085
MORENS_NIH_011045
REL0000478327

delta to make it more transmissible.

https://www.nature.com/articles/d41586- 021-02039-y

I could have added that as well. The point is it's not an all or none phenomenon as the Sachs article suggests. He wrote an awful paper that needs to be retracted.

EXTERNAL SENDER

Just read it now Peter – it's already getting amplified. Extremely glad you did this.

The response from virologists on the furin cleavage site garbage in his PNAS piece will be pretty damning…it's been discussed, debated and debunked for 2 years now!

Meanwhile, the witch hunt continues…

Cheers,

Peter

On May 19, 2022, at 4:27 PM, Peter Daszak (b) (6) wrote:

What's really irksome is that this article in PNAS is full of errors and misunderstandings.

I haven't read the whole thing, but just about every paragraph contains an erroneous assumption that could easily be refuted, e.g.:

- "EHA, UNC, NIH, USAID, and other research partners have failed to disclose their activities to the US scientific community and the US publit, instead declaring that they were not involved in any experiments that could have resulted in the emergence of SARS-CoV-2." BS – we published dozens of papers on our work (they're on our website!) and sent reports in to NIH each year. We also gave hundreds of public lectures on this and spoke with the intelligence agencies about it.

  "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the United States and China, has not been disclosed for independent analysis." BS – that's what happens when you publish peer-reviewed papers. Maybe Sachs has forgotten how that works!

  "Much of the work on SARS-like CoVs performed in Wuhan was part of an active and highly collaborative US–China scientific research program funded by the US Government (NIH, Defense Threat Reduction Agency [DTRA], and US Agency for International Development [USAID]), coordinated by researchers at EcoHealth Alliance (EHA), but involving researchers at several other US institutions." Wrong again – DoD DTRA do not and have not funded work in China, let alone the Wuhan lab.

  "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown." BS – all 'viruses' collected from the field have been published already.

  "These research proposals make clear that the EHA-WIV-UNC collaboration was involved in the collection of a large number of so-far undocumented SARS-like viruses and was engaged in their manipulation within biological safety level (BSL)-2 and BSL-3 laboratory

MORENS_SUBPOENA_004091
MORENS_NIH_011051
REL0000478327

facilities, raising concerns that an airborne virus might have infected a laboratory worker (9)" BS – there were only 3 SARS-related CoVs isolated in China. All the rest are simply genetic sequences of a short read of the RdRp gene, with a few dozen full genomes. It's all in the scientific papers that Sachs hasn't bothered to read.

And so on, and so forth.

Honestly, it would take me about a day to go through this paper and rebut every single error and misconception, but who's got time for that!

By the way – all of these questions have been asked repeatedly on Twitter, by journalists, by the FBI and CIA, and by hundreds of people who've spoken with me over the last 2 years. I've answered them all, now I have to do it all again, and again, and again. Problem I see here is that he just doesn't believe me, so the only option is for my laptop to be downloaded in front of a Great Inquisition, led by an eminent person such as…dare I say…Professor Sachs himself.

Cheers,

Peter

Subject: Jeff Sachs causing trouble via a PNAS article
Importance: High

EXTERNAL SENDER

Looks like Sachs has been taken down yet another rabbit hole by a scientist at Columbia (Harrison) who doesn't work in the field, and is just plain wrong. It's the old Furin cleavage site hypothesis again, without any new data or evidence. Of course, that's their point – the lack of evidence means we're all hiding information and need to be hung, drawn and quartered.

They've published an opinion piece in PNAS (attached) and there's this article in 'The Intercept'. Ebright is quoted, of course!

https://theintercept.com/2022/05/19/covid- lab-leak-evidence-jeffrey-sachs/

All this will be put straight into the subpoena letters that we've been told by Democrat staffers to expect to arrive in Jan/Feb 2023 when the Republicans take over the house (their words, not mine).

JEFFREY SACHS PRESENTS EVIDENCE OF

POSSIBLE LAB ORIGIN OF COVID-19

An article in the Proceedings of the National Academy of Sciences calls for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of Covid.

Sharon Lerner
May 19 2022, 4:00 p.m.

IN AN ARTICLE published Thursday, economist Jeffrey Sachs called for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of the Covid-19 pandemic. Writing in the Proceedings of the National Academy of Sciences, Sachs and his co-author, Neil Harrison, a Columbia University professor of molecular pharmacology and therapeutics, said that federal agencies and universities possess evidence that has not been adequately reviewed, including virus databases, biological samples, viral sequences, email communications, and laboratory notebooks. Sachs and Harrison also highlighted a tantalizing scientific detail that may be an indication that SARS-CoV-2, the coronavirus that causes Covid-19, originated in a laboratory: a sequence of eight amino acids on a critical part of the virus's spike protein that is identical to an amino acid sequence found in cells that line human airways.

Sachs and Harrison are hardly the first to suggest that SARS-CoV-2 might have been created in a lab. Since its genetic sequence was first published in February 2020, scientists have puzzled over the furin cleavage site, an area on the virus's spike that allows it to be broken apart by a protein on the membrane of human cells and makes the coronavirus particularly dangerous to people. Once split, the virus releases its genetic material into the cell and reproduces. While all viruses work by

MORENS_SUBPOENA_004095
MORENS_NIH_011055
REL0000478327

attaching themselves to cells, breaking apart, and releasing their genetic material, SARS-CoV-2 is the only one of its class, sarbecoviruses, to use this particular mechanism to do so.

As with past discussion of a possible lab origin of SARS-CoV-2, this latest theory has already been met with considerable pushback. Even some scientists who are open to the idea that a lab accident could have sparked the pandemic remain unconvinced by the particular trail of evidence laid out by Sachs and Harrison.

The journal article offers a scientific road map for how this unusual sequence of amino acids could have made its way into the furin cleavage site, or FCS, of the virus. Sachs and Harrison acknowledge that the sequence could have arisen naturally. But they also lay out another possibility: that scientists might have purposefully inserted this particular string of amino acids into a bat coronavirus in the course of their work. They focus particularly on scientists who submitted an unfunded grant proposal to a division of the Defense Department called the Defense Advanced Research Projects Agency, or DARPA, laying out plans to insert a furin cleavage site into a bat coronavirus.

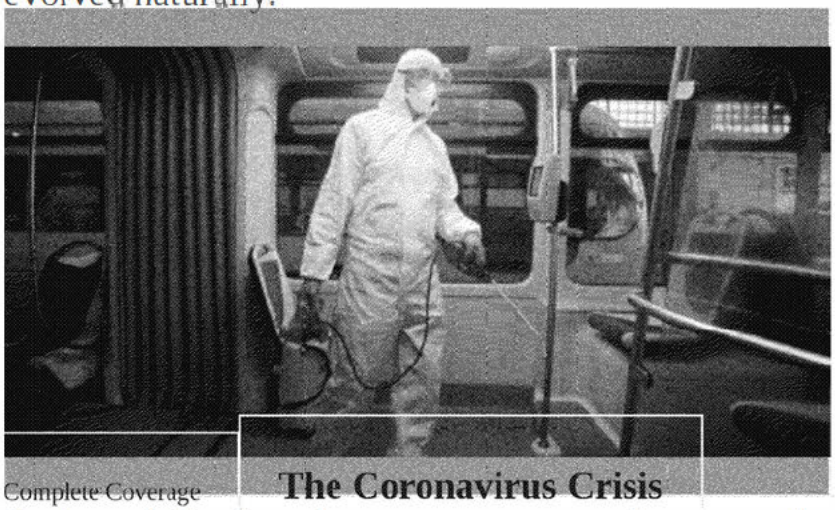
"We do not know whether the insertion of the FCS was the result of natural evolution — perhaps via a recombination event in an intermediate mammal or a human — or was the result of a deliberate introduction of the FCS into a SARS-like virus as part of a laboratory experiment," Sachs and Harrison write. "We do know that the insertion of such FCS sequences into SARS-like viruses was a specific goal of work proposed by the EHA-WIV-UNC partnership within a 2018 grant proposal ("DEFUSE") that was submitted to the US Defense Advanced Research Projects (DARPA)."

EHA is a reference to EcoHealth Alliance, a nonprofit research group based in New York City that has received more than $118 million in grants and contracts from federal agencies. WIV, or the Wuhan Institute of Virology, is a Chinese research organization that collaborated with EcoHealth Alliance in the past and was listed as a subcontractor on the DARPA grant.

UNC is mentioned because Ralph Baric, a molecular biologist at the University of North Carolina, Chapel Hill, was to have conducted part of the work pitched to DARPA. The grant proposal touted Baric's "two-decade track record of reverse engineering [coronavirus] and other virus spike proteins."

The intent of the DARPA proposal was to prevent emerging pathogenic threats, but the work, if conducted, could have created a novel virus capable of infecting humans. "We will introduce appropriate human-specific cleavage sites and evaluate growth potential in [a type of mammalian cell commonly used in microbiology] and [human airway epithelial cell] cultures," the proposal stated.

Several scientists interviewed about the DARPA proposal in September told The Intercept that scientists often begin research before seeking funding and thus that some of the experiments described in the proposal could have already been completed. But when asked about that possibility in an interview, Peter Daszak, the president of EcoHealth Alliance, rejected it: "The DARPA proposal was not funded. Therefore, the work was not done. Simple."



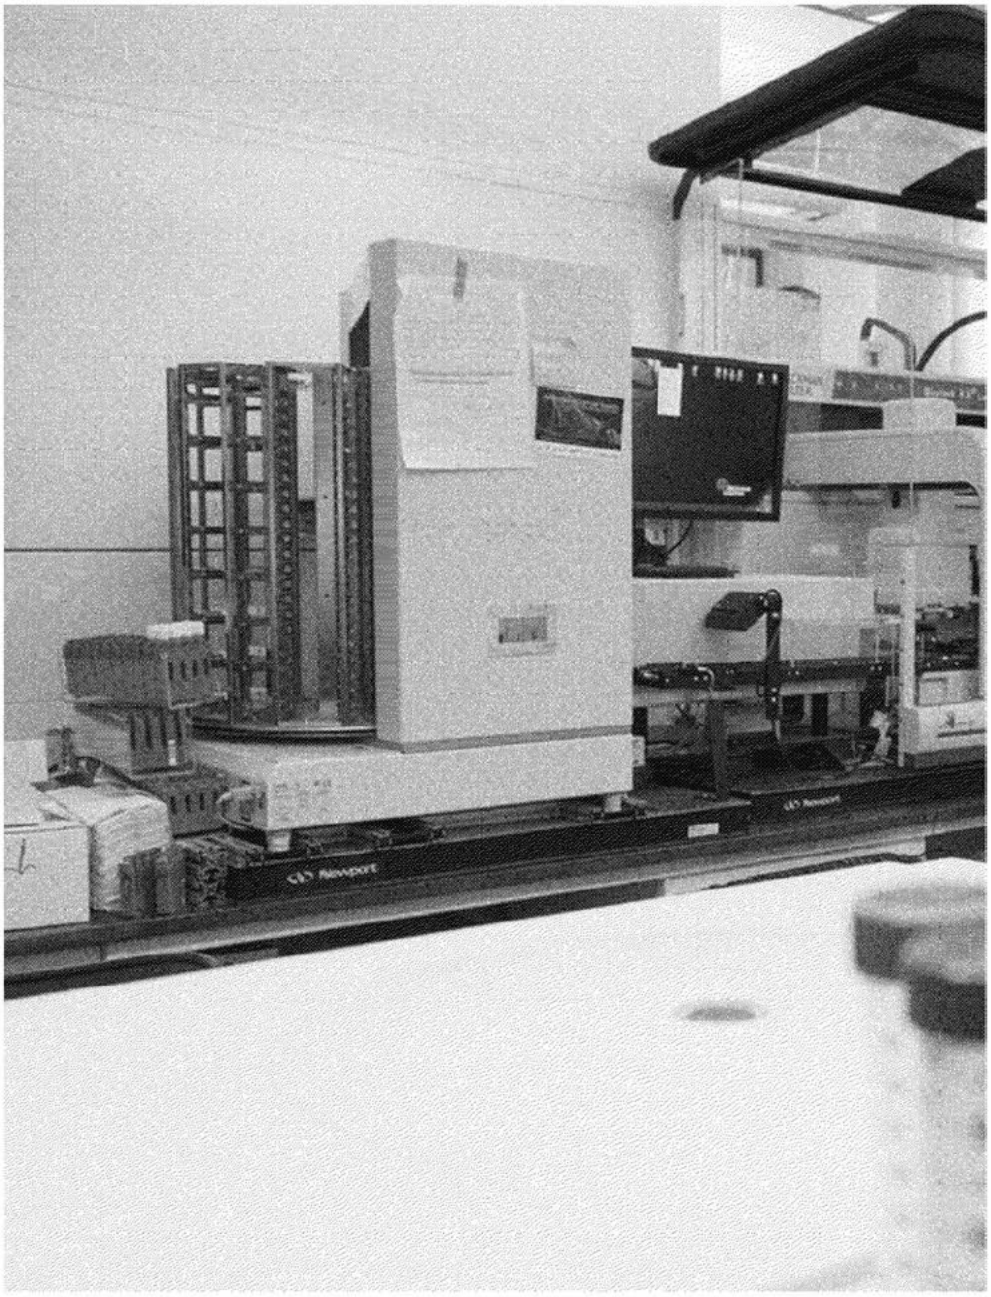
A Rational Choice

As Sachs and Harrison note, the part of a protein on the cell membrane that shares its amino acid sequence with the bat coronavirus is critical for lung function. Known as an epithelial sodium channel-alpha, or ENaC-alpha, it is found in human airway cells, as well as in human kidneys and colons. Intriguingly, like SARS-CoV-2, ENaC-alpha, which facilitates the absorption of fluid in cells, is also activated by the unusual furin cleavage site. Harrison, a physiologist affiliated with Columbia's Department of Molecular Pharmacology and Therapeutics, studies ion channels, the larger category to which ENaC-alpha belongs.

Other scientists have already pointed out the match between the amino acid series in the furin cleavage site of SARS-CoV-2 and the ENaC-alpha found in human airways. In 2020, a team from the biomedical company Nference suggested that the overlap

MORENS_SUBPOENA_004097
MORENS_NIH_011057
REL0000478327

between the virus and the sequence found in human lungs is part of the reason that Covid-19 is so damaging to the respiratory system. Those scientists described the sequence as having evolved naturally.



Complete Coverage **The Coronavirus Crisis** Read Our

Sachs and Harrison, in contrast, suggest that researchers may have inserted the string of amino acids into a bat coronavirus precisely because of its known importance to lung function. "For a research team assessing the pandemic potential of SARS-related coronaviruses, the FCS of human ENaC — an FCS known to be efficiently cleaved by host furin present in the target location (epithelial cells) of an important target organ (lung), of the target organism (human) — might be a rational, if not obvious, choice of FCS to introduce into a virus in order to alter its infectivity, in line with other work performed previously," they write.

Such a choice, they point out, would have been in keeping with another viral research project on which EcoHealth Alliance, the Wuhan Institute of Virology, and UNC's Baric collaborated: a 2014 grant from the National Institute of Allergy and Infectious Diseases that involved increasing the transmissibility and pathogenicity of bat coronaviruses.

MORENS_SUBPOENA_004098
MORENS_NIH_011058
REL0000478327

Growing List of Coincidences

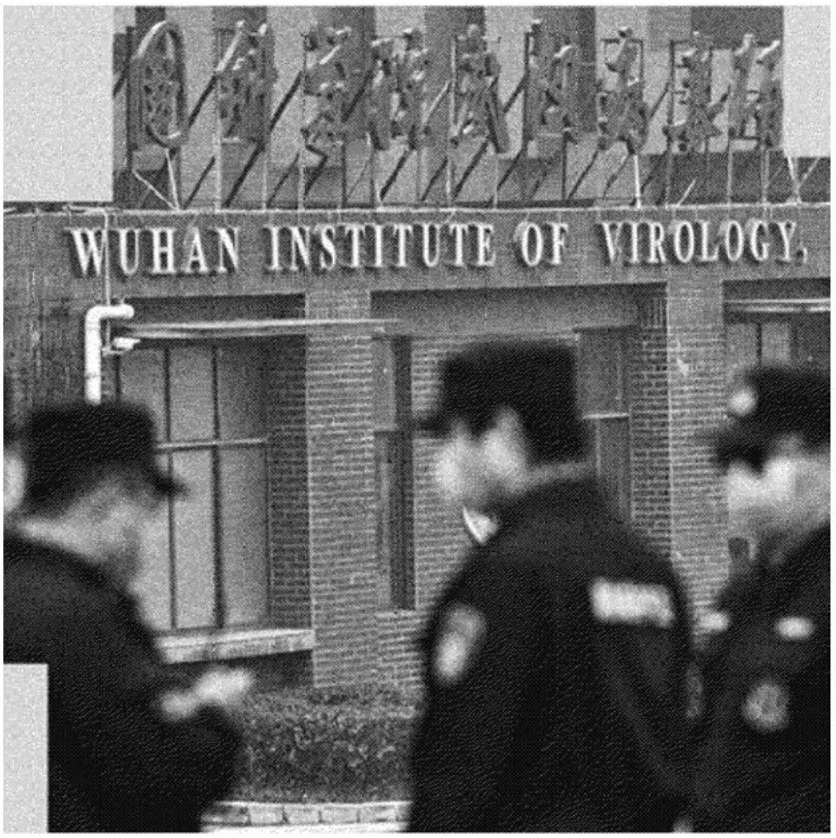
The intriguing theory of viral engineering hinges on two observations: that the amino acid sequences match and that experts in both the ENaC-alpha furin cleavage site and the

MORENS_SUBPOENA_004099
MORENS_NIH_011059
REL0000478327

insertion of genetic sequences into bat coronaviruses happen to work at the same academic institution: the University of North Carolina, Chapel Hill.

Baric, whose work aims to prevent and create treatments for viral outbreaks, has previously inserted segments of DNA and RNA into viruses and created an infectious clone of SARS using his own patented "No See'm" method of inserting genetic materials without a trace. He has also collaborated on coronavirus research with scientists from a center for lung studies at UNC-Chapel Hill who are knowledgeable about ENaC-alpha. In one 2016 study, the scientists created a new virus using the spike of a bat coronavirus that had been isolated and characterized by the Wuhan Institute of Virology. The experiment found that the new virus "replicated efficiently" in human airway cells that were cultured in a lab.

In another paper, published a year earlier, Baric, along with the Wuhan Institute of Virology's Shi Zhengli and a lung expert UNC-Chapel Hill's lung institute, described creating a hybrid virus using a SARS-like virus from a bat and a "mouse-adapted" coronavirus. The new virus caused mice to get sicker than those exposed to the original virus. The goal of these experiments was to prepare for the possibility that a virus might jump naturally from animals to humans, as SARS had in 2003. But even before the pandemic, the experiment drew criticism from other scientists, who were concerned because the researchers had created a virus that was able to spread in humans.



Sachs and Harrison note that the scientists who co-authored the DARPA grant proposal would have been aware of research on coronavirus furin cleavage sites, including one 2006 experiment in which a furin cleavage site was inserted into a coronavirus. "The research team would also have some familiarity with the FCS sequence and the FCS-dependent activation mechanism of human ENaC, which was extensively characterized at UNC," they write.

"The list of coincidences is getting verrrrrrrrrrry long."

Still, both the overlap in the amino acid sequence and the fact that experts in the furin cleavage site of the ENaC-alpha and insertion of genetic material into bat coronaviruses work at the same university could be coincidental, as Harrison and Sachs acknowledge. Some virologists, though, say that the coincidence strains credulity.

"Could be," Richard Ebright, a molecular biologist at Rutgers University, wrote in an email to The Intercept when asked about the possibility that these things are both chance occurrences. "But the list of coincidences is getting verrrrrrrrrry long."

Ebright, a vocal proponent of the lab-leak theory whom Harrison and Sachs thank "for helpful commentary on the manuscript," spelled out some of the other Covid coincidences that he considers questionable, including its initial outbreak in a city that, well before 2019, had already been pegged as a biosafety risk. Ebright also noted Wuhan's 1,000-mile distance from the nearest wild bats that carry the type of SARS-related coronaviruses that caused the pandemic. And he pointed to the particular coding of the amino acids in the furin cleavage site of SARS-CoV2.

MORENS_SUBPOENA_004101
MORENS_NIH_011061
REL0000478327

Related

The Lab-Leak Theory Is Looking Stronger by the Day. Here's What We Know.

"The sequence encoding the FCS of the pandemic virus contained two consecutive CGG arginine codons," Ebright explained in his email. (A codon, or a combination of three nucleotides, supplies the genetic code for a single amino acid, though most amino acids can be represented by multiple different codons. Each nucleotide is represented by a letter — for RNA, either A, C, U, or G.) "This codon usage is unusual for a natural bat SARS-related coronaviruses (for which fewer than 1 in 30 arginine codons are CGG) but is optimal for humans (for which most arginine codons are CGG codons)."

Still, Ebright said that at first he didn't see the identical amino acid sequences as particularly suspicious. "I had known for more than a year that there was a perfect match to an eight-amino acid sequence present in human ENaC. What I had not known was that the sequence was known to be a functional furin cleavage site and that it was a sequence extensively studied at UNC," he said. "The crucial point that the ENaC sequence was a known functional site, not just that there happens to be a match to a protein that happens to be in humans. … That suddenly turned it from what I thought to be largely irrelevant to being a logical and obvious choice to proceed."

Ralph Baric and the University of North Carolina did not immediately respond to requests for comment.

The Wuhan Institute of Virology in Wuhan, China, on June 24, 2021.

Name Calling

Other scientists dismiss the idea that the ENaC sequence might have been purposefully inserted into a coronavirus. Scientists who are already convinced that the new coronavirus emerged naturally are unlikely to be persuaded by Sachs and Harrison's article, which appears in the opinion section of the esteemed journal. Over the past year, many scientists involved in the

MORENS_SUBPOENA_004103
MORENS_NIH_011063
REL0000478327

debate over the origins of the pandemic have settled into an increasingly acrimonious, coarse, and unyielding opposition.

Some proponents of the natural origin theory became particularly dismissive of those open to the possibility of a lab leak after the February release of two pre-print studies mapping the early spread of the virus at the Huanan market in Wuhan. Angela Rasmussen, one of a team of virologists who worked on the project, described it on Twitter as "dispositive evidence of a zoonotic origin" that will "drive those with personal interest in the lab leak hypothesis out of their goddam minds." In another tweet, Rasmussen referred to proponents of the lab-leak theory as a "pack of ghouls, who through gullibility, stupidity, & conspiracist thinking have decided this is their thing despite zero expertise."

Although the pre-prints had not been peer-reviewed and may have simply illustrated the spread of the virus rather than its original outbreak, the New York Times ran a front-page story about them that quoted an epidemiologist as saying that the origins debate "has been settled with a very high degree of evidence." The story, which was announced by a push notification from the paper, also noted a lack of direct evidence for a lab leak.

Meanwhile, Kristian Andersen, another co-author of the pre-prints and a virologist at the well-regarded Scripps Research Institute, used the "poop" emoji to criticize a deeply researched article by Katherine Eban about EcoHealth Alliance. On Twitter, Andersen tarred Eban, New York Times columnist Zeynep Tufekci, and others reporting on biosafety issues that could have led to the release of SARS-CoV-2 as "deep in conspiracy theories" and on the other side of "a clear split" from journalists who dismiss the possibility of a lab origin, whom Andersen referred to as "science-based."

Even some scientists who have been vocal about the possibility that the pandemic may have been sparked by research have expressed skepticism about the theory suggested by Harrison and Sachs. "I'm sure that these authors believe in their own hypothesis and arguments, but to me, it's not one that is particularly convincing," said Alina Chan, a scientist who laid

out a number of possible routes for how the coronavirus might have emerged through research-related incidents in her recent book "Viral: The Search for the Origin of Covid-19."

"There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

While she is open to the possibility that the furin cleavage site might have been purposefully inserted into the coronavirus, Chan said there was no reason to think that researchers would mine humans for such material. "These scientists literally had access to hundreds of SARS-like viruses and sequences," said Chan, referring to the vast collection of coronaviruses from bats and other animals that researchers amassed at the Wuhan Institute of Virology. "There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

Jack Nunberg, a virologist at the University of Montana, was also not immediately persuaded by the theory of engineering suggested by Sachs and Harrison. "It's possible," Nunberg said of the idea that the ENaC segment was inserted into a bat coronavirus as part of research designed to gauge the pandemic potential of a virus. "But I don't find their evidence on ENaC compelling because furin cleavage sites have a lot of common amino acids, and therefore it may just have happened by chance."

Others say that the article adds noteworthy information to the public conversation about the origins of the pandemic. "The defenders of the natural origin indicate that the virus on which this type of experiment could have been done — the backbone has never been published and that specialists in the furin cleavage sites would have chosen a more commonly used furin cleavage site like RARR rather than PRRAR. The Proceedings of the National Academy of Sciences article contradicts this argument and indicates that specialists knew that the RRAR'SVAS site was efficiently cleaved by furin," Etienne

MORENS_SUBPOENA_004105
MORENS_NIH_011065
REL0000478327

Decroly, director of virology research at the Aix-Marseille Université in France, wrote in an email to The Intercept.

Decroly added, "It is impossible to decide on the basis of the information currently available and it is urgent that the WHO Special Advisory Group for the Origins of Novel Pathogens investigate this question."

On the suggestion of an investigation, Nunberg is in agreement. "You can't argue with that," he told The Intercept. "Who's going to argue for burying one's head in the sand?"

For their part, Sachs and Harrison emphasize that they're not saying laboratory manipulation was involved in the emergence of the pandemic virus, only "that it could have been." They also give a nod to other possibilities, including that an airborne virus might have infected a laboratory worker. Rather than argue that any of these conceivable scenarios happened, they present the clues of the matching amino acid sequences to argue for an independent and transparent scientific investigation of the U.S.-based evidence related to the origins of the virus.

Among the institutions that Sachs and Harrison list as possibly having "knowledge of the detailed activities that were underway in Wuhan and in the United States" are the National Institutes of Health; the Defense Threat Reduction Agency, which has provided grant funding to EcoHealth Alliance; the Department of Homeland Security; DARPA; the U.S. Agency for International Development, which funded the $200 million PREDICT program that catalogued potential pandemic viruses; and the University of California, Davis, which participated in that program.

The authors suggest that EcoHealth Alliance and UNC may have particularly important untapped resources. "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the US and China, has not been disclosed for independent analysis," they write. "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown."

Peter Daszak, one of the members of the World Health Organization team investigating the origins of the Covid-19, on a balcony at a hotel in Wuhan, China, on Feb. 6, 2021.

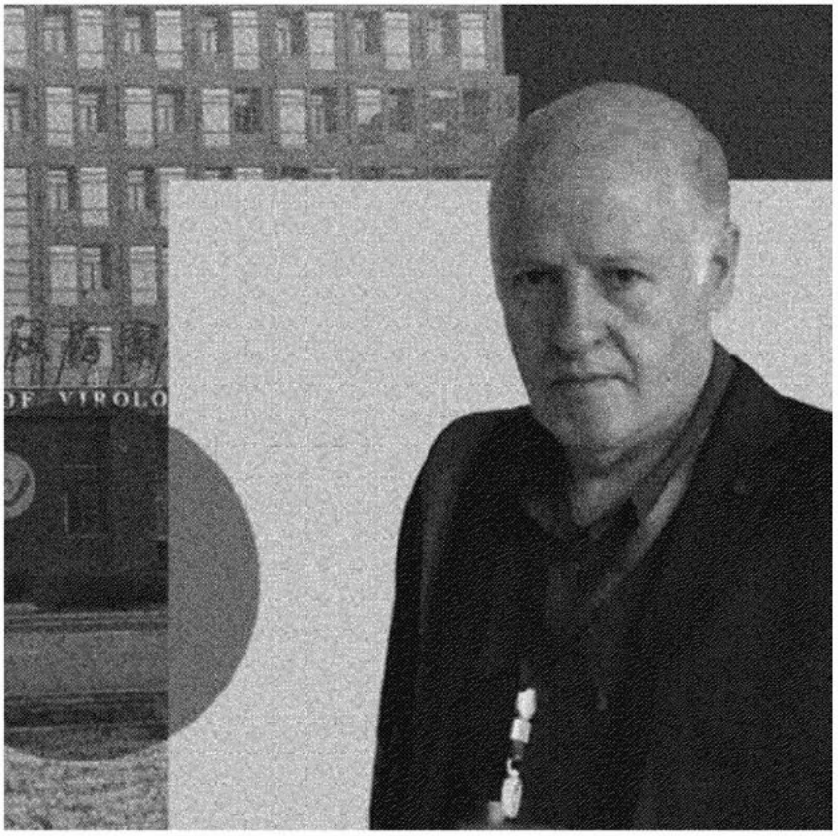

Photo: Hector Retamal/AFP via Getty Images

A Reversal

The publication in the prestigious Proceedings of the National Academy of Sciences marks a reversal of sorts for Sachs, the chair of the Lancet Covid-19 Commission who, in November 2020, appointed Daszak, the EcoHealth Alliance president, to lead a task force to investigate the origins of the pandemic.

MORENS_SUBPOENA_004107
MORENS_NIH_011067
REL0000478327

Earlier that year, Daszak had signed on to a public statement published in The Lancet on behalf of scientists who said they "condemn conspiracy theories suggesting that COVID-19 does not have a natural origin."

Related

Peter Daszak Answers Critics and Defends Coronavirus Research

Yet that early certainty about the pandemic's origins — and the sense of shared civic responsibility among members of the Lancet task force — soon disintegrated. In February 2021, emails revealed that Daszak coordinated the public statement in The Lancet tamping down suspicions of a lab leak. And by June 2021, Sachs was expressing his openness to the possibility of a lab origin, writing that NIH-funded research at the Wuhan Institute of Virology "deserves scrutiny under the hypothesis of a laboratory-related release of the virus." Three months later, he disbanded the task force that had been organized to "carefully scrutinize the origin of the SARS-CoV-2 virus" in the hopes of preventing future disease outbreaks, explaining that he had concerns that several members of the commission had conflicts

of interest because of their ties to EcoHealth Alliance.

After leading the mainstream scientific inquiry into the origins of the pandemic, Sachs is now skewering it. "A steady trickle of disquieting information has cast a darkening cloud over the agency," he and Harrison write of the NIH, going on to accuse the entire federal government of not doing enough to explore the possible role of its grantees in the emergence of SARS-CoV-2 and investigate "overlooked details" such as the matching amino acid sequences.

Noting that the NIH has insisted that "the pandemic virus could not have resulted from the work sponsored by" the agency, Sachs and Harrison write that "blanket denials from the NIH are no longer good enough."

Cheers,

Peter

Yes, i know. I fail to understand why our nih leaders keep forming circular firing squads. one thing is for sure: in recent times nih has suffered abysmal leadership

It wasn't like that in the Varmus years. He didn't suffer any political fools no matter how high up, and was comfortable giving them all a big middle finger. d

On May 11, 2022, at 18:37, Peter Daszak < (b) (6) > wrote:

This is an utterly ridiculous set of BS. Jesse Bloom is the person driving it – he buys into the lab leak theory and found that some folks from WIV uploaded partial genomes early on, then added a bunch of more complete ones, and asked for the partial sequences to be removed. Absolutely normal, but he's trying to turn it into a 'mystery'.

Of course, NIH makes it all worse by not releasing emails, redacting critical parts of them, and failing to explain why they follow the wishes of the submitter re. Genbank. It's perfectly logical really – if NIH now starts releasing sequences you as a submitter asked them to remove for whatever reason, submitters will think twice about using Genbank. We already have China working with its own database and all this BS will make them twice-shy about submitting.

Even worse, Tabak now says that 'don't worry, we still have the data on back up tapes' so everyone now knows that NIH keeps the stuff you thought they agreed to delete, and no doubt has already handed it over to the FBI and the CIA.

It's a conspiracy, wrapped within an enigma, encapsulating a riddle….

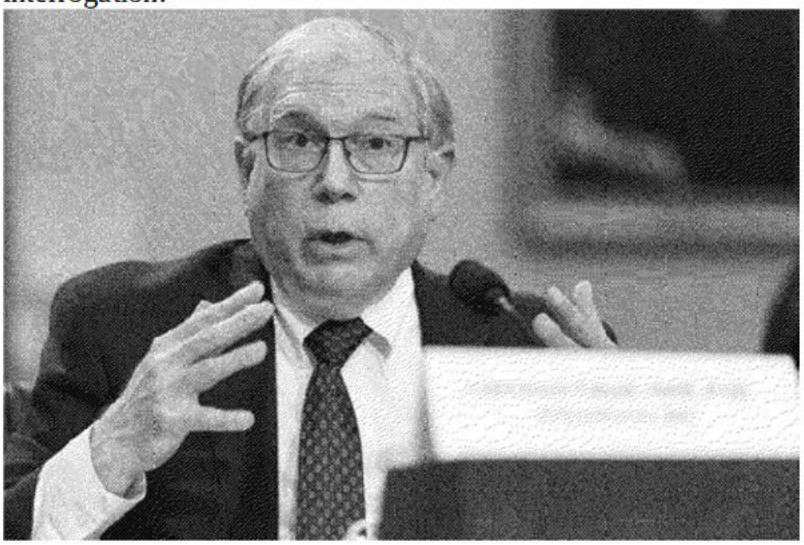
NIH director confirms agency hid early COVID genes at request of Chinese scientists

By
Steven Nelson
May 11, 2022 3:47pm



National Institutes of Health acting director Lawrence Tabak confirmed to lawmakers Wednesday that US health officials concealed early genomic sequences of COVID-19 at the request of Chinese scientists — but insisted the data remains on file.
Tabak told a House Appropriations subcommittee that the NIH

"eliminated from public view" the data from the pandemic epicenter in Wuhan, China, before adding that researchers can still access it via an archaic "tape drive."

Vanity Fair recently reported that the information was hidden in response to a request from Chinese scientists, despite potentially resolving whether the virus leaked from the Wuhan Institute of Virology or passed naturally from animals to humans.

Rep. Jaime Herrera Beutler (R-Wash.) asked Tabek to explain why US officials would comply with such a request.

"There's no question that the communication that we had about the sequence archive — Sequence Read Archive — could have been improved. I freely admit that," Tabek said. "If I may, the archive never deleted the sequence, it just did not make it available for interrogation."

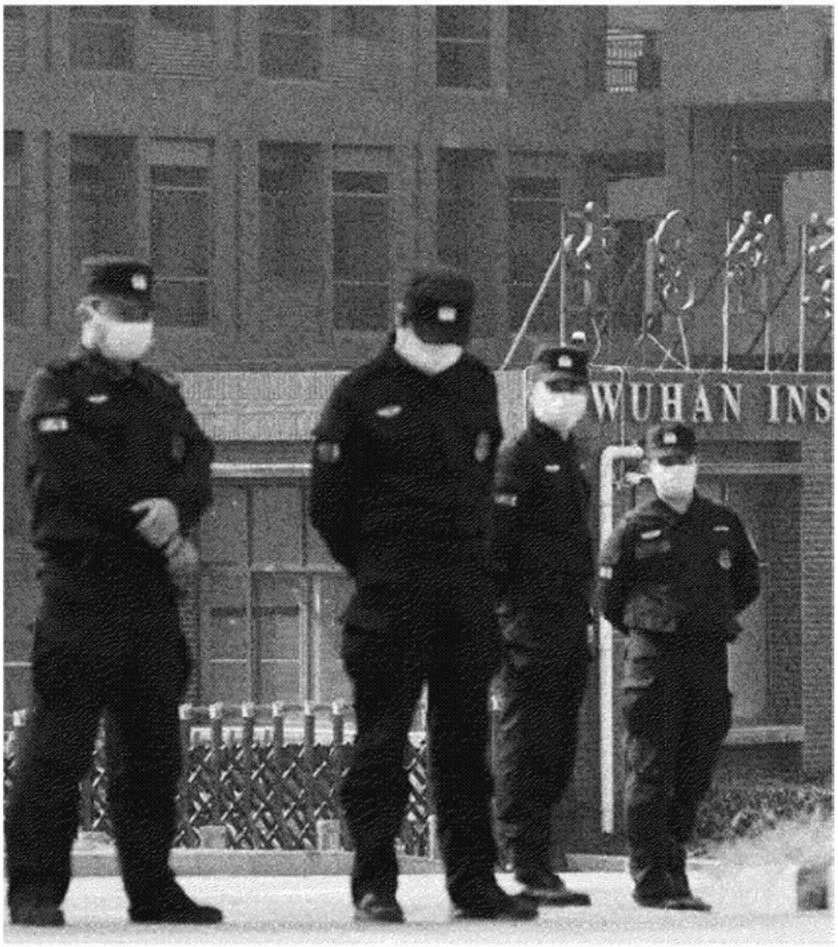
Lawrence Tabak, acting director of the National Institutes of Health, testifies on May 11. Jacquelyn Martin/AP

"So wait, you have the information still?" Beutler followed up.

"We have the information … Anybody who submits to the Sequence Read Archive is allowed to ask for it to be removed," Tabak explained. "And that investigator did do that. But we never erase it."

"So you don't have the information anymore?" Beutler asked.

"We do. We never erase the information. We keep it," Tabak clarified.



"So they were able to withdraw public viewing of it?" the congresswoman followed up.

"That's correct," he said.

"OK, so researchers can apply to the NIH and get the information from you?" Beutler asked.

"In the way that it was originally eliminated from public view, it was withdrawn, and that's the most difficult for people to access," Tabak replied. "The error that was made, and we found this out after a review of all of our processes, was it should have been suppressed. The distinction being that if it's withdrawn, it is kept archivally on a tape drive — old technology, but that's how it's done. But when it is withdrawn, it can still be accessed by accession number, and so

researchers are able to access that information."

Security personnel keep watch outside Wuhan Institute of Virology during the visit by the World Health Organization on Feb. 3, 2021. Thomas Peter/REUTERS

"So the information is still there?" Beutler summed up.

"That's correct. The information was never lost," Tabak repeated.

In a March 31 article, Vanity Fair reported that evolutionary biologist Jesse Bloom discovered last year that early COVID-19 sequences had disappeared from a federally run data repository.

When Bloom raised the issue, he was reportedly ganged up on by a group of researchers assembled by then-NIH Director Francis Collins and infectious disease institute head Dr. Anthony Fauci.

Bloom shared a draft academic paper with Collins and Fauci, who allegedly objected on a June 2021 Zoom video conference to Bloom's description of Chinese scientists "surreptitiously" removing the sequences. Fauci said the word was "loaded" and implied a coverup, the report said.

Evolutionary biologist Kristian Andersen, who was selected to participate on the call by Collins, allegedly told Bloom that the Wuhan team had a right to claw back early pandemic information and that it was unethical for Bloom to question it.

Tabak noted that while the request for information to be removed was honored, it was not erased fully.ECOHEALTH ALLIANCE Andersen allegedly went so far as to offer to delete Bloom's article from a "preprint" server "in a way that would leave no record that this had been done."

China's government has refused to cooperate with an international investigation of the origins of the pandemic. The COVID-19 virus has killed about 1 million Americans since March 2020 and caused massive social, economic and educational disruptions.

The US intelligence community said in an August report that it's possible the virus leaked from the Wuhan Institute of Virology, calling the theory one of two "plausible" explanations along with natural transmission from animals.

Lawrence Tabak confirmed Wednesday that early genomic sequences of COVID-19 were concealed at the request of Chinese specialists. Jacquelyn Martin/AP

President Biden rarely speaks publicly about wanting China to be transparent about the origins of the pandemic. Former President Donald Trump, by contrast, has demanded that China pay $10 trillion in reparations.

The Biden administration is considering undoing some of Trump's tariffs on Chinese goods "separately" from US pressure for coronavirus transparency, White House press secretary Jen Psaki told The Post on Monday.

Documents published in September by The Intercept revealed that US health officials indirectly funded so-called "gain of function" research at the Wuhan lab — including the modification three bat coronaviruses distinct from COVID-19 and the discovery that they became much more infectious among "humanized" mice when human-type receptors were added to them.

Subject: Chinese scientists modelling says Covid starts in US in Sept 2019

http://chinaxiv.org/abs/202109.00058

There is a pre-print of the paper and it's been reported by Xinhua and People's daily this morning. The study used statistic modelling to infer the earliest occurrence of Covid in China and the US. It's conclusion is Covid started in late December in China, about the same time it's reported while it could start as early as September, much earlier than the first case reported in the US in Jan 2020.

Looks like China is making a crescendo of the virus origin lately. There was also an report recently saying some of the vendors at Wuhan huanan seafood market got infected with Covid after they imported seafood in November 2019 via cold chain from Maine, US, where the local CDC, media and residents have reported viping-associated pneumonia between July and end of Oct. The company that exported those seafood to China, according to the report, is less than 2.6 km from a county hospital treating these pneumonia patients.

This story didn't get much of prominent play though. It's published by a local state-backed media called rednet.cn in central China's Hunan Province. But if you take this one with the study, it feels like they are setting the stage for renewed rhetorics to shift the focus to the US over where the virus came from. It seems they are taking a page from the US intelligence making a big deal out of three people at the wuhan lab making hospital visits late 2019.

Maybe it's worth Gov folks to ask MoFA on this? Not sure how reliable the statistical modelling is.

Very worried that Tony Fauci said the comment below. It feels like he's throwing us under a bus here.

I've attached the rules for BSL for a bunch of different viruses around the world.

Rabies is cultured at BSL-2 in the USA.

Cedar virus, a bat-paramyxovirus related to Hendra and Nipah is cultured at BSL-2 in the USA.

Chimeric Cedar virus with Hendra & Nipah genes inserted into it is cultured at BSL-2 in the USA

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

From: Kiran Stacey (b) (6)
Sent: Friday, June 4, 2021 6:34 PM
To: Peter Daszak (b) (6) >
Subject: FT request

Dear Peter, I wanted to give you a chance to respond to a comment Tony Fauci made to me in an interview which we are publishing tomorrow. Referring to the accusation that some work on bat coronaviruses in Wuhan

was done at BSL-2, he said:

"We will have to go back and look at that, but that is something that should have been monitored by EcoHealth Alliance."

Can you let me know if you have a response?

Thanks
Kiran

Subject: RE: COVID origins issues and NASEM Forum on Microbial Threats
From: "Keusch, Gerald T" <(b) (6)
To: Morens, David (NIH/NIAID) [E] <(b) (6) >;

You are right about Stacey, and right about the funding from NIAD. Peter will know more about the present support. But my experience over a 12 year or so involvement with the Forum is that we decided on the issues to take up and organized the meetings, and that the slate of USG and private sector organizations involved in it would nominate people to be Forum members. I'm not sure how the non-USG members were picked but it was always an interesting, diverse, and smart group of people.

Subject: Re: COVID origins issues and NASEM Forum on Microbial Threats

I don't know anything about this. I have been involved extensively with the Microbial Threats group in the more distant past, and they have always done good work. The way it used to work is that we (NIAID) more or less had a regaular recurring obligation to fund it, and it was all an insider's deal: we did the funding and mostly picked our guys to be on the panel, and then they gave us a product that justified outr funding requests to Congress. Isn't that your understanding?????? As I recall, Stacey Knobler used to staff them back about 20+ years ago..... d

On 7/21/2021 5:04 PM, Keusch, Gerald T wrote:

> No relevant information I have heard of. It wouldn't surprise me as I know that Victor Dzau wants NAM to be engaged in these issues. I will ask my colleague Nicki Lurie if she is aware of any such initiative. She is on vacation in Europe now and may not be as rapidly responsive as she usually is.
>
> Regarding the Academies, Victor is not only ambitious but also cautious and doesn't stick his head out very far. Marcia McNutt (NAS President) has been supportive of a rational science based inquiry into the origins and the separation of politics from science, sort of, but not very bold. Subject: COVID origins issues and NASEM Forum on Microbial Threats

Here's a request for any inside info you may have picked up.

MORENS_SUBPOENA_020999
MORENS_NIH_041765
REL0000478344

I'm the chair of the NASEM Forum on Microbial Threats. Jerry used to be a member or Co-Chair and (ironically) David Relman was the Chair before me. The Forum is planning a workshop on COVID-19 for early Fall. I'm not on the organizing committee but heard they were planning a section on 'origins', then were told from the top (I believe Victor Dzau of NAM) that because there is no new research on this, it's not something that would be good for the workshop to publicly consider right now. They've dropped that session. I actually agree with this decision, but it certainly adds to the feeling that the NAM is being very hesitant on this issue.

Then I got an email from staff asking if I'd like to avoid giving my usual opening comments for the workshop as chair, given the nasty publicity I've been getting. I pushed back (strongly) and pointed out that a key goal of the conspiracy theorists is to attack, discredit and silence scientists who's opinions don't support their political agenda. Staff were very nice and somewhat apologetic about this and I'm now giving my usual opening.

They also mentioned that the academies (maybe NAM, but could be NASEM) are planning something on origins – maybe a consensus study, workshop or just a statement. I don't have more info, but the reason I'm concerned is that 1) David Relman is a member of the NASEM Intelligence Community Studies Board (science-intel agency interface) and he may be trying to use that to 'investigate' the lab leak agenda; or 2) there may be an effort for an NASEM committee to investigate COVID-19 origins. I note that in my last letter from the NIH office of the director, they requested an inspection of the Wuhan lab either by NIH scientists or through the NASEM.

The way the NAM and NASEM operate is that USG agencies go to them, or they approach agencies with an idea for a consensus study or workshop and then they're funded to do one. It sounds likely that this is happening, and would likely end up as a forum for all the lab leak accusations and gain-of-function myths to be brought up by known scientists (e.g. Drs. Relman, Lipsitch, Ebright and others). This could end up putting me in the awful situation of either having to publicly defend EcoHealth's work and get attacked in the press for this, or decline to take part in a National Academy activity despite being a member. Not looking forward to that moment!

Have any of you heard anything about this?

Cheers,

Peter

EXTERNAL SENDER

I totally agree with you that Tony was remarkable. I sent him a one word email, Bravo, and copied it to Patty Conrad so maybe he will see it as evidence of the support he has from the responsible scientific community.

Thanks for the response regarding the CNN reporters. I'll keep that in mind when I do talk to them and consider whether speaking with you might help them distinguish between good science and crap. I have no doubts about your expertise in science and knowing the difference between, well, good science and crap.

Harold is rather quiet – any sense of what he is up to?

Tony was excellent in confronting Paul! It's high time that these senators are told the truth directly.

As for speaking with the reporters, in general I am always prepared to do that, but in this particular case I don't feel my credentials are necessarily the best when dealing with specifics. I have very much been an onlooker and not directly connected to any of the research itself. Peter Hotez and Peter D. are clearly much better informed and have the appropriate expertise. There are plenty of authors on the recent Lancet piece that would be good to include. I am happy to speak as an outsider, but would not want to be considered a knowledgeable expert.

EXTERNAL SENDER

I had a long talk with two CNN International reporters who are preparing a story essentially on the politics and the misinformation about the origins controversy. I was talking to them off the record but I decided they were legitimately exploring the issues and would likely be a voice of reason if they were given the necessary space to build their case and it was eventually shown.

I mentioned Peter Hotez to them, among some others, and while I mentioned Peter D as well I also said you were under constant attack and it might well be better to allow others to take up the fight on your behalf. GOF and the Goffers were part of the chat. I have agreed to be interviewed on the record and potentially to do a video session as they were potentially interested in using some of that as part of the report. Rich, I didn't specifically mention your name, but if you would be willing to speak with them I can do that when I next connect.

Subject: Tony Fauci's testimony today
Importance: High

I'm delighted to see Tony Fauci fighting to let everyone understand clear line between what is gain-of-function (work EcoHealth does NOT do), and what is not Gain of function (work EcoHealth did do with Wuhan).

It's a shame it will generate publicity, but he did this so well today that I'm hoping it might help get rid of the willful misinformation the Republicans are engaging in…

Here's a news piece on it https://thehill.com/policy/healthcare/563874- fauci-paul-doesnt-know-what-hes-talking-about-and-i-want-to-say-that , and there's some pretty exciting video to watch.

David – please pass this information on to Tony and Clifford if you possibly can,

The WHO DG, Dr. Tedros set up a 6am Monday morning meeting with the current WHO Origins team – the international experts who went to Wuhan to work with our China counterparts on COVID origins. He announced they'd be disbanding the team, setting up a separate structure and moving to a system whereby a new team will be formed to do Phase 2 of the work in China. The stated goal is to follow member state's wishes and improve transparency in the way the origins team is selected. Sadly it will reduce transparency because there will now be a 'behind closed doors' decision from the member states on who of the nominees are put forward to WHO, then another 'behind closed doors' decision from WHO on who is selected, with, we've been told, the DG of WHO having final say.

From my point of view it's a real problem because given the political pressure from the Right wing, it might prevent my future involvement in this work. This means my 17 years + of collaboration with the very people in China who we need to work with, will not be part of Phase 2 work – including designing the animal testing protocols that are my key expertise. Disbanding the current team will also significantly delay the work and this threatens to undermine our capacity to do the trace-back, as antibodies wane among wildlife farmers in rural China who we've proposed should be interviewed and tested in Phase 2, for example. The current team has a good working relationship with the China side and has made significant progress over the last few months, meeting weekly as an international expert group and working with our Chinese counterparts to update the WHO report, include new data and get phase 2 Terms of Reference thrashed out. We'd reached the beginnings of consensus on this.

It will also be seen as an implicitly political move on behalf of WHO, and one that projects a perception of undermining the hard work we did to produce buckets of new data in the WHO report. The rest of the team are very angry about the way we've been repeatedly undermined by politics, and we're working on a communications strategy right now.

David, I'm not sure who is the US representative for WHO Covid origins negotiations. It was publicly announced that Tony would represent the US at WHO, but it may be a State Dept or other HHS person. I think it's important that Tony and perhaps Clifford know what's happening.

Cheers,

Peter

Dear all,

It was a pleasure to meet you on Monday. Please find attached for your information and on behalf of the DG our communication to member states, shared with them as a circular letter this evening. Please don't hesitate to reach out to us for follow up discussions.
Please keep this confidential during the next days. We will have a member state briefing and discussion on this subject on Friday.

With my best regards,
Catharina

P.S. I hope I have the correct list of emails addresses.

Responding to your email below David, you're right about the best defense being offense. I end up going through a process with these attacks. First day I feel like giving up on science. Then after a while, sometimes a few days of moping around, I get my aggression back and start trying to find ways to counter. As a strategy, I'm gradually talking to a few of the nastier journalists who have been attacking us, and I'm working on approaching some of the Republicans who are trying to defund us, and will have a better chance of doing that if they win the mid-terms.

First attempt came this week when *The Intercept* told us they were planning a story and sent a list of ridiculous questions about some typos in our reports on the terminated R01 – the issues that the House E&C Republicans sent to NIH last week (attached). *The Intercept* has filed FoIAs on our NIH grants back to 2001 and is currently in court to challenge NIH about handing over information on FoIA requests. Their play is to file a story every time Republicans on the Hill rip into EcoHealth or NIH then report in a dramatic way without our side of the story, usually quoting Ebright and Larry Gostin. I spent an hour and a half answering their questions on zoom and explaining how every allegation levelled at EHA about our NIH work can be answered by understanding the process of doing normal science. They've now put a story out that is less damaging than we believe it would have been, and has them turning their ire a bit more onto NIH O/D rather than us – not great for that to happen, but better than just lots of innuendo about our motives. There's still plenty of mudslinging particularly from Ebright who believes the typos in our report represent "Serious violations". The story's here: https://theintercept.com/2022/03/03/wuhan- coronavirus-research-nih-ecohealth/

I'm also working with Jon Cohen (Science) and Betsy McKay (WSJ) to send them every document we receive from NIH O/D and our responses. Both seem to be building up to doing a story and both recognize that this is a load of garbage being churned up for political purposes.

Amusingly, I sent Jon Cohen the Intercept story and he said it broke the ultimate rule of journalism – it was too boring to reach the end.

By the way David – I removed Holly Irving from the email chain because it's a NIAID address and can be FoIA'd

Cheers,

Peter

Subject: Re: open letter: United States and the investigation of COVID origin—letter from American scientists and policy specialists

Peter and colleagues, this is all really horrible, but what else is new? I once advised you to read the Arthur Miller play The Crucible (or see the great film) and now i add: read the transcript of the trial of Jeanne d'Arc..... In terms of demagoguery and evil there is nothing new under the sun, and there will always be people who take pleasure in trying to destroy people who are their betters, especially their moral betters....

It will be small consolation to hear the following but in my face to face meeting with Tony this morning, he once again brought up, as he usually does, your plight (Peter) and bemoaned all the crap he and you and others are ensnared in. He seems not to believe it is all happening and today was particularly upset about continued drum beating about lab leaks, specifically mentioning one I won't name whose father is a noted NIH virologist. I won't repeat the expletives we exchanged. I am beginning to feel more and more like a therapist lately.... He doesn't know how to stop this, nor do I.

I have said this before, and you all have disagreed, maybe you are right, probably u are, but i sometimes think the best defense is a good offense. That's what we tried to do in our COVID origin paper in spring 2020, but obviously few listened. Since the facts are on our side, and since there is zero proof of a lab leak or engineering, it's always possible to ask the assholes: prove it or shut up. That they have no proof and no evidence, they have an Achilles heel that can be struck.

If this was about a person rather than a scientific fact, these guys would be in court for slander

Just keep hanging in there. I wish there was more i can do, and, if i get cut lose from NIH, there may be

Of course, none of this would get to the bottom of anything, and it would just serve to drive more politics in the way of

MORENS_SUBPOENA_005647
MORENS_NIH_013939
REL0000478347

doing science.

The truth of all of this is that there is no real debate over the origins. A lab leak is a possible scenario, but extremely unlikely based on the zero evidence put forward by anyone. On the other hand, we now have 11 peer-reviewed or under-review papers (and counting) that point towards the natural origins. I've listed them out in the attached doc, as well as the lab leak papers I could find (all of which are opinion pieces of non-peer-reviewed).

The real debate is purely political - Republicans using this as a way to target NIH and just regurgitating fact-free innuendo-filled conspiracies with EcoHealth's work at the center. Richard Ebright, I hear, is working with Rand Paul and others to feed them these half-baked ideas and make them sound science-y enough to convince the public.

I can hear the villagers sharpening their pitchforks....

Cheers,

Peter

On May 19, 2022, at 4:27 PM, Peter Daszak <(b) (6) > wrote:

What's really irksome is that this article in PNAS is full of errors and misunderstandings.

I haven't read the whole thing, but just about every paragraph contains an erroneous assumption that could easily be refuted, e.g.:

- "EHA, UNC, NIH, USAID, and other research partners have failed to disclose their activities to the US scientific community and the US public, instead declaring that they were not involved in any experiments that could have resulted in the emergence of SARS-CoV-2." BS – we published dozens of papers on our work (they're on our website!) and sent reports in to NIH each year. We also gave hundreds of public lectures on this and spoke with the intelligence agencies about it.

  "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the United States and China, has not been disclosed for independent analysis." BS – that's what happens when you publish peer-reviewed papers. Maybe Sachs has forgotten how that works!

  "Much of the work on SARS-like CoVs performed in Wuhan was part of an active and highly collaborative US–China scientific research program funded by the US Government (NIH, Defense Threat

MORENS_SUBPOENA_003090
MORENS_NIH_009614
REL0000478348

Reduction Agency [redacted] and US Agency for International Development [USAID]), coordinated by researchers at EcoHealth Alliance (EHA), but involving researchers at several other US institutions." Wrong again – DoD DTRA do not and have not funded work in China, let alone the Wuhan lab.

"The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown." BS – all 'viruses' collected from the field have been published already.

"These research proposals make clear that the EHA-WIV-UNC collaboration was involved in the collection of a large number of so-far undocumented SARS-like viruses and was engaged in their manipulation within biological safety level (BSL)-2 and BSL-3 laboratory facilities, raising concerns that an airborne virus might have infected a laboratory worker (9)" BS – there were only 3 SARS-related CoVs isolated in China. All the rest are simply genetic sequences of a short read of the RdRp gene, with a few dozen full genomes. It's all in the scientific papers that Sachs hasn't bothered to read.

And so on, and so forth.

Honestly, it would take me about a day to go through this paper and rebut every single error and misconception, but who's got time for that!

By the way – all of these questions have been asked repeatedly on Twitter, by journalists, by the FBI and CIA, and by hundreds of people who've spoken with me over the last 2 years. I've answered them all, now I have to do it all again, and again, and again. Problem I see here is that he just doesn't believe me, so the only option is for my laptop to be downloaded in front of a Great Inquisition, led by an eminent person such as…dare I say…Professor Sachs himself.

Cheers,

Peter

Subject: Jeff Sachs causing trouble via a PNAS article
Importance: High

EXTERNAL SENDER

Looks like Sachs has been taken down yet another rabbit hole by a scientist at Columbia (Harrison) who doesn't work in the field, and is just plain wrong. It's the old Furin cleavage site hypothesis again, without any new data or evidence. Of course, that's their point – the lack of evidence means we're all hiding information and need to be hung, drawn and quartered.

They've published an opinion piece in PNAS (attached) and there's this article in 'The Intercept'. Ebright is quoted, of course!

https://theintercept.com/2022/05/19/covid-lab-leak-evidence-jeffrey-sachs/

All this will be put straight into the subpoena letters that we've been told by Democrat staffers to expect to arrive in Jan/Feb 2023 when the Republicans take over the house (their words, not mine).

JEFFREY SACHS PRESENTS EVIDENCE

OF POSSIBLE LAB ORIGIN OF COVID-19

An article in the Proceedings of the National Academy of Sciences calls for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of Covid.

Sharon Lerner
May 19 2022, 4:00 p.m.

IN AN ARTICLE published Thursday, economist Jeffrey Sachs called for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of the Covid-19 pandemic. Writing in the Proceedings of the National Academy of Sciences, Sachs and his co-author, Neil Harrison, a Columbia University professor of molecular pharmacology and therapeutics, said that federal agencies and universities possess evidence that has not been adequately reviewed, including virus databases, biological samples, viral sequences, email communications, and laboratory notebooks. Sachs and Harrison also highlighted a tantalizing scientific detail that may be an indication that SARS-CoV-2, the coronavirus that causes Covid-19, originated in a laboratory: a sequence of eight amino acids on a critical part of the virus's spike protein that is identical to an amino acid sequence found in cells that line human airways.

Sachs and Harrison are hardly the first to suggest that SARS-CoV-2 might have been created in a lab. Since its genetic sequence was first published in February 2020, scientists have puzzled over the furin cleavage site, an area on the virus's spike that allows it to be broken apart by a protein on the membrane of human cells and makes the coronavirus particularly dangerous to people. Once split, the virus releases its genetic material into the cell and reproduces. While all viruses work by attaching themselves to cells, breaking apart, and releasing their genetic material, SARS-CoV-2 is the only one of its class, sarbecoviruses, to use this particular mechanism to do so.

MORENS_SUBPOENA_003094
MORENS_NIH_009618
REL0000478348

As with past discussion of a possible lab origin of SARS-CoV-2, this latest theory has already been met with considerable pushback. Even some scientists who are open to the idea that a lab accident could have sparked the pandemic remain unconvinced by the particular trail of evidence laid out by Sachs and Harrison.

The journal article offers a scientific road map for how this unusual sequence of amino acids could have made its way into the furin cleavage site, or FCS, of the virus. Sachs and Harrison acknowledge that the sequence could have arisen naturally. But they also lay out another possibility: that scientists might have purposefully inserted this particular string of amino acids into a bat coronavirus in the course of their work. They focus particularly on scientists who submitted an unfunded grant proposal to a division of the Defense Department called the Defense Advanced Research Projects Agency, or DARPA, laying out plans to insert a furin cleavage site into a bat coronavirus.

"We do not know whether the insertion of the FCS was the result of natural evolution — perhaps via a recombination event in an intermediate mammal or a human — or was the result of a deliberate introduction of the FCS into a SARS-like virus as part of a laboratory experiment," Sachs and Harrison write. "We do know that the insertion of such FCS sequences into SARS-like viruses was a specific goal of work proposed by the EHA-WIV-UNC partnership within a 2018 grant proposal ("DEFUSE") that was submitted to the US Defense Advanced Research Projects (DARPA)."

EHA is a reference to EcoHealth Alliance, a nonprofit research group based in New York City that has received more than $118 million in grants and contracts from federal agencies. WIV, or the Wuhan Institute of Virology, is a Chinese research organization that collaborated with EcoHealth Alliance in the past and was listed as a subcontractor on the DARPA grant. UNC is mentioned because Ralph Baric, a molecular biologist at the University of North Carolina, Chapel Hill, was to have conducted part of the work pitched to DARPA. The grant proposal touted Baric's "two-decade track record of reverse engineering [coronavirus] and other virus spike proteins."

The intent of the DARPA proposal was to prevent emerging pathogenic threats, but the work, if conducted, could have created a novel virus capable of infecting humans. "We will introduce appropriate human-

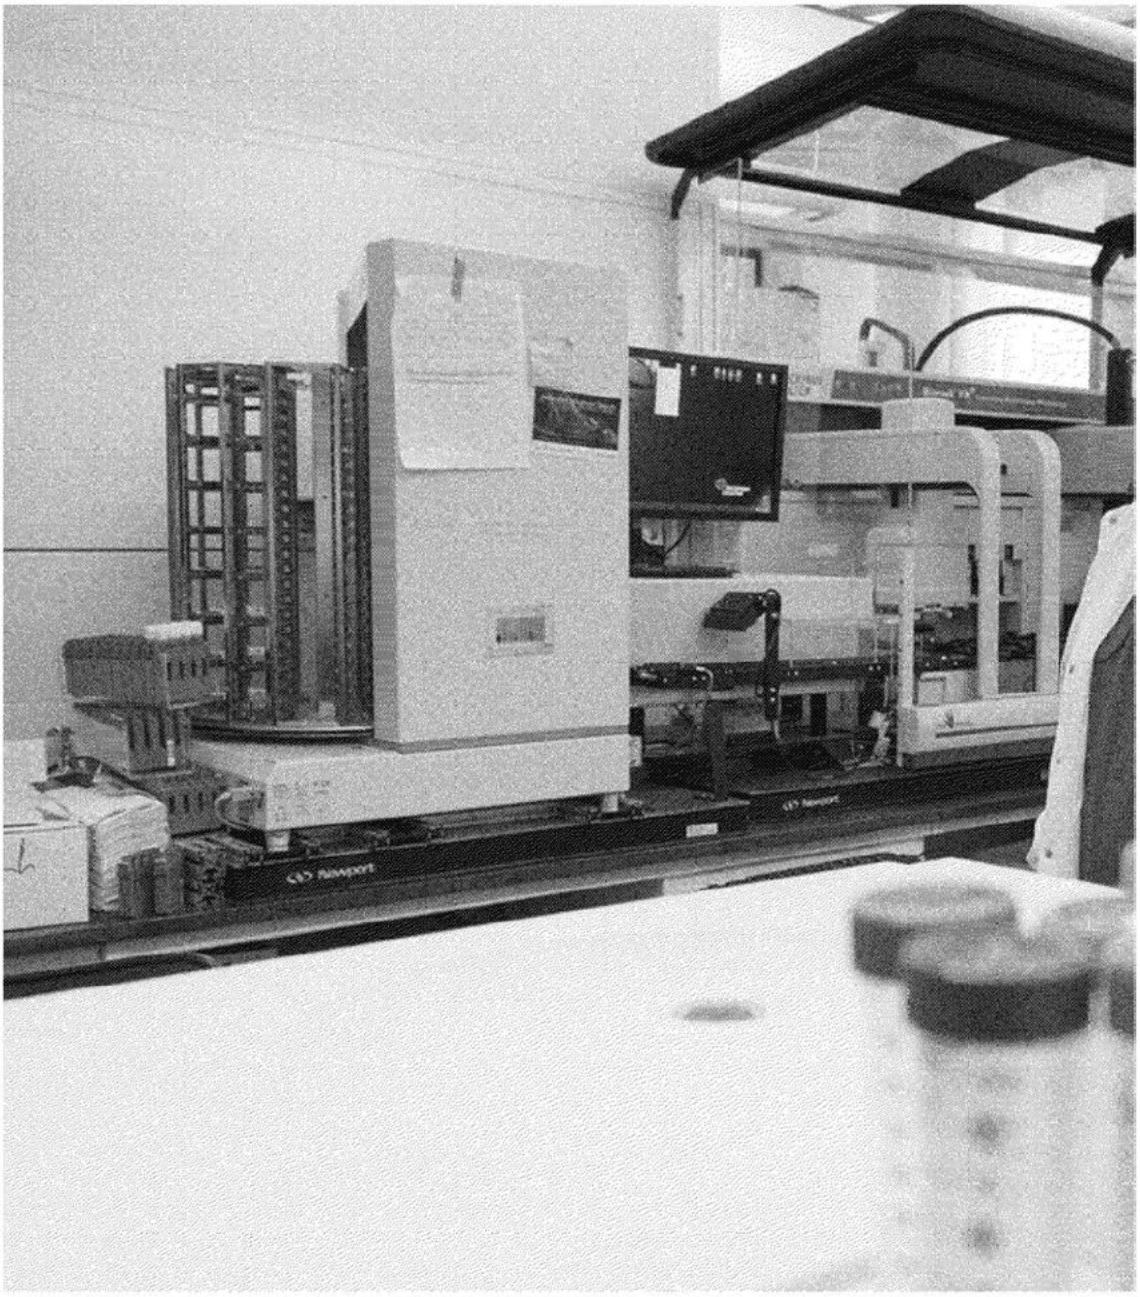
specific cleavage sites and evaluate growth potential in [a type of mammalian cell commonly used in microbiology] and [human airway epithelial cell] cultures," the proposal stated.

Several scientists interviewed about the DARPA proposal in September told The Intercept that scientists often begin research before seeking funding and thus that some of the experiments described in the proposal could have already been completed. But when asked about that possibility in an interview, Peter Daszak, the president of EcoHealth Alliance, rejected it: "The DARPA proposal was not funded. Therefore, the work was not done. Simple."

A Rational Choice

As Sachs and Harrison note, the part of a protein on the cell membrane that shares its amino acid sequence with the bat coronavirus is critical for lung function. Known as an epithelial sodium channel-alpha, or ENaC-alpha, it is found in human airway cells, as well as in human kidneys and colons. Intriguingly, like SARS-CoV-2, ENaC-alpha, which facilitates the absorption of fluid in cells, is also activated by the unusual furin cleavage site. Harrison, a physiologist affiliated with Columbia's Department of Molecular Pharmacology and Therapeutics, studies ion channels, the larger category to which ENaC-alpha belongs.

Other scientists have already pointed out the match between the amino acid series in the furin cleavage site of SARS-CoV-2 and the ENaC-alpha found in human airways. In 2020, a team from the biomedical company Nference suggested that the overlap between the virus and the sequence found in human lungs is part of the reason that Covid-19 is so damaging to the respiratory system. Those scientists described the sequence as having evolved naturally.



Read Our Complete

MORENS_SUBPOENA_003096
MORENS_NIH_009620
REL0000478348

Sachs and Harrison, in contrast, suggest that researchers may have inserted the string of amino acids into a bat coronavirus precisely because of its known importance to lung function. "For a research team assessing the pandemic potential of SARS-related coronaviruses, the FCS of human ENaC — an FCS known to be efficiently cleaved by host furin present in the target location (epithelial cells) of an important target organ (lung), of the target organism (human) — might be a rational, if not obvious, choice of FCS to introduce into a virus in order to alter its infectivity, in line with other work performed previously," they write.

Such a choice, they point out, would have been in keeping with another viral research project on which EcoHealth Alliance, the Wuhan Institute of Virology, and UNC's Baric collaborated: a 2014 grant from the National Institute of Allergy and Infectious Diseases that involved increasing the transmissibility and pathogenicity of bat coronaviruses.

Growing List of Coincidences

The intriguing theory of viral engineering hinges on two observations: that the amino acid sequences match and that experts in both the ENaC-alpha furin cleavage site and the insertion of genetic sequences into bat

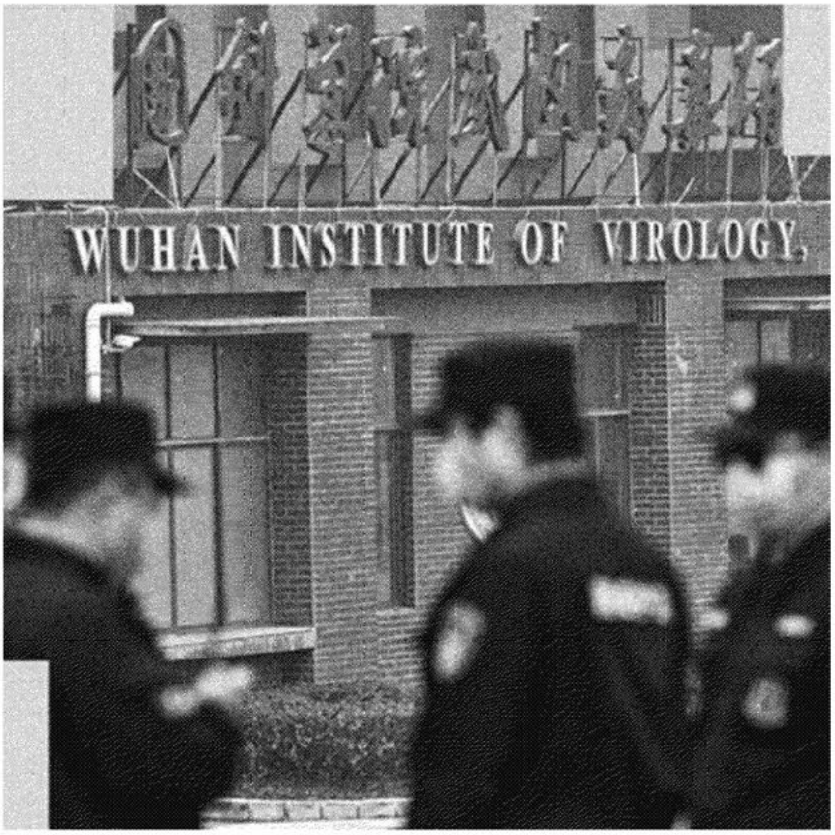
MORENS_SUBPOENA_003098
MORENS_NIH_009622
REL0000478348

coronaviruses happen to work at the same academic institution: the University of North Carolina, Chapel Hill.

Baric, whose work aims to prevent and create treatments for viral outbreaks, has previously inserted segments of DNA and RNA into viruses and created an infectious clone of SARS using his own patented "No See'm" method of inserting genetic materials without a trace. He has also collaborated on coronavirus research with scientists from a center for lung studies at UNC-Chapel Hill who are knowledgeable about ENaC-alpha. In one 2016 study, the scientists created a new virus using the spike of a bat coronavirus that had been isolated and characterized by the Wuhan Institute of Virology. The experiment found that the new virus "replicated efficiently" in human airway cells that were cultured in a lab.

In another paper, published a year earlier, Baric, along with the Wuhan Institute of Virology's Shi Zhengli and a lung expert UNC-Chapel Hill's lung institute, described creating a hybrid virus using a SARS-like virus from a bat and a "mouse-adapted" coronavirus. The new virus caused mice to get sicker than those exposed to the original virus. The goal of these experiments was to prepare for the possibility that a virus might jump naturally from animals to humans, as SARS had in 2003. But even before the pandemic, the experiment drew criticism from other scientists, who were concerned because the researchers had created a virus that was able to spread in humans.

Sachs and Harrison note that the scientists who co-authored the DARPA grant proposal would have been aware of research on coronavirus furin cleavage sites, including one 2006 experiment in which a furin cleavage site was inserted into a coronavirus. "The research team would also have some familiarity with the FCS sequence and the FCS-dependent activation mechanism of human ENaC, which was extensively characterized at UNC," they write.



"The list of coincidences is getting verrrrrrrrrrry long."

Still, both the overlap in the amino acid sequence and the fact that experts in the furin cleavage site of the ENaC-alpha and insertion of genetic material into bat coronaviruses work at the same university could be coincidental, as Harrison and Sachs acknowledge. Some virologists, though, say that the coincidence strains credulity.

MORENS_SUBPOENA_003099
MORENS_NIH_009623
REL0000478348

"Could be," Richard Ebright, a molecular biologist at Rutgers University, wrote in an email to The Intercept when asked about the possibility that these things are both chance occurrences. "But the list of coincidences is getting verrrrrrrrrry long."

Ebright, a vocal proponent of the lab-leak theory whom Harrison and Sachs thank "for helpful commentary on the manuscript," spelled out some of the other Covid coincidences that he considers questionable, including its initial outbreak in a city that, well before 2019, had already been pegged as a biosafety risk. Ebright also noted Wuhan's 1,000-mile distance from the nearest wild bats that carry the type of SARS-related coronaviruses that caused the pandemic. And he pointed to the particular coding of the amino acids in the furin cleavage site of SARS-CoV2.

Related

The Lab-Leak Theory Is Looking Stronger by the Day. Here's What We Know.

"The sequence encoding the FCS of the pandemic virus contained two consecutive CGG arginine codons," Ebright explained in his email. (A codon, or a combination of three nucleotides, supplies the genetic code for a single amino acid, though most amino acids can be represented by multiple different codons. Each nucleotide is represented by a letter — for

RNA, either A, C, U, or G.) "This codon usage is unusual for a natural bat SARS-related coronaviruses (for which fewer than 1 in 30 arginine codons are CGG) but is optimal for humans (for which most arginine codons are CGG codons)."

Still, Ebright said that at first he didn't see the identical amino acid sequences as particularly suspicious. "I had known for more than a year that there was a perfect match to an eight-amino acid sequence present in human ENaC. What I had not known was that the sequence was known to be a functional furin cleavage site and that it was a sequence extensively studied at UNC," he said. "The crucial point that the ENaC sequence was a known functional site, not just that there happens to be a match to a protein that happens to be in humans. … That suddenly turned it from what I thought to be largely irrelevant to being a logical and obvious choice to proceed."

Ralph Baric and the University of North Carolina did not immediately respond to requests for comment.

The Wuhan Institute of Virology in Wuhan, China, on June 24, 2021.

Name Calling

Other scientists dismiss the idea that the ENaC sequence might have been purposefully inserted into a coronavirus. Scientists who are already convinced that the new coronavirus emerged naturally are unlikely to be persuaded by Sachs and Harrison's article, which appears in the opinion section of the esteemed journal. Over the past year, many scientists involved in the debate over the origins of the pandemic have settled into

MORENS_SUBPOENA_003102
MORENS_NIH_009626
REL0000478348

an increasingly acrimonious, coarse, and unyielding opposition.

Some proponents of the natural origin theory became particularly dismissive of those open to the possibility of a lab leak after the February release of two pre-print studies mapping the early spread of the virus at the Huanan market in Wuhan. Angela Rasmussen, one of a team of virologists who worked on the project, described it on Twitter as "dispositive evidence of a zoonotic origin" that will "drive those with personal interest in the lab leak hypothesis out of their goddam minds." In another tweet, Rasmussen referred to proponents of the lab-leak theory as a "pack of ghouls, who through gullibility, stupidity, & conspiracist thinking have decided this is their thing despite zero expertise."

Although the pre-prints had not been peer-reviewed and may have simply illustrated the spread of the virus rather than its original outbreak, the New York Times ran a front-page story about them that quoted an epidemiologist as saying that the origins debate "has been settled with a very high degree of evidence." The story, which was announced by a push notification from the paper, also noted a lack of direct evidence for a lab leak.

Meanwhile, Kristian Andersen, another co-author of the pre-prints and a virologist at the well-regarded Scripps Research Institute, used the "poop" emoji to criticize a deeply researched article by Katherine Eban about EcoHealth Alliance. On Twitter, Andersen tarred Eban, New York Times columnist Zeynep Tufekci, and others reporting on biosafety issues that could have led to the release of SARS-CoV-2 as "deep in conspiracy theories" and on the other side of "a clear split" from journalists who dismiss the possibility of a lab origin, whom Andersen referred to as "science-based."

Even some scientists who have been vocal about the possibility that the pandemic may have been sparked by research have expressed skepticism about the theory suggested by Harrison and Sachs. "I'm sure that these authors believe in their own hypothesis and arguments, but to me, it's not one that is particularly convincing," said Alina Chan, a scientist who laid out a number of possible routes for how the coronavirus might have emerged through research-related incidents in her recent book "Viral: The Search for the Origin of Covid-19."

"There's no need for them to go hunting inside the human protein catalogue to

MORENS_SUBPOENA_003103
MORENS_NIH_009627
REL0000478348

look for cleavage sites to put into viruses."

While she is open to the possibility that the furin cleavage site might have been purposefully inserted into the coronavirus, Chan said there was no reason to think that researchers would mine humans for such material. "These scientists literally had access to hundreds of SARS-like viruses and sequences," said Chan, referring to the vast collection of coronaviruses from bats and other animals that researchers amassed at the Wuhan Institute of Virology. "There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

Jack Nunberg, a virologist at the University of Montana, was also not immediately persuaded by the theory of engineering suggested by Sachs and Harrison. "It's possible," Nunberg said of the idea that the ENaC segment was inserted into a bat coronavirus as part of research designed to gauge the pandemic potential of a virus. "But I don't find their evidence on ENaC compelling because furin cleavage sites have a lot of common amino acids, and therefore it may just have happened by chance."

Others say that the article adds noteworthy information to the public conversation about the origins of the pandemic. "The defenders of the natural origin indicate that the virus on which this type of experiment could have been done — the backbone — has never been published and that specialists in the furin cleavage sites would have chosen a more commonly used furin cleavage site like RARR rather than PRRAR. The Proceedings of the National Academy of Sciences article contradicts this argument and indicates that specialists knew that the RRAR'SVAS site was efficiently cleaved by furin," Etienne Decroly, director of virology research at the Aix-Marseille Université in France, wrote in an email to The Intercept.

Decroly added, "It is impossible to decide on the basis of the information currently available and it is urgent that the WHO Special Advisory Group for the Origins of Novel Pathogens investigate this question."

On the suggestion of an investigation, Nunberg is in agreement. "You can't argue with that," he told The Intercept. "Who's going to argue for burying one's head in the sand?"

For their part, Sachs and Harrison emphasize that they're not saying

MORENS_SUBPOENA_003104
MORENS_NIH_009628
REL0000478348

laboratory manipulation was involved in the emergence of the pandemic virus, only "that it could have been." They also give a nod to other possibilities, including that an airborne virus might have infected a laboratory worker. Rather than argue that any of these conceivable scenarios happened, they present the clues of the matching amino acid sequences to argue for an independent and transparent scientific investigation of the U.S.-based evidence related to the origins of the virus.

Among the institutions that Sachs and Harrison list as possibly having "knowledge of the detailed activities that were underway in Wuhan and in the United States" are the National Institutes of Health; the Defense Threat Reduction Agency, which has provided grant funding to EcoHealth Alliance; the Department of Homeland Security; DARPA; the U.S. Agency for International Development, which funded the $200 million PREDICT program that catalogued potential pandemic viruses; and the University of California, Davis, which participated in that program.

The authors suggest that EcoHealth Alliance and UNC may have particularly important untapped resources. "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the US and China, has not been disclosed for independent analysis," they write. "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown."

Peter Daszak, one of the members of the World Health Organization team investigating the origins of the Covid-19, on a balcony at a hotel in Wuhan, China, on Feb. 6, 2021.

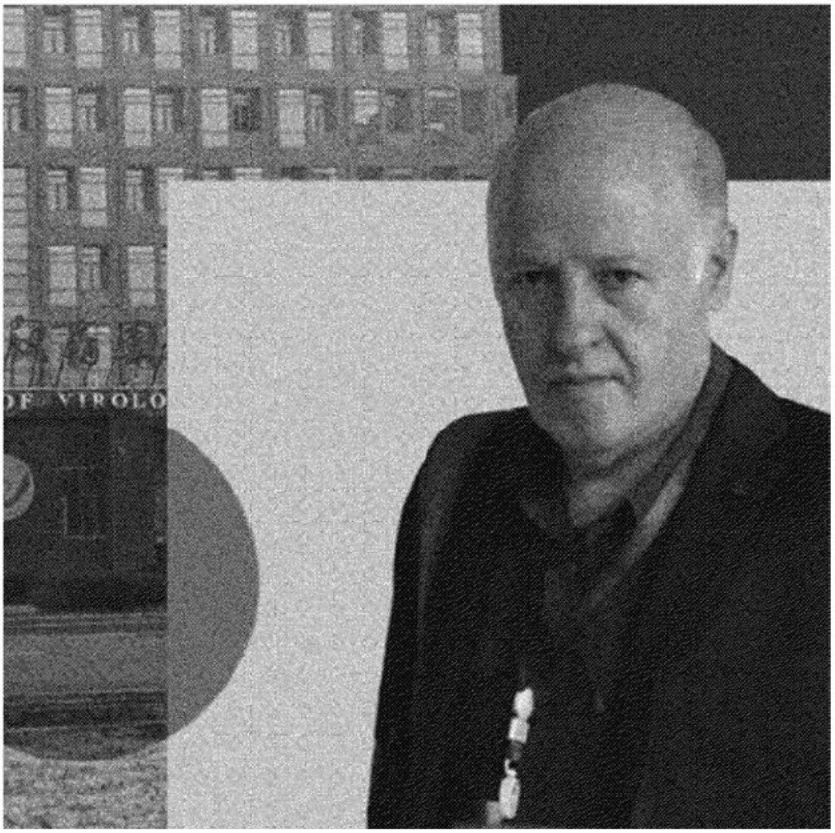

Photo: Hector Retamal/AFP via Getty Images

A Reversal

The publication in the prestigious Proceedings of the National Academy of Sciences marks a reversal of sorts for Sachs, the chair of the Lancet Covid-19 Commission who, in November 2020, appointed Daszak, the EcoHealth Alliance president, to lead a task force to investigate the origins of the pandemic. Earlier that year, Daszak had signed on to a

MORENS_SUBPOENA_003106
MORENS_NIH_009630
REL0000478348

public statement published in The Lancet on behalf of scientists who said they "condemn conspiracy theories suggesting that COVID-19 does not have a natural origin."

Related

Peter Daszak Answers Critics and Defends Coronavirus Research

Yet that early certainty about the pandemic's origins — and the sense of shared civic responsibility among members of the Lancet task force — soon disintegrated. In February 2021, emails revealed that Daszak coordinated the public statement in The Lancet tamping down suspicions of a lab leak. And by June 2021, Sachs was expressing his openness to the possibility of a lab origin, writing that NIH-funded research at the Wuhan Institute of Virology "deserves scrutiny under the hypothesis of a laboratory-related release of the virus." Three months later, he disbanded the task force that had been organized to "carefully scrutinize the origin of the SARS-CoV-2 virus" in the hopes of preventing future disease outbreaks, explaining that he had concerns that several members of the commission had conflicts of interest because of their ties to EcoHealth Alliance.

After leading the mainstream scientific inquiry into the origins of the

MORENS_SUBPOENA_003107
MORENS_NIH_009631
REL0000478348

pandemic, Sachs is now skewering it. "A steady trickle of disquieting information has cast a darkening cloud over the agency," he and Harrison write of the NIH, going on to accuse the entire federal government of not doing enough to explore the possible role of its grantees in the emergence of SARS-CoV-2 and investigate "overlooked details" such as the matching amino acid sequences.

Noting that the NIH has insisted that "the pandemic virus could not have resulted from the work sponsored by" the agency, Sachs and Harrison write that "blanket denials from the NIH are no longer good enough."

Cheers,

Peter

This is an utterly ridiculous set of BS. Jesse Bloom is the person driving it – he buys into the lab leak theory and found that some folks from WIV uploaded partial genomes early on, then added a bunch of more complete ones, and asked for the partial sequences to be removed. Absolutely normal, but he's trying to turn it into a 'mystery'.

Of course, NIH makes it all worse by not releasing emails, redacting critical parts of them, and failing to explain why they follow the wishes of the submitter re. Genbank. It's perfectly logical really – if NIH now starts releasing sequences you as a submitter asked them to remove for whatever reason, submitters will think twice about using Genbank. We already have China working with its own database and all this BS will make them twice-shy about submitting.

Even worse, Tabak now says that 'don't worry, we still have the data on back up tapes' so everyone now knows that NIH keeps the stuff you thought they agreed to delete, and no doubt has already handed it over to the FBI and the CIA.

It's a conspiracy, wrapped within an enigma, encapsulating a riddle….

PS – heres a cracker of an email from an NIH press office (?) person at O/D ripping into a journalist (Carl Zimmer) who wanted information on the 'missing' china sequences. Now it turns out that US submitters also deleted early COVID genomes…even more reason for the public to not trust scientists…:

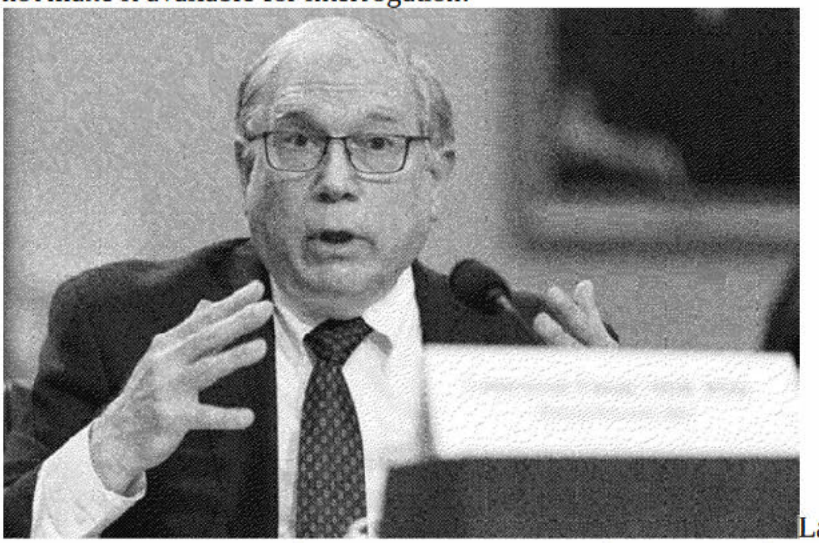
NIH director confirms agency hid early COVID genes at request of Chinese scientists

By
Steven Nelson
May 11, 2022 3:47pm

National Institutes of Health acting director Lawrence Tabak confirmed to lawmakers Wednesday that US health officials concealed early genomic sequences of COVID-19 at the request of Chinese scientists — but insisted the data remains on file.



Tabak told a House Appropriations subcommittee that the NIH "eliminated from public view" the data from the pandemic epicenter in Wuhan, China, before adding that researchers can still access it via an archaic "tape drive."

Vanity Fair recently reported that the information was hidden in response to a request from Chinese scientists, despite potentially resolving whether the virus leaked from the Wuhan Institute of Virology or passed naturally from animals to humans.

Rep. Jaime Herrera Beutler (R-Wash.) asked Tabek to explain why US officials would comply with such a request.

MORENS_SUBPOENA_003113
MORENS_NIH_009637
REL0000478348

"There's no question that the communication that we had about the sequence archive — Sequence Read Archive — could have been improved. I freely admit that," Tabek said. "If I may, the archive never deleted the sequence, it just did not make it available for interrogation."

Lawrence Tabak, acting director of the National Institutes of Health, testifies on May 11. Jacquelyn Martin/AP

"So wait, you have the information still?" Beutler followed up.

"We have the information … Anybody who submits to the Sequence Read Archive is allowed to ask for it to be removed," Tabak explained. "And that investigator did do that. But we never erase it."

"So you don't have the information anymore?" Beutler asked.

"We do. We never erase the information. We keep it," Tabak clarified.

"So they were able to withdraw public viewing of it?" the congresswoman followed up.

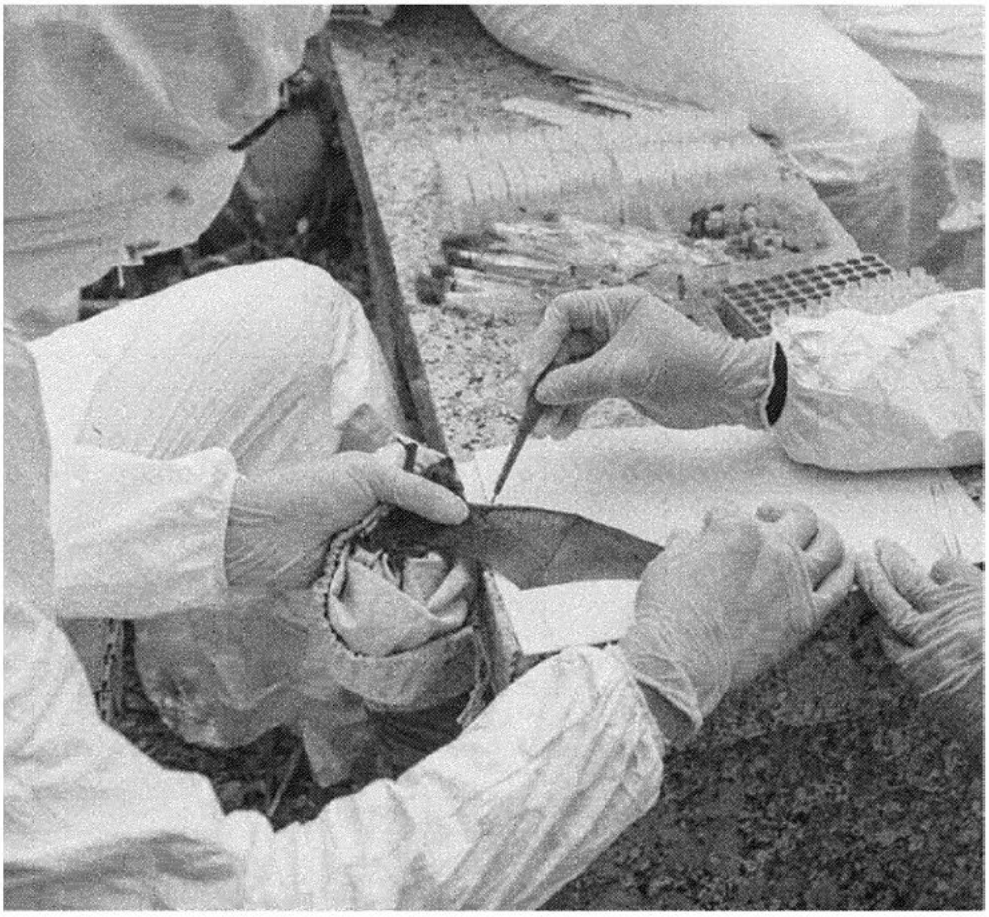
"That's correct," he said.

"OK, so researchers can apply to the NIH and get the information from you?" Beutler asked.

"In the way that it was originally eliminated from public view, it was withdrawn, and that's the most difficult for people to access," Tabak replied. "The error that was made, and we found this out after a review of all of our processes, was it should have been suppressed. The distinction being that if it's withdrawn, it is kept archivally on a tape drive — old technology, but that's how it's done. But when it is withdrawn, it can still be accessed by accession number, and so researchers are able to access that information."

Security personnel keep watch outside Wuhan Institute of Virology during the visit by the World Health Organization on Feb. 3, 2021. Thomas Peter/REUTERS

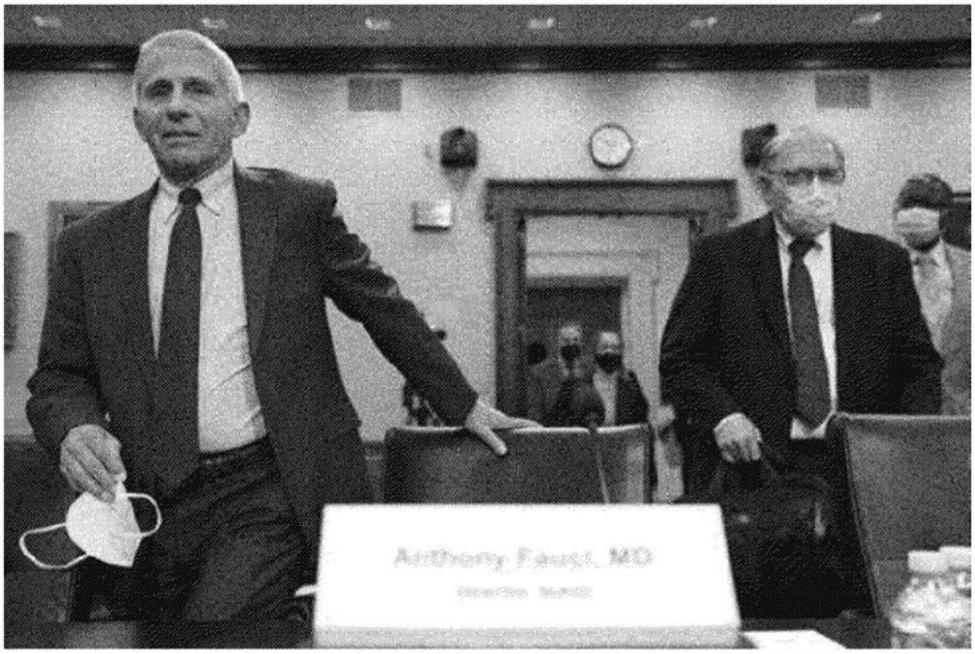
"So the information is still there?" Beutler summed up.



"That's correct. The information was never lost," Tabak repeated.

In a March 31 article, Vanity Fair reported that evolutionary biologist Jesse Bloom discovered last year that early COVID-19 sequences had disappeared from a federally run data repository.

When Bloom raised the issue, he was reportedly ganged up on by a group of researchers assembled by then-NIH Director Francis Collins and infectious disease institute head Dr. Anthony Fauci.



Bloom shared a draft academic paper with Collins and Fauci, who allegedly objected on a June 2021 Zoom video conference to Bloom's description of Chinese scientists "surreptitiously" removing the sequences. Fauci said the word was "loaded" and implied a coverup, the report said.

Evolutionary biologist Kristian Andersen, who was selected to participate on the call by Collins, allegedly told Bloom that the Wuhan team had a right to claw back early pandemic information and that it was unethical for Bloom to question it.

Tabak noted that while the request for information to be removed was honored, it was not erased fully.ECOHEALTH ALLIANCE
Andersen allegedly went so far as to offer to delete Bloom's article from a "preprint" server "in a way that would leave no record that this had been done."
China's government has refused to cooperate with an international investigation of the origins of the pandemic. The COVID-19 virus has killed about 1 million Americans since March 2020 and caused massive social, economic and educational disruptions.
The US intelligence community said in an August report that it's possible the virus leaked from the Wuhan Institute of Virology, calling the theory one of two "plausible" explanations along with natural transmission from animals.

President Biden rarely speaks publicly about wanting China to be transparent about the origins of the pandemic. Former President Donald Trump, by contrast, has demanded that China pay $10 trillion in reparations.

The Biden administration is considering undoing some of Trump's tariffs on Chinese goods "separately" from US pressure for coronavirus transparency, White House press secretary Jen Psaki told The Post on Monday.

Documents published in September by The Intercept revealed that US health officials indirectly funded so-called "gain of function" research at the Wuhan lab — including the modification three bat coronaviruses distinct from COVID-19 and the discovery that they became much more infectious among "humanized" mice when human-type receptors were added to them.

First on CNN: HHS watchdog announces review of NIH grants that likely includes money connected to Wuhan lab

By Kristen Holmes and Priscilla Alvarez, CNN
Updated 10:30 AM ET, Tue June 15, 2021

(CNN) Federal government investigators said Tuesday that they are launching a review into how the National Institutes of Health manages and monitors its grant program, which likely includes money connected to a Wuhan lab that GOP lawmakers have been scrutinizing.

Republicans have zeroed in on NIH's relationship with EcoHealth Alliance, the global nonprofit that helped fund some research at China's Wuhan Institute of Virology, to attack Dr. Anthony Fauci and score political points.

The comprehensive review also coincides with renewed questions over the origin of the Covid-19 virus and the potential role that China's Wuhan Institute of Virology may have played.

"We share stakeholders' concerns regarding compliance and oversight of NIH grant funds. We have been monitoring this issue for some time and consider it a high-priority matter that can pose a threat to the integrity of the NIH grant program," Tesia Williams, the director of communications for the Department of Health and Human Services Office of Inspector General, told CNN.

"Based on our preliminary research and analysis, HHS-OIG has decided to conduct an extensive audit reviewing how NIH monitored selected grants and how the grantees and subgrantees used and managed federal funds between years 2014 through 2021," Williams said.

Roughly 80% of NIH funding goes to supporting research grants, including grants to foreign organizations. According to the work plan on the review, it will look at how these grants are monitored and making sure the recipient's use and management of NIH grant funds is in accordance with federal requirements.

One NIH official, who spoke under the condition of anonymity in order to discuss the review openly, called it "political" in nature but believed that ultimately it would be a good thing and would clear NIH of any wrongdoing.

"It's an opportunity to educate the public," the official said.

Questions about the relationship between NIH and EcoHealth Alliance have grown louder after Fauci, the director of the National Institute of Allergy and Infectious Diseases within NIH, confirmed to lawmakers earlier this year that hundreds of thousands of dollars that NIH had given to the New York-based global nonprofit went to the Wuhan Institute of Virology to study coronaviruses in bats.

"About $600,000 was spent over a five-year period," Fauci said during a congressional budget hearing. "That comes to anywhere between $125 (thousand) and $150,000 per year that went to collaboration with Wuhan."

A recent US intelligence report found that several researchers at China's Wuhan Institute of Virology fell ill in November 2019 and had to be hospitalized, a new detail about the severity of their symptoms. It's not clear what might have affected the

MORENS_SUBPOENA_020163
MORENS_NIH_040687
REL0000478351

researchers, there is no indication they caught Covid-19 and the lab strongly denied the report, calling it a lie to push the so-called lab-leak theory for the disease origin.

There are competing theories about how the pandemic got started. One is that it developed naturally in the wild and transferred from animal to human, as many other viruses have in the past. Another is that such a naturally originating virus was studied in a lab and accidentally infected someone. A third theory, most widely discounted by scientists, is that it was engineered in a lab and somehow leaked to humans.

For much of 2020, pursuing the lab leak theory was treated publicly as xenophobic, and, thanks in part to an open letter signed by 27 scientists and published in an influential medical journal in February 2020, scientifically unsound.

But in recent months, the classified intelligence emerged that three researchers at the Wuhan Institute of Virology who were conducting the kind of controversial research that some scientists now believe may have led to the pandemic had gotten sick in the autumn of 2019, before the outbreak was known to have begun, although there's no evidence they were infected with Covid-19.

Conservative attacks on Fauci have also intensified after media organizations released a trove of the doctor's emails.

In one email sent to Fauci in April 2020, an executive at EcoHealth Alliance thanked him for publicly stating that scientific evidence supports a natural origin for the coronavirus and not a lab release.
Fauci recently told CNN's John Berman the email was being misconstrued and called claims he had a cozy relationship with the people behind the Wuhan lab research "nonsense."

"I have always said, and will say today to you, John, that I still believe the most likely origin is from an animal species to a human, but I keep an absolutely open mind that if there may be other origins of that, there may be another reason, it could have been a lab leak," Fauci told Berman. "I believe if you look historically, what happens in the animal-human interface, that in fact the more likelihood is that you're dealing with a jump of species. But I keep an open mind all the time. And that's the reason why I have been public that we should continue to look for the origin.

"You can misconstrue it however you want -- that email was from a person to me saying 'thank you' for whatever it is he thought I said, and I said that I think the most likely origin is a jumping of species. I still do think it is, at the same time as I'm keeping an open mind that it might be a lab leak."

Nonetheless, Republicans are using the emails -- and controversy about how the pandemic began and whether US government grant money can be connected to it -- to fundraise and campaign against the Biden administration.

GOP Sen. Rand Paul of Kentucky has lashed out at Fauci, calling for his ouster.

"He's continuously and deliberately misleading the public at every turn. It's time to FIRE FAUCI," a Paul fundraising email read. "There are 2,000 emails proving Fauci chose his own ego over the facts."

Florida Sen. Marco Rubio recently penned a Fox News op-ed titled "If Biden Believes in Science, He Must Fire Fauci."

President Joe Biden was asked earlier this month if he still had confidence in Fauci.

"Yes, I am very confident in Dr. Fauci," Biden said.

To: Keusch, Gerald T <(b) (6)
Subject: question from undark magazine

Dr. Keusch,

I'm writing a story for Undark, an editorially independent publication of the Knight Science Journalism Program at MIT.

My story is about why the debate over whether SARS-CoV-2 came from a lab got so heated. My story is not making a case for lab leak vs natural origins. I'm only writing about the way scientists interacted on the matter.

You're an author on a statement that came out in the Lancet last March claiming that anything other than natural origins for the virus is a "conspiracy theory."

There were many authors on that letter, I want to know why the authors chose this particular phrase (conspiracy theory). Would you be able to to tell me?

Also, a number of accomplished scientists, including David Relman from Stanford, have said the lab-leak hypothesis never got a fair and dispassionate hearing. Do you agree?

Thanks

Charlie Schmidt

Peter and all,

I am so sorry you are still going through all of this. For what it's worth, I broke my rule of talking to disingenuous journalists and sent Mara Hvistendahl a long email telling her exactly what I think of the "experts" she's talked to and setting the record straight about what these FOIAd reports supposedly show. From what I can see, they show that you were reporting your work appropriately to NIH as required, the work itself was done in appropriate biocontainment, and, importantly, you didn't have SARS-CoV-2 or a progenitor. I also explained that previous work was published with WIV1 chimeras and that this type of study precludes doing more dangerous (and technically very difficult) virus isolation.

She wanted to know whether I agreed with her two sources (likely Alina Chan or Richard Ebright, based on her prior story) that this fits the definition of GoF by NIH and I told her no and explained at length why not and the assertions that it was should disqualify any supposed "expert". Took every opportunity to dunk on their amateurish, disingenuous bullshit, while also emphasizing the importance of this work. Mara wrote back defensively, claiming she's talked to 10 virologists or "people in adjacent fields" for her follow-up. I am not optimistic that the follow-up will be more balanced, but I did try to provide some juicy quotes about how her "experts" actually have no expertise, and emphasized the profound damage these people have done to this essential research. They make all of us less safe.

Hang in there. Ultimately the truth will come out and it's not going to be from the likes of the Daily Caller's inability to interpret virology data or from Jesse Bloom and all the grifters and conspiracy theorists populating the rabbit hole that he's crawled down.

Here's a report in the Daily Caller that goes after the GoF argument that the chimeric bat viruses yielded more virus in

humanized mice than the parental bat virus strain. https://dailycaller.com/2021/09/09/ecohealth- alliance-gain-of-function-higher-viral-load-anthony-fauci/

There's a good response from NIH: 'An NIH spokesperson told the DCNF the agency "never approved any research that would make a coronavirus more dangerous to humans." "The research we supported in China, where coronaviruses are prevalent, sought to understand the behavior of coronaviruses circulating in bats that have the potential to cause widespread disease," the spokesperson said. "The body of science produced by this research demonstrates that the bat coronavirus sequences published from that work NIH supported were not SARS-CoV-2. More importantly, because of similar research to understand coronaviruses, we were able to move swiftly to develop vaccines against SARS-CoV-2 and save lives."'

This story is particularly irritating because if you look at the P3CO rules, it's clear they are meant for pathogens that occur in humans and might be made more dangerous. These were bat viruses that have never been shown to occur in humans. L et's also not forget that the virus with a higher viral load in mice was actually because it had the spike protein of a bat virus being flown around every night by tens of thousands of bats in rural china – not something new created by us to enhance virulence - In fact, the opposite: the fact that we could do this work with a chimera means that we don't have to isolate and culture every single new bat cov we find. It reduces risk!

INVESTIGATIVE GROUP

Fauci-Funded Wuhan Lab Viruses Exhibited Over 10,000 Times Higher Viral Load Than Natural Strain, Documents Show

<image003.jpg>

<image007.jpg>

-
-
-

ANDREW KERRINVESTIGATIVE REPORTER

September 09, 20213:25 PM ET

- **U.S. and Chinese researchers funded by the National Institutes of Allergy and Infectious Diseases created viruses in a Wuhan lab that exhibited over 10,000 times higher viral load in humanized mice, records released by the agency show.**
- **Rutgers University professor Richard Ebright said the data was a "bona fide bombshell" that proves the NIAID, under Dr. Anthony Fauci's leadership, violated federal policies, endangered the public and lied to the public.**
- **Fauci testified before the Senate in June that his agency never funded gain-of-function research at the Wuhan Institute of Virology.**

U.S. and Chinese researchers funded by Dr. Anthony Fauci's National Institute of Allergy and Infectious Diseases (NIAID) created viruses in a Wuhan lab that exhibited over 10,000 times higher viral load in humanized mice than the natural virus they were based on, according to an infectious disease professor citing documents recently released by the agency.

The U.S. nonprofit group EcoHealth Alliance notified the NIAID in two reports that between June 2017 and May 2018 it had created three lab-generated chimeric SARS-related coronaviruses in China that exhibited "significantly higher" viral loads, documents first reported by The Intercept show, but the agency continued to fund the project with taxpayer dollars without flagging it for review by an independent federal committee created in late 2017 to oversee gain-of-function research.

Rutgers University professor Richard Ebright, a vocal opponent of gain-of-function research, said the data was a "bona fide bombshell" that proves the NIAID, under Fauci's leadership, violated federal policies, endangered the public and lied to the public.

"Three EcoHealth/[Wuhan Institute of Virology] lab-generated viruses exhibited >10x to >10,000x higher viral load than the starting bat virus in humanized mice," Ebright tweeted. "One EcoHealth/WIV lab-generated virus exhibited higher

pathogenicity than the starting bat virus in infection studies with humanized mice."
"The results demonstrate–unequivocally–a gain in function," he said.
In comparison, the viral load for people infected with the delta variant is roughly 1,000 times higher than those infected with the original strain of the virus, according to Nature science journal.
Ebright added on Twitter that the gain-of-function research activity that NIAID allowed EcoHealth Alliance to conduct in China could have yielded the virus that causes COVID-19 or a progenitor of that virus.
EcoHealth Alliance first notified the NIAID it created the three lab-generated SARS-related coronaviruses in a progress report detailing its research activities between June 2017 and May 2018.
"Using the reverse genetic methods we previously developed, infectious clones with the WIV1 backbone and the spike protein of SHC014, WIV16 and Rs4231, respectively, were constructed and recombinant viruses were successfully rescued," the group said in its progress report. "2 and 4 days post infection, the viral load in lung tissues of mice challenged with rWIV1-SHC014S, rWIV1-WIV16S and rWIV1-Rs4231S … were significantly higher than that in rWIV1-infected mice."
"These results demonstrate varying pathogenicity of SARSr-CoVs with different spike proteins in humanized mice," the report added.
EcoHealth Alliance included a chart visualizing the increased viral load of their lab-created viruses. The chart is presented in a Log scale, meaning each tick of the chart represents a 100-fold increase in viral load in mice with humanized cells, Ebright explained to the Daily Caller News Foundation.
<image005.jpg>
Charts submitted by EcoHealth Alliance to the National Institute of Allergy and Infectious Diseases showing loss of body weight (right) and viral load (left) of mice with humanized cells infected with the natural WIV1 viral strain and three EcoHealth lab-created virus strains. The viral load chart is presented in Log scale, meaning each tick of the graph represents a 100-fold increase in viral load, Rutgers University professor Richard Ebright explained to the DCNF. (Screenshot)
"Each tick in the chart on the right represents an increment of 100x," Ebright told the DCNF. "The day 4 data show greater-than-10,000x higher viral loads for the lab-generated viruses."
The viral load for humanized mice infected with the natural virus caught up with the lab-created strains by the end of the experiment, the chart shows, but Ebright said that viral loads in the early stages of an infection are important figures to consider when assessing a pathogen's transmissibility.
"In terms of assessing potential for transmissibility, the viral load at all time points, particularly at early time points, is relevant. (See Delta variant)," Ebright told the DCNF.
EcoHealth Alliance provided another chart in its progress report showing that humanized mice infected with EcoHealth's lab-created viruses lost more bodyweight than humanized mice infected with the natural WIV1 strain.
EcoHealth Alliance included the same two charts in a 2018 request to the NIAID requesting additional funding for its research in China, the document trove released by The Intercept shows.
Federal funding for gain-of-function experiments that increase the transmissibility or pathogenicity of potential pandemic pathogens was temporarily suspended in 2014 due to widespread scientific concerns it risked leaking supercharged viruses into the human population.
Funding for gain-of-function research was resumed in late 2017, but only for projects that went through the new Potential Pandemic Pathogens Control and Oversight (P3CO) Framework, which includes a review by an HHS review board tasked with critically evaluating whether grants that involve enhancing dangerous pathogens, such as coronaviruses, are worth the risks and that proper safeguards are in place.
The NIAID opted not to flag the EcoHealth Alliance grant for P3CO after determining on its own accord that the project "did not involve the enhancement of the pathogenicity or transmissibility of the viruses studied," a National Institutes of Health spokesperson previously told the DCNF. **(RELATED: US Grant To Wuhan Lab To Enhance Bat-Based Coronaviruses Was Never Scrutinized By HHS Review Board, NIH Says)**
Fauci said during a congressional hearing in May that the NIH and NIAID "categorically has not funded gain-of-function research to be conducted at the Wuhan Institute of Virology," a claim that led Republican Sen. Rand Paul of Kentucky in July to send a criminal referral to the Department of Justice to investigate whether Fauci lied before Congress.
The P3CO framework defines an "enhanced" potential pandemic pathogen as any lab-created virus that exhibits any level of boosted transmissibility and/or virulence. Funding agencies such as the NIAID are required to flag any research grant that is "reasonably anticipated to create, transfer, or use enhanced PPPs" for P3CO review.
Despite this, documents released by The Intercept suggest that the NIAID authorized EcoHealth Alliance to conduct

gain-of-function experiments on bat coronaviruses up to a certain threshold.

The NIAID informed EcoHealth Alliance in a June 2018 award notice that it must notify the agency only if it creates a virus "with enhanced growth by more than [10 times] compared to wild type strains," according to documents released by The Intercept. The NIAID linked to the P3CO review process, which contains no such mention of a 10 times allowance, in the very next sentence, the document shows.
<image006.jpg>
NIAID notice to EcoHealth Alliance in June 2018 saying it must notify the agency only if it produces a lab virus that exhibits more than 10 times enhancement over wild-type strains. (Screenshot)
An NIH spokesperson told the DCNF the agency "never approved any research that would make a coronavirus more dangerous to humans."
"The research we supported in China, where coronaviruses are prevalent, sought to understand the behavior of coronaviruses circulating in bats that have the potential to cause widespread disease," the spokesperson said. "The body of science produced by this research demonstrates that the bat coronavirus sequences published from that work NIH supported were not SARS-CoV-2. More importantly, because of similar research to understand coronaviruses, we were able to move swiftly to develop vaccines against SARS-CoV-2 and save lives."

Subject: RE: The Intercept report on coronavirus research at Chinese labs

That's interesting about Jesse Bloom – I wasn't aware of that work and hadn't really heard of him before this year to be honest. I suspect that like many people his view of his own research is that it's highly professionally managed and carefully controlled re. biosafety. He clearly has a different view of the work at WIV & by other leading Chinese scientists and seems suspicious of their motives in many of his public comments. This can't be based on their published work – it's often excellent. It just seems like a difficulty people have teasing apart their viewpoint about the Chinese Govt from their opinion about individual scientists. Anyone who's been on the ground in China rapidly realizes that the two are not the same.

Cheers,

Peter

Sorry this is happening. The anti-science attacks are just getting more and more extreme.

Unfortunately, there exists a small vocal group of scientists that see virtually every experiment done by virologists as risky and potentially GoF. Many of those ppl are quoted in the Intercept article.

WRT Jesse Bloom it is rather ironic I must say. One need not look too hard at his influenza virus publications to identify quite a number that could be considered "risky" at least by a Relman/Ebright definition. Selecting drug resistant influenza virus mutants, and creating influenza virus SARS-CoV-2 recombinants to name two. Just saying…

External Sender. Be aware of links, attachments and requests.

Great to see your email Kristian – right on every point. The isolate vs. sequence vs. sample misnomer is something that really has plagued me with this stuff – Zhengli's group repeatedly used 'isolate' for 'sample' on Genbank and I've made that mistake here also.

Re. the MERS work, you're dead right – we proposed it, explained that it would likely need review by the P3CO committee equivalent, and then pushed it to Yr4. In the end we didn't do this work – there was already a ton of other more interesting work directly on SARSr-CoVs to do.

The latest line of attack that will be coming out in a follow-up article in the *Intercept* tonight is that in the Y4 report, we show one of the chimeras having more than a log virus output than the parent strain (WIV-1). The NoA was updated in Y3 to say that if this happened we had to report to NIH and cease expts. Ironically, the way *Intercept* found this out is because they now have a copy of our "report to NIH" in which we show this, but of course that's not going to stop them saying we broke the rules on GoF.

The other line of attack is the one Jesse Bloom's pursuing – that we didn't publish sequence data within 6 months of the "final version being received" as per our proposal. Jesse sneakily suggested this in an email to me last night in which he asked for the sequences so he can do SARS-CoV-2 origin analyses, while at the same time tweeting an accusation that we broke the rules in a chain with Alina Chan and the "Seeker". I'm not sure whether to respond at all, but I might just let him know that all SARSr-CoV sequences we had are already published in our 2020 paper in Nat. Comm. Again – the problem with these accusations is that just being accused of this by the press causes us seven levels of hell, and arguing back is even worse.

Cheers,

Peter

Subject: Re: The Intercept report on coronavirus research at Chinese labs

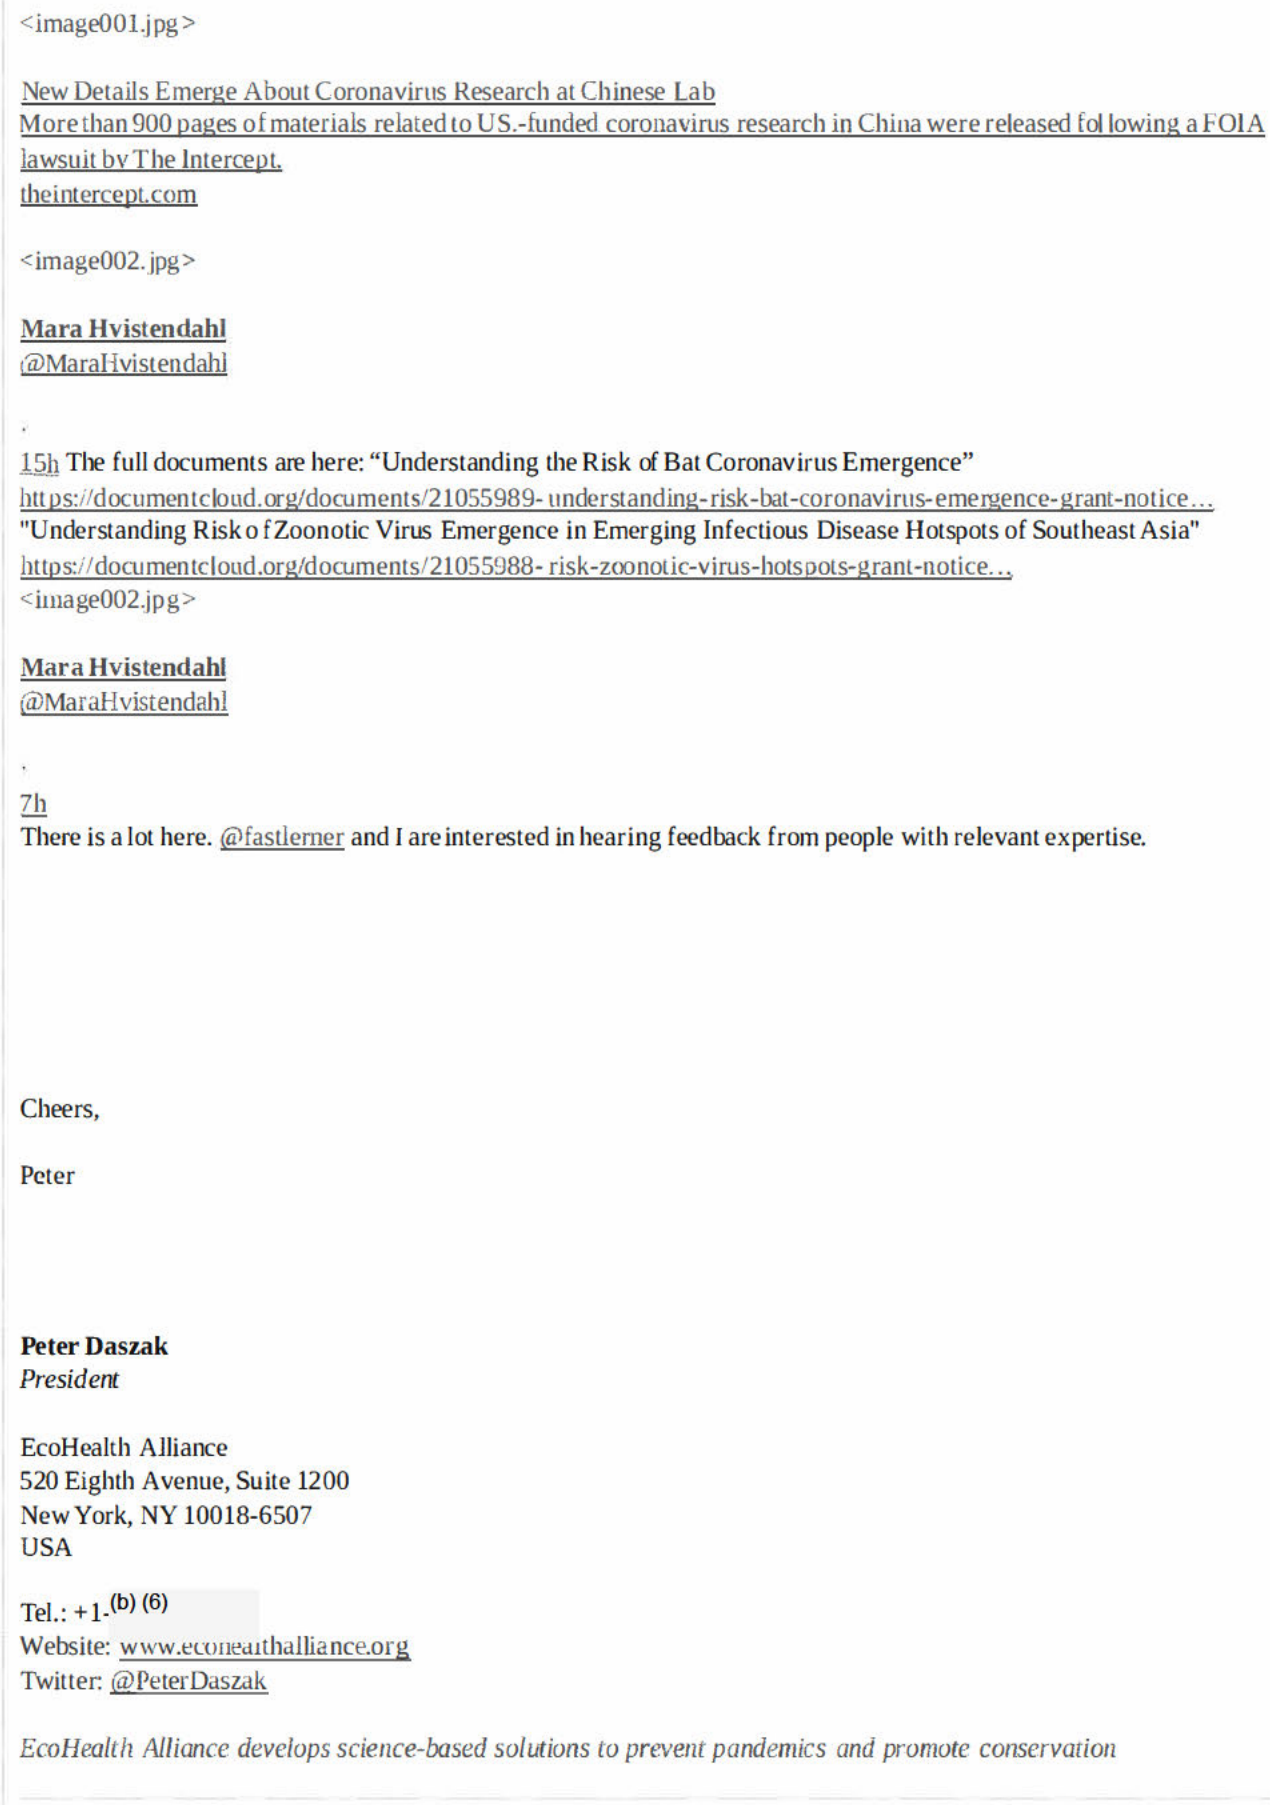
It's harassment, plain and simple - it has absolutely nothing to do with trying to find the truth of how SARS-CoV-2 emerged in the human population.

The way I see it though, we now have (a) the entire US IC having completed their investigation, (b) unredacted grants and annual reports from EcoHealth, and (c) old theses from the WIV.

This is *exactly* the type of information that Ebright, Metzl, Relman, Bloom, Chan, and the rest of the lot have been requesting. Now this work has been completed, what was unearthed? Nothing. Nada. Zilch. No evidence of the virus (or sequence) at the WIV (or anywhere else) prior to the pandemic. No gain-of-function work (despite what Ebright says). The same cloning system used again and again (WIV1). Vero cells used for virus isolation (SARS-CoV-2 loses the FCS in those cells), and no previously unreported viruses isolated (although I note the repeated use of "isolates" in one of the annual reports to describe 11 samples - I myself have made that mistake before). So again, there's nothing.

This absence of evidence is *in fact* evidence of absence in this particular case - there would have been *some* evidence for SARS-CoV-2 in *some* of these documents had it been at the WIV. Yet, nothing.

As for GOF work, again nothing. I note the mention of work with recombinant MERS in the year 3 report for work proposed in year 4 - depending on the nature of work, that could be considered GOF/DURC. However, when reading the year 4 report, I don't see any of that work mentioned - just work with pseudotyped viruses, which is clearly not GOF (or DURC).



Of course, people will take stuff out of context to make *anything* fit a particular narrative. However, there's an expiration date on bullshit and I suspect we're well past due.

To be honest, this whole process is beyond a joke. We're spending a huge amount of staff time dealing with the BS from these FoIA requests even though the grant's been terminated, suspended and funds are still unavailable.

The lab leakers are already stirring up bullshit lines of attack that will bring more negative publicity our way – which is what this is about – a way to line up the GoF attack on Fauci, or the 'risky research' attack on all of us.

Jesse Bloom's now trying to claim we weren't following our proposed rules for data release (not true – all SARSr-CoV RdRp sequences on Genbank in summer 2020, despite the grant being terminated) – he's tagging Alina Chan and 'The Seeker' on Twitter. Ebright's trying to claim we were working on MERS as a 'shadow' line of work. There'll be more to come – just a free-for-all effort to find a few sentences that they can take out of context.

Totally - that the real story of the FOIAed grants - no SC2 or anything close that could have been converted to it.

Metzl, Chan and others wanted a "forensic investigation.' The grants that they thought would be private and written before the pandemic do not mention a new SARS-like virus. YOu can be sure that a new virus 76% similar to SC1 would have been front and center in the applications and progress reports.

My guess this is part of the info the IC used to conclude no bioweapon, likely no engineering - NO SC2 before the pandemic. This Gof debate now very clearly has nothing to do with the origin of SC2.

External Sender. Be aware of links, attachments and requests.

Going through it carefully as we speak (already wasted a few hours) - because that's how idiotic this has become.

Nicely detailed annual reports - makes it easy to show that there's in fact no SARS-CoV-2 in there...

People have lost their minds with this s***.

EXTERNAL SENDER

The one I like best is Sachs has to admit that DEFUSE was not funded and the research wasn't done - but then he makes the wholly baseless assertion that EHA used other NIAID funds to do the DEFUSE work.

This is a textbook case of what Nobel laureate Irving Langmuir long ago called "pathological science." When his conclusions are challenged, the pathological scientist simply makes an ad hoc hypothesis without evidence to attempt to expain away the anomaly. This is the opposite of Isaac Newton's rigorous "hypotheses non fingo. "

As ever,
Jrff

Thanks david. If you listen to Francis Collins' comment and read the letter he's now responding to (guarantee Micheal Lauer is all over this), they've been asked a series of questions directly about ecohealth alliance and want all our communication with NIH.

Just feels like I'm being set up here as a patsy for the initial illegal action from NIH to cancel the grant. The letters from lauer flat out accuse us of being in breach of federal codes on biosafety monitoring. My lawyers say we are not, but NIH O/D is now the one who gets to talk publicly about it. Very upsetting.

Cheers,

Peter

A couple of weeks ago, I received the attached letter from the Republican minority leadership of the House Energy & Commerce Committee (EHA letter re. COVID origins attached).

MORENS_SUBPOENA_014173
MORENS_NIH_026765
REL0000478383

They're asking my 34 questions that are very detailed, all based on the lab leak conspiracy theory, and requesting answers by May 17th. They also ask to meet with me. I spoke to my lawyers who advised that I don't have to respond.

Their letter follows a letter to Francis Collins in March with similar questions. I've just seen a clip from him testifying last week where he's sucking up to these people explaining that the WHO should mount a more detailed investigation to follow up on questions we weren't able to address (exactly what's in our recommendations actually!). He then says he's preparing a detailed response to their letter to NIH. No doubt some of that response will involve handing over my 10 page response to NIH's demands for reinstatement of my grant (they ask for any response from EHA – their letter to him is attached). Here's the clip:
https://www.youtube.com/watch?v=BcB2W7CtvF0

The advice I'm asking is what should I do? To respond to these 34 questions would take days of work. It would take me and other staff off projects we're funded for, and get us defending conspiracy attacks for a project we're not even funded for right now, because of those attacks. My view is I can't win either way – if we don't respond, we'll be accused of hiding information or disrespecting congress. If I do respond, if fuels these conspiracies and gives them a chance to continue attacking us and undermining our work. Note that the minute these letters were sent, they were published on their websites with some innuendo and biased wording to make us look like we're in cahoots with a China-based lab release program. https://republicans-energycommerce.house.gov/news/ec-republican-leaders-request-information-from-u-s-group-affiliated-with-chinese-lab-at-center-of-covid-19-origin-investigation/

If asked about this publicly, one response could be: 1) our funding is cut and we don't have the staff to find answers to 34 detailed questions – it would take days of work; 2) these questions are not designed to find out answers to the origins of COVID, they're focused entirely on a widely debunked conspiracy that the virus originated in a lab – where are the questions on the more likely pathway of emergence from the wildlife trade?; 3) Any information I have about the origins of COVID-19 that has any relevance on further understanding these pathways was shared with the WHO on our mission, and/or is published in scientific papers (over a dozen in top journals from our work in China), or is in the process of being prepared for publication; 4) I have already sent a detailed response to NIH on their demands for similar information, in the hope that they can continue funding our work so we can get on the ground in China again and get to the bottom of the origins of COVID and identify risk of the next emerging pandemic.

I think we have a number of choices:

1) Respond to them in full
2) Set up a meeting to talk with them off the record, maybe to brief them on the origins of COVID work on the WHO committee, and what EHA is doing.
3) Send a letter with the above 4 responses (note – it would be published straight away I expect)
4) Reach out to the Majority on the committee (this is on my To Do list)
5) Do nothing (my current default)

Jerry – I'm around this weekend if you've got time to chat about this?

Cheers,

Peter

Thanks, David.
I support review and importance of last topic-continuing research essential. Define what has been accomplished, key issues for future, and touch conditions in which field and lab work should be done.

Phil here are my thoughts…..

I feel that "we" need to arrive at a consensus of what to do. We could do something, as many have suggested, or nothing at this time, as several have urged.

That Charlie Calisher (who coauthored our article last year) has had second thoughts, suggests that ASTMH members don't have consensus on at least some issues. To me that suggests it would be difficult to write something/things that take an ASTMH position, although views of individual scientists within ASTMH should be fine.

Of several related things that might be written about singly or together are:

Man-made virus origin

MORENS_SUBPOENA_017433
MORENS_NIH_035630
REL0000478388

Lab leak origin

Grant termination issues

Gain of function issues

Importance of continuing collaborative international research on sarbeco- and merbeco-virus

Last year's two papers covered the first 3 of the items above, and my sense is that we may not have unanimity on the first two of those. If we did a one year update we might have to do some finessing.

The third issue, grant termination, is something I would personally have difficulty doing since my boss, Tony, might take the heat, and I can't throw him under the bus, especially as he is working hard behind the scenes to undo the damage.

Gain of function is something that could be written about, but it is a bit tangential and in any case related to the man-made virus issue.

The issue of the importance of continuing sarbeco research is the easiest life, and if the focus was on that it would perhaps be possible to slip in a side dish of the unlikelihood of the first 2 issues, and perhaps the others as well.

I think that if we do tackle the first two subjects it will be a problem representing the Society. In my view, it would ideally be a paper by scientists themselves, not the Society as a whole.

The one year follow up, which I and several others have raised, would have to be such a paper, but several of us on this email have advised against doing even that.

So, where are we?

I look to the leadership, you Phil, Presidents past present and future, Karen, and other leaders to help steer this forward.

RE: Daily Mail: Now one of the original lab leak deniers calls for a 'thorough investigation' into Covid's origin as he admits 'a lot of disturbing information' has surfaced since he signed Lancet letter denouncing theory

David, Jerry, et al,

I'm fully supportive of a follow-up article in the AJTMH on COVID origins. The sooner the better. I suggest working, despite the craziness, on a fully reasoned and rational discussion, admitting uncertainty, but not implying that uncertainty supports a possibility with no scientific support. After the long, thoughtful piece last year, we might go with a short editorial format (~1000 words) this year, but alternatively this piece could again be a longer Perspective if this seems appropriate. I'm happy to help with writing if desired, but of course I'm not an expert in this area, and we have many experts involved.

Regards,
Phil

Subject: FW: Daily Mail: Now one of the original lab leak deniers calls for a 'thorough investigation' into Covid's origin as he admits 'a lot of disturbing information' has surfaced since he signed Lancet letter denouncing theory

Dear ASTMH colleagues,

As of today, shockingly, our own Charlie Calisher, who has been involved in so-called GOF research, and who coauthored last year's ASTMH paper, and who has been an esteemed colleague of mine for 45+ years, told the press in two separate interviews that he now thinks the lab leak theory is possible. Peter Palese, an esteemed researcher who has done and been accused of GOF research today said the same. I am very depressed by this, as I know these men and their scientific creds and their integrity.

What is going on?

Possibility no. 1: I am totally crazy and the whole world is a conspiracy that I am blind to.

Possibility no. 2: this is a McCarthy-era witch hunt story and good people are being drawn into it from fear, moral confusion, or a weak inability to evaluate scientific evidence I (I rather hope it's not the latter)….

Before deciding on which of these two, I would recommend seeing the play, or more conveniently and quickly the movie made from it, of Arthur Miller's McCarthy-era classic "The Crucible". I went through all of this as a kid. This whole thing is to me déjà vu all over again.

I don't know what, if anything, ASTMH can or should do, but let us at least agree that this is one of the most dangerous attacks on science in memory.

Surely we should have a voice in some sphere.

Now one of the original lab leak deniers calls for a 'thorough investigation' into Covid's origin as he admits 'a lot of disturbing information' has surfaced since he signed Lancet letter denouncing theory

- **EXCLUSIVE: Peter Palese has U-turned after claiming virus was natural in origin**
- **New York microbiologist signed letter in Lancet denouncing all other theories**
- **'Bullying' letter has been described as ostracizing dissenting voices in science**

By Joe Davies For Mailonline
Published: 12:11 EDT, 4 June 2021 | Updated: 13:46 EDT, 4 June 2021

<image003.jpg>
Dr Peter Palese, a professor of microbiology at the Icahn School of Medicine at Mount Sinai in New York, has U-turned after previously supporting a letter denying that COVID-19 could've leaked from a Wuhan lab

One of the 27 Covid lab leak deniers who signed a letter denouncing the theory that the virus escaped from a lab in Wuhan has now called for a 'thorough investigation' into Covid's origins, MailOnline can reveal.

Dr Peter Palese, a microbiologist at the Icahn School of Medicine at Mount Sinai in New York, signed the letter in the Lancet in February last year claiming the virus could only have been natural in origin and to suggest otherwise would create 'fear, rumors, and prejudice'.

The 'bullying' letter was criticized by experts for ostracizing anyone offering different opinions on the virus' origins, dismissing them as conspiracy theorists.

It is only now, nearly 16 months after that letter was published in the world-renowned medical journal, that the theory Covid was accidentally leaked from a lab in Wuhan is being looked at seriously.

US President **Joe Biden** last week ordered intelligence agencies to launch a probe into whether Covid was man-made after all. But China immediately hit back and called the suggestion a 'conspiracy'.

And now Professor Palese, 77, has made a significant U-turn, admitting all theories on how Covid came about now need proper investigating.

He told MailOnline: 'I believe a thorough investigation about the origin of the Covid-19 virus is needed.

'A lot of disturbing information has surfaced since the Lancet letter I signed, so I want to see answers covering all questions.'

Asked how he was originally approached to sign the letter and what new information had come to light specifically, Professor Palese declined to comment.

Palese spoke out as America's leading pandemic expert Dr. Anthony Fauci continues to face fevered calls to resign after emails revealed that leading virus experts warned Covid could be man-made even as he downplayed the possibility.

The emails also showed he communicated with Dr. Peter Daszak, the head of a non-profit that funneled U.S. taxpayer dollars to the Wuhan Institute of Virology.

Biden through his support behind the embattled expert on Friday, saying: 'Yes I'm very confident in Dr. Fauci.'

Dr. Daszak - a key architect of the Lancet letter - runs the New York-based, tax payer-funded non-profit EcoHealth Alliance, which has funneled hundreds of thousands of dollars to the Wuhan Institute of Virology.

Guardian forced to amend article it published by Peter Daszack to reveal his ties to Wuhan lab as Lancet editor voices support for lab leak theory denouncement

The Guardian was forced to amend an article it published by Dr Peter Daszack to include a reference to his work with the Wuhan Institute of Virology.

The article, published in June last year, was amended three days after its publication.

In the article titled 'Ignore the conspiracy theories: scientists know Covid-19 wasn't created in a lab', Dr Daszack

MORENS_SUBPOENA_017437
MORENS_NIH_035634
REL0000478388

said the lab-leak theory was a 'chapter in a tale of blame, misinformation and finger-pointing'.
He characterised lab-leak theorists as 'conspiracy theorists' believing in 'frankenviruses'.
The Guardian was forced to amend the original article to highlight Dr Daszack's ties to the Wuhan lab from where some suggest Covid was accidentally leaked.
The paper said: 'This article was amended on 11 June 2020 to make clear the writer's past work with researchers at the Wuhan Institute of Virology.'
Editor of the Lancet Richard Horton — who published the letter dismissing theories Covid may not have originated naturally in his prestigious scientific journal — Tweeted support for the piece.
He wrote: 'Peter Daszak rejects conspiracy theories about the origins of Covid-19 and he knows more than most of us about coronaviruses.'
Mr Horton has regularly criticised lab-leak theories during the pandemic.
He told the Hong Kong-based South China Morning Post it was it is 'not helpful' and 'unfair' to blame China for being the source of the pandemic last year.
He worked with the lab's so-called 'bat woman' Shi Zhengli as they investigated and modified coronaviruses.
Shi, 57, proved that horseshoe bats were behind a SARS virus that killed nearly 800 people in 2002 and has collected thousands of samples from bat caves.
Dr Daszak was one four Brits to sign the letter, including SAGE advisor Sir Jeremy Farrar and two other experts working for the Welcome Trust at the time. The letters' signatories included four others who worked for EcoHealth.
Jamie Metzl, who sits on the World Health Organization's advisory committee on human genome editing and is a form Bill Clinton administration staffer, said Dr Daszak's letter was a 'form of thuggery'.
He said: 'The Lancet letter was scientific propaganda and a form of thuggery and intimidation.
'By labeling anyone with different views a conspiracy theorist, the Lancet letter was the worst form of bullying in full contravention of the scientific method.'
MailOnline has approached the letters' other signatories for comment.
A Freedom of Information Act request revealed Dr Daszak told his fellow signatories in an email that the letter would not be sent under the EcoHealth logo 'and will not be identifiable as coming from any one organization of person'.
The emails show he even considered not signing the letter himself, although in the end he did.
The idea, he said was for it to be coming from 'a community supporting our colleagues'.
The letter — titled 'Statement in support of the scientists, public health professionals, and medical professionals of China combatting Covid-19' — praised the Chinese 'who continue to save lives and protect global health during the challenge of the Covid-19 outbreak'.
It went on to add: 'We stand together to strongly condemn conspiracy theories suggesting that Covid-19 does not have a natural origin.
'Conspiracy theories do nothing hut create fear, rumors and prejudices that jeopardize our global collaboration in the fight against the virus.'
It ended with the words: 'We declare no competing interests.'
The letter proved so influential that it virtually ended debate on the origin of Covid for more than a year.
Anyone who suggested it could have been man-made was shot down amid accusations of anti-Chinese xenophobia.
Robert Redfield, the former director of the Centers for Disease Control told **Vanity Fair** he received death threats after floating the theory that the virus could have been man-made.
He said: 'I was threatened and ostracized because I proposed another hypothesis. I expected it from politicians. I didn't expect it from science.'
Dr Peter Daszak, 55, from Manchester, orchestrated a behind-the-scenes 'bullying' campaign to ensure blame for Covid was directed away from a Chinese lab with which he had worked closely.
Dr Daszack worked with the lab's so-called 'bat woman' Shi Zhengli (pictured left) as they investigated and modified coronaviruses. Shi, 57, proved that horseshoe bats were behind a SARS virus that killed nearly 800 people in 2002 and has collected thousands of samples from bat caves
The theory the virus escaped from the Wuhan Institute of Virology was originally dismissed by left-leaning media outlets last year as a conspiracy theory after it was mentioned by then-President Donald Trump.
But they have now changed course with the launch of the US investigation.
Liberal US outlets, who slammed Mr Trump when he said a year ago said he had 'a high degree of confidence' that the virus escaped from a lab, have finally conceded that he may have been right — after a year ridiculing the suggestion.

The lab-leak theory was bolstered last week after it was revealed three workers at the Wuhan lab were hospitalized in November, 2019, months before Covid was first discovered in China.

China claims the virus was transmitted to humans from an animal host, with bats and pangolins both named as potential sources. Many scientists agree that is the most likely theory.

Professor of clinical microbiology at the University of Cambridge Ravi Gupta, a member of Nervtag, said the theory has not yet been investigated with 'scientific rigor'.

He told **The Telegraph**: 'The possibility was not adequately explored due to lack of access to primary records by the WHO group. Lab leak has not been scientifically rejected as a cause using [the] scientific rigor that one would expect.'

A soon to be published report by a team of British and Norwegian experts suggests it is possible to trace the creation of the virus to research in China that began in 2008.

Professor David Relman, a microbiologist at Stanford University, said the theory needs to be investigated by an international consortium of scientists in collaboration with the UN.

He said: 'Ideally, an investigation would rely on an international consortium of scientists under the auspices of many national academies of science working in partnership, in collaboration with an international governance entity, the UN Secretary General's Office, or something of that sort.'

And Harvard epidemiologist Professor Marc Lipsitch said a lab escape scenario 'remains plausible enough that it should be looked into rigorously'.

He told the paper: 'This is not a fringe position, given that multiple European governments and Dr Tedros have said the same.'

He said that while scientists are not saying a lab origin is more likely than a natural one, a thorough investigation is needed to reveal the cause of the pandemic.

As Dr Daszak's links to the Wuhan lab become clearer, more questions are being asked about his influence over the WHO team that went to China in January and stayed for four weeks searching for answers.

The team was met with resistance in China. Authorities there made them quarantine for two weeks in Wuhan and barred two members completely after they tested positive for coronavirus antibodies.

But critics say the WHO researchers were too cozy with Chinese authorities, who are desperate not to shoulder the blame for a worldwide death toll now approaching 3.6 million.

They claim its members may have been influenced by a tour they took round a 'propaganda museum' which described Wuhan's fight against the virus and the leading role taken by President Xi Jinping.

While China has tried to insist the virus originated elsewhere, academics, politicians and the media have begun to contemplate the possibility it escaped from the WIV - raising suspicions that Chinese officials simply hid evidence of the early spread

MORENS_SUBPOENA_017439
MORENS_NIH_035636
REL0000478388

The Wuhan Institute of Virology is about 20 miles from the Huanan Seafood Market where the first coronavirus cases are reported to have occurred

In recent weeks, the lab-escape theory has gained ground. Already British intelligence officials, who are helping the US search for the cause of the pandemic that has cost nearly 600,000 American lives, are said to be leaning towards the man-made scenario.

Last week MailOnline revealed two leading scientists had found 'unique fingerprints' in Covid samples that could only have come from lab manipulation.

British Professor Angus Dalgleish and Norwegian scientist Birger Sørensen, wrote that they have had 'prima facie evidence of retro-engineering in China' for a year — but were ignored by academics and major journals.

Did Covid originate in Chinese lab?

The Wuhan Institute of Virology has been collecting numerous coronaviruses frombats ever since the SARS outbreak in 2002.

They have also published papers describing how these bat viruses have interacted with human cells.

US Embassy staff visited the lab in 2018 and 'had grave safety concerns' over the protocols which were being observed at the facility.

The lab is just eight miles from the Huanan wet market which is where the first cluster of infections erupted in Wuhan.

The market is just a few hundred yards from another lab called the Wuhan Centers for Disease Prevention and Control (WHCDC).

The WHCDC kept disease-ridden animals in its labs, including some 605 bats.

Those who support the theory argue that Covid-19 could have leaked from either orboth ofthese facilities and spread to the wet market.

Most argue that this would have been a virus they were studying rather than one which was engineered.

Last year a bombshell paper from the Beijing-sponsored South China University of Technology recounted how bats once attacked a researcher at the WHCDC and 'blood of bat was on his skin.'

The report says: 'Genome sequences from patients were 96% or 89% identical to the Bat CoV ZC45 coronavirus originally found in Rhinolophus affinis (intermediate horseshoe bat).'

It describes how the only native bats are found around 600 miles away from the Wuhan seafood market and that the probability of bats flying from Yunnan and Zhejiang provinces was minimal.

In addition there is little to suggest the local populace eat the bats as evidenced by testimonies of 31 residents and 28 visitors.

Instead the authors point to research being carried out within 300 yards at the WHCDC.

One of the researchers at the WHCDC described quarantining himself for two weeks after a bat's blood got on his skin, according to the report. That same man also quarantined himself after a bat urinated on him.

And he also mentions discovering a live tick from a bat - parasites known for their ability to pass infections through a host animal's blood.

'The WHCDC was also adjacent to the Union Hospital (Figure 1, bottom) where the first group of doctors were infected during this epidemic.' The report says.

'It is plausible that the virus leaked around and some of them contaminated the initial patients in this epidemic, though solid proofs are needed in future study.'

Professor Dalgleish, 71, a vaccine researcher and professor of oncology at St George's Hospital, last year struggled to find a publisher for his paper suggesting the virus's spike protein contains artificially inserted sequences.

He said the research was shunned by the scientific community, who did not want to threaten China or be seen to be agreeing with President Donald Trump — who was a big advocate for the theory the virus was leaked from a lab at the time.

The oncologist said: 'The changes required to infect humans are extremely unlikely to have occurred naturally.'

Professor Dalgleish — who ran for Parliament as a UKIP candidate in 2015 — said the President's use of the terms 'Wuhan flu' and 'China virus' damaged scientific debate on the subject.

He told **The Times**: 'I was basically ostracized. I was fearful — really frightened by the way I was being treated. I was told I was not an expert on coronaviruses and I should just shut up.

'We couldn't believe people with whom we'd collaborated and published papers with in the past would shun us— I was warned I was out of my depth and I shouldn't get into this and I'd make a fool of myself.'

And just last week President Joe Biden ordered another look at the theory as part of a wide-ranging intelligence investigation into the pandemic's origins. He felt it so urgent that he put a 90-day deadline for a conclusion.

Emails from Dr Anthony Fauci, Mr Biden's chief medical advisor, show that leading virus experts warned Covid could be man-made even as he downplayed the possibility.

Fauci says those emails, obtained by Buzzfeed, have been taken out of context.

But he did U-turn about where the virus may have originated this week, saying 'you never know'.

One of them was from Dr Daszak, who thanked Dr Fauci for pushing back on the man-made theory.

In April, Dr Drazak wrote: 'I just wanted to say a personal thank you on behalf of our staff and collaborators, for publicly standing up and stating that the scientific evidence supports a natural origin for Covid-19 from a bat-to-human spillover, not a lab release from the Wuhan Institute of Virology.'

Even WHO's Ethiopian director-general Tedros Adhanom Ghebreyesus said the report was not extensive enough and more work needed to be done to discover the cause of Covid.

'As far as WHO is concerned, all hypotheses remain on the table,' he said.

'This report is a very important beginning, but it is not the end.'

America is looking at the theory seriously, leading to China hitting out at the 'dark history' of the US intelligence community after President Biden's probe was announced.

Lijian Zhao, foreign ministry spokesman who has been Beijing's point-man in trying to pin blame for the pandemic outside the country's borders, accused the US of trying to shift blame away from its own high Covid case and death counts - and suggested security services may be involved in a cover-up.

Meanwhile Hu Xijin, editor of the state mouthpiece Global Times newspaper, accused Biden of trying to discredit a WHO investigation which concluded that a lab leak is 'unlikely' — although critics have previously blasted that report as a China-centric whitewash.

China's American embassy also hit out, accusing Biden and his security services of being 'fixated on political manipulation and (the) blame game' in a statement on its website.

No10 officials have called for investigators to probe all theories as to how the Covid pandemic began.

Dominic Cummings this week revealed the PM held meetings when the crisis first began to discuss whether it had 'escaped' from a laboratory and whether the disease had been 'engineered'.

The Lancet letter in full: 'Statement in support of the scientists, public health professionals, and medical professionals of China combatting COVID-19'

We are public health scientists who have closely followed the emergence of 2019 novel coronavirus disease (Covid-19) and are deeply concerned about its impact on global health and wellbeing.

We have watched as the scientists, public health professionals, and medical professionals of China, in particular, have worked diligently and effectively to rapidly identify the pathogen behind this outbreak, put in place significant measures to reduce its impact, and share their results transparently with the global health community. This effort has been remarkable.

We sign this statement in solidarity with all scientists and health professionals in China who continue to save lives and protect global health during the challenge of the Covid-19 outbreak.

We are all in this together, with our Chinese counterparts in the forefront, against this new viral threat.

The rapid, open, and transparent sharing of data on this outbreak is now being threatened by rumours and misinformation around its origins.

We stand together to strongly condemn conspiracy theories suggesting that Covid-19 does not have a natural origin.

Scientists from multiple countries have published and analysed genomes of the causative agent, severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), and they overwhelmingly conclude that this coronavirus originated in wildlife, as have so many other emerging pathogens.

This is further supported by a letter from the presidents of the US National Academies of Science, Engineering, and Medicine and by the scientific communities they represent.

Conspiracy theories do nothing but create fear, rumours, and prejudice that jeopardise our global collaboration in the fight against this virus.

We support the call from the Director-General of WHO to promote scientific evidence and unity over misinformation and conjecture.

We want you, the science and health professionals of China, to know that we stand with you in your fight against this virus.

We invite others to join us in supporting the scientists, public health professionals, and medical professionals of Wuhan and across China. Stand with our colleagues on the frontline!

We speak in one voice. To add your support for this statement, sign our letter online. LM is editor of ProMED-mail. We declare no competing interests.

Sen. Rand Paul says Fauci's emails paint a 'disturbing picture' about what he knew about work inside the Wuhan lab

Sen. **Rand Paul** continued his blitz on Dr. **Anthony Fauci** in the wake of Fauci's email dump, telling Fox that Fauci knew the US was funding gain-of-function research in Wuhan even though he continues to deny it.

The Republican from **Kentucky** told Fox Thursday night that Fauci's emails 'tell me early on that he was very worried' before the pandemic even started.

'There's a disturbing picture. He gets an email or he gets notification of what's going on in Wuhan and immediately sends something to his assistant saying, "We must meet immediately." And in the subject line it says gain of function research in Wuhan.'

MORENS_SUBPOENA_017441
MORENS_NIH_035638
REL0000478388

While Paul and other Republicans have come after Fauci, Biden reaffirmed his confidence in Fauci in a Friday morning press conference.
The president had actually left the room where he gave the speech when DailyMail.com shouted a question to him about the director of the U.S. National Institute of Allergy and Infectious Diseases.
President Biden stuck his head back in to answer.
'Yes I'm very confident in Dr. Fauci,' he said.
Paul's Thursday night interview on Fox - and weeks of public comments that - makes it clear that senator doesn't share have the same faith in Fauci, and he alluded to a February 1, 2020 email exchange between Fauci and Principal NIAID Director Dr. Hugh Auchincloss.
Auchincloss wrote to Fauci to discuss a paper Fauci sent him appearing to question if National Institute of Health (NIH) grants funded gain-of-function research relating to coronaviruses.
In the email to Fauci, Auchincloss said, 'The paper you sent me says the experiments were performed before the gain of function pause but have since been reviewed and approved by NIH.'
He also noted that a colleague would 'try to determine if we have any distant ties to this work abroad.'
This was one of the 3,200-plus emails obtained and published by Buzzfeed News on Tuesday.
The NIH awarded a $3.7 million grant to EcoHealth Alliance, which is based in the United States, to study the risk of coronaviruses emerging from bats in 2014. EcoHealth Alliance in turn distributed nearly $600,000 of that funding to its collaborator, the Wuhan Institute of Virology.
The senator also took a shot Thursday at the embattled chief medical advisor on Twitter after Amazon and Barnes & Noble pulled his book from their sites because it wasn't supposed to be released until November: 'Oh, I don't know. I think they should publish it. I love science fiction.'
Paul's interview came after Fauci dismissed the recent revelations that he was warned that COVID-19 may have been 'engineered' and said that the emails are easily misunderstood.
During a Wednesday interview on the Donlon Report, Fauci said of the emails, 'The only trouble is they are really ripe to be taken out of context where someone can snip out a sentence in an email without showing the other emails, and say "based on an email from Dr. Fauci, he said such and such" where you don't really have the full context.'
Fauci added that the Wuhan lab 'is a very large lab to the tune of hundreds of millions, if not billions of dollars.'
'The grant that we're talking about was $600,000 over five years for an average of about $125,000 to $140,000 a year,' he said.
Fauci also said on Donlon that he 'can't guarantee everything that is going on in the Wuhan lab.'
Paul has been on Fox twice since a trove of Fauci's emails - dating from January to June 2020 - were obtained and published by Buzzfeed on Tuesday.
Within hours of publication, Paul tweeted '#firefauci' and other Republicans, like Majorie Greene Taylor, followed suit.
Until recently, the Wuhan lab leak was at best a fringe theory, and it has been mostly laughed off by many scientists. The general consensus on COVID-19's origin was that it jumped from a bat to a human in the Wuhan market.
Despite the recent scrutiny, Fauci continues to say that's what he believes happened.
During Senate committee hearings in early May, Paul sparred with Fauci over the two origin theories and said the lab leak is a real possibility that's not being acknowledged.
Instead of investigating the cause of COVID-19 'government authorities - self-interested in continuing gain of function research - say there's nothing to see here,' Paul said during the May 11 hearing.
'To arrive at the truth, the U.S. government should admit that the Wuhan Virology Institute was experimenting to enhance the coronavirus' ability to infect humans,' he said.
The lab leak theory is now one that President Joe Biden wants investigated.
Last week, Biden ordered a 90-day review to investigate the possibility and several high-profile public health experts have come out in recent months saying they believe that's how COVID-19 started.
British intelligence also reportedly assessed the theory recently and upgraded its likeliness from 'remote' to 'feasible'.

Agree, but we must borrow heavily on their published research to tell the science.

Tom Monath is a great scientist and an excellent writer. Really good at integration.

David, You, Tom Monath, and Peter Daszak for early drafts. Jim Leduc and Jerry Keusch for safety. Consider adding Shi Zhengli, Heinz Feldmann…First, define the questions which are probably posed in EcoHealth Alliance grant applications.

On Jun 5, 2021, at 12:43 PM, Morens, David (NIH/NIAID) [E] < wrote:

Phil here are my thoughts…..

I feel that "we" need to arrive at a consensus of what to do. We could do something, as many have suggested, or nothing at this time, as several have urged.

That Charlie Calisher (who coauthored our article last year) has had second thoughts, suggests that ASTMH members don't have consensus on at least some issues. To me that suggests it would be difficult to write something/things that take an ASTMH position, although views of individual scientists within ASTMH should be fine.

Of several related things that might be written about singly or together are:

Man-made virus origin

Lab leak origin

Grant termination issues

Gain of function issues

Importance of continuing collaborative international research on sarbeco- and merbeco-virus

Last year's two papers covered the first 3 of the items above, and my sense is that we may not have unanimity on the first two of those. If we did a one year update we might have to do some finessing.

The third issue, grant termination, is something I would personally have difficulty doing since my boss, Tony, might take the heat, and I can't throw him under the bus, especially as he is working hard behind the scenes to undo

MORENS_SUBPOENA_017422
MORENS_NIH_035619
REL0000478390

the damage.

Gain of function is something that could be written about, but it is a bit tangential and in any case related to the man-made virus issue.

The issue of the importance of continuing sarbeco research is the easiest life, and if the focus was on that it would perhaps be possible to slip in a side dish of the unlikelihood of the first 2 issues, and perhaps the others as well.

I think that if we do tackle the first two subjects it will be a problem representing the Society. In my view, it would ideally be a paper by scientists themselves, not the Society as a whole.

The one year follow up, which I and several others have raised, would have to be such a paper, but several of us on this email have advised against doing even that.

So, where are we?

I look to the leadership, you Phil, Presidents past present and future, Karen, and other leaders to help steer this forward.

RE: Daily Mail: Now one of the original lab leak deniers calls for a 'thorough investigation' into Covid's origin as he admits 'a lot of disturbing information' has surfaced since he signed Lancet letter denouncing theory

David, Jerry, et al,
I'm fully supportive of a follow-up article in the AJTMH on COVID origins. The sooner the better. I

MORENS_SUBPOENA_017423
MORENS_NIH_035620
REL0000478390

suggest working, despite the craziness, on a fully reasoned and rational discussion, admitting uncertainty, but not implying that uncertainty supports a possibility with no scientific support. After the long, thoughtful piece last year, we might go with a short editorial format (~1000 words) this year, but alternatively this piece could again be a longer Perspective if this seems appropriate. I'm happy to help with writing if desired, but of course I'm not an expert in this area, and we have many experts involved.
Regards,
Phil

FW: Daily Mail: Now one of the original lab leak deniers calls for a 'thorough investigation' into Covid's origin as he admits 'a lot of disturbing information' has surfaced since he signed Lancet letter denouncing theory

Dear ASTMH colleagues,

As of today, shockingly, our own Charlie Calisher, who has been involved in so-called GOF research, and who coauthored last year's ASTMH paper, and who has been an esteemed colleague of mine for 45+ years, told the press in two separate interviews that he now thinks the lab leak theory is possible. Peter Palese, an esteemed researcher who has done and been accused of GOF research today said the same. I am very depressed by this, as I know these men and their scientific creds and their integrity.

What is going on?

Possibility no. 1: I am totally crazy and the whole world is a conspiracy that I am blind to.

Possibility no. 2: this is a McCarthy-era witch hunt story and good people are being drawn into it from fear, moral confusion, or a weak inability to evaluate scientific evidence I (I rather hope it's not the latter)….

Before deciding on which of these two, I would recommend seeing the play, or more conveniently and quickly the movie made from it, of Arthur Miller's McCarthy-era classic "The Crucible". I went through all of this as a kid. This whole thing is to me déjà vu all over again.

I don't know what, if anything, ASTMH can or should do, but let us at least agree that this is one of the most dangerous attacks on science in memory.

Surely we should have a voice in some sphere.

Now one of the original lab leak deniers calls for a 'thorough investigation' into Covid's origin as he admits 'a lot of disturbing information' has surfaced since he signed Lancet letter denouncing theory

- **EXCLUSIVE: Peter Palese has U-turned after claiming virus was natural in origin**
- **New York microbiologist signed letter in Lancet denouncing all other theories**
- **'Bullying' letter has been described as ostracizing dissenting voices in science**

By Joe Davies For Mailonline
Published: 12:11 EDT, 4 June 2021 | Updated: 13:46 EDT, 4 June 2021

Dr Peter Palese, a professor of microbiology at the Icahn School of Medicine at Mount Sinai in New York, has U-turned after previously supporting a letter denying that COVID-19 could've leaked from a Wuhan lab

One of the 27 Covid lab leak deniers who signed a letter denouncing the theory that the virus escaped from a lab in Wuhan has now called for a 'thorough investigation' into Covid's origins, MailOnline can reveal.

Dr Peter Palese, a microbiologist at the Icahn School of Medicine at Mount Sinai in New York, signed the letter in the Lancet in February last year claiming the virus could only have been natural in origin and to suggest otherwise would create 'fear, rumors, and prejudice'.

The 'bullying' letter was criticized by experts for ostracizing anyone offering different opinions on the virus' origins, dismissing them as conspiracy theorists.

It is only now, nearly 16 months after that letter was published in the world-renowned medical journal, that the theory Covid was accidentally leaked from a lab in Wuhan is being looked at seriously.

US President **Joe Biden** last week ordered intelligence agencies to launch a probe into whether Covid was man-made after all. But **China** immediately hit back and called the suggestion a 'conspiracy'.

And now Professor Palese, 77, has made a significant U-turn, admitting all theories on how Covid came about now need proper investigating.

He told MailOnline: 'I believe a thorough investigation about the origin of the Covid-19 virus is needed. 'A lot of disturbing information has surfaced since the Lancet letter I signed, so I want to see answers covering all questions.'

Asked how he was originally approached to sign the letter and what new information had come to light specifically, Professor Palese declined to comment.

Palese spoke out as America's leading pandemic expert Dr. Anthony Fauci continues to face fevered calls to resign after emails revealed that leading virus experts warned Covid could be man-made even as he downplayed the possibility.

The emails also showed he communicated with Dr. Peter Daszak, the head of a non-profit that funneled U.S. taxpayer dollars to the Wuhan Institute of Virology.

Biden through his support behind the embattled expert on Friday, saying: 'Yes I'm very confident in Dr. Fauci.'

Dr. Daszak - a key architect of the Lancet letter - runs the New York-based, tax payer-funded non-profit EcoHealth Alliance, which has funneled hundreds of thousands of dollars to the Wuhan Institute of Virology.

Guardian forced to amend article it published by Peter Daszack to reveal his ties to Wuhan lab as Lancet editor voices support for lab leak theory denouncement

The Guardian was forced to amend an article it published by Dr Peter Daszack to include a reference to his work with the Wuhan Institute of Virology.

The article, published in June last year, was amended three days after its publication.

In the article titled 'Ignore the conspiracy theories: scientists know Covid-19 wasn't created in a lab', Dr Daszack said the lab-leak theory was a 'chapter in a tale of blame, misinformation and finger-pointing'.

He characterised lab-leak theorists as 'conspiracy theorists' believing in 'frankenviruses'.

The Guardian was forced to amend the original article to highlight Dr Daszack's ties to the Wuhan lab from

MORENS_SUBPOENA_017426
MORENS_NIH_035623
REL0000478390

where some suggest Covid was accidentally leaked.
The paper said: 'This article was amended on 11 June 2020 to make clear the writer's past work with researchers at the Wuhan Institute of Virology.'
Editor of the Lancet Richard Horton — who published the letter dismissing theories Covid may not have originated naturally in his prestigious scientific journal — Tweeted support for the piece.
He wrote: 'Peter Daszak rejects conspiracy theories about the origins of Covid-19 and he knows more than most of us about coronaviruses.'
Mr Horton has regularly criticised lab-leak theories during the pandemic.
He told the Hong Kong-based South China Morning Post it was it is 'not helpful' and 'unfair' to blame China for being the source of the pandemic last year.
He worked with the lab's so-called 'bat woman' Shi Zhengli as they investigated and modified coronaviruses.
Shi, 57, proved that horseshoe bats were behind a SARS virus that killed nearly 800 people in 2002 and has collected thousands of samples from bat caves.
Dr Daszak was one four Brits to sign the letter, including SAGE advisor Sir Jeremy Farrar and two other experts working for the Welcome Trust at the time. The letters' signatories included four others who worked for EcoHealth.
Jamie Metzl, who sits on the World Health Organization's advisory committee on human genome editing and is a form Bill Clinton administration staffer, said Dr Daszak's letter was a 'form of thuggery'.
He said: 'The Lancet letter was scientific propaganda and a form of thuggery and intimidation.
'By labeling anyone with different views a conspiracy theorist, the Lancet letter was the worst form of bullying in full contravention of the scientific method.'
MailOnline has approached the letters' other signatories for comment.
A Freedom of Information Act request revealed Dr Daszak told his fellow signatories in an email that the letter would not be sent under the EcoHealth logo 'and will not be identifiable as coming from any one organization of person'.
The emails show he even considered not signing the letter himself, although in the end he did.
The idea, he said was for it to be coming from 'a community supporting our colleagues'.
The letter — titled 'Statement in support of the scientists, public health professionals, and medical professionals of China combatting Covid-19' — praised the Chinese 'who continue to save lives and protect global health during the challenge of the Covid-19 outbreak'.
It went on to add: 'We stand together to strongly condemn conspiracy theories suggesting that Covid-19 does not have a natural origin.
'Conspiracy theories do nothing but create fear, rumors and prejudices that jeopardize our global collaboration in the fight against the virus.'
It ended with the words: 'We declare no competing interests.'
The letter proved so influential that it virtually ended debate on the origin of Covid for more than a year. Anyone who suggested it could have been man-made was shot down amid accusations of anti-Chinese xenophobia.
Robert Redfield, the former director of the Centers for Disease Control told **Vanity Fair** he received death threats after floating the theory that the virus could have been man-made.
He said: 'I was threatened and ostracized because I proposed another hypothesis. I expected it from politicians. I didn't expect it from science.'
Dr Peter Daszak, 55, from Manchester, orchestrated a behind-the-scenes 'bullying' campaign to ensure blame for Covid was directed away from a Chinese lab with which he had worked closely.
Dr Daszack worked with the lab's so-called 'bat woman' Shi Zhengli (pictured left) as they investigated and modified coronaviruses. Shi, 57, proved that horseshoe bats were behind a SARS virus that killed nearly 800 people in 2002 and has collected thousands of samples from bat caves
The theory the virus escaped from the Wuhan Institute of Virology was originally dismissed by left-leaning media outlets last year as a conspiracy theory after it was mentioned by then-President Donald Trump.
But they have now changed course with the launch of the US investigation.
Liberal US outlets, who slammed Mr Trump when he said a year ago said he had 'a high degree of confidence' that the virus escaped from a lab, have finally conceded that he may have been right — after a year ridiculing the suggestion.

Who signed the letter in The Lancet?

The lab-leak theory was bolstered last week after it was revealed three workers at the Wuhan lab were hospitalized in November, 2019, months before Covid was first discovered in China.

China claims the virus was transmitted to humans from an animal host, with bats and pangolins both named as potential sources. Many scientists agree that is the most likely theory.

Professor of clinical microbiology at the University of Cambridge Ravi Gupta, a member of Nervtag, said the theory has not yet been investigated with 'scientific rigor'.

He told **The Telegraph**: 'The possibility was not adequately explored due to lack of access to primary records by the WHO group. Lab leak has not been scientifically rejected as a cause using [the] scientific rigor that one would expect.'

A soon to be published report by a team of British and Norwegian experts suggests it is possible to trace the creation of the virus to research in China that began in 2008.

Professor David Relman, a microbiologist at Stanford University, said the theory needs to be investigated by an international consortium of scientists in collaboration with the UN.

He said: 'Ideally, an investigation would rely on an international consortium of scientists under the auspices of many national academies of science working in partnership, in collaboration with an international govemance entity, the UN Secretary General's Office, or something of that sort.'

And Harvard epidemiologist Professor Marc Lipsitch said a lab escape scenario 'remains plausible enough that itshould be looked into rigorously'.

He told the paper: 'This is not a fringe position, given that multiple European governments and Dr Tedros have said the same.'

He said that while scientists are not saying a lab origin is more likely than a natural one, a thorough investigation is needed to reveal the cause of the pandemic.

As Dr Daszak's links to the Wuhan lab become clearer, more questions are being asked about his influence over the WHO team that went to China in January and stayed for four weeks searching for answers.

The team was met with resistance in China. Authorities there made them quarantine for two weeks in Wuhan and barred two members completely after they tested positive for coronavirus antibodies.

But critics say the WHO researchers were too cozy with Chinese authorities, who are desperate not to shoulder the blame for a worldwide death toll now approaching 3.6 million.

They claim its members may have been influenced by a tour they took round a 'propaganda museum' which described Wuhan's fight against the virus and the leading role taken by President Xi Jinping.

While China has tried to insist the virus originated elsewhere, academics, politicians and the media have begun to contemplate the possibility it escaped from the WIV - raising suspicions that Chinese officials simply hid evidence of the early spread

The Wuhan Institute of Virology is about 20 miles from the Huanan Seafood Market where the first coronavirus cases are reported to have occurred

MORENS_SUBPOENA_017428

REL0000478390

In recent weeks, the lab-escape theory has gained ground. Already British intelligence officials, who are helping the US search for the cause of the pandemic that has cost nearly 600,000 American lives, are said to be leaning towards the man-made scenario.

Last week MailOnline revealed two leading scientists had found ‘unique fingerprints’ in Covid samples that could only have come from lab manipulation.

British Professor Angus Dalgleish and Norwegian scientist Birger Sørensen, wrote that they have had 'prima facie evidence of retro-engineering in China' for a year — but were ignored by academics and major journals.

Did Covid originate in Chinese lab?

The Wuhan Institute of Virology has been collecting numerous coronaviruses from bats ever since the SARS outbreak in 2002.

They have also published papers describing how these bat viruses have interacted with human cells.

US Embassy staff visited the lab in 2018 and 'had grave safety concerns' over the protocols which were being observed at the facility.

The lab is just eight miles from the Huanan wet market which is where the first cluster of infections erupted in Wuhan.

The market is just a few hundred yards from another lab called the Wuhan Centers for Disease Prevention and Control (WHCDC).

The WHCDC kept disease-ridden animals in its labs, including some 605 bats.

Those who support the theory argue that Covid-19 could have leaked from either or both of these facilities and spread to the wet market.

Most argue that this would have been a virus they were studying rather than one which was engineered.

Last year a bombshell paper from the Beijing-sponsored South China University of Technology recounted how bats once attacked a researcher at the WHCDC and 'blood of bat was on his skin.'

The report says: 'Genome sequences from patients were 96% or 89% identical to the Bat CoV ZC45 coronavirus originally found in Rhinolophus affinis (intermediate horseshoe bat).'

It describes how the only native bats are found around 600 miles away from the Wuhan seafood market and that the probability of bats flying from Yunnan and Zhejiang provinces was minimal.

In addition there is little to suggest the local populace eat the bats as evidenced by testimonies of 31 residents and 28 visitors.

Instead the authors point to research being carried out within 300 yards at the WHCDC.

One of the researchers at the WHCDC described quarantining himself for two weeks after a bat's blood got on his skin, according to the report. That same man also quarantined himself after a bat urinated on him.

And he also mentions discovering a live tick from a bat - parasites known for their ability to pass infections through a host animal's blood.

'The WHCDC was also adjacent to the Union Hospital (Figure 1, bottom) where the first group of doctors were infected during this epidemic.' The report says.

'It is plausible that the virus leaked around and some of them contaminated the initial patients in this epidemic, though solid proofs are needed in future study.'

Professor Dalgleish, 71, a vaccine researcher and professor of oncology at St George's Hospital, last year struggled to find a publisher for his paper suggesting the virus's spike protein contains artificially inserted sequences.

He said the research was shunned by the scientific community, who did not want to threaten China or be seen to be agreeing with President Donald Trump — who was a big advocate for the theory the virus was leaked from a lab at the time.

The oncologist said: 'The changes required to infect humans are extremely unlikely to have occurred naturally.'

Professor Dalgleish — who ran for Parliament as a UKIP candidate in 2015 — said the President's use of the terms 'Wuhan flu' and 'China virus' damaged scientific debate on the subject.

He told **The Times**: 'I was basically ostracized. I was fearful — really frightened by the way I was being treated. I was told I was not an expert on coronaviruses and I should just shut up.

'We couldn't believe people with whom we'd collaborated and published papers with in the past would shun us — I was warned I was out of my depth and I shouldn't get into this and I'd make a fool of myself.'

And just last week President Joe Biden ordered another look at the theory as part of a wide-ranging intelligence investigation into the pandemic’s origins. He felt it so urgent that he put a 90-day deadline for a conclusion.

Emails from Dr Anthony Fauci, Mr Biden’s chief medical advisor, show that leading virus experts warned Covid could be man-made even as he downplayed the possibility.

Fauci says those emails, obtained by Buzzfeed, have been taken out of context.

MORENS_SUBPOENA_017429
MORENS_NIH_035626
REL0000478390

But he did U-turn about where the virus may have originated this week, saying 'you never know'.
One of them was from Dr Daszak, who thanked Dr Fauci for pushing back on the man-made theory.
In April, Dr Drazak wrote: 'I just wanted to say a personal thank you on behalf of our staff and collaborators, for publicly standing up and stating that the scientific evidence supports a natural origin for Covid-19 from a bat-to-human spillover, not a lab release from the Wuhan Institute of Virology.'
Even WHO's Ethiopian director-general Tedros Adhanom Ghebreyesus said the report was not extensive enough and more work needed to be done to discover the cause of Covid.
'As far as WHO is concerned, all hypotheses remain on the table,' he said.
'This report is a very important beginning, but it is not the end.'
America is looking at the theory seriously, leading to China hitting out at the 'dark history' of the US intelligence community after President Biden's probe was announced.
Lijian Zhao, foreign ministry spokesman who has been Beijing's point-man in trying to pin blame for the pandemic outside the country's borders, accused the US of trying to shift blame away from its own high Covid case and death counts - and suggested security services may be involved in a cover-up.
Meanwhile Hu Xijin, editor of the state mouthpiece Global Times newspaper, accused Biden of trying to discredit a WHO investigation which concluded that a lab leak is 'unlikely' — although critics have previously blasted that report as a China-centric whitewash.
China's American embassy also hit out, accusing Biden and his security services of being 'fixated on political manipulation and (the) blame game' in a statement on its website.
No10 officials have called for investigators to probe all theories as to how the Covid pandemic began.
Dominic Cummings this week revealed the PM held meetings when the crisis first began to discuss whether it had 'escaped' from a laboratory and whether the disease had been 'engineered'.

The Lancet letter in full: 'Statement in support of the scientists, public health professionals, and medical professionals of China combatting COVID-19'

We are public health scientists who have closely followed the emergence of 2019 novel coronavirus disease (Covid-19) and are deeply concerned about its impact on global health and wellbeing.
We have watched as the scientists, public health professionals, and medical professionals of China, in particular, have worked diligently and effectively to rapidly identify the pathogen behind this outbreak, put in place significant measures to reduce its impact, and share their results transparently with the global health community. This effort has been remarkable.
We sign this statement in solidarity with all scientists and health professionals in China who continue to save lives and protect global health during the challenge of the Covid-19 outbreak.
We are all in this together, with our Chinese counterparts in the forefront, against this new viral threat.
The rapid, open, and transparent sharing of data on this outbreak is now being threatened by rumours and misinformation around its origins.
We stand together to strongly condemn conspiracy theories suggesting that Covid-19 does not have a natural origin.
Scientists from multiple countries have published and analysed genomes of the causative agent, severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), and they overwhelmingly conclude that this coronavirus originated in wildlife, as have so many other emerging pathogens.
This is further supported by a letter from the presidents of the US National Academies of Science, Engineering, and Medicine and by the scientific communities they represent.
Conspiracy theories do nothing but create fear, rumours, and prejudice that jeopardise our global collaboration in the fight against this virus.
We support the call from the Director-General of WHO to promote scientific evidence and unity over misinformation and conjecture.
We want you, the science and health professionals of China, to know that we stand with you in your fight against this virus.
We invite others to join us in supporting the scientists, public health professionals, and medical professionals of Wuhan and across China. Stand with our colleagues on the frontline!
We speak in one voice. To add your support for this statement, sign our letter online. LM is editor of ProMED-mail. We declare no competing interests.

Sen. Rand Paul says Fauci's emails paint a 'disturbing picture' about what he knew about work inside the Wuhan lab

Sen. **Rand Paul** continued his blitz on Dr. **Anthony Fauci** in the wake of Fauci's email dump, telling Fox that Fauci knew the US was funding gain-of-function research in Wuhan even though he continues to deny it.
The Republican from **Kentucky** told Fox Thursday night that Fauci's emails 'tell me early on that he was very worried' before the pandemic even started.

MORENS_SUBPOENA_017430
MORENS_NIH_035627
REL0000478390

'There's a disturbing picture. He gets an email or he gets notification of what's going on in Wuhan and immediately sends something to his assistant saying, "We must meet immediately." And in the subject line it says gain of function research in Wuhan.'

While Paul and other Republicans have come after Fauci, Biden reaffirmed his confidence in Fauci in a Friday morning press conference.

The president had actually left the room where he gave the speech when DailyMail.com shouted a question to him about the director of the U.S. National Institute of Allergy and Infectious Diseases.

President Biden stuck his head back in to answer.

'Yes I'm very confident in Dr. Fauci,' he said.

Paul's Thursday night interview on Fox - and weeks of public comments that - makes it clear that senator doesn't share have the same faith in Fauci, and he alluded to a February 1, 2020 email exchange between Fauci and Principal NIAID Director Dr. Hugh Auchincloss.

Auchincloss wrote to Fauci to discuss a paper Fauci sent him appearing to question if National Institute of Health (NIH) grants funded gain-of-function research relating to coronaviruses.

In the email to Fauci, Auchincloss said, 'The paper you sent me says the experiments were performed before the gain of function pause but have since been reviewed and approved by NIH.'

He also noted that a colleague would 'try to determine if we have any distant ties to this work abroad.'

This was one of the 3,200-plus emails obtained and published by Buzzfeed News on Tuesday.

The NIH awarded a $3.7 million grant to EcoHealth Alliance, which is based in the United States, to study the risk of coronaviruses emerging from bats in 2014. EcoHealth Alliance in turn distributed nearly $600,000 of that funding to its collaborator, the Wuhan Institute of Virology.

The senator also took a shot Thursday at the embattled chief medical advisor on Twitter after Amazon and Barnes & Noble pulled his book from their sites because it wasn't supposed to be released until November: 'Oh, I don't know. I think they should publish it. I love science fiction.'

Paul's interview came after Fauci dismissed the recent revelations that he was warned that COVID-19 may have been 'engineered' and said that the emails are easily misunderstood.

During a Wednesday interview on the Donlon Report, Fauci said of the emails, 'The only trouble is they are really ripe to be taken out of context where someone can snip out a sentence in an email without showing the other emails, and say "based on an email from Dr. Fauci, he said such and such" where you don't really have the full context.'

Fauci added that the Wuhan lab 'is a very large lab to the tune of hundreds of millions, if not billions of dollars.'

'The grant that we're talking about was $600,000 over five years for an average of about $125,000 to $140,000 a year,' he said.

Fauci also said on Donlon that he 'can't guarantee everything that is going on in the Wuhan lab.'

Paul has been on Fox twice since a trove of Fauci's emails - dating from January to June 2020 - were obtained and published by Buzzfeed on Tuesday.

Within hours of publication, Paul tweeted '#firefauci' and other Republicans, like Majorie Greene Taylor, followed suit.

Until recently, the Wuhan lab leak was at best a fringe theory, and it has been mostly laughed off by many scientists. The general consensus on COVID-19's origin was that it jumped from a bat to a human in the Wuhan market.

Despite the recent scrutiny, Fauci continues to say that's what he believes happened.

During Senate committee hearings in early May, Paul sparred with Fauci over the two origin theories and said the lab leak is a real possibility that's not being acknowledged.

Instead of investigating the cause of COVID-19 'government authorities - self-interested in continuing gain of function research - say there's nothing to see here,' Paul said during the May 11 hearing.

'To arrive at the truth, the U.S. government should admit that the Wuhan Virology Institute was experimenting to enhance the coronavirus' ability to infect humans,' he said.

The lab leak theory is now one that President Joe Biden wants investigated.

Last week, Biden ordered a 90-day review to investigate the possibility and several high-profile public health experts have come out in recent months saying they believe that's how COVID-19 started.

British intelligence also reportedly assessed the theory recently and upgraded its likeliness from 'remote' to 'feasible'.

Yes – I think you're right. I'm trying to walk the line in this letter between clearly stating that EcoHealth didn't breach reporting requirements, and not causing any damage to NIH, but I do have to respond if they're going to be out there with comments to the press like Francis who is quoted in the Washington Post as saying there'll be consequences for us for 'messing up':

> The grant to EcoHealth has been suspended, Collins said Thursday. "They messed up here. There's going to be some consequences for EcoHealth," he said. But he also said that, had the experimental result been reported earlier, "it would not have been a reason to sort of hit the panic button and say my god this is dangerous stuff."

https://www.washingtonpost.com/health/2021/10/21/nih-ecohealth-alliance-coronavirus/

I get it that the consequences may not amount to much, but if the public is being told we did risky research and didn't monitor it well, they'll not support us if NIH cancels all our funding.

Please tell Francis, Tony, Dr. Tabak and all that my whole family is being affected when they read comments like this in the press. The toll is awful, and the language they are using is just not fair. We're a $10 million a year non-profit – they represent NIH.

Cheers,

Peter

Hi Rich, your note prompted me to contact Mary Woolley and Ellie Dehoney from R!A (see the string that follows starting with my note, their individual response, and my reaction to each of them at the bottom). I was actually surprised to hear from both of them so quickly. I hope my note raised their attention level, as their comment to be in touch with ASM suggests. Its why I followed up and suggested they build a coalition with the other big scientific societies as there is power and some degree of protection by banding together albeit no guarantee of results. Its just the need to get this out there for the scientific community to see and be willing to speak out. I don't see much of that happening.

Jerry

Subject: Rand Paul hearing

Hi Mary,

Hope you are well and continue to fight the good battle for the integrity of science. Unless I have missed it, however, I haven't seen any response by R!A to the continued attacks on Tony Fauci by Rand Paul, and in particular his outrageous hearing set for tomorrow to discuss "gain-of-function" research with such experts as Richard Ebright, Stephen Quay, and Kevin Esfelt – none of whom are virologists, geneticists, students of pathobiology or microbial pathogenesis, biomedical laboratory trained, have expertise in containment research, are evolutionary biologists, or biosafety experts.

The scientific community needs bold leadership from responsible organizations like R!A and its leadership, to mobilize reaction to such overt politicization and the attempt to disparage Tony and other thoughtful experts on whom we depend. Advocacy must be for more than funding because without preserving the highest principles of science and the scientists that practice and actually live them funding doesn't really matter.

Jerry

Subject: RE: Rand Paul hearing

Hi Gerry – very concerning, indeed. Ellie and I happened to be talking when your email arrived. It is shocking indeed that attacks on public servants seem to be escalating rather than in retreat. I read a JAMA abstract sometime recently about a study showing that the % of people who think it is justified and appropriate to harass (yes) and threaten (yes) elected and appointed officials has increased to about 25%. Incredible!

Per your specific questions, a couple of things to note:

We worked with others, very much including ASM, to assure that gain-of-function language was kept out of the CHIPS + Science authorizing legislation that passed both houses last week. We will continue to keep an eye on it during appropriations.

Ellie will be in touch with ASM, which we see as very much a leader in this, to see how we can help regarding tomorrow's hearing.

Our experience is that there are times to avoid giving attention to certain actors, as it can increase media and other coverage, which can play out badly, emboldening those actors.

This is an area where nuance matters and we don't always get it exactly right – although we aim for that!

Thank you for all you are doing.

My best,

Mary

Hi Jerry, thanks so much for sharing this info! We have been working in coalition with the American Society for Microbiology on the gain of function issue and were thrilled when the gain of function provision was dropped from the COMPETES plus SCIENCE Act. I'll get in touch with my colleagues at ASM now re the hearing. My guess is that they are intentionally not engaging, since Sen. Paul tries to rile up opponents to lengthen an otherwise short news cycle.

<(b) (6)
Subject: RE: Rand Paul hearing

Thanks for the quick reply, Ellie. I understand the complex political implications of any action, considering inaction itself an action. Teaming with ASM is a good strategy. Even better if R!A could lead a coalition of the leading societies and organizations, including AAAS, IDSA, ASTM, and even with the National Academies of Science or perhaps just the National Academy of Medicine. There is power in such a coalition, but only to the degree there is a willingness to speak out, support the principles of scientific integrity, and defend those who are being attacked.

I personally appreciate your willingness to immediately follow up, and I hope your counterparts at ASM are equally appalled over this and the parade of non-expert witnesses being featured to an unsophisticated TV audience and, yes, the news cycle and cable TV.

Re. commenting on this – I think you should wait to see if it gets any publicity first, otherwise you might inadvertently amplify their impact..

Re. November – I worry that our lives will be made miserable by constant harassment from what could be Republican-led Congressional committees. If this HSGAC group is any indication, they expect us to just dump all of our emails for the last dozen years or more so that they can go through them and find sentences that support their narrative when quoted out of context. It's not just utterly disingenuous, it's also dangerous because it drives the public hate campaigns and efforts to attack us in many other ways.

We've managed to avoid a couple of serious efforts to defund us so far, and are only working with this committee to try and avoid even more pressure, but we know they're talking to many other groups to build their 'case'. On our last call, they asked us for not only any emails to govt agencies, but emails between staff members. I pointed out that it's against our org's policy to snoop on staff conversations, and they smugly told us we should get used to requests for documents because we'll "soon be doing a lot more of them".

Cheers,

Peter

Dear all (David – I didn't cc Jeff Taubenberger because you've all been using his NIH address which would be subject to Congressional requests and to FoIA),

I just spotted this upcoming HSGAC Subcommittee on Emerging Threats and Spending Oversight hearing on Wednesday, on one of the lab leaker's social media feeds.

https://www.hsgac.senate.gov/subcommittees/etso/hearings/revisiting- gain-of-function-research-what-the-pandemic-taught-us-and-where-do-we-go-from-here

The three speakers are all non-virologists, and have been attacking all research that tries to get to the bottom of COVID origins, unless it's pushing a China lab leak agenda.

- Richard Ebright has been attacking EcoHealth's work ever since the pandemic as part of his long term criticism of recombinant virus technology. He was part of the Cambridge Group that ended up pausing recombinant viral research in the past, and is extremely vocal (and quite offensively) about our work, which he uses to try to leverage attacks against Dr. Fauci, NIAID, NIH in general.
- Stephen Quay is pretty much on the edge of being a quack at this point having made many public statements about HIV inserts in the virus etc.
- Kevin Esvelt is calling for research identifying viruses in wildlife as a way to get ahead of pandemics to be closed down, following his criticisms of CRISPR etc.

It looks like this is another effort by Rand Paul to drum up some public interest from his base, perhaps?

Appreciate your comments David. Please read the letter I just sent to Rich Roberts. I've made some quick comments to refute some of the stuff in the Wade piece. RE. the furin cleavage site – there's nothing special about it and it does not suggest a lab origin. MERS-CoV, feline CoV and some rat CoVs all have similar insertions. Simple explanations for its presence in SARS-CoV-2 could be:

1. It was present in a bat-CoV (one of the many thousands awaiting our discovery), and we selected for its spillover by having 14 million people working in wildlife farms in china in places where bats live. Given a continued exposure to myriad bat-CoVs, one with a furin cleavage site would be more likely to emerge
2. It evolved in people early on in the COVID outbreak. WHO report and modeling suggest spillover occurred in last few months of 2019. It could have easily been selected for as the virus spread from human-to-human during that early period
3. It evolved after a progenitor bat-CoV spilled over into wildlife in farms in S. China. SARS-CoV-2 spillover into mink in Europe led to rapid evolution of strains that bore similarities to pangolin-CoVs. Mink strains then re-infected people in the Netherlands. Now, there's a report of mink clearing the virus, showing antibodies to SARS-CoV-2 and being reinfected later – all good evidence that farms full of raccoon dogs, ferret badgers and civets in S. China could have had circulation of SARS-CoV-2 for many months prior to it emerging.

Hope this all helps. One day, the research will be done and all this will be demonstrated. Unfortunately, the one group that had access to China to do this work (EcoHealth) is currently blocked from doing it!

Cheers,

Peter

Subject: Re: Another letter - almost amusing - from House E&C Committee Republicans re. Zhengli's "Blah Blah" comment

Peter, I agree, and I think we should try to not use the term GOF, notly because it suggests something nefarious, but also, at least as I would define it, it doesnt apply to your work, as you just said. In my mind it doesn;'t apply to Ralph's work either.

Secondly, I re-read the Wade article carefully, and did NOT conclude that just about everything he said was wrong. I think it is the best researched, and most literate and thorough media article on the subject. BUT. I think it is biased and uses cherry-picked facts. Moreover, it tries to pretend non-bias in a disingenuous way.

In short, high order sophistry.

I am also troubled by David Baltimore's opinion that finding a furn-cleavage site indicates human manipulation. I suspect that may not be true, since these viruses hyper-circulate in bats and spillover into mammals and people frequently, and also frequently recombine in spike protein sequences. But I am not knowledgeable about such things. In this context, the idea of David Robertson, cited in the Wade article, is of particular interest: the idea that the precursor virus had become a "generalist" by long evolving through bats and mammals including humans. Something analogous happens with arboviruses, e.g., dengue, which serially pass through humans and mosquitos every couple weeks, and have to be well adapted to two very different alternating hosts.... d

On 5/8/2021 1:51 AM, Peter Daszak wrote:

> I also think it's important to let the journalist know that nothing in the work we were doing in China could be reasonably called "Gain of function". The only recombinant viruses were bat-CoVs, with spike proteins of other bat-CoVs. None had enhanced transmissibility or cell infectivity. None are known to be infectious to people.
>
> I believe the whole 'gain of function' phrasing used to describe the Wuhan CoV research is just a ruse to scare a gullible public – journalists today have been using phrases like "making viruses more dangerous in the lab in Wuhan" etc. None of this is true.

Cheers,

Peter

EXTERNAL SENDER

Peter, I just tsalked to Ms. Eban for an hour, and connected her with Jim LeDuc and Jeff T. I also sent her a paper I and others wrote with David Baltimore 10 years ago about the BENEFITS of GOF research vis a vis the 1918 flu virus. To wit, the growing up of the virus and studying it in primate challenges, and in vitro, yielding hugely important info on flu pathogenesis.

Rich, this relates to my own feeling that GOF is a double-edged sword, so to speak, that while we must work to prevent dangerous use of virologic techniques, totally agree on that point, we must also consider that every infection of a cell, in tissue culture, organ culture, experimental animals, humans, whatever, is in essence a GOF experiment (and also a loss of fuinction experiment, since host adaptation usually results in ftness penalties), without which we would have no viral vaccines except vaccinia, and arguably not even that.

Her interest in David B results from his comments in the Wade article about the SARS-CoV-2 furin cleavage site, about which I am a tiny bit skeptical, not fully understanding the complexities of cleavage site evolutions in RNA viruses. I asked Jeff and his folks to comment. He and I had a discussion about David's comments yesterday, but I will let him follow up on that, since he has been thinking about RNA virus cleavge sites with respect to flu A and other viruses for over 20 years. It seems to be more complicated than one might think..

MORENS_SUBPOENA_014602
MORENS_NIH_029170
REL0000478398

The Wade article also cites some ideas by a guy named David Robertson. Do you know him? I do not. But he posits that the SARS-CoV-2 precursor may have become a "generalist" by circulating between bats and mammals, maybe even humans. No eviodence for this, but the idea makes alot of sense to me. Plausible in my mind, what do u think?

David

On 5/7/2021 6:20 PM, Peter Daszak wrote:

> Really interesting to hear those comments about "Blah blah" and "Deng deng". It just saddens me because I know Zhengli's English is not the best, and I don't think she realizes that every word she says publicly, even in response to a question at a University seminar, is being manipulated and used politically. It feels like racism to me.

This could be taken in a positive sense, that the documents will refute the lab release hypothesis, although I don't think that's how they mean it.
>
> Regarding what Peter previously said about Shi's use of the phrase blah blah, which will

MORENS_SUBPOENA_014603
MORENS_NIH_029171
REL0000478398

surely be characterized as dismissive and therefore put into a negative perspective. I have access to a senior endowed full professor of Chinese politics at Harvard and I asked about the meaning of blah blah when a Chinese native speaker uses it while speaking English. Here is the answer:

"In my experience many Chinese mistakenly use "blah, blah" as equivalent to the Chinese term "deng, deng" which means "and so forth" and has no negative connotation."

So Peter was right, and now we know the Chinese term it is trying to translate, however awkwardly. This might be useful in any conversation with a report about her remarks or the Republicans letter.

Sorry for yet another email, but this one is so bizarre it's almost funny. It's a letter from the House E&C Committee Republicans to Blinken asking him to release the classified intel that people in the Wuhan lab were sick prior to COVID, and that the WIV does military research. It quotes some comments from a recent talk my collaborator Zhengli Shi from the Wuhan Institute of Virology, gave during a lecture at Rutgers. Some of the online conspiracists heard about the talk in advance and they packed the audience – some of their questions from the chat were read out. Her response included a very common "blah blah" phrase used in China when speaking English – here's the quote:

During a March 23, 2021 seminar at Rutgers University, a WHO advisory committee member asked Dr. Shi if [knew].. whether "the U.S. government claims of classified Chinese military research being carried out at the WIV [are] correct, and if so, did you have full awareness of and access to all aspects of this research?"[4]

Dr. Shi answered: From my knowledge, all our research work is open, is transparent. At the beginning of COVID-19, we heard the rumors that claimed our laboratory would have some project blah blah with army blah blah . . . but this is not correct, because I am the director and responsible for research activity. I don't know any kind of research work performed in this lab.[5]

This is ridiculous, of course, and they're obviously using that quote to suggest Dr. Shi doesn't take these

MORENS_SUBPOENA_014604
MORENS_NIH_029172
REL0000478398

questions seriously, but it's actually a racist trope – people in China use the phrase "blah blah" to simply mean "and so on, and so forth". Just unfortunate…

Cheers,

Peter

Subject: RE: Republican Rep. Gallagher to Dr. Fauci re. WIV and gain of function
Importance: High

David,

A Republican representative sent a letter to Tony Fauci today asking some pretty simple questions that are clearly designed to play to their political base.

If Tony Fauci is going to respond to the attached letter that was made public today, I hope he's ready to point out that the work we did was NOT gain of function. This phrase has been bandied about now for a few months and is utterly incorrect.

If he decides to draft a response, I'd be happy to do a quick briefing with you and him to explain the work that has been done up to now with WIV, and was planned to be done on our NIAID grant.

Cheers,

Peter

Subject: Chili recipe

Peter, it's taken me a long time to get you the chili recipe I promised, because my scanner had brokene down. Today I got it semi fixed although it is scanning upside down

You can either print it and reverse it, or else read it while standing on your head.

I have made this recipe a number of times, and it always gets rave reviews.

The two key/unusual ingredients are the addition to the beef of the Italian sausage and the pitted black olives, which change the taste significantly, and for the better.

The original recipe came from my 84 year old hashing friend Nelson Joyner, passed down through the family and tweaked and modified by him and his Swedish wife Susanne.

Over the years, I added my own embellishments (shown with asterisks*), mostly to add more chili heat and also some poblano, as well as being served with sour cream, chopped cilantro, chopped purrple onion, etc.

This is the basic and you might add or take out as your tasted disctate. Enjoy! david

Subject: Marjorie Taylor-Greene on the COVID 'investigation'

EXTERNAL SENDER

I think the news that Marjorie Taylor-Greene will be on the panel 'investigating' the origins of COVID-19 is actually a good thing. It instantly reveals it for what it is – a Republican witch hunt targeting Fauci and Biden by pushing anti-science conspiracy theories.

It's going to be hard to answer questions as a scientist when you have someone who doesn't believe in evolution – just check out her Wikipedia page! https://en.wikipedia.org/wiki/Marjorie_Taylor_Greene

Evolution

Greene has said that she does not accept the scientific fact of evolution, calling it a "type of so-called science" and saying: "I don't believe in evolution. I believe in God."[265][266]

Er… that could be a problem, considering we're watching these viruses evolve, in real-time, in our own population!

Cheers,

Peter

Please share.

These were rats sampled at wildlife farms in S. China under USAID PREDICT funding. 2 Beta-CoVs and an alpha-. One of the beta-covs has a furin cleavage site in the S Protein. It's not bats and SARS-CoV-2, but it adds to the argument that Eddie's paper makes (and others before that), that these insertions are not so uncommon in CoVs in nature.

Intel officials draft classified report as they near

finish of 90-day Covid probe

By Kylie Atwood, Natasha Bertrand, Zachary Cohen and Katie Bo Williams, CNN
Updated 4:03 PM ET, Wed August 11, 2021

Washington (CNN) Intelligence officials are nearing the end of a 90-day investigation into the origins of Covid-19 that was ordered by President Joe Biden, and have drafted a classified report that is now in the preliminary review process, according to three sources familiar with the probe.
Sources familiar with the initial report say that after three months of poring over data and raw intelligence, the intelligence community is still divided over two theories -- one suggesting the virus originated from a lab in Wuhan, China, and the other suggesting it jumped naturally to humans from animals, the sources said. The report as it stands now contains "nothing too earth shattering," one source explained.

In May, Biden told US intelligence agencies to "redouble" their efforts to investigate how the virus originated, including the possibility that it emerged from a lab accident. Biden ordered the investigation after receiving an earlier report on the origins and asking for follow-up information, he said in a statement. The 90-day clock that Biden set for this investigation will be up in late August.

It's possible that the draft report could undergo significant revisions during the remaining review process. Biden also tasked the intelligence community with declassifying as much of the report as possible, a process now underway as it undergoes initial reviews.

Exclusive: Intel agencies scour reams of genetic data from Wuhan lab in Covid origins hunt,

The intelligence community's inability to present one theory with high confidence after three months of intense work underscores just how hard it is to probe the origins of the Covid-19 pandemic.
"We will not weigh in on the substance of the 90-day review while it is still underway," an ODNI spokesman said in a statement to CNN.

Last week, CNN reported that intelligence agencies had gotten their hands on a trove of genetic data drawn from virus samples at the lab in Wuhan that some officials believe could have been the source of the outbreak. It's unclear whether officials have finished analyzing that data.

Intelligence officials have also taken a fresh look at signals intelligence, like intercepted communications and satellite imagery, that could provide clues.

But ultimately, China's refusal to share information from the early days of the outbreak and the country's lack of transparency has been a major hurdle, and officials had been broadly pessimistic about finding a smoking gun during the 90-day push.
The report -- which was done without any Chinese participation -- is now being reviewed by the intelligence community and outside experts for feedback before it is finalized later this month, the three sources said. Once the classified version is finalized, an unclassified version will also be developed so that the Biden administration can share something with the public, one source explained.

Officials told CNN that the Biden administration has considered whether to launch another investigation if this one proves inconclusive, but it is unclear whether a decision has been made to reopen the probe after the 90-day report is released.
Last month, a bipartisan group of lawmakers made clear they want Biden to continue investigating the origins issue until the intelligence community reaches a high confidence assessment, even if that takes longer than 90 days.

But there are some concerns that the political debate around Covid origins and China's refusal to share pertinent information means that the US may never reach a definitive conclusion on that front, two sources said.

"The failure to get our inspectors on the ground in those early months will always hamper any investigation into the origin of Covid-19," Biden said when he announced that he had launched the investigation, noting that he had previously called for the CDC to get access to China to learn about the virus in order to help fight it more effectively.

Collecting intelligence about the breadth of Chinese actions that may have inhibited the World Health Organization or other origins investigations was one of the two primary objectives of the Biden administration's 90-day review earlier this summer, according to a tasking memo sent to relevant agencies that was obtained by CNN.

Chinese government rejects WHO plan for second phase of Covid-19 origins study

But unlike the question of whether the coronavirus first emerged naturally through human contact with animals in the wild or in markets, or via a lab accident, intelligence officials believe there is enough evidence to make a compelling case that the Chinese government's initial handling of the outbreak and efforts to suppress relevant information in the months since, has significantly constrained all efforts to examine the pandemic's true origins, according to a source familiar with the findings.

Despite a near consensus among those officials about the impact of China's actions, it remains unclear how far the Biden administration will go in calling out Beijing publicly once its ongoing 90-day review is over or how those findings will factor into the version of the report that is publicly released, the source said.

"What they release will be interesting ... but how far is Biden willing to go? If he tries these coercive measures on origins, how will that impact the other issues?" a former US official familiar with intelligence related to the origins investigation told CNN. Biden's launch of the investigation came after a US intelligence report found several researchers at China's Wuhan Institute of Virology became ill with an unidentified infection or disease in November 2019 and had to be hospitalized -- a new detail that fueled fresh public pressure on Biden to delve deeper into the origin of the virus.

It also came after CNN reported that Biden's team shut down a closely held State Department effort launched late in the Trump administration to prove that Covid-19 originated in a Chinese lab over concerns about the quality of its work.
White House officials have said that getting to the bottom of the origin of the pandemic will help prevent another one, and after unsuccessful World Health Organization (WHO) efforts to investigate the matter, the Biden administration orchestrated their own effort.

In July, the White House said it was "deeply disappointed" when China rejected the WHO's plan for a second phase of an investigation into the origin of the coronavirus. And after the WHO's first investigation the White House was critical of their findings due to limited access to "complete, original data and samples."

Subject: earlier small outbreak

5 July
Mirror
https://www.mirror.co.uk/news/world-news/china found coronavirus strain seven-22304139

China 'found coronavirus strain seven years ago' after mine workers fell ill and died

An investigation has revealed that the coronavirus trail goes back seven years after men working down a bat and rat-infested mine in China died from a strain and it was sent to Wuhan for testing

Scientists in China discovered a strain of virus close to Covid-19 seven years ago but allegedly kept quiet about it after the outbreak.

An investigation by the Sunday Times [need a subscription to read] has revealed the closest "strain" to coronavirus found so far was discovered in an abandoned mine in 2013 and taken to a virology lab in Wuhan.

It was found in a bat and rat-infested copper mine in south west China.

The strain saw six men come down with a fever, coughs and pneumonia in 2012 after working in the mine, with two of them sadly dying from the disease.

Four of the men were tested and they came up positive for coronavirus antibodies, with the other two unable to be tested having died from the disease.

...-more on virus having escaped lab, which I didn't copy here.

David,
Please send me the final version when available as a Word document by e-mail. It will also need to be entered into the system by Alison, but that is not urgent. Regarding authorship by me, I think that I contributed little editorially (much less than on many other COVID perspectives in the last few months), and since I am not an expert on coronaviruses, etc, I think that I should not be an author.
I have gotten another round of feedback on the accompanying editorial and will put together another (near-final) draft later today.
If all goes well we can hope for approval of both by Monday or soon thereafter.
Thanks,
Phil

Thanks David.

At CDC everything is cleared to be sure it is scientifically accurate and not inconsistent with CDC policy. I checked with the other IC deputies when I came to NIH five years ago. As you can imagine, there is a wide range of practices at NIH. As Joel knows, we have a pretty quick and generally light review process at FIC. There is very occasionally something that can be reworded. For example, we don't generally recommend that NIH do more research on X, because we are the NIH.

We'll get back to you about this one.

Thanks,
PK

Colleagues, and particularly Roger and Peter,

We don't have any screening or censorship in NIAID OD, and nothing i write has ever been Screened or approved by Tony, except when we write things together and he gets the last word when we disagree. We have written 40-50 papers together.

I have never seen or heard of him trying to censor anything. A couple weeks ago i was co-author on a paper that essentially said trying to make a universal flu vaccine based on stem antigens won't work, one of his pet ideas for 15 years, and his comment was oh well, nothing's easy So i would not ask his opinion or expect him to weigh in.

He knows i am writing something on this subject, but that's all. When it is published he will read it and probably be delighted that it presents a potential media opportunity for him. If not, I get the flak

Bottom line, I am not worried, i will take any heat, and will be sure he is not dragged into any pushback. As far ad FIC is concerned, i leave that to you and would be happy to discuss

This paper is fully scientifically accurate and defensible in all aspects, and is signed off on by some of the worlds experts, including a very top phylogeneticist who has worked with Tony fir decades, 2 directors of BSL4 labs, one of whom personally trained And evaluated the Wuhan scientists, a Nobel laureate, and various other very senior experts. How much more objective do things get?

My feeling is, sometimes you just gotta stand up and say what's what.
This virus came from nature, period. I will not accept anyone saying otherwise without proof, which i am absolutely confident doesn't and never will exist. the reasons are

abstract for Perspective ms. dmm

On 7/11/2020 4:51 PM, Rosenthal, Philip (Infectious Diseases) wrote:
David, Jeffrey, and Joel,
I have re-read the revised MS. It is great! I have made a number of very minor edits. In some cases there were minor glitches, probably due to group authorship. All very easily fixable.
The bigger problem is that we missed until now the fact that Perspective articles need abstracts. These can be up to 250 words, but this one can be much shorter; whatever seems best to introduce your article to readers (a snappy abstract will help to get readers to click the full paper).
I don't think that I need to see this MS again, except please send me a draft of the abstract and I will review it. Almost done...
Thanks,
Phil

Beautiful, David. Two minors and query about the map.

1. Title page Joel G. Breman
2. p21, top incomplete para. "Pandemic prevention...on par with chemical and nuclear weapons prevention."

3.Fig 2. Map. Looks like the Indian subcontinent is the hottest area in world for emergence of pathogens. Accurate?

Phil and Joel, attached is a new Perspectives draft which incorporates ideas and edits of ALL of the co-authors, plus your own from the last draft.

Rather than try to smooth out and edit further the new text ideas-working-at-cross-puproses, I decided to stop editing and word-smithing so as to just get it in. The rest we can do later, including the institutional affiliations of all coauthors and those sorts of things.

I must say, despite the confusion of many cooks stirring the broth, some new and good ideas have been added by coauthors. David

Phil, David, and, Jeff,

Agree with abstract and Phil's tweaks.

Use only my ASTMH affiliation for article as for editorial. No need for FIC, NIH disclaimer for me. The editorial and article will now both have same contact information.

FIC leadership laudatory of paper: different affiliations on editorial and article could confuse readers.

Outstanding job David and Jeff.

Ok, got it:

There are/will be 2 Cell papers.

1. The Zhou et al. paper ("Identification of novel bat coronaviruses sheds light on the evolutionary origins of SARS-CoV-2 and related viruses") is online at Cell. You can cite via the DOI.

2. The Holmes et al. paper ("The Origins of SARS-CoV-2: A Critical Review") has just been accepted at Cell and will be available as a pre-proof version online at Cell next week. It should also have a Cell DOI at that point.

Cheers,

Eddie

If anybody is confused its me. I have the one in Cell, which will appear next week, the 19th I think. I was referring to the paper with you as first author titled "The Origins of SARS-CoV-2: A Critical Review" which is in fact a very thorough and critical review. I would like to include both papers, but I don't find it in PubMed and it isn't clear to me where it may be published. In fact when I search on Google the paper appears and I was able and still can download it. It seems to be both the Zhou et al and Holmes et al papers should be cited if at all possible. But again, as I said, and for obvious reasons, I want to stick to papers in or in press in reputable journals.

If the review is not in press somewhere it needs to be published soon because of the compelling scientific argument it makes, in contrast to the garbage Quay and some of the others have published.

Jerry

Thanks Eddie,

Its important information. If we do submit a response to the Lancet we will be limited to 5 references. I don't know if I have to cite the document we are responding to, or our original correspondence, which would allow 1 or 2 additional references. At the moment I have the Cell preprint in there along with another evolutionary biology paper from PLoS Biology with David Robertson as a co-author. I would also like to include the very well done review article currently available on Zenodo, if this is on its way to publication in a legitimate peer reviewed journal – I think it's better not to use

preprint references because anything can be "published" in this manner. But not all of my colleagues on the Lancet correspondence from July 5th feel we should reply to every reactive response we may get. If we do go ahead my draft makes it clear this is not a productive way to advance the science and learn more.

I'm sorry we all have to deal with the diverse agendas of our scientific colleagues that ignore the cogent high quality data in favor of their own pet peeves.

Jerry

Hi Jerry,

Sorry you are having to deal with this.

Our Cell paper has just formally been accepted. Cell said that the pre-proof of the paper will be online 'next week'. I've asked the editor exactly what day that means. If you can cite the pre-proof that would be advantageous because has been peer-reviewed. I will let you know when I get an exact date.

What would evidence of a natural origin look like? It would be SARS-CoV-2 being most closely related to animal viruses that have not been isolated or cultured in the lab, which is exactly what we have at the moment.

Best wishes,

Eddie

Dear Eddie,

I am currently drafting a potential reply to the letter in Lancet that Peter, I and 22 others published in Lancet last month (attached for your convenience). We have been invited to respond to a letter from a group of French scientists stating that "There is no scientifically validated evidence that directly supports a natural origin". While we don't want to engage in an endless series of back and forth arguments in the Lancet we are considering a brief response to focus on the real evidence there is. To that we would cite just one reference, your recent review (the French included 15 references, not including yours, as they clearly submitted before your paper appeared as a preprint. I would obviously like to have a peer-reviewed citation

even if just in press, so I would greatly appreciate it if you could update me on the status of your paper and whether or not there is a new citation for your exceptional review.

Thanks in advance, Jerry Keusch

Exclusive: Intel agencies scour reams of genetic data from Wuhan lab in Covid origins hunt

By Katie Bo Williams, Zachary Cohen and Natasha Bertrand, CNN
Updated 9:02 AM ET, Thu August 5, 2021

*Washington (CNN)*US intelligence agencies are digging through a treasure trove of genetic data that could be key to uncovering the origins of the coronavirus -- as soon as they can decipher it.

This giant catalog of information contains genetic blueprints drawn from virus samples studied at the lab in Wuhan, China which some officials believe may have been the source of the Covid-19 outbreak, multiple people familiar with the matter tell CNN.

It's unclear exactly how or when US intelligence agencies gained access to the information, but the machines involved in creating and processing this kind of genetic data from viruses are typically connected to external cloud-based servers -- leaving open the possibility they were hacked, sources said.

Still, translating this mountain of raw data into usable information -- which is only one part of the intelligence community's 90-day push to uncover the pandemic's origins -- presents a range of challenges, including harnessing enough computing power to process it all.

To do that, intelligence agencies are relying on supercomputers at the Department of Energy's National Labs, a collection of 17 elite government research institutions.

There's also a manpower issue. Not only do intelligence agencies need government scientists skilled enough to interpret complex genetic sequencing data and who have the proper security clearance, they also need to speak Mandarin, since the information is written in Chinese with a specialized vocabulary.

"Obviously there are scientists who are (security) cleared," one source familiar with the intelligence told CNN. "But Mandarin-speaking ones who are cleared? That's a very small pool. And not just any scientists, but ones who specialize in bio? So you can see how this quickly becomes difficult."

Officials conducting the 90-day review hope this information will help answer the question of how the virus jumped from animals to humans. Unlocking that mystery is essential to ultimately determining whether Covid-19 leaked from the lab or was transmitted to humans from animals in the wild, multiple sources told CNN.

Investigators both inside and outside the government have long sought genetic data from 22,000 virus samples that were being studied at the Wuhan Institute of Virology. That data was removed from the internet by Chinese officials in September 2019, and China has since refused to turn over this and other raw data on early coronavirus cases to the World Health Organization and the US.

The question for investigators is whether the WIV or other labs in China possessed virus samples or other contextual information that could help them trace the coronavirus' evolutionary history.

Two scientists who study coronaviruses told CNN they are skeptical that there is any genetic data either in the tranche of 22,000 samples or any other database from the WIV that scientists don't already know about.

"Basically in [a 2020 research paper published in Nature], the WIV talked about all the sequences they had up until a certain point in time -- it's what most scientists virologists believe, that's pretty much what they had," said Dr. Robert Garry, a virologist at the Tulane University School of Medicine.

NIH 57707 - 018968

MORENS_NIH_033586
REL0000478415

A source familiar with the US investigation would neither confirm nor deny that any of the data pertaining to those 22,000 samples is among what US intelligence agencies are currently analyzing.

No 'smoking gun'

Sources familiar with the effort say filling in that missing genetic link won't be enough to definitively prove whether the virus originated in the lab at Wuhan or first emerged naturally. Officials will still need to piece together other contextual clues to determine the true origins of the pandemic.

But it is a critical puzzle piece that the Biden administration has been prioritizing.

"The most prized technical data in this context are genetic sequences, database entries and contextual information about the provenance of the samples and the time and context in which they were acquired -- information people would use to place them in a narrative of the origins of SARS, Covid," one source familiar with the investigation told CNN.

For now, senior intelligence officials still say that they are genuinely split between the two prevailing theories on the pandemic's origins, or some combination of both scenarios. CNN reported last month that senior Biden administration officials overseeing the 90-day review now believe the theory that the virus accidentally escaped from a lab in Wuhan is at least as credible as the possibility that it emerged naturally in the wild -- a dramatic shift from a year ago, when Democrats publicly downplayed the so-called lab leak theory.

Multiple sources told CNN that absent an unexpected windfall of new information, officials don't expect to uncover a "smoking gun" -- like intercepted communications, for example -- that would offer definitive proof for either theory. The Biden administration's 90-day push is predicated on the expectation that science, not intelligence will be the key.

Intelligence officials are tasked with addressing several "scientific knowledge gaps" about the virus' evolution, according to the collection guidance governing the 90-day push, distributed to more than a dozen agencies on June 11 by the Office of the Director of National Intelligence and obtained by CNN.

The memo instructs the intelligence community to "expand its collection" and consider data already in its

NIH 57707 - 018969

MORENS_NIH_033587
REL0000478415

possession to identify both the initial host of the coronavirus and any species that it may have passed through as it adapted to humans -- or to find as "any progenitor virus and/or virus that could serve as backbone for genetic engineering purposes."

But former Director of National Intelligence John Ratcliffe told CNN that the US intelligence community already had sufficient collection on the topic of Covid origins.

"Obviously the more, the better. But we've had extraordinary insight into this topic for many months, much more than has been declassified. Pretending we didn't is political theater and a classic example of a politician trying to buy time by using the IC as a scapegoat," he told CNN in a statement.

Digging into the science

That's where the genomic data from the Wuhan lab could come in.

The genetic code of a given virus is the signature that allows scientists to tell the difference between the Delta and Beta variants of the coronavirus, for example. It can also offer clues as to how the virus has adapted or mutated over time, including whether it shows signs of human manipulation -- a kind of genetic history.

Many scientists continue to believe that the most likely scenario is that the virus jumped from animals to humans naturally. But despite testing thousands of animals, researchers still haven't identified the intermediate host through which the virus passed as it adapted to humans.

But some researchers, intelligence officials and Republican lawmakers believe that researchers at the WIV might have genetically altered a virus in the lab, using a controversial kind of research known as "gain of function" that could have infected researchers who then spread it in their community.

It's also plausible that the initial infection took place naturally outside of the lab, perhaps while a scientist was collecting a sample from an animal in the wild, and that scientist then spread the virus unknowingly when he returned to the lab with the samples, multiple sources familiar with the intelligence explained.

"If it was the latter, it was likely brought into a lab to study because someone got sick ... which means there

NIH 57707 - 018970

MORENS_NIH_033588
REL0000478415

were an unknowable number of other people who were already sick," the source familiar with the probe said. Understanding exactly which viruses researchers at the WIV were working on could provide important evidence for any one of these theories. It's one of the reasons that investigators on Capitol Hill and elsewhere have been keenly focused on the database that was taken offline in 2019.

But it might not prove anything definitively, sources familiar with the intelligence say. Even if scientists in the intelligence community are able to use the data from the lab to stitch together a complete genetic history that shows how the virus mutated, they might not have enough information about how it was handled by the Chinese lab to determine with a high level of confidence that it leaked.

"Despite having that complete history of variants, [officials might] lack the contextual information to make sense of it in a narrative way," the source familiar with the investigation explained.
"Even a complete sequence history is difficult to obtain. And doesn't really tell us anything about the origins of the pandemic itself without the context," this person added.

Some Republicans on Capitol Hill have jumped into the uncertainty with their own report claiming that "the preponderance of evidence suggests" the coronavirus was "accidentally" released from a lab in Wuhan in 2019 -- an assertion that goes far beyond the intelligence community's current view of the matter.

90 days -- and then what?

It's possible that at the end of Biden's 90-day push, the intelligence community won't have reached what's known as a "high-confidence" assessment as to the pandemic's origins. Administration officials have previously suggested to CNN that it's possible a second review could be ordered at the end of the 90 days.

A bipartisan group of lawmakers on the Senate Intelligence and Foreign Relations Committees earlier this week sent a letter urging the administration to continue to prioritize the hunt until such a judgment can be made in order to prevent future pandemics.

But the lawmakers also zeroed in on a related focus for intelligence officials probing the pandemic's origins: China's "efforts to conceal the severity and scope of the outbreak of the SARS-CoV-2 virus that caused the COVID-19 pandemic."

NIH 57707 - 018971

MORENS_NIH_033589
REL0000478415

"We also believe that the investigation should address PRC efforts to prevent international inquiries into the origins of SARS-CoV-2, and other actions PRC authorities have taken to obscure the nature of the virus and its transmission," the lawmakers said.

Republican lawmakers in the House, meanwhile, have latched onto the theory that the virus escaped from a lab. GOP lawmakers in a report released Monday by Rep. Michael McCaul of Texas have claimed that "the preponderance of evidence suggests" the coronavirus was "accidentally" released from a lab in Wuhan in 2019.

Intelligence officials say it's still far too soon to say.

Subject:	Under Embargo - Commentary in Nature Wednesday morning
Attachments:	Koopmans et al. Comment Covid Origins Nature 2021.pdf
Importance:	High

I'm attaching a commentary that will come out on Wednesday in Nature. It was originally written as a response to the WHO DG deciding to bail on the WHO team and call for a new structure and a focus on the lab leak/audit. We've watered it down so it's not too political, and focuses on the fact that this has stalled the process. The key messages from our point of view are that:

1. the search for the origins is important and needs to continue
2. since our report, we feel that most attention has gone to debates regarding likelihood of a lab leak, at the cost of progress in other areas
3. we should all be concerned that time passing - in part owing to these discussions – and this could close the window of opportunity for some critical studies
4. there are critical issues to deal with that are laid out in the report as recommendations for Phase 2: tracking back from the market, following new leads from the recent paper on mammals in the market, representative wild animal and farmed wild animal surveys, and comparative serosurveys in all regions where there has been evidence of early circulation.
5. the lab audit - as added- will need to be developed to define questions. The smallpox audit example cited by WHO in their press addresses biosafety and biosecurity for that pathogen, but would not necessarily help identify evidence for a lab leak. Developing those studies, and agreeing them with China may take of lot of time and that these should not lead to further delays for the other recommended studies

I'm still trying to stay out of publicity as much as possible, so will be avoiding reporters on this one.

Cheers,

Peter

Subject: Francis Collins on CNBC today

Hello everyone - Not looking forward to the publicity this week with the Intel report coming out sometime soon, but wanted to share a couple of things.

First – here's an interview by Francis Collins on Squawkbox CNBC that makes him come over like a wet lettuce. He goes one way then the other, making sure he sounds somewhat anti-China (they could have been doing mysterious things), but makes it clear NIH didn't fund Gain of Function there.

It's the definition of flip-flopping I guess. Maybe he genuinely believes China were up to something. In any case, it feels like he basically couldn't care less about the organization in the middle (EcoHealth) that's being batted around like a table tennis ball...
The URL is here: https://www.cnbc.com/2021/08/23/covid-origin-nih-director-doesnt-rule-out-that-virus-could-have-leaked-from-lab.html

NIH director says Covid likely came from nature, but doesn't rule out it could have escaped from lab

PUBLISHED MON, AUG 23 202112:53 PM EDTUPDATED MON, AUG 23 20211:08 PM EDT
Rich Mendez@RICHMENDEZCNBC

KEY POINTS
President Joe Biden gave the U.S. intelligence community 90 days to investigate Covid's origins and report the findings, which are due Tuesday.

NIH 57707 - 018974

MORENS_NIH_033592
REL0000478415

Through a grant to non-profit EcoHealth Alliance, the NIH funded research at the Wuhan Institute of Virology to study how bat viruses could infect humans.

Collins said the research didn't meet the technical definition of so-called gain-of-function research.

The director of the National Institutes of Health said Monday it appears Covid-19 originated from an animal, but he didn't rule out the possibility that scientists at the Wuhan Institute of Virology were secretly studying it and that it could have leaked out from there.

It's still unknown if the virus leaked out of a Wuhan lab, NIH director Dr. Francis Collins said Monday in an interview on CNBC's "Squawk Box," adding that the World Health Organization's investigation into the origin of the coronavirus has gone "backwards."

"The vast evidence from other perspectives says no, this was a naturally occurring virus," Collins said. "Not to say that it could not have been under study secretly at the Wuhan Institute of Virology and got out of there, we don't know about that. But the virus itself does not have the earmarks of having been created intentionally by human work."

The WHO investigation has been made harder by China's refusal to participate, says Collins.

"I think China basically refused to consider another WHO investigation and just said 'nope not interested'," Collins told CNBC's Squawk Box.

"Wouldn't it be good if they'd actually open up their lab books and let us know what they were actually doing there and find out more about those cases of people who got sick in November of 2019 about which we really don't know enough," Collins said.

U.S. intelligence reports first reported by the Wall Street Journal indicated that in November 2019, three workers at the Wuhan Institute of Virology fell ill with symptoms similar to those seen in Covid-19 infections, a report that China said was "completely untrue."

About three months ago, President Joe Biden initiated an investigation of his own and gave his intelligence community 90 days to further the investigation the virus' origins and report the findings. The deadline is Tuesday.

"It will be an interesting week because tomorrow is the day of the 90-day deadline that President Biden set for the intelligence community to do all their poking around that they could to see if they could come up with anymore insight as to how this virus got started in China," Collins said.

Most of the information gathered will likely remain classified, but some information from the report will be released, according to Collins.

NIH 57707 - 018975

MORENS_NIH_033593
REL0000478415

"We don't know what they're going to come up with either, but we're intensely interested," Collins said.

Collins also weighed in on the debate over whether or not the U.S. funded so-called gain-of-function research at the Wuhan lab, a debate that Republican Sen. Rand Paul of Kentucky and medical advisor to the president, Dr. Anthony Fauci, have engaged in time and time again. Gain-of-function research is when scientists take a pathogen and make it more contagious, deadly or both to study how to combat it.

"The kind of gain-of-function research that's under very careful scrutiny is when you take a pathogen for humans, and you do something with it that would enhance its virulence or its transmissibility," Collins said. "They were not studying a pathogen that was a pathogen for humans, these are bat viruses."

Some of the research at the Wuhan Institute of Virology that was funded, in part, by the NIH through a grant to non-profit EcoHealth Alliance studied how bat viruses could infect humans.

"So by the strict definition, and this was look at exquisitely carefully by all the reviewers of that research in anticipation that this might come up, was that this did not meet the official description of what's called gain-of-function research that requires oversight," Collins said. "I know this has gotten lots of attention, but I think it's way out of place."

Sneers,

Peter

Why China Is Struggling to Make the Lab Leak Theory Go Away

U.S. spy agencies are about to report on COVID-19's origins, but don't hold your breath.

by Alan Wong
by Viola Zhou
August 20, 2021, 9:38am

Robert Redfield has a lot of questions. The virologist and former director of the U.S. Centers for Disease Control and Prevention wants to know what happened at the Wuhan Institute of Virology, especially in the months before the emergence of COVID-19 in the same city. But China's answers didn't satisfy him.

"On Sept. 12, 2019, coronavirus bat sequences were deleted from the institute's database. Why? It changed the security protocols for the lab. Why? It put out requests for more than $600 million for a new ventilation system. What prompted this new need?"

Redfield, who believes that the coronavirus escaped from the lab in Wuhan, asked those questions in the *Wall Street Journal* on Sunday, alluding to the possibility that something bad happened at the facility as early as September that year and caused a pandemic that has killed more than 4 million people worldwide. To bolster this view, he said a Harvard study of satellite images revealed a shutdown of traffic around the Wuhan lab around that time and that hospital parking lots in the city were filling up—signs, perhaps, of a lab accident and a subsequent surge in sick people.

But almost all of those insinuations are disputed, inaccurate, or just plain wrong.

The opinion article offers a stark illustration of the limits of circumstantial evidence as the search for the origins of COVID-19 enters a contentious new phase.

U.S. spy agencies are preparing to release a report on their findings on whether the pandemic started from human contact with an infected animal or a laboratory accident in China. The report is expected no later than next week, after President Joe Biden in May gave the U.S. intelligence community a 90-day deadline to further collect and analyze information that could "bring us closer to a definitive conclusion" on the origins of COVID-19.

But China is not keen to cooperate. Further muddling the search is Beijing's renewed push of an unsubstantiated, alternative theory that the virus could have originated in a U.S. army lab at Fort Detrick, Maryland. The move has only fueled suspicions that the Chinese government is hiding something.

Unless U.S. spies uncovered substantial evidence—such as proof that the Wuhan lab possessed the virus that caused COVID-19 or evidence that it created the virus—the debate on the pathogen's origins is likely to persist.

Redfield co-authored the *Journal* article with Marc Siegel, a physician and *Fox News* contributor who last March said the coronavirus was no worse than the flu. It was riddled with mistakes.

For example, the planned ventilation system upgrade at the Wuhan Institute of Virology cost about $600,000, not $600 million as the authors stated. The figure was corrected on Friday, a day after VICE World News emailed questions to the *Journal*'s opinion desk. That number came from a report by Republicans that exaggerated the amounts of several other projects by orders of magnitude and has been cited in several other prominent news outlets.

NIH 57707 - 018978
MORENS_NIH_033596
REL0000478415

The Trump-appointed former director of the CDC apparently also misattributed the findings of a military contractor's report to Harvard. The Harvard study he links to analyzed satellite images of hospital parking lots in Wuhan, but it did not once mention the Wuhan Institute of Virology. It was also criticized for its poor dataset, abuse of statistical methods, and mistranslation.

The analysis of traffic outside the Wuhan institute used commercial satellite imagery and phone location data to conclude that traffic was unusually thin around the Wuhan institute and was the result of containment efforts following a hazardous event. But the report's key assertions were found to be false as early as June last year.

These are just a few examples, from one article, showing the challenges of investigating the origins of the coronavirus without being in China and without the country's full cooperation.

The closest thing to a field study the world has seen was the World Health Organization (WHO) trip to China early this year, but the global health body has complained about not being able to access the complete raw data from the early COVID-19 patients that could give researchers insights into how the virus emerged.

Last month, the WHO chief urged Beijing to share the data, but Chinese officials said the information could not be disclosed due to patients' privacy. Some scientists are not convinced by the argument, citing the possibility of disclosing the data while keeping the patients' anonymous.

Beijing's obsession with a theory that the coronavirus could have been brought into China through frozen food imports has also raised doubts. Officials have kept calling for more research into such potential cold-chain transmission, although few scientists abroad have found it credible enough to justify further investigation.

"In my opinion, it's even less likely than lab origin," Angela Rasmussen, a virologist at the University of Saskatchewan in Canada, told VICE World News. Rasmussen, who has argued in favor of a natural origin of the coronavirus, said the Chinese government might be trying to distract people from the wildlife trade that could have led to a virus zoonotic spillover.

Scientists say only greater transparency will help Chinese authorities fend off all these suspicions. "We are being asked to take their words for it, without seeing any data," said Alina Chan, a biologist at the Broad Institute in Cambridge, Massachusetts, who has promoted the lab leak hypothesis. Chan told VICE World News she would like to see all of the sequences of the pathogens that were processed at the Wuhan lab. If the data could not be made public, she said, they should at least be reviewed by an international team of scientists.

"This situation is setting precedents for how future outbreaks are tracked," she said. "If every single country does this, and refuses to let international investigators check where the virus came from, we would just be facing a future where viruses are just exploding everywhere, and we are just getting a new pandemic every five or ten years."

Some other scientists still maintain that the lab leak theory is unlikely, in contrast with what they have called a "substantial body of scientific evidence" supporting a natural origin for the coronavirus, according to a peer-reviewed paper published in *Cell* this week.

Still, with few new data points to inform the origins probe, scientists on both sides of the debate have called for greater transparency.

WHO Director-General Tedros Adhanom Ghebreyesus in July said the lack of raw data on the early days of the outbreak was hampering the investigations into the origin of the virus and urged China to be more transparent. Tedros suggested further studies into Chinese laboratories in the next phase of studies.

NIH 57707 - 018979

MORENS_NIH_033597
REL0000478415

But the Chinese government would not feel comfortable with this degree of transparency. The Communist Party leadership is used to conducting investigations and making decisions behind closed doors, and sees the call for openness as a political threat.

That is not atypical in China's crisis management," Yanzhong Huang, a senior fellow for global health at the Council on Foreign Relations, told VICE World News. "The U.S. could push for more transparency, but they fail to recognize that the lack of transparency itself is part of the authoritarian governance in the country."

This mindset could hurt China's reputation—the pandemic is not a small crisis but one that has upended almost everyone's life. "Even if the virus is caused by a natural spillover event," Huang said, "when you don't show transparency, when you are perceived as unwilling to share the data, people naturally will think you have something to hide."

The Chinese government has remained intransigent to the mounting calls for more transparency.

At the press conference last month, Chinese officials said they were "shocked" to hear about WHO's proposal for fresh audits into Chinese labs, adding the suggestion indicated "disrespect for common sense and an arrogant attitude toward science."

The same month, state media quoted a Facebook post by a self-claimed Swiss biologist named Wilson Edwards as saying that researchers faced intimidation from the U.S. for supporting the WHO-China origin-tracing study. The Swiss embassy said no such person exists.

It's unclear whether the U.S. intelligence probe, which was condemned by Chinese state media as a "political witch-hunt," would yield anything more than circumstantial evidence.

By the time a preliminary report was drafted, the intelligence community was still divided over the lab leak theory and the natural origin one, CNN reported this month. The outlet cited a source as saying that the draft contained "nothing too earth shattering."

In September 2019, the Wuhan Institute of Virology shut off public access to its database, which holds thousands of genetic sequences of bat coronaviruses it studied.

Shi Zhengli, director of the Center for Emerging Infectious Diseases at the institute, said the online database was shut down after cyberattacks—believe it or not, that's the answer to ex-CDC director Robert Redfield's first question. But almost two years later, the database remains offline. It's no wonder that people are asking questions.

CAUTION: This email is not from a BCM Source. Only click links or open attachments you know are safe.

I'll also report that the paper you cofunded with EcoHealth Alliance dealt with rWIV1-SHC014S, a chimeric virus shown to be very dangerous to mice with human airway cells, which biosafety experts consider to be gain of function, and which is already under GOP congressional investigators' microscope. Were you aware of this? Should you have disclosed this to your followers on Twitter and The Lancet Commission?

Please clarify if this is incorrect.

Thank you,
Emily

On Sun, Aug 7, 2022 at 2:32 PM Emily Kopp <emily@usrtk.org> wrote:
Dr. Hotez,

I received an anonymous tip regarding an apparent conflict of interest relevant to your criticism of the GOP investigation into the possibility that a lab accident sparked the pandemic.

The tipster pointed out that your grant to develop a SARS vaccine was in part motivated by the possibility that a lab accident or bioterrorist attack could result in a SARS outbreak.

Questions:

1. Could you please clarify why you believe the lab origin theory of SARS-CoV-2 is ridiculous pseudoscience, even though you did research under the presumption that a SARS-like virus escaping from a laboratory was possible? Taxpayers devoted $1.6 million in funding toward that project - was it under pseudoscientific pretenses?

2. Could you clarify your involvement in this research project underwritten by both your grant and EcoHealth Alliance's controversial "understanding the risk of bat coronavirus emergence" grant? Do you have a personal or professional relationship with Shi Zhengli? What about Peter Daszak? Have you ever funded or co-funded research at the Wuhan Institute of Virology?

Thank you,

--

I'll email Rich later today probably. Erik Stemmy, my program officer at NIAID says he'll look into it. I don't think for a minute the funds will be released, but this is the correct thing to do before moving on.

If NIH O/D won't release the grant at this point, the only way forward would be to file an action. I'll need public support for that. It would be very unfortunate and I'm hoping it won't come to it.

Cheers,

Peter

Thanks Peter,

Thanks for the update. I would be happy to be a Tony Whisperer when the time is right. It's a bit hard for me to interpret the NIH speak and the actions to follow will provide the necessary clarification. I too hope this is now history. However, my sense also tells me that until there is a public disclosure that will preclude any precedent arising from this terrible episode at NIH I don't think we can just rest easy.

Were you in touch with Rich Roberts? Keep me in the loop.

Importance: High

Jerry and David,

Just got off a call with our pro bono lawyers. They'd been in contact with NIH O/D re. another FOIA request. The person they dealt with told them that there are no pending inquiries into the Wuhan Institute of Virology – the stated reason that our grant was initially terminated. The email chain is below including an email I just sent to Erik Stemmy, cc'd to Emily Erbelding and Cristina Cassetti asking to let me know of the status of our grant. We're hoping that we'll get information that the grant is now fully reinstated without conditions.

I'm letting you know so that you might whisper in Tony's ear in case it gets up to him. I realize it's been dealt with in the past by the Office of the Director, but let's see what happens – this is an attempt to give them a way to quietly continue the funding without further escalation.

Keeping my fingers crossed here, and anything that you can do to help or advise, or smooth the right passage would be very much appreciated.

Cheers,

Peter

Hi Erik,

We received an email (below) from Garcia-Malone Gorka of the Office of Director letting us know that they have confirmed there are no pending investigations into the Wuhan Institute of Virology, and that the grant is funded. Because of that email, I'm writing to ask if you can confirm that we can move ahead with a continuation of our 5-yr award R01AI110964 and spend funds against the budget.

We're really hopeful that this is the case, and everyone at EcoHealth Alliance is looking forward to continuing this critical work.

Looking forward to hearing news from you!

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

From: Garcia-Malene, Gorka (NIH/OD) [E] (b) (6)
Sent: Tuesday, January 26, 2021 12:20:51 PM

Subject: [EXT] FW: FOIA Case No. 55702 re: EcoHealth Alliance & Grant No. R01AI110964-6

Good afternoon, Mr. Torsiello –

I'd like to insert myself into the unfolding FOIA conversation in hopes of providing some helpful context. Our records show that

MORENS_SUBPOENA_012475
MORENS_NIH_023719
REL0000478420

this competing renewal has in fact been funded. In addition, any indication from my program that there is an ongoing investigation into WIV can now be disregarded, as we recently confirmed there are no pending investigations into that organization. If we can agree on the above, all that would remain is to receive your proposed redactions to the records sought under the FOIA request.

Please let me know if there are any questions. I look forward to facilitating the Pre-Disclosure Notification process as efficiently as possible.

Best regards.

Gorka Garcia-Malene |FOIA Officer for the National Institutes of Health

Subject: FOIA Case No. 55702 re: EcoHealth Alliance & Grant No. R01AI110964-6

Dear Ms. Bartok:

As you may recall, this firm represents EcoHealth Alliance, Inc. ("EcoHealth Alliance"), with respect to certain FOIA requests, including the instant request, FOIA Case No. 55702. The instant request seeks the same documents sought last year in FOIA Case No. 53996, regarding the research project *Understanding the Risk of Bat Coronavirus Emergence*, funded under grant 2R01AI110964. A copy of our prior letter regarding FOIA 53996 is available via the link provided below using the password NIH12345. On the grounds set forth in the letter, FOIA 53996 was denied in its entirety.

Likewise, FOIA 55702 should be denied and the grant documents should be withheld. First, grant 2R01AI110964-06 remains an unfunded competing renewal grant that is the subject of a pending first-level appeal and, thus, the materials are not subject to disclosure under NIH Grants Policy Statement §2.3.11.2.2. Moreover, in the context of the appeal, NIH has made multiple requests for further information regarding The Wuhan Institute of Virology ("WIV"), which requests indicate that a law enforcement investigation concerning WIV remains ongoing. Second, as demonstrated by the recent attack on the US Capital fueled by disinformation and conspiracy theories, the need to protect the privacy of EcoHealth Alliance's employees and affiliates is more important than ever. Last, while EcoHealth Alliance did not initially identify that the grant proposal contained confidential-commercial and propriety information, this is not dispositive. Moreover, since the filing of the renewal application, there has been a global COVID-19 pandemic, which has sparked international and highly competitive research in the area of bat coronaviruses.

At the very least, the responsive documents will require significant redactions. While the grant documents were previously reviewed and redacted in connection with FOIA 53996, we require a further opportunity to review the documents to confirm, *inter alia*, that all personnel information has been removed given the heightened risk of harm in this unprecedented political environment. Accordingly, EcoHealth Alliance respectfully requests a forty-five (45) day extension of time to respond to FOIA 55702, to allow sufficient time for EcoHealth Alliance to conduct a further review of the responsive documents and provide an updated letter response that incorporates recent developments and specific justifications for additional redactions.

Please confirm that NIH will deny FOIA 55702 in its entirety or that NIH is agreeable to EcoHealth Alliance's request for an extension of time to provide a particularized response to FOIA 55702. Please also confirm NIH's receipt of this email.

Thank you.

Best,

MORENS_SUBPOENA_012476

EXTERNAL SENDER

Thanks for sharing this document. I don't know Peter personally, so don't understand how he wants to present himself and EcoHealth to the politicians. As we all have seen, politicians purposefully come across as combative, like to speak in sound bites, and take much liberty with the facts. As a scientist, my personal style is to stick to the facts, insist that others stick to those facts, and admit when and where science cannot answer questions. The way this statement is written, it tends towards giving the politicians a taste of their own medicine, so to speak, by stating in absolute terms topics that are more nuanced. For example:

"Many of the claims levied against EcoHealth Alliance are built on the false assumption that COVID-19 emerged from the Wuhan Institute of Virology because of a lab leak during research supported by the NIH under a subgrant from EcoHealth Alliance: There is not a scintilla of scientific evidence for this narrative. "

I probably would have stated this differently. The failure to find the SARS-COV2 virus in nature has been the primary support for the lab leak hypothesis. So I think stating that "there is not a scintilla of scientific evidence" is overstated, and could bring trouble. The epidemiology of the disease does suggest origin at the market, but without the cooperation of the Chinese, we will not solve this problem. I am sure that many interpret the lack of cooperation by the Chinese as "proof" that they engineered the disease, even if by mistake.

The rest of the statement follows in similar vein, by showing anger and frustration. (And believe me, I can

completely relate to why Peter is so frustrated!) But emotion tends to detract from the impression that this is a fact-based rebuttal. I guess I would have just made the same points more dispassionately. e.g. Debarment is not an appropriate action in this case based on government regulations. The timing of the request for data and notebooks was too late, and by that time political tensions virtually guaranteed that they would not be forthcoming as distrust was evident on both sides (Chinese and US). etc.

Please note that these comments are just based on my personal experience with Congress. Peter can take or leave.

One strategy I used to use with Congress was to meet privately with the Members prior to my testimony. For those likely to be in opposition to my case, I would explain in great detail to them and in terms they can understand why they should back off or change their minds. For those likely to be sympathetic to my case, I would feed them questions to ask. I remember one case when I was testifying for the USGS budget, and the proposal had been to zero out the Earthquake Research Grants to universities, a program in place for many decades. I had one Member ask me whether these grants had any impact in the past. That gave me the opening to tell the story of a young Stanford grad student from France whose research funding had run out, and he was going to have to return to France. The USGS stepped in, supported the student, and he used the funds to conduct a strong ground motion mapping of the Bay Area to predict what areas were most vulnerable to earthquake shaking and sediment liquification. Three years later, the Loma Prieta earthquake occurred, and basically validated all of the microzonation shaking that the map had predicted. The student was able to stay in the US, finish his degree, obtain US citizenship, and at the time of my testimony was President of Caltech. All of the money for the earthquake research grants was restored by Congress as a result of that testimony, and no funds were taken out elsewhere.

Peter needs an opportunity to talk about all of the good that the EcoHealth Alliance has done, and needs to create an opening to tell that story.

Hope this is helpful. Have a great Memorial Day!

Marcia

Marcia:

Here is a draft of a document that Peter Daszak is preparing in order to answer the questions from the Congressional sub-committee concerning EcoHealth Alliance. Any comments or advice you might have would be welcome.

There is getting to be increasing concern among the colleagues I speak to about the attacks on Science from politicians and many have expressed a willingness to help with a campaign to counter them. Has any progress been made from your end? I would be happy to talk with you or your communications staff about this.

Not pleasant reading but thanks for sharing this link. It's a stream-of-consciousness diatribe that makes you think this guy is simply mentally ill, but actually he's a well-known right wing 'influencer', appearing on Steve Bannon's podcast, member of the Brownstone Institute and regular on other outlets. In the end, just probably a sad lonely person looking for outside validation. Still, pretty disturbing to read…

On May 19, 2022, at 4:27 PM, Peter Daszak (b) (6) > wrote:

What's really irksome is that this article in PNAS is full of errors and misunderstandings.

I haven't read the whole thing, but just about every paragraph contains an erroneous assumption that could easily be refuted, e.g.:

- "EHA, UNC, NIH, USAID, and other research partners have failed to disclose their activities to the US scientific community and the US public, instead declaring that they were not involved in any experiments that could have resulted in the emergence of SARS-CoV-2." BS – we published dozens of papers on our work (they're on our website!) and sent reports in to NIH each year. We also gave hundreds of public lectures on this and spoke with the intelligence agencies about it.

  "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the United States and China, has not been disclosed for independent analysis." BS – that's what happens when you publish peer-reviewed papers. Maybe Sachs has forgotten how that works!

  "Much of the work on SARS-like CoVs performed in Wuhan was part of an active and highly collaborative US–China scientific research program funded by the US Government (NIH, Defense Threat Reduction Agency [DTRA], and US Agency for International Development [USAID]), coordinated by researchers at EcoHealth Alliance (EHA), but involving researchers at several other US institutions." Wrong again – DoD DTRA do not and have not funded work in China, let alone the Wuhan lab.

  "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown." BS – all 'viruses' collected from the field have been published already.

  "These research proposals make clear that the EHA-WIV-UNC collaboration was involved in the collection of a large number of so-far undocumented SARS-like viruses and was engaged in their manipulation within biological safety level (BSL)-2 and BSL-3 laboratory facilities, raising concerns that an airborne virus might have infected a laboratory worker (9)" BS – there were only 3 SARS-related CoVs isolated in China. All the rest are simply genetic sequences of a short read of the RdRp gene, with a few dozen full genomes. It's all in the scientific papers that Sachs hasn't bothered to read.

And so on, and so forth.

MORENS_SUBPOENA_011185
MORENS_NIH_021965
REL0000478430

Honestly, it would take me about a day to go through this paper and rebut every single error and misconception, but who's got time for that!

By the way – all of these questions have been asked repeatedly on Twitter, by journalists, by the FBI and CIA, and by hundreds of people who've spoken with me over the last 2 years. I've answered them all, now I have to do it all again, and again, and again. Problem I see here is that he just doesn't believe me, so the only option is for my laptop to be downloaded in front of a Great Inquisition, led by an eminent person such as…dare I say…Professor Sachs himself.

Cheers,

Peter

Subject: Jeff Sachs causing trouble via a PNAS article
Importance: High

EXTERNAL SENDER

Looks like Sachs has been taken down yet another rabbit hole by a scientist at Columbia (Harrison) who doesn't work in the field, and is just plain wrong. It's the old Furin cleavage site hypothesis again, without any new data or evidence. Of course, that's their point – the lack of evidence means we're all hiding information and need to be hung, drawn and quartered.

They've published an opinion piece in PNAS (attached) and there's this article in 'The Intercept'. Ebright is quoted, of course!

https://theintercept.com/2022/05/19/covid- lab-leak-evidence-jeffrey-sachs/

All this will be put straight into the subpoena letters that we've been told by Democrat staffers to expect to arrive in Jan/Feb 2023 when the Republicans take over the house (their words, not mine).

JEFFREY SACHS PRESENTS EVIDENCE OF POSSIBLE LAB ORIGIN OF COVID-19

An article in the Proceedings of the National Academy of Sciences calls for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of Covid.

Sharon Lerner

May 19 2022, 4:00 p.m.

IN AN ARTICLE published Thursday, economist Jeffrey Sachs called for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of the Covid-19 pandemic. Writing in the Proceedings of the National Academy of Sciences, Sachs and his co-author, Neil Harrison, a Columbia University professor of molecular pharmacology and therapeutics, said that federal agencies and universities possess evidence that has not been adequately reviewed, including virus databases, biological samples, viral sequences, email communications, and laboratory notebooks. Sachs and Harrison also highlighted a tantalizing scientific detail that may be an indication that SARS-CoV-2, the coronavirus that causes Covid-19, originated in a laboratory: a sequence of eight amino acids on a critical part of the virus's spike protein that is identical to an amino acid sequence found in cells that line human airways.

Sachs and Harrison are hardly the first to suggest that SARS-CoV-2 might have been created in a lab. Since its genetic sequence was first published in February 2020, scientists have puzzled over the furin cleavage site, an area on the virus's spike that allows it to be broken apart by a protein on the membrane of human cells and makes the coronavirus particularly dangerous to people. Once split, the virus releases its genetic material into the cell and reproduces. While all viruses work by attaching themselves to cells, breaking apart, and releasing their genetic material, SARS-CoV-2 is the only one of its class, sarbecoviruses, to use this particular mechanism to do so.

As with past discussion of a possible lab origin of SARS-CoV-2, this latest theory has already been met with considerable pushback. Even some scientists who are open to the idea that a lab accident could have sparked the pandemic remain unconvinced by the particular trail of evidence laid out by Sachs and Harrison.

The journal article offers a scientific road map for how this unusual sequence of amino acids could have made its way into the furin cleavage site, or FCS, of the virus. Sachs and Harrison acknowledge that the sequence could have arisen naturally. But they also lay out another possibility: that scientists might have purposefully inserted this particular string of amino acids into a bat coronavirus in the course of their work. They focus particularly on scientists who submitted an unfunded grant proposal to a division of the Defense Department called the Defense Advanced Research Projects Agency, or DARPA, laying out plans to insert a furin cleavage site into a bat coronavirus.

"We do not know whether the insertion of the FCS was the result of natural evolution — perhaps via a recombination event in an intermediate mammal or

MORENS_SUBPOENA_011189
MORENS_NIH_021969
REL0000478430

a human — or was the result of a deliberate introduction of the FCS into a SARS-like virus as part of a laboratory experiment," Sachs and Harrison write. "We do know that the insertion of such FCS sequences into SARS-like viruses was a specific goal of work proposed by the EHA-WIV-UNC partnership within a 2018 grant proposal ("DEFUSE") that was submitted to the US Defense Advanced Research Projects (DARPA)."

EHA is a reference to EcoHealth Alliance, a nonprofit research group based in New York City that has received more than $118 million in grants and contracts from federal agencies. WIV, or the Wuhan Institute of Virology, is a Chinese research organization that collaborated with EcoHealth Alliance in the past and was listed as a subcontractor on the DARPA grant. UNC is mentioned because Ralph Baric, a molecular biologist at the University of North Carolina, Chapel Hill, was to have conducted part of the work pitched to DARPA. The grant proposal touted Baric's "two-decade track record of reverse engineering [coronavirus] and other virus spike proteins."

The intent of the DARPA proposal was to prevent emerging pathogenic threats, but the work, if conducted, could have created a novel virus capable of infecting humans. "We will introduce appropriate human-specific cleavage sites and evaluate growth potential in [a type of mammalian cell commonly used in microbiology] and [human airway epithelial cell] cultures," the proposal stated.

Several scientists interviewed about the DARPA proposal in September told The Intercept that scientists often begin research before seeking funding and thus that some of the experiments described in the proposal could have already been completed. But when asked about that possibility in an interview, Peter Daszak, the president of EcoHealth Alliance, rejected it: "The DARPA proposal was not funded. Therefore, the work was not done. Simple."

A Rational Choice

As Sachs and Harrison note, the part of a protein on the cell membrane that shares its amino acid sequence with the bat coronavirus is critical for lung function. Known as an epithelial sodium channel-alpha, or ENaC-alpha, it is found in human airway cells, as well as in human kidneys and colons. Intriguingly, like SARS-CoV-2, ENaC-alpha, which facilitates the absorption of fluid in cells, is also activated by the unusual furin cleavage site. Harrison, a physiologist affiliated with Columbia's Department of Molecular

MORENS_SUBPOENA_011190
MORENS_NIH_021970
REL0000478430

Pharmacology and Therapeutics, studies ion channels, the larger category to which ENaC-alpha belongs.

Other scientists have already pointed out the match between the amino acid series in the furin cleavage site of SARS-CoV-2 and the ENaC-alpha found in human airways. In 2020, a team from the biomedical company Nference suggested that the overlap between the virus and the sequence found in human lungs is part of the reason that Covid-19 is so damaging to the respiratory system. Those scientists described the sequence as having evolved naturally.

The Coronavirus Crisis

Read Our Complete Coverage

Sachs and Harrison, in contrast, suggest that researchers may have inserted the string of amino acids into a bat coronavirus precisely because of its known importance to lung function. "For a research team assessing the pandemic potential of SARS-related coronaviruses, the FCS of human ENaC — an FCS known to be efficiently cleaved by host furin present in the target location (epithelial cells) of an important target organ (lung), of the target organism (human) — might be a rational, if not obvious, choice of FCS to introduce into a virus in order to alter its infectivity, in line with other work performed previously," they write.

Such a choice, they point out, would have been in keeping with another viral research project on which EcoHealth Alliance, the Wuhan Institute of Virology, and UNC's Baric collaborated: a 2014 grant from the National Institute of Allergy and Infectious Diseases that involved increasing the transmissibility and pathogenicity of bat coronaviruses.

Growing List of Coincidences

The intriguing theory of viral engineering hinges on two observations: that the amino acid sequences match and that experts in both the ENaC-alpha furin cleavage site and the insertion of genetic sequences into bat coronaviruses

MORENS_SUBPOENA_011192
MORENS_NIH_021972
REL0000478430

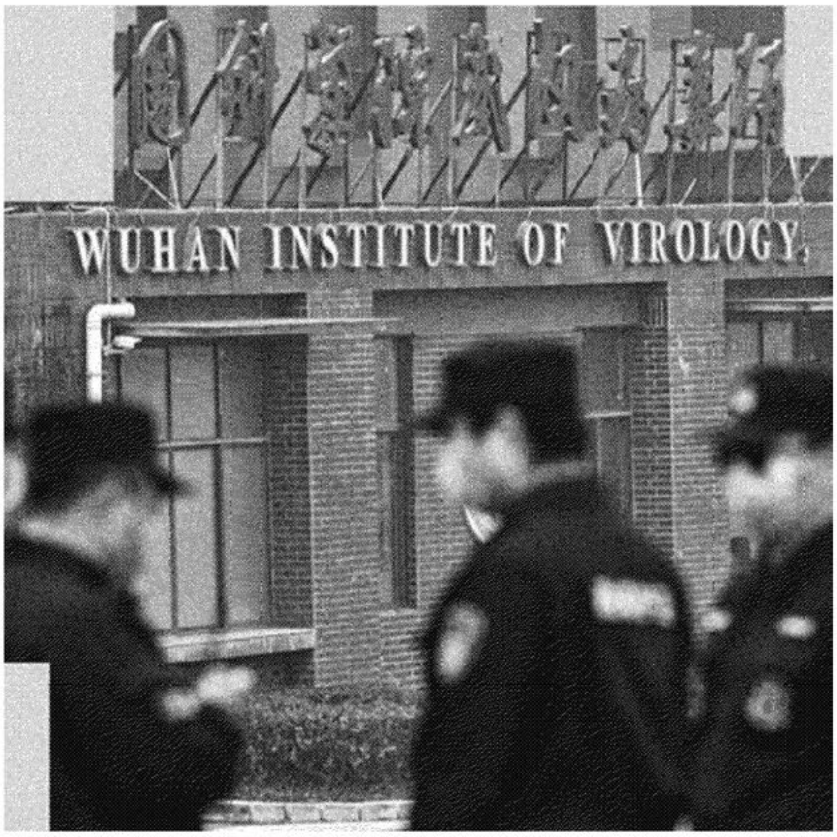
happen to work at the same academic institution: the University of North Carolina, Chapel Hill.

Baric, whose work aims to prevent and create treatments for viral outbreaks, has previously inserted segments of DNA and RNA into viruses and created an infectious clone of SARS using his own patented "No See'm" method of inserting genetic materials without a trace. He has also collaborated on coronavirus research with scientists from a center for lung studies at UNC-Chapel Hill who are knowledgeable about ENaC-alpha. In one 2016 study, the scientists created a new virus using the spike of a bat coronavirus that had been isolated and characterized by the Wuhan Institute of Virology. The experiment found that the new virus "replicated efficiently" in human airway cells that were cultured in a lab.

In another paper, published a year earlier, Baric, along with the Wuhan Institute of Virology's Shi Zhengli and a lung expert UNC-Chapel Hill's lung institute, described creating a hybrid virus using a SARS-like virus from a bat and a "mouse-adapted" coronavirus. The new virus caused mice to get sicker than those exposed to the original virus. The goal of these experiments was to prepare for the possibility that a virus might jump naturally from animals to humans, as SARS had in 2003. But even before the pandemic, the experiment drew criticism from other scientists, who were concerned because the researchers had created a virus that was able to spread in humans.

Sachs and Harrison note that the scientists who co-authored the DARPA grant proposal would have been aware of research on coronavirus furin cleavage sites, including one 2006 experiment in which a furin cleavage site was inserted into a coronavirus. "The research team would also have some familiarity with the FCS sequence and the FCS-dependent activation mechanism of human ENaC, which was extensively characterized at UNC," they write.

"The list of coincidences is getting verrrrrrrrrry long."



Still, both the overlap in the amino acid sequence and the fact that experts in the furin cleavage site of the ENaC-alpha and insertion of genetic material into bat coronaviruses work at the same university could be coincidental, as Harrison and Sachs acknowledge. Some virologists, though, say that the coincidence strains credulity.

"Could be," Richard Ebright, a molecular biologist at Rutgers University,

MORENS_SUBPOENA_011193
MORENS_NIH_021973
REL0000478430

wrote in an email to The Intercept when asked about the possibility that these things are both chance occurrences. "But the list of coincidences is getting verrrrrrrrrry long."

Ebright, a vocal proponent of the lab-leak theory whom Harrison and Sachs thank "for helpful commentary on the manuscript," spelled out some of the other Covid coincidences that he considers questionable, including its initial outbreak in a city that, well before 2019, had already been pegged as a biosafety risk. Ebright also noted Wuhan's 1,000-mile distance from the nearest wild bats that carry the type of SARS-related coronaviruses that caused the pandemic. And he pointed to the particular coding of the amino acids in the furin cleavage site of SARS-CoV2.

Related

The Lab-Leak Theory Is Looking Stronger by the Day. Here's What We Know.

"The sequence encoding the FCS of the pandemic virus contained two consecutive CGG arginine codons," Ebright explained in his email. (A codon, or a combination of three nucleotides, supplies the genetic code for a single amino acid, though most amino acids can be represented by multiple different codons. Each nucleotide is represented by a letter — for RNA, either A, C, U, or G.) "This codon usage is unusual for a natural bat SARS-related

MORENS_SUBPOENA_011194
MORENS_NIH_021974
REL0000478430

coronaviruses (for which fewer than 1 in 30 arginine codons are CGG) but is optimal for humans (for which most arginine codons are CGG codons)."

Still, Ebright said that at first he didn't see the identical amino acid sequences as particularly suspicious. "I had known for more than a year that there was a perfect match to an eight-amino acid sequence present in human ENaC. What I had not known was that the sequence was known to be a functional furin cleavage site and that it was a sequence extensively studied at UNC," he said. "The crucial point that the ENaC sequence was a known functional site, not just that there happens to be a match to a protein that happens to be in humans. … That suddenly turned it from what I thought to be largely irrelevant to being a logical and obvious choice to proceed."

Ralph Baric and the University of North Carolina did not immediately respond to requests for comment.

Name Calling

Other scientists dismiss the idea that the ENaC sequence might have been purposefully inserted into a coronavirus. Scientists who are already convinced that the new coronavirus emerged naturally are unlikely to be persuaded by Sachs and Harrison's article, which appears in the opinion section of the esteemed journal. Over the past year, many scientists involved in the debate over the origins of the pandemic have settled into an increasingly acrimonious,

MORENS_SUBPOENA_011196
MORENS_NIH_021976
REL0000478430

coarse, and unyielding opposition.

Some proponents of the natural origin theory became particularly dismissive of those open to the possibility of a lab leak after the February release of two pre-print studies mapping the early spread of the virus at the Huanan market in Wuhan. Angela Rasmussen, one of a team of virologists who worked on the project, described it on Twitter as "dispositive evidence of a zoonotic origin" that will "drive those with personal interest in the lab leak hypothesis out of their goddam minds." In another tweet, Rasmussen referred to proponents of the lab-leak theory as a "pack of ghouls, who through gullibility, stupidity, & conspiracist thinking have decided this is their thing despite zero expertise."

Although the pre-prints had not been peer-reviewed and may have simply illustrated the spread of the virus rather than its original outbreak, the New York Times ran a front-page story about them that quoted an epidemiologist as saying that the origins debate "has been settled with a very high degree of evidence." The story, which was announced by a push notification from the paper, also noted a lack of direct evidence for a lab leak.

Meanwhile, Kristian Andersen, another co-author of the pre-prints and a virologist at the well-regarded Scripps Research Institute, used the "poop" emoji to criticize a deeply researched article by Katherine Eban about EcoHealth Alliance. On Twitter, Andersen tarred Eban, New York Times columnist Zeynep Tufekci, and others reporting on biosafety issues that could have led to the release of SARS-CoV-2 as "deep in conspiracy theories" and on the other side of "a clear split" from journalists who dismiss the possibility of a lab origin, whom Andersen referred to as "science-based."

Even some scientists who have been vocal about the possibility that the pandemic may have been sparked by research have expressed skepticism about the theory suggested by Harrison and Sachs. "I'm sure that these authors believe in their own hypothesis and arguments, but to me, it's not one that is particularly convincing," said Alina Chan, a scientist who laid out a number of possible routes for how the coronavirus might have emerged through research-related incidents in her recent book "Viral: The Search for the Origin of Covid-19."

"There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

While she is open to the possibility that the furin cleavage site might have been

MORENS_SUBPOENA_011197
MORENS_NIH_021977
REL0000478430

purposefully inserted into the coronavirus, Chan said there was no reason to think that researchers would mine humans for such material. "These scientists literally had access to hundreds of SARS-like viruses and sequences," said Chan, referring to the vast collection of coronaviruses from bats and other animals that researchers amassed at the Wuhan Institute of Virology. "There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

Jack Nunberg, a virologist at the University of Montana, was also not immediately persuaded by the theory of engineering suggested by Sachs and Harrison. "It's possible," Nunberg said of the idea that the ENaC segment was inserted into a bat coronavirus as part of research designed to gauge the pandemic potential of a virus. "But I don't find their evidence on ENaC compelling because furin cleavage sites have a lot of common amino acids, and therefore it may just have happened by chance."

Others say that the article adds noteworthy information to the public conversation about the origins of the pandemic. "The defenders of the natural origin indicate that the virus on which this type of experiment could have been done — the backbone — has never been published and that specialists in the furin cleavage sites would have chosen a more commonly used furin cleavage site like RARR rather than PRRAR. The Proceedings of the National Academy of Sciences article contradicts this argument and indicates that specialists knew that the RRAR'SVAS site was efficiently cleaved by furin," Etienne Decroly, director of virology research at the Aix-Marseille Université in France, wrote in an email to The Intercept.

Decroly added, "It is impossible to decide on the basis of the information currently available and it is urgent that the WHO Special Advisory Group for the Origins of Novel Pathogens investigate this question."

On the suggestion of an investigation, Nunberg is in agreement. "You can't argue with that," he told The Intercept. "Who's going to argue for burying one's head in the sand?"

For their part, Sachs and Harrison emphasize that they're not saying laboratory manipulation was involved in the emergence of the pandemic virus, only "that it could have been." They also give a nod to other possibilities, including that an airborne virus might have infected a laboratory worker. Rather than argue that any of these conceivable scenarios happened, they present the clues of the matching amino acid sequences to argue for an independent and transparent scientific investigation of the U.S.-based evidence related to the origins of the virus.

Among the institutions that Sachs and Harrison list as possibly having "knowledge of the detailed activities that were underway in Wuhan and in the United States" are the National Institutes of Health; the Defense Threat Reduction Agency, which has provided grant funding to EcoHealth Alliance; the Department of Homeland Security; DARPA; the U.S. Agency for International Development, which funded the $200 million PREDICT program that catalogued potential pandemic viruses; and the University of California, Davis, which participated in that program.

The authors suggest that EcoHealth Alliance and UNC may have particularly important untapped resources. "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the US and China, has not been disclosed for independent analysis," they write. "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown."

Peter Daszak, one of the members of the World Health Organization team investigating the origins of the Covid-19, on a balcony at a hotel in Wuhan, China, on Feb. 6, 2021.

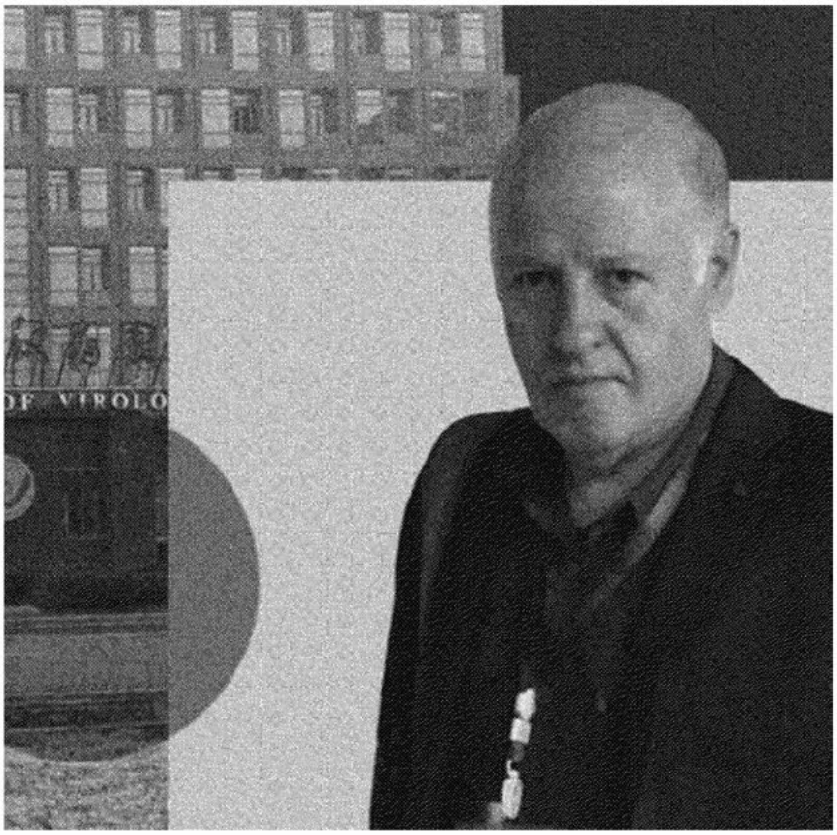

Photo: Hector Retamal/AFP via Getty Images

A Reversal

The publication in the prestigious Proceedings of the National Academy of Sciences marks a reversal of sorts for Sachs, the chair of the Lancet Covid-19 Commission who, in November 2020, appointed Daszak, the EcoHealth Alliance president, to lead a task force to investigate the origins of the pandemic. Earlier that year, Daszak had signed on to a public statement

MORENS_SUBPOENA_011200
MORENS_NIH_021980
REL0000478430

published in The Lancet on behalf of scientists who said they "condemn conspiracy theories suggesting that COVID-19 does not have a natural origin."

Related

Peter Daszak Answers Critics and Defends Coronavirus Research

Yet that early certainty about the pandemic's origins — and the sense of shared civic responsibility among members of the Lancet task force — soon disintegrated. In February 2021, emails revealed that Daszak coordinated the public statement in The Lancet tamping down suspicions of a lab leak. And by June 2021, Sachs was expressing his openness to the possibility of a lab origin, writing that NIH-funded research at the Wuhan Institute of Virology "deserves scrutiny under the hypothesis of a laboratory-related release of the virus." Three months later, he disbanded the task force that had been organized to "carefully scrutinize the origin of the SARS-CoV-2 virus" in the hopes of preventing future disease outbreaks, explaining that he had concerns that several members of the commission had conflicts of interest because of their ties to EcoHealth Alliance.

After leading the mainstream scientific inquiry into the origins of the pandemic, Sachs is now skewering it. "A steady trickle of disquieting information has cast a darkening cloud over the agency," he and Harrison write

MORENS_SUBPOENA_011201
MORENS_NIH_021981
REL0000478430

of the NIH, going on to accuse the entire federal government of not doing enough to explore the possible role of its grantees in the emergence of SARS-CoV-2 and investigate "overlooked details" such as the matching amino acid sequences.

Noting that the NIH has insisted that "the pandemic virus could not have resulted from the work sponsored by" the agency, Sachs and Harrison write that "blanket denials from the NIH are no longer good enough."

Cheers,

Peter

This is an utterly ridiculous set of BS. Jesse Bloom is the person driving it – he buys into the lab leak theory and found that some folks from WIV uploaded partial genomes early on, then added a bunch of more complete ones, and asked for the partial sequences to be removed. Absolutely normal, but he's trying to turn it into a 'mystery'.

Of course, NIH makes it all worse by not releasing emails, redacting critical parts of them, and failing to explain why they follow the wishes of the submitter re. Genbank. It's perfectly logical really – if NIH now starts releasing sequences you as a submitter asked them to remove for whatever reason, submitters will think twice about using Genbank. We already have China working with its own database and all this BS will make them twice-shy about submitting.

Even worse, Tabak now says that 'don't worry, we still have the data on back up tapes' so everyone now knows that NIH keeps the stuff you thought they agreed to delete, and no doubt has already handed it over to the FBI and the CIA.

It's a conspiracy, wrapped within an enigma, encapsulating a riddle….

PS – heres a cracker of an email from an NIH press office (?) person at O/D ripping into a journalist (Carl Zimmer) who wanted information on the 'missing' china sequences. Now it turns out that US submitters also deleted early COVID genomes…even more reason for the public to not trust scientists…:

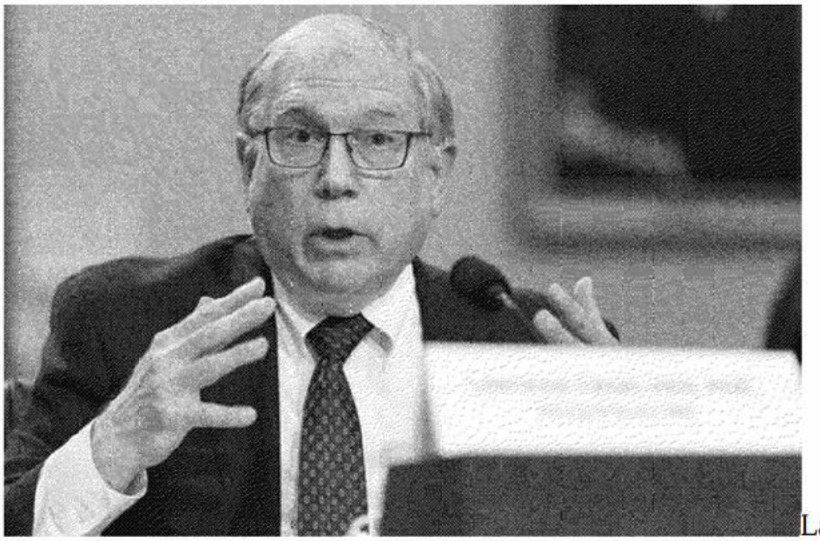
NIH director confirms agency hid early COVID genes at request of Chinese scientists

By
Steven Nelson
May 11, 2022 3:47pm

National Institutes of Health acting director Lawrence Tabak confirmed to lawmakers Wednesday that US health officials concealed early genomic sequences of COVID-19 at the request of Chinese scientists — but insisted the data remains on file.



Tabak told a House Appropriations subcommittee that the NIH "eliminated from public view" the data from the pandemic epicenter in Wuhan, China, before adding that researchers can still access it via an archaic "tape drive."

Vanity Fair recently reported that the information was hidden in response to a request from Chinese scientists, despite potentially resolving whether the virus leaked from the Wuhan Institute of Virology or passed naturally from animals to humans.

Rep. Jaime Herrera Beutler (R-Wash.) asked Tabek to explain why US officials would comply with such a request.

"There's no question that the communication that we had about the sequence archive — Sequence Read Archive — could have been improved. I freely admit that," Tabek said. "If I may, the archive never deleted the sequence, it just did not make it available for interrogation."

MORENS_SUBPOENA_011207
MORENS_NIH_021987
REL0000478430

Lawrence Tabak, acting director of the National Institutes of Health, testifies on May 11. Jacquelyn Martin/AP

“So wait, you have the information still?” Beutler followed up.

“We have the information … Anybody who submits to the Sequence Read Archive is allowed to ask for it to be removed,” Tabak explained. “And that investigator did do that. But we never erase it.”

“So you don’t have the information anymore?” Beutler asked.

“We do. We never erase the information. We keep it,” Tabak clarified.

“So they were able to withdraw public viewing of it?” the congresswoman followed up.

“That’s correct,” he said.

“OK, so researchers can apply to the NIH and get the information from you?” Beutler asked.

“In the way that it was originally eliminated from public view, it was withdrawn, and that’s the most difficult for people to access,” Tabak replied. “The error that was made, and we found this out after a review of all of our processes, was it should have been suppressed. The distinction being that if it’s withdrawn, it is kept archivally on a tape drive — old technology, but that’s how it’s done. But when it is withdrawn, it can still be accessed by accession number, and so researchers are able to access that information.”

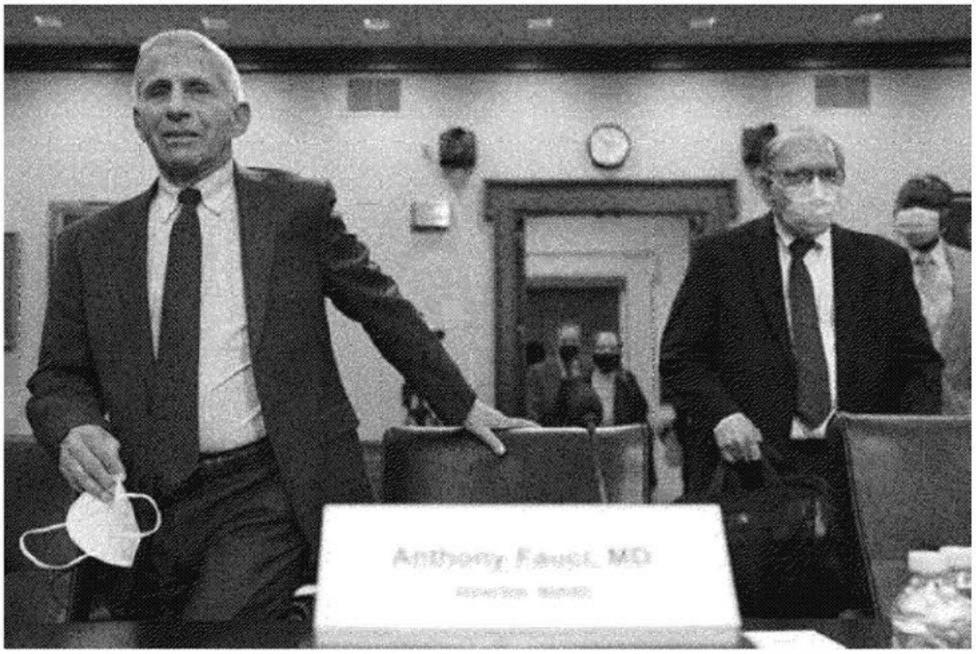
Security personnel keep watch outside Wuhan Institute of Virology during the visit by the World Health Organization on Feb. 3, 2021. Thomas Peter/REUTERS

"So the information is still there?" Beutler summed up.

"That's correct. The information was never lost," Tabak repeated.

In a March 31 article, Vanity Fair reported that evolutionary biologist Jesse Bloom discovered last year that early COVID-19 sequences had disappeared from a federally run data repository.

When Bloom raised the issue, he was reportedly ganged up on by a group of researchers assembled by then-NIH Director Francis Collins and infectious disease institute head Dr. Anthony Fauci.



Bloom shared a draft academic paper with Collins and Fauci, who allegedly objected on a June 2021 Zoom video conference to Bloom's description of Chinese scientists "surreptitiously" removing the sequences. Fauci said the word was "loaded" and implied a coverup, the report said.

Evolutionary biologist Kristian Andersen, who was selected to participate on the call by Collins, allegedly told Bloom that the Wuhan team had a right to claw back early pandemic information and that it was unethical for Bloom to question it.

Tabak noted that while the request for information to be removed was honored, it was not erased fully.ECOHEALTH ALLIANCE
Andersen allegedly went so far as to offer to delete Bloom's article from a "preprint" server "in a way that would leave no record that this had been done."
China's government has refused to cooperate with an international investigation of the origins of the pandemic. The COVID-19 virus has killed about 1 million Americans since March 2020 and caused massive social, economic and educational disruptions. The US intelligence community said in an August report that it's possible the virus leaked from the Wuhan Institute of Virology, calling the theory one of two "plausible" explanations along with natural transmission from animals.

REL0000478430

Lawrence Tabak confirmed Wednesday that early genomic sequences of COVID-19 were concealed at the request of Chinese specialists. Jacquelyn Martin/AP

President Biden rarely speaks publicly about wanting China to be transparent about the origins of the pandemic. Former President Donald Trump, by contrast, has demanded that China pay $10 trillion in reparations.

The Biden administration is considering undoing some of Trump's tariffs on Chinese goods "separately" from US pressure for coronavirus transparency, White House press secretary Jen Psaki told The Post on Monday.

Documents published in September by The Intercept revealed that US health officials indirectly funded so-called "gain of function" research at the Wuhan lab — including the modification three bat coronaviruses distinct from COVID-19 and the discovery that they became much more infectious among "humanized" mice when human-type receptors were added to them.

Ranking Member Ruiz's Opening Statement at Select Subcommittee Hearing on Scientific Journals and the Peer Review Process

April 16, 2024

•

Press Release

Washington, D.C. (April 16, 2024)—Below is Ranking Member Raul Ruiz's, M.D. opening statement, as prepared for delivery, at today's Select Subcommittee on the Coronavirus Pandemic hearing examining the peer review process and the relationship between scientific journals and the federal government.

MORENS_SUBPOENA_014499
MORENS_NIH_027209
REL0000478431

Opening Statement

Ranking Member Raul Ruiz, M.D.

Select Subcommittee on the Coronavirus Pandemic

Hearing on "Academic Malpractice: Examining the Relationship Between Scientific Journals, the Government, and Peer Review"
April 16, 2024

Scientific journals play an important role in informing the public about the world around us, critical issues facing our nation, and advances in science and medicine.

Since their inception, these journals have placed objectivity at the forefront of their efforts to study, review, and publish articles that advance our research enterprise.

And when a once in a generation pandemic struck our nation in 2020, this was no different.

Despite the Majority's claims, the Select Subcommittee has not uncovered any evidence that directly implicates Drs. Fauci and Collins in a cover up of the pandemic's origins fueled by their collusion with scientific journals to suppress the lab leak hypothesis.

Under the guise of investigating COVID-19's origins, the Majority has continually advanced a conspiratorial narrative against our nation's public health officials relying purely on speculation.

Their probe into federally funded research has spanned more than half a million pages of documents, more than a dozen transcribed interviews, and multiple hearings, and yet it has failed to substantiate any of their claims about Drs. Fauci and Collins or even bring us closer to understanding how COVID came to be.

Instead, it has only further politicized an issue of great importance to our public health and national security, which is not without consequence.

In fact, we're already seeing growing divides when it comes to trust in our nation's institutions and how that influences people's behavior when it comes to protecting their health.

Rebuilding the American people's trust in public health is critical to our ability to prevent, prepare for, and respond to future pandemics.

And the way we go about that is not by continuing to manufacture distrust in our nation's institutions by amplifying harmful—and often outright false—information about public health or by jumping to conclusions about how this virus emerged when its origins are still inconclusive.

Instead, it is by having honest conversations—that are rooted in fact—about what we can do better in the future.

So, as we begin today's hearing, I want to take a moment to address some of the allegations that have been levied by the Majority over the course of this probe and what the facts of the case have actually told us.

First, my Republican colleagues have alleged that Drs. Fauci and Collins orchestrated the "Proximal Origin" paper to suppress the lab leak theory, despite all evidence to the contrary.

Documents and testimony made available to this committee have repeatedly shown that British scientist Dr. Jeremy Farrar played the lead role in organizing and shepherding the paper through publication.

MORENS_SUBPOENA_014500
MORENS_NIH_027210
REL0000478431

And second, my Republican colleagues have alleged that Drs. Fauci and Collins orchestrated a "takedown" of the Great Barrington Declaration.

Dr. Collins testified before this committee that he had privately called for "a quick and devastating published take down of its premises" out of concern for the public's health.

Documents and testimony provided to this committee have never shown that Dr. Collins pressured an NIH employee or scientific journal to "take down" the Great Barrington Declaration.

This committee seems to be forgetting that there is a difference between government speech—which the Supreme Court has previously ruled government entities have a right to —and government coercion, which my Republican colleagues are accusing public health officials of without a shred of evidence.

That aside, I have to say, I'm worried that today's hearing is setting a dangerous precedent—that if Congress doesn't like what you publish, you'll be hauled in before a congressional committee to answer for it.

The fact is, Congress should not be meddling in the peer review process.

And it should not be holding hearings to throw around baseless accusations, especially when there is so much work we can and should be doing to prevent and prepare for future pandemics.

Every minute wasted on spurious conjecture, every sentence spoken amplifying false information, and every hearing spent on unsubstantiated allegations comes at a cost.

And at the end of the day, it will be the American people who will pay the biggest price.

EXTERNAL SENDER

I got a call from Drew Hinshaw at the WSJ for an interview on Tedros call for investigation of the lab origin story. It looks like we will talk in the morning.

Do either of you know him and how he approaches a story? Good guy or one to be wary of?

Importance: High

Just read your email about being allowed to do interviews on the WHO report David. Interesting and disappointing. Clearly the issue of COVID origins is not the political problem – it's the WHO report that's the problem. It's quite telling really, that the Biden Admin decided the WHO report would be a political football and therefore NSC/White House agenda, not a scientific issue and therefore NIH/NIAID agenda.

This is a symptom of a bigger issues – over the last 2-4 weeks, all of the allies who would normally talk to reporters about the science have either been silenced/sidelined, or are following a political agenda, e.g. the White House, the WHO Director-General (who single-handedly threw the whole WHO expert team under the bus), the former CDC director, and now NIAID – all following the political line.

The attacks reached a crescendo over this same period with daily op-eds in NY Post, WSJ, Daily Caller and other Right Wing papers bleeding over into CNN and even NPR. My Board are now beginning to get concerned and this puts me personally in a very difficult position – it's a risk to my job, my family's security, and my career. It's not a real problem yet – if the attacks die down a bit (which I believe they will), and if my Board continue to support me (I believe they will), the long game will win out.

But at this point I'm reaching out to call for help! Can we line up some allies who will help speak publicly about the science here on wildlife-to-human spillover vs. lab leak? Critically, there is still no evidence at all that a lab leak occurred, there is also no evidence at all that EcoHealth (or NIAID) funded or supported Gain-of-function work in China. Likewise, stories about EcoHealth 'hiding' DoD funding, being funded by China, not clearly indicating the source of funding on all public documents, etc. etc. are false and/or misleading. Still, the damage is being done and I'm worried that today the momentum is with the conspiracists.

Any and all ideas are welcome – ASTMH, NAM, NASEM, others?

Jerry – what about reaching out to Benjamin Corb and others?

Cheers,

Peter

Guys, see below..... The Biden admin apparently won't let any of us at NIH, including Tony, discuss the WHO report....

On the surface this sounds bad, but there is the possibility they just want one org to manage the message because they are trying to put out a fire. Or am I just Pollyanna? d

Hi Dr. Morens –

For your awareness (and in case she also reaches out to you directly), Mariana Lenharo followed up today on her request to speak with you or another NIAID expert about the WHO report, which as you know came out today. We've been asked to refer requests for comment about the report to the National Security Council, and we will be directing her there.

Best,
Hillary

Thanks for the background! Once we know what the WHO report says, we'll be better poised to make decisions about how to handle requests to discuss it… as you note, it is a bit of a hot issue.

That's fine, although I think she wants me because I spoke to her before, and because I published the major paper dealing with it, along with Breman at FIC and ex-FIC director Keusch, and other authors.

Also, just off the record, we may want to not give this to Tony as he has been unfairly criticized over some of the issues. It could be a hot subject for him….d

Hi Dr. Morens,

Thanks for sending. I'll write back to this reporter and ask her to send a fresh request to the press office once the WHO report is available – we can at that time better assess whether it makes sense for you or another NIAID expert to speak with the media about it.

Best,
Hillary

>
> Hello!
>
> My name is Mariana Lenharo, I'm a science and health journalist and I'm working on a story about the work of scientists investigating the origin of the Covid-19 pandemic. This story will be published in

MORENS_SUBPOENA_021110
MORENS_NIH_041953
REL0000478441

Elemental (https://elemental.medium.com/), a Medium publication focused on science-backed health coverage.

As I was reading about this topic, I came across this very interesting article, "The Origin of COVID-19 and Why It Matters" and I'd love to interview one of the authors, Dr. David M. Morens. This would be a 20-30-minute interview by phone/skype/zoom preferably this week. Please let me know if you think this would be possible.

Thank you very much!

Kind regards,

Mariana Lenharo
Science and Health Journalist

That's a very kind offer Rich. I think it might be very helpful with Gates right now.

Let me get more information from Jon Epstein who manages the grant and find out who you could reach out to potentially.

Cheers,

Peter

EXTERNAL SENDER

Thanks for sharing.

We're getting mounting damage at EcoHealth. One of our corporate funders has pulled out because of the news (Swiss Re). They donated $30K per year and I talked with the senior execs about pandemic risk.

We heard today that our brand new 3-year Gates Foundation grant for One Health work in India will now be "re-assigned". They're telling us they'll still fund us, but I think they're just being polite. This is a loss of $500K per year.

I'm extremely worried right now. People's jobs, careers, reputations are on the line, not just mine – the Gates grant is Jon Epstein's.

Cheers,

Peter

MORENS_NIH_035078
REL0000478448

Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, says the coronavirus likely jumped species, from animal to human. *GETTY IMAGES*

Former President Trump, perhaps trying to divert attention from his own disastrous handling of the COVID-19 pandemic, is now lashing out against Dr. Anthony Fauci for allegedly failing to seriously consider that the virus might have originated from China's Wuhan

MORENS_SUBPOENA_016923
MORENS_NIH_035079
REL0000478448

lab, rather than from an animal's transmission to humans.

But judging from what Fauci told me in a June 4 interview, the most respected U.S. infectious diseases expert has not yet seen any convincing evidence that the virus may have escaped from a Chinese lab.

Fauci, who heads the U.S. National

MORENS_SUBPOENA_016924
MORENS_NIH_035080
REL0000478448

Institute of Allergy and Infectious Diseases, and is a top medical adviser to President Biden, said, “It is more likely” that — much like SARS, ebola, influenza and HIV — COVID-19 “originated from an animal reservoir and jumped species to humans.” He added, “There’s the possibility that it came from the lab,

MORENS_SUBPOENA_016925
MORENS_NIH_035081
REL0000478448

but I believe that that's a much less likely possibility."

In the interview, scheduled to be aired Sunday , June 13 n "Oppenheimer Presenta" on CNN en Español, Fauci said that it's "important" to try to find out the exact origin of the pandemic, so that we can prevent it from happening again.

Biden has asked U.S. intelligence agencies to investigate the origins of COVID-19 and come back with a report before the end of August.

Asked how the investigation into the source of the virus should be conducted, Fauci said that the World Health Organization has indicated that it will go back to China to continue its investigation.

"I think it needs to be done in a collegial

way, with the collaboration of the Chinese scientists, because you're going to have to have cooperation and do it in a way that you can best get the information," he said.

Regarding his emails obtained by BuzzFeed and the Washington Post through the Freedom Of Information Act, Fauci told me that his

MORENS_SUBPOENA_016927
MORENS_NIH_035083
REL0000478448

critics
“cherrypick
things
out
of
context”
when
they
claim
that
he
knew
more
than
he
was
saying
publicly
about
the
possibility
that
the
virus
came
out
of
a
Chinese
lab.

Stressing
that
he
never
totally
discarded
the
lab
theory
—
though
he
never
thought
it
was
a
major
possibility
—
Fauci
added

MORENS_SUBPOENA_016928
MORENS_NIH_035084
REL0000478448

that, “I think what has increased is the interest, not necessarily the evidence.”

Right-wing media have had a field day with the Fauci emails, claiming that he was alerted about the “lab theory” early on and allegedly failed to take it seriously. Much of their claims are based on a Jan.

MORENS_SUBPOENA_016929
MORENS_NIH_035085
REL0000478448

31, 2020, email, in which infectious-disease expert Kristian Andersen wrote to Fauci that some of the virus' features "[potentially] looked engineered."

But what most right-wing media fail to mention is that, a few weeks later, Andersen concluded, upon further investigation, that the "lab theory" was implausible. So the criticism that Fauci was wrongfully hiding the "lab theory" from the public does not hold up.

Of course, Trump now is trying to paint Fauci as the culprit for the fact that America holds the world's record for COVID-19 deaths in

MORENS_SUBPOENA_016930
MORENS_NIH_035086
REL0000478448

absolute numbers. In a mass email on June 3, Trump claimed that "President Trump was right about the China Virus coming from the Wuhan Lab," and suggested that Fauci was defending China.

But, until we see any hard evidence that COVID-19 emerged from the Wuhan lab, Trump's accusations should be seen

MORENS_SUBPOENA_016931
MORENS_NIH_035087
REL0000478448

as just another attempt to bypass science and divert public attention from the COVID-19 deaths caused by his failure to tackle the pandemic.

Remember, Trump knew early on that COVID would be deadly — he is on tape telling author Bob Woodward this in February 2020 — but chose to lie

MORENS_SUBPOENA_016932
MORENS_NIH_035088
REL0000478448

to the American people for fear that it would ruin his re-election chances. What's more, Trump consistently refused to wear a mask or preach social distance, as scientists were recommending.

As I wrote at the time

Trump neglected his main duty — to protect the American people.

Granted, investigations

MORENS_SUBPOENA_016933
MORENS_NIH_035089
REL0000478448

into the origins of COVID-19 are justified and should continue. And there's no question that China's dictatorship is responsible for its delay in alerting the world about the deadly virus as soon as it started.

But barring solid evidence that the virus originated from a Chinese lab, Trump remains the villain

MORENS_SUBPOENA_016934
MORENS_NIH_035090
REL0000478448

—
and
Fauci
the
hero.

Subject: Re: Fact check re. emails of ours that were cited in today's public hearing
From: (b) (6) (b) (6)
To: Peter Daszak <(b) (6) Keusch, Gerald T <(b) (6)
CC: Aleksei Chmura <(b) (6) Jeff Sturchio <(b) (6)

Jerry and David,

Today in David Morens' hearing, the SSCP asked questions about an email wherein David allegedly assisted me with the reinstatement of my R01. They refer to an email on Oct 24th 2021 in their report here: https://oversight.house.gov/release/new-covid-select-memo-details-allegations-of-wrongdoing-and-illegal-activity-by-dr-faucis-senior-scientific-advisor/

It didn't sound correct to me, so I went through my email records and have located a chain that I began on 10/24/2021, that was me drafting a response to Michael Lauer's questions about the late year 5 report for the grant. This was NOT related to reinstating the grant – at that point, the grant was suspended and we were getting repeated questions about it, and there was not the slightest hint that it would be reinstated.

As you'll see by looking at the 1st email attached above – I send an email to both of you asking for advice on how to word the response to Michael Lauer, because you both are knowledgeable on issues of virology and both have experience with the type of bureaucratic questions I was being asked by NIH Office of the Director. I didn't consider this a conflict for David, because he's not part of the official decision making on this grant – by that time all decisions since 2020 had been overseen by O/D NOT NIAID, and I was under clear instructions to communicate with NIH O/D. I don't think that even Dr. Fauci had any capacity to decide on this.

Despite what's said in the SSCP report, and in David's hearing, I remembered, and it's shown in the email chains above, that David said he would suggest some 'wordsmithing', but in fact DID NOT. The emails clearly show that you spoke with others at NIAID, and that they suggested you should not be involved in this, and in fact you did not edit the letter, or even suggest edits. It's all there in the emails above.

I don't know what value this has now, considering that the public hearing has been and gone, but I felt it was important to share these, in case any of us are asked about them – from what I see, you checked with your superiors and then diplomatically cut yourself out of the editing chain.

Cheers,

Peter

The Coming Tidal Wave of Right Wing Covid Lawsuits

Lawyers have found a way to cash in on outrage over mask mandates and vaccines.

Kiera Butler10 hours ago

In late March, I watched as some 300 lawyers, doctors, and activists assembled in the aggressively beige conference wing of the Midtown Atlanta Hilton for the inaugural Covid Litigation Conference. A promotional flier promised that the event would "provide attendees with the resources they need to begin taking on Covid cases for the first time or to expand the range of Covid claims that they currently handle." An unsuspecting lawyer could have been forgiven for expecting tips on how to help clients who had been disabled by Covid that they caught at their factory jobs, for instance, or those whose medical bills their insurance refused to pay.

But those kinds of cases were entirely absent from the agenda. Rather, the topic was a very particular kind of litigation: How best to advance the movement that organizers called "medical freedom." In other words, how to sue the people who created and enforced public health measures like vaccine and mask requirements, policies against Covid misinformation, and treatment protocols for hospitalized Covid patients.

MORENS_SUBPOENA_009758
MORENS_NIH_020268
REL0000478461

The conference organizers wore t-shirts emblazoned with the slogan "Misinformation Superspreader." Steve Kirsch, a Silicon Valley entrepreneur, philanthropist, and a main organizer of the event, told me that the slogan was a cheeky reference to what he saw as the unfair labeling of anti-vaccine activists as peddlers of misinformation. "We said, 'Okay if that's what they're calling us," he explained, "let's kind of make fun of it." Indeed, many of the attendees seemed to see themselves as underdogs, scrapping against government and pharmaceutical behemoths.

What those underdogs didn't mention during the sessions, though, is their friends in high places: specifically, federal judges who seem to be sympathetic to their aversion to pandemic policies. Pointing to some of the victories that medical freedom lawyers have enjoyed in US District courts, Dorit Reiss, a public health lawyer and law professor at the University of California College of the Law, noted, "They're having some success in the federal system in front of Trump-appointed judges, and they're very much forum shopping right now." Adam Winkler, a constitutional law scholar at the University of California-Los Angeles, agreed. "The courts have issued a lot of what were once thought to be outlandish kinds of rulings with regard to any number of issues like abortion and affirmative action," he said. "I'd expect that encourages people to bind hope to the prospects of lawsuits that they would otherwise seem certain to lose."

When I arrived, I didn't think I'd get past the Misinformation Superspreaders and make it into the ballroom where the event was taking place. The media liaison for the conference, Trevor FitzGibbon, asked me if I was there to write about disinformation, and he seemed to balk at my affirmative answer. When I said I worked for Mother Jones, he noticeably brightened. He had come up in the PR business working for prominent progressive candidates and groups, he explained, including Barack Obama, MoveOn, and Planned Parenthood, which I took to mean that he considered us to be politically kindred spirits. And then he let me into the ballroom.

Once inside, I watched as one indignant panelist after another enumerated their grievances. At the Hospital Negligence Panel, doctors who refused to deviate from CDC protocol to treat Covid patients with unproven drugs like the antiparasitic medication ivermectin and antimalarial hydroxychloroquine were the targets of rage. The Education Mandates session featured the mother of a California teenager who had defied her school's mask requirement, showing up at school without a mask for weeks on end in 2021, and standing outside the school for hours every day after she was kicked out. The panelists batted around ideas: Could the refusal to wear a mask be considered free speech? Could putting a kid in detention for not wearing a mask count as false imprisonment?

In his speech, Kirsch, the conference organizer, told the story of how, at the beginning of the pandemic, he had invested $1 million of his own money toward studying existing drugs as potential Covid treatments. Somewhere along the way, he became convinced that the

Covid vaccines were dangerous. Last year, he founded the Vaccine Safety Research Foundation, whose goal, according to its website, is "to advance COVID-19 vaccine safety through scientific research, public education, and advocacy, and to support the vaccine injured." After his speech, Kirsch told me that he sees litigation as a way to force the federal government agencies to release data that he believes they're concealing about the dangers of the Covid vaccines. He said he is sure that "the only reason that we're not allowed to see any of the data is because it's bad."

Many of the other speakers seemed to share Kirsch's belief that the public isn't seeing the whole picture of Covid. In a constitutional law panel, Robert Barnes, an attorney who previously represented both Kenosha shooter Kyle Rittenhouse and Sandy Hook conspiracy theorist Alex Jones, said, "Pfizer makes the Mexican drug cartels look like a street corner dealer by comparison." To hold the public health crowd accountable, he implored the lawyers at the ballroom tables to "knock down the doors of every court we can."

But not just any court. Medical freedom activists have already started enjoying some successes in front of conservative judges. At the local level, several have sided with plaintiffs who've sued hospitals for refusing to give patients ivermectin. But it's been on the federal level, with Trump-appointed judges, where they've enjoyed some of their most significant successes. In 2021, Texas Attorney General Ken Paxton sued the Biden administration over a proposed policy that would have required Covid vaccinations for all Head Start employees. In March 2023, Judge James Wesley Hendrix of the Northern District of Texas, a Trump appointee, struck down the proposed policy. In January 2022, a group of government workers sued the Biden Administration over the president's vaccination requirements for all federal employees; in 2022, Judge Jeffrey Vincent Brown, whom Trump appointed in 2019, ruled in their favor. That ruling was briefly overturned, but in 2023, the 5th US Circuit Court of Appeals in New Orleans upheld it; the opinion was written by Trump appointee Judge Andrew Oldham.

In August 2022, a group of physicians sued the Biden Administration over its efforts to hold social media companies accountable for platforming physicians who spread misinformation about Covid. The plaintiffs, two of whom created the 2020 Great Barrington Declaration to oppose pandemic protections, accused the federal government of violating their First Amendment rights. "The US government used its vast power over social media and big tech to censor legitimate scientific and policy discussion about Covid during the pandemic," Jay Bhattacharya wrote in a statement. That case is still ongoing, but in March, Trump-appointed judge Terry Doughty, in the Western District of Louisiana, denied a motion to dismiss it.

"The US government used its vast power over social media and big tech to censor legitimate scientific and policy discussion about Covid during the pandemic."

There is more to come. Several of the conference speakers have

embarked on a Covid litigation bonanza of late. Mark Meuser, a member of the Future Litigation and Censorship panels, boasts on his website that he "has been involved in 22 lawsuits brought against [California Governor Gavin] Newsom for his unconstitutional usurpation of power as a result of COVID-19." In the exhibition area, I visited the booth of Children's Health Defense, the anti-vaccine organization helmed by the new presidential hopeful Robert F. Kennedy, Jr., who announced his bid to replace Joe Biden in April. A flier that highlighted some of the dozens of lawsuits that the group had recently filed reveals its eagerness to sue the government, at both local and federal levels. It's suing California over a law that prohibits doctors from spreading misinformation; the Washington Post and other news outlets over their efforts to stop the spread of misinformation; and the CDC for access to reports of "unusual or unexpected patterns of adverse events reporting that can signal safety problems with a vaccine." Sen. Elizabeth Warren (D-Mass.) is getting sued for calling for a review of the Amazon algorithms that allegedly promoted anti-vaccine books, and Facebook parent company Meta is being sued for "collusion with the US government to censor CHD social media content." Add to the long list of defendants Rutgers University for its vaccine mandate for students and staff.

Law professor Reiss is dubious about the prospects for some of those lawsuits, especially those in which individuals sue a private company for censorship. The First Amendment, she noted, also protects "the freedom of private companies like Twitter and YouTube to kick them off." Nor was the idea of students suing universities, a winning strategy. "You don't have the right to go to a specific university," she said. "And if you don't like the university policies, universities are on pretty solid grounds denying you admission."

Yet she noted that some of the victories the medical freedom movement has racked up so far could pave the way for future legislation that would last long beyond the Covid era—and possibly transform established public health practices. In fact, that's already happening: Several panelists suggested making vaccination status a protected class like race or sex—which means that it would be illegal to discriminate against someone on the basis of whether or not they had received immunizations. In 2021, Montana became the first state to pass such a law. In February of this year, Idaho followed suit. Employers there who require vaccination against Covid can now be fined $1,000 per violation. A similar bill in Florida is currently under consideration.

Another potential opening for medical freedom advocates, Reiss said, is a broader interpretation of laws about religious exemptions to vaccine mandates, which most states allow. With the current Supreme Court's expansion of what is included within the definition of freedom of religion, she worried they may include religious objections to vaccines. "If they go there, it will make it a lot harder to prevent the abuse of religious exemption," she said. On April 18, a few weeks after I spoke to Reiss, a US district judge ruled that Mississippi must change its current policy to allow religious exemptions for

MORENS_SUBPOENA_009761
MORENS_NIH_020271
REL0000478461

vaccine mandates. (The judge, Halil Suleyman Ozerden, had been nominated by Trump in 2019 to serve on the 5th Circuit Court of Appeals, but key Republicans questioned his conservative bona fides and he was never confirmed.)

With all this coming litigation, some of the conference sponsors saw a business opportunity. While the speakers inside the ballroom railed against big pharma and the CDC, just outside, representatives from law-firm-adjacent companies handed out business cards. Zena Obebe, the CEO of Hill Redaction Services, told me, "We wanted to get in front of those litigation lawyers and say, 'Hey, you can use us for the medical records.'" She expects to see many more Covid-related cases soon, explaining, "There's a huge influx that's coming down the pipeline."

Though Covid was the official topic of the conference, many of the people I talked to made detours into other subjects. Their involvement in the medical freedom movement, they said, had caused the scales to fall from their eyes. Kirsch, the conference organizer, explained that before the pandemic, he had never been skeptical of routine childhood vaccinations, but over the past few years, he has come to believe they cause autism (a theory that has been extensively discredited but one cherished by RFK, Jr. whose campaign, Kirsch says, he looks forward to supporting). So fervent is his newfound aversion to immunizations, he told me, that he now believes "nobody should ever" even vaccinate their pets.

For FitzGibbon, the comms guy, his involvement with the medical freedom movement has led to a more thorough disenchantment with his progressive roots. In 2020, during the height of the pandemic, he had become acutely ill with Covid, but two different hospitals sent him home. Only when a doctor-client put in a good word for him did he get admitted to an ICU, where he received monoclonal antibodies—an effective though underutilized treatment—which he credits with saving his life.

In the months that followed, he became skeptical of what he saw as the single-minded focus on Covid vaccines and what he considered to be the suppression of treatments like the one he received, as well as more scientifically dubious drugs like ivermectin and hydroxychloroquine. "All you saw in the US media was vaccine, vaccine, vaccine," he said. "Any other mentions of these alternative treatments were blacklisted." He now believes not only that the Covid vaccines are bioweapons, but also that the Democratic party has lost its way—he saw it even before Covid in Democrats' soft stance on domestic surveillance under Obama, and now he sees it in foreign policy, too. In a pivot I frankly did not see coming, he said, "I do not recognize this administration or this party when it comes to the war in Ukraine," especially since he claims that Russia had good reason to invade the country because of its problem with Nazis (ostensibly a reference to Russian President Vladimir Putin's shaky-at-best justification for his invasion).

It's possible, though, that something unrelated to politics deepened his disenchantment with progressives: In 2015, his PR firm closed

MORENS_SUBPOENA_009762
MORENS_NIH_020272
REL0000478461

abruptly after several female former employees accused him of sexual assault and harassment; he spoke to me on the condition that I note that the US Attorney declined to file any criminal charges, and a woman who had accused him of rape publicly retracted her allegations and apologized as part of a settlement in 2019.

Both Kirsch and FitzGibbon complained that progressive groups with whom they both were previously allied would no longer return their calls—about Covid or anything else. Aggrieved, they were determined to press on in what they saw as a countercultural but righteous crusade—a sentiment echoed by many of the speakers. Their alienation and what they consider to be oppression only further energizes them and their cause. In a heartfelt speech in the ballroom, Sujata Gibson, a New York-based lawyer and activist who recently won a lawsuit that led to New York overturning its vaccine mandate for healthcare workers, compared current medical freedom activism to the Indian struggle for independence, Nelson Mandela's campaign against apartheid in South Africa, and the American civil rights movement. "Part of what we have to do as lawyers when we're in these tyrannical moments in history—and this one is quite extreme—is we have to hold the line in the courts," she said. "I've been lucky enough to see time after time how David and Goliath battles can be won."

Not pleasant reading but thanks for sharing this link. It's a stream-of-consciousness diatribe that makes you think this guy is simply mentally ill, but actually he's a well-known right wing 'influencer', appearing on Steve Bannon's podcast, member of the Brownstone Institute and regular on other outlets. In the end, just probably a sad lonely person looking for outside validation. Still, pretty disturbing to read…

Cheers,

Peter

Importance: High

Dear all – can we set up a call maybe next week to talk about building a Coalition to protect science.

Alison – could you look at availability for the week beginning Feb 27th or March 6th for us all…

I've also attached a revised version of the Coalition concept note. Jeff re-wrote this following our call and we also reached out to a political consultant to get his input on how this would be perceived from both Dems and moderate Republicans. I added a few comments using track changes. Please feel free to add to this also.

Cheers,

Peter

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the

MORENS_SUBPOENA_019494
MORENS_NIH_039080
REL0000478480

COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.
Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.
In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.
I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?
Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists.
What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.
The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.
The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.
All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the

partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?

Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.

Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus
