Re: NIH FOIA Case No.: 57707; U.S. Right to Know v. NIH, Case No. cv-02954-KAW

This is a partial response to your Freedom of Information Act (FOIA) Request Two that is the subject of the complaint filed in *U.S. Right to Know*, Case No. 4:23-cv-02954, now pending in the U.S. District Court for the Northern District of California. Your FOIA request, dated November 5, 2021, was received by the National Institutes of Health (NIH) on the same day.

FOIA Request Two remains as "originally written" in which the request seeks: "all email correspondence from or to Dr. Morens (including CC, BCC, and attachments) with the following email domains and organizations: @ecohealthalliance.org [and] 'EcoHealth Alliance[.]'" The date range for the request is from 1/1/2016 to the present.

Pursuant to the Court's order dated November 7, 2023, NIH has processed 2,535 pages of responsive records this month. Portions of the enclosed records have been withheld under FOIA Exemption 6. Specifically, information is being withheld pursuant to 5 U.S.C. § 552 (b)(6), as well as section 5.31 (f) of the HHS FOIA Regulations, 45 CFR Part 5. Exemption 6 protects against disclosures that would constitute a clearly unwarranted invasion of personal privacy.

Please direct any questions regarding this response to Jevechius D. Bernardoni of the Department of Justice, who can be reached at Jevechius.Bernardoni@usdoj.gov.

Sincerely,

for Karen E. R. Lampe, Ph.D.
Acting Freedom of Information Officer, NIH

Rich: Your summary of my summary is right on point – that was exactly the vibe of Sachs's comments during the webinar. He let Ebright and Kopp spell out the crazier aspects of the lab leakers' viewpoint.
Chan was more balanced than I expected her to be (although her summary clearly had a thumb on the scale).

Best regards,

Jeff

Jeff:

Great summary, but nothing really new as all the presenters had well-known views. My only comment is that Sachs recently seems to be a little less adamant that it was a lab leak and just now relies on innuendo.

Subject: Jeff Sachs moderated a Lancet Commission webinar on COVID-19 origins this morning
Importance: High

EXTERNAL SENDER

All: I listened in this morning on the webinar on COVID-19 origins that Jeff Sachs moderated under the auspices of the Sustainable Development Solutions Network (SDSN). I wasn't able to stay until the end of the Q&A, but I did hear the three main presentations. Sachs said that he plans to post the recording of the session (on SDSN?). This was the first of three planned webinars – the second (on global health financing) will take place on November 22, the third (on health system strengthening) on December 8.

Sachs served as moderator. His introduction was fairly mundane. His basic premise was that there are two "absolutely viable" hypotheses for the origin of COVID-19 – either zoonotic or due to a lab leak. (Note that the language he uses – "absolutely viable" – obscures the fact that the evidence differs significantly for each of the two hypotheses. But this was a bias that ran through all of the presentations.) He then argued that we need to follow both lines of inquiry equally, to have a proper understanding of both possibilities. He alluded to the bimodal distribution of most discussion of these questions – with "mainstream media" coming down on natural origins, and "alternate media" arguing for laboratory origins (including in this Senator Burr's Senate Minority Report). He then turned to two "leading scientists" and a "leading reporter" for further perspectives.

The speakers were Alina Chan (Broad Institute), Richard Ebright (Rutgers University) and Emily Kopp (US Right to Know) – no great surprises there.

Alina Chan's main argument was that there is not enough evidence to decide which hypothesis is true, and that all the evidence is circumstantial. She did say that there is no argument over the fact

that the pandemic originated in spillover from bats – just a difference of opinion on how and where this happened.

She presented a set of factors that would explain the chain of causation for each of the two hypotheses:

Natural origins

- Earliest cases handled live animals?

- Were there infected animals in markets or farms?

- Were there animal variants of the virus?

- Was there antibody evidence of infected animals or traders (not presenting with pneumonia)?

- Was there a strong wildlife conduit between known bat reservoirs and the outbreak site?

She then claimed that none of these have been established for SARS-CoV-2, and thus we can't say that natural origins hypothesis is true.

Lab leak

- WIV was the HQ for virus hunting program targeting both animals and humans

- WIV found and developed SARS-CoV-2-like viruses by 2013

- WIV did advanced work with virus isolates and "seamless clones"

- Live virus work was done in BSL2 and BSL3 environments, which could not contain airborne viruses

- WIV and collaborators were planning to insert furin cleavage sites in different viruses (she referred to a "pipeline" of risky research and made a big deal of the rejected DARPA proposal, for which the research was never done)

Her conclusion: evidence is not definitive for either hypothesis, but these aspects of research at the WIV were "very concerning" and thus we need to investigate both conclusions.

MORENS_SUBPOENA_002231
MORENS_NIH_008747
REL0000482141

Richard Ebright was then asked what should be done about improving the oversight of research in this area from the perspective of biosafety, biosecurity, and biorisk management. He concurred with Sachs and Chan that the available data do not enable a choice between the two hypotheses of COVID-19 origin. But regardless of where one stood on this question, the research by EcoHealth Alliance, WIV, and their collaborators – according to Ebright – used inadequate biosafety protocols and lacked transparency. Again, according to him, this points to, but does not prove, a research spillover as the origin of COVID-19.

I've attached a screen shot of the slide he shared that lays out his bill of complaint. As you can see, he's fixated on the work that WIV and EHA did from 2016-2019, arguing that, while this doesn't prove laboratory origins, it "exceeds the standard of probable cause" and provides "ample basis to initiate investigation and ample basis to improve oversight." (Like Chan, he also made much of EHA's rejected DARPA proposal, trying to use it as a "smoking gun" for malign intent by EHA and WIV, despite the fact that this research was never done!)

He spent most of his time, however, outlining a basis for and recommendations for improved research regulation and oversight in biosafety, biosecurity, and bio risk management.

Sachs and Ebright had an exchange about the recent news of the creation of a variant of COVID-19 that appeared to be more virulent than Omicron, without the "knowledge or approval of NIH." This was evidence for both of them of the need for enhanced oversight.

Emily Kopp, an investigative journalist with US Right to Know, then made a breathless presentation about her attempts to bring the truth about COVID-19 origins to light through FOIAs and dogged persistence. The gravamen of her complaint is that much of the relevant research has been underwritten by NIH, DOD, and USAID with taxpayer funds, and conducted in the US (at EHA, University of North Carolina, University of Texas, and UC Davis), yet she and her colleagues have had to file dozens of FOIA requests and lawsuits to get access to what they consider to be relevant information.

She reviewed five categories of evidence:

MORENS_SUBPOENA_002232
MORENS_NIH_008748
REL0000482141

1. EHA progress reports to the NIH: She noted that the Intercept is going after 31 EHA NIH proposals and over 1000 other documents not yet released. They also plan to go after EHA Board members and collaborators at the U of Maryland and UC Davis.

2. USAID databases from PREDICT.

3. NIH bioinformatics databases for sequence data from WIV: She was quite exercised about the "apathy" of NIH at not going through archived sequences to provide the information that USRTK wants.

4. The Baric Lab at UNC: She said as yet there are few clues to planned work on genetic engineering techniques here.

5. Department of Defense: Again, she railed about the lack of transparency about the rejected EHA DARPA proposal, which she claimed DARPA tried to conceal. She also mentioned data from PREEMPT.

She then claimed that the public can't trust the credibility and integrity of the NIH on these matters, since they tried to obscure the existence of relevant data – and event tried to obscure the involvement of other scientists in the discussion of COVID-19 origins in the conversations that led to the Nature Medicine correspondence in 2020 (I lost her here – the discussion became very "inside baseball"). She concluded with a plea that the public deserves more clarity about the pandemic's early days.

Sachs then threw her a softball about the Nature Medicine correspondence, inviting her to tell the listeners how it appeared that NIH was trying to obscure who came up with the zoonotic origins theory (and then didn't credit those authors on the publication). She then said that the virologists who were on this correspondence have continued "to be aggressive about natural origins and to marginalize other theories" – asking (rhetorically) if they have shown integrity.

Sachs then said that all of this information had to be pried out of the NIH and the USG, rather than being offered transparently. He showed how the NIAID had redacted most of the 300-page COVID strategic

MORENS_SUBPOENA_002233
MORENS_NIH_008749
REL0000482141

plan of April 2020, and also made a point of saying that Robert Redfield had wanted to attend today's webinar but couldn't, noting that he believes a lab leak is more likely – and that he was shut down by NIH when he tried to call for further investigation. Sachs then teased that there may be new revelations that the WIV and US scientists were implicated in evidence that COVID-19 emerged in China before December 2019. (This latter evidence-free speculation seems to refer to Mike Pompeo's evidence-free contention that the USG had evidence of this – but that evidence has never materialized.)

Sachs then reiterated his contention that both hypotheses need further investigation – and that the relevant information may be in the US, not China. We need an independent, rigorous, transparent scientific investigation. (Despite this language, I think you can sense from my summary of the webinar that Sachs is actually shading the argument toward his belief that COVID-19 had a laboratory origin.)

I wasn't able to stay on for the Q&A, but we should be able to review the rest of the session when Sachs posts the recording.

Hope this is helpful.

As ever,

Jeff

Subject: Introduction to our key Collaborator in France, and heads-up re. a PREZODE event at French Embassy Oct 21st
From: Peter Daszak [b6]
To: David Morens [b6] [b6]
CC: Carlos Zambrana-Torrelio [b6]>;
Attachments: image001.png

Hi David,

I'm introducing you by email to my colleague Dr. Ben Roche from IRD France. He is the PI of the new French Govt pandemic prediction initiative PREZODE. As you can see from the Email below mine, there is an event scheduled for October 21st at the French Embassy in DC. I'll be moderating the panel discussion and will be in DC in person (FINALLY!!).

Ben is looking for someone from NIH to represent at that event. I've suggested you would be perfect for that role, and wanted to introduce you to him now.

Full disclosure, Ben is working with EHA on joint projects and we signed an MOU with the French Govt IRD to stimulate joint efforts to predict and prevent pandemics. I've also cc'd Carlos Zambrana-Torrelio from EHA who I believe you've met in the past, who has worked closely on this initiative.

Hope you're available and look forward to seeing you while I'm in DC whatever the case!

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

From: POIRIER Agnès <[b6]>
Sent: Tuesday, September 14, 2021 8:47 AM
To: Biffl, Claire [b6]
Cc: Liao, Julie [b6]>; LIGEARD Christian [b6]
Subject: French Embassy: conference on the PREZODE Initiative (October 21st)

Dear Ms. Biffl,

As you well know, the Covid-19 pandemic has highlighted the urgency of designing effective strategies for preventing and responding to health crises by taking greater account of the interactions between human health, animal health and environmental health.

In response to this emergency, the French President Emmanuel Macron launched the PREZODE initiative during the One Planet Summit on January 11, with the support of the Director General of the FAO and the President of the European Commission.

This initiative (see attached document) aims to network, on a global scale, research work and operational actions to prevent the risks of zoonotic emergencies and pandemics through the reduction of pressures on biodiversity, in accordance with the "One Health" approach. It will improve knowledge of the risks of emergence and spread of zoonoses, strengthen the surveillance activities of the networks that already exist and ensure greater compliance with prevention measures for future diseases.
The PREZODE initiative will strengthen cooperation with several regions of the world (Africa, Asia, Caribbean, Indian Ocean, America, Europe…) and will support the integration and strengthening of human, animal and environmental health networks. It will also support the work of the "One Health" High Level Panel of Experts proposed by France with the support of Germany, and launched by what we call the Tripartite + (WHO-FAO-World Organization For Animal Health-UN Environment Programme) on May 17 and 18.
The year 2021 is dedicated to building the strategic framework and the operation of the initiative, with the objective of entering the operational phase from 2022.

In this context, the French Embassy is planning to host a conference (preferably an in-person event) to present the PREZODE initiative and discuss the possible involvement of US government and research institutions.

The event is scheduled for October 21, 2021, in the afternoon (2:30–5:30 pm) and would consist (see draft program attached) of two sequences of approximately one hour each:

- Presentation of the PREZODE initiative by representatives (scientific or institutional directors) of the three French research institutes involved, CIRAD (Agricultural Research Centre for International Development), INRAE (National Research Institute for Agriculture, Food and Environment), IRD (National Research Institute for Sustainable Development)
- Panel discussion on national and international initiatives: statements by DoS, DoD (DTRA), CDC, USDA, USAID, OHHLEP, the Tripartite+, the World Bank, private sector…

We are currently looking for a moderator for this event, and would be honored to involve an expert from the NASEM Forum on Microbial Threats. Indeed, the Forum's work on these issues, its leadership and independence, and its broad audience seem to me to be perfect for our event. If you agree to this role, I would be happy to discuss further the organization of the meeting.

Thank you for your consideration and best regards,

It was an awful experience – Republicans repeatedly calling for us to be debarred, Democrats saying 'while ecohealth didn't cause covid, their behavior with Federal grant compliance raises serious questions as to whether they should receive federal funding in the future'.

I did a good job from what I'm hearing overall, on defending our work, and the issues they're coming after us on are of no real consequence (a late NIH report, margin notes in a draft proposal etc.), but used to paint a picture of a deceptive organization. I've spoken with Jeff about why the Dems are seemingly ready to throw us under a bus, and he believes it's partly because the SSCP has come up with nothing and this would be a 'scalp' for them to wave around. Secondly, the politics for the Dems are all about winning in November, so they're happy to defend NIH and point the finger at EcoHealth, even though many of the issues they highlighted were due to NIH bureaucratic sluggishness, rather than any genuine issue with EHA.

We're going to pick apart the democrat and Republican reports finding-by-finding, draft rebuttal statements and probably set up a press conference next week. The next phase will now be fighting to try to make sure we aren't debarred.

Cheers,

Peter

Ralph Baric, Whose Virology Techniques Were Used in Wuhan, Testified That Lab Leak Was Possible

The UNC coronavirologist who has collaborated on gain-of-function research with the Wuhan Institute of Virology's Shi Zhengli, told congressional investigators that he has long worried about biosafety protocols inside China. Though he thinks it's far more likely COVID-19 originated in nature, he said of a possible laboratory escape, "You can't rule that out."

Ralph Baric, researcher and lab leader at North Carolina's Gillings School of Global Public Health, sits for a photograph in Chapel Hill, North Carolina, U.S., on Friday, Feb. 14, 2020.ILLUSTRATION BY PAMELA WANG. Photo by Christopher Janaro/Bloomberg/Getty Images.

In 2015, **Ralph S. Baric,** arguably the world's most accomplished coronavirologist, published groundbreaking research with **Shi Zhengli,** the leading coronavirus researcher at the Wuhan Institute of Virology.

They had mixed components of different coronaviruses and created an artificial virus, or chimera, that could infect human cells. The research helped crystallize the threat posed by bat coronaviruses lurking in nature. But the experiments were dangerous too. In 2014, while their research was underway, the Obama administration enacted a pause on so-called gain-of-function research that could increase the virulence or transmissibility of certain viruses. Baric and Shi even flagged the dangers of the research themselves, writing, "Scientific review panels may deem similar studies…too risky to pursue."

The experiments were done in Baric's well-secured laboratory in Chapel Hill, North Carolina.

Afterward, however, Shi's team at the WIV continued to utilize Baric's cutting-edge research techniques. Their work was funded in part with a US research grant.

Baric testified that he had specifically warned Shi Zhengli that the WIV's critical coronavirus research

was being conducted in labs with insufficient biosafety protections.

Amid competing theories about the origins of SARS-CoV-2, the virus that causes COVID-19—including whether it could have originated in a Wuhan laboratory—Baric has become a figure of intense interest. After all, he had pioneered techniques the WIV was using, including one that allows researchers to invisibly splice components of viruses together without leaving a trace.

For the last three years, as the COVID-19 origins debate has grown increasingly toxic, a small army of global sleuths and Freedom of Information petitioners have taken aim at Baric's emails and research documents, hoping to uncover information about the true genetic-engineering capabilities of the WIV scientists, the ongoing research they were pursuing, and the viral genome sequences they had in their possession prior to the pandemic.

Through it all, Baric has kept mostly silent—until now. On January 22, he gave a six-hour interview to investigators from two Republican-led House committees: the Oversight and Accountability's Select Subcommittee on the Coronavirus Pandemic, and Energy and Commerce's Subcommittee on Oversight and Investigations. Though the committees have not yet made his testimony public, *Vanity Fair* has exclusively reviewed his statements. While not formally under oath, Baric was required by federal law to answer truthfully. (Through a University of North Carolina-Chapel Hill spokesperson, Baric declined to comment for this article.)

While there is little in the 212-page transcript that is likely to markedly shift the debate on how COVID-19 originated, the picture that emerges is of an American scientist who is deeply wary of his Chinese counterparts and has no way of knowing if or how they may have made use of the groundbreaking research techniques he developed.

Perhaps most notably, Baric testified that he had specifically warned Shi Zhengli that the WIV's critical coronavirus research was being conducted in labs with insufficient biosafety protections. When he urged her to move the work to a more secure biosafety level 3 (BSL-3) lab, he testified that she did not heed his recommendation. Because the WIV continued to perform coronavirus research at what he considers an inappropriately low biosafety level, Baric said of a laboratory accident, "You can't rule that out.... You just can't."

"Clearly, the market was a conduit for expansion," Baric testified. "Is that where it started? I don't think so."

In an email turned over to the Select Subcommittee as part of its investigation, Baric told **Peter Daszak,** president of the scientific nonprofit EcoHealth Alliance, that it was "a load of BS" to suggest that the WIV conducted coronavirus research in labs with sufficient biosafety protocols.

Baric told congressional investigators that he believes it's far more likely that SARS-CoV-2 spilled over naturally from animals to humans, given the sheer abundance of viruses in nature. But he also said in his testimony that he disagrees with the most widely promulgated spillover argument: that the virus leapt from infected animals to people at the Huanan Seafood Wholesale Market, where it first burst into public view in December 2019. The argument does not hold up, he said, because genomic evidence suggests that COVID-19 was already circulating in the human population by mid-to-late October. "Clearly, the market was a conduit for expansion," he testified. "Is that where it started? I don't think so."

Baric also weighed in on a controversy that has pitted Dr. **Anthony Fauci** against Senator **Rand Paul** (R-KY), who has leveraged his credentials as an eye doctor to position himself as a crusader against America's scientific and medical establishments. In contentious Senate hearings, Fauci has repeatedly denied Paul's claims that the National Institute of Allergy and Infectious Diseases, which Fauci led at the time, had funded gain-of-function research at the WIV. However, Baric told investigators that the experiment in dispute, in which technicians created a chimeric virus that made lab mice sicker, was "absolutely" gain-of-function research: "You can't argue with that." He also said he felt that the experiment's results should have triggered regulatory review.

The federal grant money for the experiment in question, which was conducted at the WIV sometime between 2018 and 2019, was funneled through EcoHealth Alliance. It was Daszak, EcoHealth's president, who organized an open letter in the *Lancet* medical journal early in the pandemic that helped paint the lab-leak hypothesis as a baseless conspiracy theory. Today, the Select Subcommittee is expected to release a report that calls for NIH to recommend that EcoHealth Alliance, and Daszak personally, be

debarred from receiving federal funds. As part of its investigation into COVID-19's origins, the Select Subcommittee is holding a series of hearings. Daszak is scheduled to testify publicly today, and Fauci is set to do so on June 3.

America's intelligence agencies remain divided over whether SARS-CoV-2 came from a natural spillover or a lab accident. US Health and Human Services Secretary **Xavier Becerra** recently said the question may "never" be answered "unless China opens up some more."

The single biggest issue to jump from the pages of Baric's testimony is his persistent concern over unsafe research practices at the WIV. Some of Shi's research papers, he said, "actually stated that they were doing the culturing work under BSL-2." BSL-3 labs typically require negative pressure air flow, HEPA air filtration systems, and full Tyvek suits for lab workers—all to protect against leaks. BSL-2 laboratories do not require specialized air filtration or full gowns.

Throughout his interview, Baric took pains to emphasize to congressional investigators that he had not simply turned over his research techniques to his colleagues at the WIV. Referring to his 2015 research with Shi, he said, "Although we published the approaches for how to build molecular clones of coronaviruses, we never had anyone from Dr. Shi's lab or any of the Wuhan Institute of Virology come to our lab and train. We never taught them."

His trust was violated on at least one occasion, he said. In order to test the ability of different viruses to infect humans, Baric had engineered mice with lungs that contained a human gene. He said he shared these mice with the WIV under a contractual agreement that they only be used there. Then, during the pandemic, he said he discovered that his mice were being offered for sale by a commercial company. The profiteering, he told investigators, was "infuriating."

As Baric recounted to congressional investigators, Shi's earlier work was "very vague about safety conditions. They said they followed Chinese regulations." But in two subsequent papers, said Baric, "They actually stated that they were doing the culturing work under BSL-2.... And then they continued that even into September of 2020, which I thought was irresponsible." (Neither Shi Zhengli nor a spokesperson for the Wuhan Institute of Virology responded to requests for comment.)

Baric told the committee that, from his earliest days working with zoonotic coronaviruses, he always understood there was a real if "rare" chance that one could prove infectious to humans. "And if that's your hypothesis, then you do it under BSL-3," he said. "So I kind of set the standard in the United States."

But the WIV, he said, operated under a looser set of biosafety protocols. "Their regulations state pretty clearly that they don't consider culturing bat viruses at BSL-2 as a biosafety concern," he said. "I also had that verbally confirmed by Zhengli Shi at a meeting in Harbin, when I was telling her she should move it all to BSL-3 and the reasons why." (Less than a year into the pandemic, the Chinese government passed legislation that tightened the nation's laboratory safety practices.)

The dispute over biosafety arose again in 2018, as Baric and Shi worked with Daszak on a grant proposal to collect SARS-like bat coronaviruses and insert a genetic component called a furin cleavage site that would enable them to more easily infect human cells. The proposal has since drawn attention because, when SARS-CoV-2 subsequently emerged in Wuhan, it possessed a furin cleavage site, making it unique among SARS-related coronaviruses. The 2018 proposal was submitted by Daszak to the Pentagon research and development agency DARPA.

Last December, a Freedom of Information research group called U.S. Right to Know released margin comments from an early draft of the grant proposal. In one, Peter Daszak tagged his collaborators and said, "Ralph. Zhengli. If we win this contract, I do not propose that all of this work will necessarily be conducted by Ralph, but I do want to stress the US side of this proposal so that DARPA are comfortable with our team. Once we get the funds, we can then allocate who does what exact work, and I believe that a lot of these assays can be done in Wuhan as well."

The early draft stipulated that the research would be done at a BSL-2 level, making it "highly cost-effective." Baric objected to this in a margin comment of his own: "IN the US, these recombinant SARS CoV are studied under BSL3, not BSL2, especially important for those that are able to bind and replicate in primary human cells. In china, might be growin these virus under bsl2. US researchers will likely freak out." In the finished proposal, BSL-2 was changed to BSL-3.

Baric told congressional investigators that he wrote the margin comment to Daszak "to make sure he

pays attention." He added, "First, I'm informing him, just in case he doesn't know, that a lot of the virus discovery work and culturing work that the Chinese do with zoonotic coronaviruses is done at BSL-2…. I'm letting him know there's a difference."

After a congressional investigator observed, "It appears there may have been a willingness, not necessarily by you, to do some of this work in the BSL-2 in China," Baric responded, "There was no willingness on my part to do any of this work…. Let me make that clear." He subsequently clarified, "My role was to study a couple of the viruses that the Wuhan Institute of Virology found that they were willing to share with me."

DARPA rejected the grant, but questions have persisted over whether WIV scientists carried out the proposed research anyway. Baric told congressional investigators that he doesn't know whether the WIV continued the research or got other funding for it. He added that he does not believe SARS-CoV-2 was engineered and discounted a 2022 paper making that argument as "biostatistical BS." **Alex Washburne,** one of the paper's authors, told *Vanity Fair,* "Baric doesn't provide any scientific evidence or reasoning that would lead us to revisit our results or change our theory."

In May 2021, Baric signed an open letter in the journal *Science* affirming that the lab and natural origin hypotheses are both viable and calling for further investigation. A fellow scientist, Columbia University virologist **Ian Lipkin,** questioned him about why he signed the letter. In response, Baric told the subcommittee, "I sent him a couple of papers that the Chinese had published where they were doing virus discovery work under BSL-2 conditions, which is one of the main reasons why I felt that the potential laboratory escape hypothesis shouldn't be, in essence, put under the rug."

"You believe this was appropriate containment if you want but don't expect me to believe it," Baric wrote Daszak. "Moreover, don't insult my intelligence by trying to feed me this load of BS."

Baric's signing of that letter also precipitated a testy email exchange with Daszak over the WIV's safety standards, obtained by *Vanity Fair.* Daszak enumerated to Baric the various ways in which China's lab safety standards did not lag far behind US standards. He added, "We checked with Zhengli, who let us know that she used 'BSL-2 with negative pressure and appropriate PPE.'"

This brought a withering response from Baric. "Bsl2 with negative pressure, give me a break." He pointed out that even Shi's most recent papers never defined the safety precautions used. "Yes china has the right to set their own policy. You believe this was appropriate containment if you want but don't expect me to believe it. Moreover, don't insult my intelligence by trying to feed me this load of BS."

Reached for comment, Daszak told *Vanity Fair* that the WIV performed its animal infection experiments "at BSL-3, as per work at Dr. Baric's lab in the USA." He also stated that the research rejected by DARPA was "never done," and said that the proposal called for only work that "did not involve any infectious materials" to be done in a BSL-2 facility at the WIV. Regarding the Subcommittee's call for the NIH to recommend debarring him and EcoHealth Alliance from receiving federal funds, he said he hadn't yet seen the report and couldn't comment on it. However, he stated that EcoHealth Alliance has "cooperated fully and expeditiously with the NIH on additional oversight measures since 2020" and shared a letter from last October in which the NIH deemed the nonprofit compliant with oversight requirements.

Another signatory to the May 2021 letter was Dr. **Michael Worobey,** who has since become a leading proponent of the theory that the virus spilled over from infected animals at the Huanan Seafood Wholesale Market.

In 2022, Worobey and a team of international scientists published an influential research paper that used a geospatial analysis of early infections in Wuhan to make a case for the market spillover theory. Using data collected by Chinese scientists, Worobey's team later also published evidence in a preprint that virus-susceptible mammals, such as raccoon dogs, were present at the market.

When prominent virologists state that the preponderance of evidence points to a natural origin, they are often referring to Worobey's research. Baric, for his part, told congressional investigators that Worobey's geospatial study has a "major problem" with its timeline. He told the subcommittee, "The only thing we have really solid data [for] is that the market was the site of amplification in late December, January. That's still two months from the origin date, based on a molecular clock, which means it was circulating somewhere before it got there. And the question is, where was it?"

Baric said the earliest cases are "almost impossible" to document because many were asymptomatic. "It's

a fundamental problem with the papers that are reported to prove—they write it too strong, I think, but they're very passionate about their data. And to be fair to them, it is the best data that's out there." He went on to critique the papers' claim of two independent jumps from different infected animals at the market based on the presence of two different lineages of the virus. "It's a stretch," he said, adding that his view is shared by "a lot of virologists that look at that data and go, mmm."

Calling the evidence for a market origin "powerful," Worobey told *Vanity Fair* that he thinks the first jump from animals to humans happened in November. Baric, he said, "possesses essentially no expertise in the subjects of the papers he is commenting on…. It is irresponsible for him to share these views with anyone without also making it clear that he is in no better position than the average educated person to judge this work."

In his testimony, Baric was equivocal on the question of whether WIV scientists could have possessed SARS-CoV-2, or a very close progenitor, prior to the pandemic. There "was evidence that they were building chimeras" and "doing some discovery work about the functions of spike genes of zoonotic strains that they discovered later on, but I don't know if they did any of the engineering or anything."

Without further disclosure from China, the answer may be unknowable. As Baric told congressional investigators, "If you had access to the laboratory notebooks, if you had access to the safety records of the Wuhan Institute of Virology, if you had access to the sequence databases, the level of assurance that you would have would be greater. No question."

"Which we didn't really have?" a congressional investigator asked.

"Which we don't really have," Baric responded. "That's very true."

Subject: Origins of CoV-2

Dear Dr. Gupta,

You totally missed the point with your comments about the origins of CoV-2. Whether or not the virus was even in the Wuhan Institute of Virology or there was an accidental release, CoV-2 originated as a spillover from bats and ultimately to humans. To prevent or mitigate the response to the next spillover we need to know as much about this true origin story as possible. By buying in to the acrimonious stories about the lab origin you, and others like Dr. Redfield, make it increasingly difficult if not impossible for anybody or any organization to gain the cooperation of the Chinese government. Unwittingly you have played the wrong card – a joker and it's not funny because it has major consequences for the world. Instead of allowing WHO to pursue further work with China, including the bat origins and the lab release story you, Redfield and the real conspiracy believers have done immeasurable harm.

Think about it – you are an intelligent individual – and do better to clarify and not further muddy the sewage left over from the behavior of the U.S. government toward China about the pandemic throughout 2020. I urge you to use your credibility as a physician and reporter positively and productively.
Sincerely,

Gerald T. Keusch, M.D.

Rich: Your summary of my summary is right on point – that was exactly the vibe of Sachs's comments during the webinar. He let Ebright and Kopp spell out the crazier aspects of the lab leakers' viewpoint. Chan was more balanced than I expected her to be (although her summary clearly had a thumb on the scale).
Best regards,
Jeff

Jeff:

Great summary, but nothing really new as all the presenters had well-known views. My only comment is that Sachs recently seems to be a little less adamant that it was a lab leak and just now relies on innuendo.

Subject: Jeff Sachs moderated a Lancet Commission webinar on COVID-19 origins this morning
Importance: High

All: I listened in this morning on the webinar on COVID-19 origins that Jeff Sachs moderated under the auspices of the Sustainable Development Solutions Network (SDSN). I wasn't able to stay until the end of the Q&A, but I did hear the three main presentations. Sachs said that he plans to post the recording of the session (on SDSN?). This was the first of three planned webinars – the second (on global health financing) will take place on November 22, the third (on health system strengthening) on December 8.

Sachs served as moderator. His introduction was fairly mundane. His basic premise was that there are two "absolutely viable" hypotheses for the origin of COVID-19 – either zoonotic or due to a lab leak. (Note that the language he uses – "absolutely viable" – obscures the fact that the evidence differs significantly for each of the two hypotheses. But this was a bias that ran through all of the presentations.) He then argued that we need to follow both lines of inquiry equally, to have a proper understanding of both possibilities. He alluded to the bimodal distribution of most discussion of these questions – with "mainstream media" coming down on natural origins, and "alternate media" arguing for laboratory origins (including in this Senator Burr's Senate Minority Report). He then turned to two "leading scientists" and a "leading reporter" for further perspectives.

The speakers were Alina Chan (Broad Institute), Richard Ebright (Rutgers University) and Emily Kopp (US Right to Know) – no great surprises there.

Alina Chan's main argument was that there is not enough evidence to decide which hypothesis is true, and that all the evidence is circumstantial. She did say that there is no argument over the fact that the pandemic originated in spillover from bats – just a difference of opinion on how and where this happened.

She presented a set of factors that would explain the chain of causation for each of the two hypotheses:

Natural origins
- Earliest cases handled live animals?
- Were there infected animals in markets or farms?
- Were there animal variants of the virus?
- Was there antibody evidence of infected animals or traders (not presenting with pneumonia)?
- Was there a strong wildlife conduit between known bat reservoirs and the outbreak site?

MORENS_SUBPOENA_003670
MORENS_NIH_010582
REL0000482236

She then claimed that none of these have been established for SARS-CoV-2, and thus we can't say that natural origins hypothesis is true.

Lab leak
- WIV was the HQ for virus hunting program targeting both animals and humans
- WIV found and developed SARS-CoV-2-like viruses by 2013
- WIV did advanced work with virus isolates and "seamless clones"
- Live virus work was done in BSL2 and BSL3 environments, which could not contain airborne viruses
- WIV and collaborators were planning to insert furin cleavage sites in different viruses (she referred to a "pipeline" of risky research and made a big deal of the rejected DARPA proposal, for which the research was never done)

Her conclusion: evidence is not definitive for either hypothesis, but these aspects of research at the WIV were "very concerning" and thus we need to investigate both conclusions.

Richard Ebright was then asked what should be done about improving the oversight of research in this area from the perspective of biosafety, biosecurity, and biorisk management. He concurred with Sachs and Chan that the available data do not enable a choice between the two hypotheses of COVID-19 origin. But regardless of where one stood on this question, the research by EcoHealth Alliance, WIV, and their collaborators – according to Ebright – used inadequate biosafety protocols and lacked transparency. Again, according to him, this points to, but does not prove, a research spillover as the origin of COVID-19.

I've attached a screen shot of the slide he shared that lays out his bill of complaint. As you can see, he's fixated on the work that WIV and EHA did from 2016-2019, arguing that, while this doesn't prove laboratory origins, it "exceeds the standard of probable cause" and provides "ample basis to initiate investigation and ample basis to improve oversight." (Like Chan, he also made much of EHA's rejected DARPA proposal, trying to use it as a "smoking gun" for malign intent by EHA and WIV, despite the fact that this research was never done!)

He spent most of his time, however, outlining a basis for and recommendations for improved research regulation and oversight in biosafety, biosecurity, and bio risk management.

Sachs and Ebright had an exchange about the recent news of the creation of a variant of COVID-19 that appeared to be more virulent than Omicron, without the "knowledge or approval of NIH." This was evidence for both of

them of the need for enhanced oversight.

Emily Kopp, an investigative journalist with US Right to Know, then made a breathless presentation about her attempts to bring the truth about COVID-19 origins to light through FOIAs and dogged persistence. The gravamen of her complaint is that much of the relevant research has been underwritten by NIH, DOD, and USAID with taxpayer funds, and conducted in the US (at EHA, University of North Carolina, University of Texas, and UC Davis), yet she and her colleagues have had to file dozens of FOIA requests and lawsuits to get access to what they consider to be relevant information.

She reviewed five categories of evidence:

1. EHA progress reports to the NIH: She noted that the Intercept is going after 31 EHA NIH proposals and over 1000 other documents not yet released. They also plan to go after EHA Board members and collaborators at the U of Maryland and UC Davis.

2. USAID databases from PREDICT.

3. NIH bioinformatics databases for sequence data from WIV: She was quite exercised about the "apathy" of NIH at not going through archived sequences to provide the information that USRTK wants.

4. The Baric Lab at UNC: She said as yet there are few clues to planned work on genetic engineering techniques here.

5. Department of Defense: Again, she railed about the lack of transparency about the rejected EHA DARPA proposal, which she claimed DARPA tried to conceal. She also mentioned data from PREEMPT.

She then claimed that the public can't trust the credibility and integrity of the NIH on these matters, since they tried to obscure the existence of relevant data – and event tried to obscure the involvement of other scientists in the discussion of COVID-19 origins in the conversations that led to the *Nature Medicine* correspondence in 2020 (I lost her here – the discussion became very "inside baseball"). She concluded with a plea that the public deserves more clarity about the pandemic's early days.

Sachs then threw her a softball about the *Nature Medicine* correspondence, inviting her to tell the listeners how it appeared that NIH was trying to obscure who came up with the zoonotic origins theory (and then didn't credit those authors on the publication). She then said that the virologists who were on this correspondence have continued "to be

aggressive about natural origins and to marginalize other theories" – asking (rhetorically) if they have shown integrity.

Sachs then said that all of this information had to be pried out of the NIH and the USG, rather than being offered transparently. He showed how the NIAID had redacted most of the 300-page COVID strategic plan of April 2020, and also made a point of saying that Robert Redfield had wanted to attend today's webinar but couldn't, noting that he believes a lab leak is more likely – and that he was shut down by NIH when he tried to call for further investigation. Sachs then teased that there may be new revelations that the WIV and US scientists were implicated in evidence that COVID-19 emerged in China before December 2019. (This latter evidence-free speculation seems to refer to Mike Pompeo's evidence-free contention that the USG had evidence of this – but that evidence has never materialized.)

Sachs then reiterated his contention that both hypotheses need further investigation – and that the relevant information may be in the US, not China. We need an independent, rigorous, transparent scientific investigation. (Despite this language, I think you can sense from my summary of the webinar that Sachs is actually shading the argument toward his belief that COVID-19 had a laboratory origin.)

I wasn't able to stay on for the Q&A, but we should be able to review the rest of the session when Sachs posts the recording.

Hope this is helpful.

As ever,
Jeff

Jerry:

I take your point about the need to proceed deliberately. I like the suggestion of Peter asking NAM to say that he has to consult with colleagues to prepare a response and therefore needs to expand the circle of confidentiality.

This whole situation reminds me of the days of McCarthy and HUAC. It's sad to think that the hyperpartisanship on Capitol Hill is now infecting what should be the more rational precincts of science.

I'm available for a conversation whenever convenient.

Best regards,
Jeff

Subject: RE: The NAM are now investigating me based on some of the allegations from the Republican congressional members

Hi Jeff,

I agree, and so is his committee. My first thought in response is the following. When this originally came up I was in touch with Bruce Alberts and Harvey Fineberg, both past Presidents at NASEM, and asked them to intervene. They did and were not favorable to NAM pursuing these allegations. I could follow up with them with the latest information and see what they have to say. The conundrum is that the NAM cover letter dated April 11 says that "all involved respect the confidentiality of the review process" and the attached document says it is "Privileged and Confidential". Peter will be in conflict with these instructions if he shares the material, and perhaps more so if any of us then further disseminates (however precisely) the material. Having no sense of what they are actually thinking, is this just a cover their ass process or do they actually believe there is a real issue, it is impossible to figure out where they are going with it.

My advice on the phone to Peter was to take it slow, restrain the anger and the frustration, and figure out how to respond based on a personal code of behavior as a scientist involved in research both

before and after it was politicized, from being the darling of NIH and NAM to being trolled by people who have nothing but raw politics as the ideal they follow. Let's talk among ourselves, and think about the pros and the cons for any action taken. Then with Peter. Some of us could talk to Tony Fauci confidentially, and be confident it would be confidential. I think I could talk to Bruce Alberts in a confidential manner, and he is at UCSF, the same institution as the writer of the letter, Elena Fuentes-Afflick, so he presumably knows her and she certainly would know of him.

Is there any strategy that would include having Peter write to Fuentes-Afflick to say he has to consult with scientific colleagues and respected members of the Academies as part of his preparation of a response – its not just what he did or said or didn't do or say, its about the very soul and conscience of science and being a scientist when attacked in an aggressive and politically charged manner like this.

I didn't expect it to go to this step, which is why I am struggling here. Your thoughts, and maybe a call soon?

Jerry

Jerry:

This situation is outrageous. The NAM is not covering itself in glory right now – rather than standing up for the freedom of scientific inquiry, they are abetting politically-motivated character assassination. As Peter H observes, the NAM could just tell Congress to stuff it – instead they are doing their dirty work. Victor Dzau could have exercised leadership on this question – instead he is hiding behind anonymous process. Is there any way we can bring pressure to bear on Dzau to put a stop to this?

Best regards,
Jeff

My outrage aside…The legality of this does not make sense. NAM is not a government entity, right? So NAM could tell them to get stuffed if they wanted to?

Please see the email below that I just received and the attachments.

They've cut down the allegations to a handful that I have to respond to within 30 days. But as I see this, these are grey areas that they could use to easily push me out, no matter my response. It would save them political hassle if they get rid of me, and I'm very worried that this is their ultimate goal.

Obviously, I'll try to be as aggressive as possible in defending against this, but this is devastating to me personally to have to go through this and if they expel me, it would likely cost me my job and career. Even more worrisome is the last paragraph in the letter from the Congressional members – they are playing pure politics here – if I'm found to be in breach, they are demanding that every report I've been involved in, and every committee be investigated.

This feels like a purge orchestrated by politicians for a political goal, and an academy that is too weak to push back.

Cheers,

Peter

Dear Dr. Daszak,

On behalf of the National Academy of Medicine (NAM), I am notifying you that the NAM has received a complaint alleging that you have engaged in conduct(s) that may constitute violation(s) of the NAM Code of Conduct for members.

Please find attached a notification letter, supplemental documentation, and NAM bylaws and Code of Conduct. Pursuant to the NAM Policy and Procedure on Violations of the Code of Conduct, please provide a response to the allegations within 30 days of the date of this notification, and by no later than May 13, 2022.

For your awareness, copies of this notification is postage mailed by FedEx to your office address at EcoHealth Alliance, 520 Eighth Ave Suite 1200, New York, NY 10018.

Sincerely,

Elena Fuentes-Afflick, M.D., M.P.H.
Home Secretary, National Academy of Medicine

Some US government agencies believe Covid originated from a lab leak in China (Getty/iStock)

In late February, *The Wall Street Journal* published a shocking report. Investigators at the US Energy Department had concluded with "low confidence" that the Covid-19 pandemic most likely originated from a laboratory leak in Wuhan, China.

The finding seemed to fly in the face of measured assurances from scientists and government officials who insisted the disease, like all other pandemics before it, originated when an animal virus crossed over into humans sometime in the fall of 2019 in China. The conclusion, in a space of days, seemed to validate claims from Republican politicos and China hawks alike, which had previously been dismissed as conspiracy theories and over-heated partisan attacks.

The FBI has also concluded, with "moderate confidence," that a Covid lab leak was the most likely origin, while the National Intelligence Council and four other other top government agencies retain a "low confidence" assessment that the disease began zoonotically.

So, has the world of Covid knowledge really been flipped upside down? Not quite, according to coronavirus experts.

According to environmental and occupational health sciences professor Gerard Cangelosi, associate dean for research at the University of Washington School of Public Health, the DOE's findings, which the agency acknowledged it only held with "low confidence," represent a conclusion "slightly better than a coin flip."

"We know nothing for sure," he told *The Independent*, noting that the DOE's evidence for its findings haven't been made public for review. "Anyone who claims to know how it arose is fooling themselves. That should always be established. It really really takes a long time to figure these things out. We still don't know exactly where HIV came from. We don't know exactly where 1918 flu came from. It's a very difficult thing to pin down."

Instead, he prefers to start from what we do know.

"Every single infectious disease that we've ever known arose naturally," he continued. "In most cases, zoonotically, meaning it started in an animal species and made a jump to humans. That alone makes it seem most plausible that's how SARS-CoV-2 started."

The early cluster of cases that began in the fall of 2019 around Wuhan, China, could've still infected workers studying coronaviruses at nearby labs – a lab leak and natural origins are not "mutually exclusive," Professor Cangelosi noted – but the public health expert said there is no evidence that concretely suggests Covid began as an experiment in a Chinese lab and spread across the world after an accident, as many on the right would have you believe.

"The evidence I've seen is largely circumstantial that the Chinese are hiding something," he said. "That's not evidence."

Other experts agree.

"All the evidence available for scrutiny points to the pandemic originating from transmission from live animals to humans," Angela Rasmussen, a virologist at Vaccine and Infectious Disease Organization at the University of Saskatchewan who co-authored one of the major 2022 studies on Covid's origins, wrote this month in *The Washington Post*.

"One thing everyone involved in studying the origins of SARS-CoV-2 seems to agree on — FBI and Energy Department included: No laboratory modification of a virus was involved," she added. "Indeed, there has never been an infection reported as a result of a pathogen generated through gain-of-function research."

Instead, we're left with a mix of uncertainty and educated guesses, a reality when studying pandemics, where the exact contours of a disease's journey around the world are often calculated probabilistically rather than with exact, crime-scene precision.

A Republican-led committee in the House of Representatives held a contentious public hearing on the origins of Covid recently, the first in a planned series and a sign that the debate over the early days of the pandemic isn't going away any time soon. We may never know the precise moment the coronavirus jumped into humans, but the long-running fight over its origins has revealed not only lapses in global pandemic preparedness, but the long shadow of partisanship that might hamstring our response to the next infectious disease that inevitably crosses over.

The first cluster of Covid cases can be traced back to the Huanan Seafood Wholesale Market in Wuhan, according to researchers, where vendors sold animals like raccoon dogs and red foxes in late 2019 that can both get and shed the disease which causes Covid. The creatures were photographed near stalls where scientists later found Covid on surfaces like cages, carts, and machines that process slaughtered animals.

The earliest known patient at the market, later the site of an early cluster, had symptoms as of 10 December 2019, when between 10 and 70 people had Covid worldwide, according to genetic analysis.

Michael Worobey, an evolutionary biologist at the University of Arizona who extensively studied the early days of the disease, told NPR in February that there's an "absurd" level of evidence tying the early outbreak of the disease to the area around the market

"We do have one analysis where we show essentially that the chance of having this pattern of cases [clustered around the market] is 1 in 10 million [if the market isn't a source of the virus]. We consider that strong evidence in science," he told the broadcaster. "The analyses that we've done are telling a very strong story. The evidence is amongst the best we have for any emerging virus."

Professor Worobey's findings were published in an extensive, peer-reviewed paper in *Science* last summer, but there hasn't always been such concrete evidence to work with.

MORENS_SUBPOENA_019741
MORENS_NIH_039405
REL0000482266

With so much unknown about Covid's origins, especially during its early days, scientists quickly had to start fending off conspiracy theories as they raced to analyse the rapidly spreading disease.

In a February 2020 letter in *The Lancet*, a prestigious medical journal, a group of top scientists condemn those arguing Covid had an unnatural origin somewhere in a lab in China.

"We stand together to strongly condemn conspiracy theories suggesting that COVID-19 does not have a natural origin," the letter reads. "Scientists from multiple countries have published and analysed genomes of the causative agent, severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) and they overwhelmingly conclude that this coronavirus originated in wildlife, as have so many other emerging pathogens."

That didn't stop partisan actors from jumping into the fray, such as White House trade adviser Peter Navarro, who speculated wildly that the Chinese wanted to "weaponise" Covid and "sent hundreds of thousands of Chinese nationals over here to seed and spread the virus." Donald Trump, meanwhile, had taken to describing the pandemic with the racist epithet "kung flu."

Eventually, though, questions about the origins of Covid and a possible lab leak entered more scientific quarters.

In May of 2021, another group of prominent scientists called for investigating both the natural spillover and lab leak theory of Covid, writing in *Science* "knowing how COVID-19 emerged is critical for informing global strategies to mitigate the risk of future outbreaks."

"SARS-CoV-2 could have spent some time in a laboratory before encountering humans," one of the letter's authors, Stanford University professor of microbiology and immunology David Relman, explained in 2021. "We know that some of the largest collections of bat coronaviruses in the world — and a vigorous research program involving the creation of 'chimeric' bat coronaviruses by integrating unfamiliar coronavirus genomic sequences into other, known coronaviruses — are located in downtown Wuhan. And we know that laboratory accidents happen everywhere there are laboratories."

That year, following a joint investigation with China, the World Health Organization concluded it was "extremely unlikely" Covid leaked from a lab, though criticisms from both within and without acknowledge that Chinese officials weren't fully forthcoming during the process, blocking access to some forms of patient data. Plans for a second phase of investigation, including potentially auditing individual labs, have been quietly shelved.

"They have not been transparent," then-White House press secretary Jen Psaki said of China after the release of the WHO's initial report. "They have not provided underlying data. That certainly doesn't qualify as cooperation."

She said the report "doesn't lead us to any closer of an understanding or greater knowledge than we had six to nine months ago about the origin" of the virus.

Chinese officials have continued to stand behind the WHO finding.

Chinese Embassy spokesperson Liu Pengyu told *ProPublica* last year "the allegation of lab leaking is extremely unlikely. The conclusion should be respected. … From the very beginning, China has taken a scientific, professional, serious and responsible attitude in origins tracing."

The official said some in the American political and media sphere "distort facts and truth" and should "stop using the epidemic for political manipulation and blame games."

As the pandemic deepend, the blame games ratcheted up in intensity, as Republican officials continued to insist there was a shadowy truth behind the origins of Covid. In an infamous July 2021 exchange, Senator Rand Paul, alleged that Dr Anthony Fauci lied about the federal government funding research so-called "gain of function" research on novel coronaviruses in Wuhan that could've made them more contagious, alleging the long-time health leader was "trying to obscure responsibility for 4 million dying around the world from a pandemic".

"Senator Paul, you do not know what you're talking about, quite frankly, and I want to say that officially," Dr Fauci said. "You do not know what you're talking about."

"You are implying that what we did was responsible for the deaths of individuals. I totally resent that," he continued. "If anybody's lying here, senator, it is you."

That fall, *The Intercept* reported on documents showing that the National Institute of Health's National Institute of Allergy and Infectious Diseases, headed by Dr Fauci at the time, had in fact funded a nonprofit called the EcoHealth Alliance, which partnered with the Wuhan Institute of Virology (WIV) in the past, complicating Dr Fauci's testimony in May of 2021 that the NIH doesn't and hadn't funded such work.

It's unclear whether Dr Fauci was aware of the EcoHealth Alliance work. A 2014 award to the Chinese research institute explicitly stated the money couldn't be used for gain-of-function work, and none of the viruses listed in write-ups of the experiments performed under the grants are closely related enough to Covid-19 to spark an accidental evolution into the disease, according to *The Intercept*. The NIH told the news site it reviewed the nonprofit's work and concluded that it didn't qualify as gain-of-function research, an analysis some scientists have questioned.

Other Republican-led efforts yielded more pointed questions about Covid's origins.

In the Senate, the committee on health, education, labour and pensions, led by then-senator Richard Burr of North Carolina, who has been recognised for his work on biodefence issues, concluded in an October 2022 report that Covid was "more likely than not, the result of a research-related incident."

Investigators poring over opaque Chinese government reports about the lab work underway in Wuhan described a culture of intense pressure to produce prestigious scientific discoveries, mixed with worrying safety lapses and an effort to scale

MORENS_SUBPOENA_019742
MORENS_NIH_039406
REL0000482266

up the country's bio-research apparatus before it had capacity to oversee it properly.
Ambiguous archived reports from the WIV spoke ominously of seeming references to past lab safety and biosecurity problems, describing a swift response "every time this has happened" and an urgent set of visits and communications from top Chinese government officials in the fall of 2019 surrounding some unnamed matter. Past inspections of the facility in 2011 and 2018 found issues with viral sample storage, and the Senate committee concluded that "the WIV struggled to maintain key biosafety capabilities at its high-containment BSL3 and BSL4 laboratories," referring to a classification of labs conducting the most sensitive levels of viral research.
What's more, a declassified US State Department fact sheet noted that the "US government has reason to believe that several researchers inside the WIV became sick in autumn 2019, before the first identified case of the outbreak, with symptoms consistent with both COVID-19 and common seasonal illnesses."
"This raises questions about the credibility of WIV senior researcher Shi Zhengli's public claim that there was 'zero infection' among the WIV's staff and students of SARS-CoV-2 or SARS-related viruses," according to the document.
Even ostensibly neutral attempts at finding information around Covid's origins quickly descended into acrimony and accusations of cover-ups.
In 2022, the eminent economist Jeffrey Sachs disbanded a high-profile *Lancet* commission working on the origins of Covid, arguing the scientists he'd helped select for the project had conflicts of interest, accusing them of hiding their past work with the WIV and EcoHealth Alliance. (Those involved with the panel have argued they had completely normal contacts with the institute, a center of international viral research that regularly works with outside researchers, contacts that made them a better fit to serve on the investigative commission.)
Mr Sachs, meanwhile, has attracted criticism for attempting to sit in on commission-members' sometimes sensitive interviews with Chinese researchers, and for doing a podcast interview in August of 2022 with Robert F Kennedy Jr, a leading anti-vaxxer.
Seemingly wherever any group of experts and officials got together, acrimony, doubt, and politics tended to overshadow the scientific discussion. It's a legacy that can be felt even in the comparatively dry confines of academic journals.
In October of 2022, another group of experts published their findings on the origins of Covid in the *Proceedings of the National Academy of Sciences*
"Considerable scientific peer-reviewed evidence supports COVID-19's origin as a zoonotic infection within the wildlife trade, as in many prior outbreaks," they wrote. "While a laboratory leak cannot be ruled out, no verifiable evidence or scientific data are available to support this interpretation."
"However, laboratory accidents do happen, and no independent formal audit of the Wuhan laboratory facilities has been possible in the wake of geopolitical conflicts," they added.
In the face of such dispute and unceratiny, University of Washington's Professor Cangelosi understands, in a certain way, the appeal of the lab leak theory, that a phenomenon as complex and far-reaching as the Covid pandemic could have one culprit who made a mistake in one moment. However, he cautions against using inquiries into the disease's origins as a weapon of political blame. Instead, he said, they should be about helping us prevent future outbreaks.
"It might steer people, even people who are not politically inclined and have no ill will, it might steer them towards what they think will be a simple solution, which is shut down the labs in china," he said. "Actually that will do nothing at all."
Humans and animals will continue living side-by-side. Humans will continue doing research about viruses. Laboratories will continue to have issues. The key point, he said, is to take the lessons learned in this pandemic about the effectiveness of mRNA vaccines, the need for rapid and widespread viral surveillance, the crucialness of mass stockpiles of personal protective equipment, and make sure we're ready for the next pandemic.
We may never know where this infectious disease first began, but we know for a fact it won't be the last of its kind.

EXTERNAL SENDER

I love that idea Rich.

Truth is, our lawyers told us early on that the actions NIH took are likely illegal. They've looked at all prior cases of NIH terminated grants, suspending grants and appeals against them. There are precedents for winning these cases, e.g. Planned Parenthood and others. The only catch is that suing NIH would mean litigation that drags on for a few years, discovery actions that would demand all sorts of private correspondence, and ultimately a jury that might by now be contaminated with the lab leak narrative. They advised us that the best option is to push privately for the grant to be renegotiated, which I suppose is where we are now.

All of this is of course exacerbated by the other actions and attacks that add to a general narrative that EcoHealth must have been up to no good – this includes the NAM investigation that we're still waiting to hear about, and the OIG audit. There's also a lawsuit against us that we've tried not to talk publicly about, but it's real and we have to defend against it. A lawyer in Long Island who's sued EHA, myself and even my wife for a huge sum for causing COVID-19 that then infected him etc.

Cheers,

Peter

EXTERNAL SENDER

Thanks Rich - I've got to look at the positives in all of this and just carry on fighting, if only for my own health reasons. It's been a really horrible couple of years and I've found that the constant harassment can really get you down – it's been shocking to me how much of struggle this is with many days spent despairing over my own personal future and the future of EcoHealth. It's been tough on my family as well, and the other staff at EHA.

I'm determined not to give up though and will be going through all the options carefully. The other glimmer of hope is that any 'renegotiation' will be with NIAID staff, so I'll reach out to them ASAP. I think that if most of the funding is planned for the US, with just one subcontract to China, for a group that works on epidemiology, that might work. The other strategy would be to see if a shift to another country would work. I'm mindful that NIH (Lauer et al.) would be delighted if we just handed in the towel, and will probably be looking for excuses to consider our alternative plans out of scope.

On this issue of who is 'the pits' and who isn't at NIH, I think the list begins with Francis Collins, who committed the original sin of terminating our grant when he could have simply resisted. Second is his lackey Lauer who took it to another level of bumbling errors, illegal actions, and aggressive brinksmanship, but there are others also. Lawrence Tabak (now acting Director NIH) publicly stated that we were out of compliance and really threw us under the bus, and there are a group of legal advisors and Congressional staffers at the Office of the Director who have actively worked to publicly undermine us, sometimes with clear glee and delight.

For example, in one of the FoIA'd emails that Peter Aldhous at Buzzfeed unearthed, he spotted Michael Lauer sending details of our animal experiment oversight, which they then used to tighten the screw on us very publicly and unfairly.

MORENS_SUBPOENA_011012
MORENS_NIH_021755
REL0000482283

Lauer used the subject Header "A Gift" when he sent this to his legal and Congressional relations colleagues at NIH. That sort of gloating is pretty disgusting, and won't be forgotten by me. Peter Aldhous also dug up clear evidence that NIH requested an OIG audit as part of their efforts to tighten the screws on us, and get them off the hook. We're just negotiating the final results of that audit – a huge timesink that's been going on over a year now, has looked at grants to EHA over the last 8 years, and has only found $77,000 of mis-coded financial errors (including a $19 overpayment to a contractor, with $7 indirect costs; and a single $5 alcoholic beverage at a hotel mistakenly coded to our grant). Great use of taxpayer money and time and the total of these mis-coded finances is less than 1% of the grants they reviewed, and less than 0.01% of our budget over that period. Of course, when the report goes public in a few weeks, it'll be used by Republicans to demand we're de-funded and closed down (again).

Ironically, in the emails (below), Michael Lauer cc's Michelle Bulls, who's listed in his correspondence yesterday as the person we have to write to if we want to appeal their decision. Pretty sure she's not an objective overseer at this point.

Here's the article: https://www.buzzfeednews.com/article/peteraldhous/white- coat-waste-anthony-fauci-nih-ecohealth-alliance-lab

And here's the section (and you can click on the links to see the FoIA'd emails):

A heavily redacted series of emails from May 2021 centers on the July 2016 letter from the NIAID that had given EcoHealth permission to resume the chimera work. Accepting a suggestion made by Daszak himself, it stated that if any of the chimeric viruses showed unexpectedly rapid growth, he would "immediately stop all experiments with these viruses" and provide NIAID officials with information about the unexpected outcomes. Shortly after receiving the letter, Lauer sent it on to a senior attorney with the Department of Health and Human Services, assigned to the NIH, changing the subject line on the email thread to "Gift."

Daszak's problem was that the NIH determined that an experiment described in annual progress reports for the grant indicated that one of these viruses had made mice engineered to carry the human receptor targeted by SARS-like viruses sicker than expected and showed signs of rapid growth. "EcoHealth failed to report this finding right away," NIH deputy director Tabak later wrote in an October 2021 letter to James Comer, the ranking Republican member on the House of Representatives Committee on Oversight and Reform.

None of this amounts to a smoking gun linking EcoHealth and the Wuhan institute to the origins of COVID, as the viruses involved were very different to SARS-CoV-2. And in a letter to Lauer and Tabak after the latter's communication with Comer, Daszak contested the conclusion that the experiment did show rapid viral growth and argued that EcoHealth had complied with its reporting requirements.

But it gave Lauer evidence that he was looking for. EcoHealth is now under audit from the Office of Inspector General for the Department of Health and Human Services, an independent watchdog that monitors fraud, waste, and other problems, as part of a review of the NIH and "selected grantees" initiated on June 11, 2021. Documents received by BuzzFeed News through its FOIA lawsuit, including a timeline of events put together by Lauer dated June 13, 2021, indicate that the suggestion for an OIG audit of EcoHealth came from the NIH, just days after Lauer sent his "Gift" email.

The NIH declined to discuss Lauer's email and timeline, saying in a statement: "NIH doesn't comment on internal deliberation of grant awards."

Cheers,

Peter

EXTERNAL SENDER

I found a copy on Twitter of Lauer's letter to Rep Comer yesterday – word doc attached, recreated using screenshot jpegs, so hope it works.

It's good that they're publicly stating we've cooperated with NIH – this is related to their continued series of letters about our other grants – making us jump through all sorts of hoops just to continue our work. At the same time, they're clearly trying to show the aggressive Republicans in Congress that NIH is going to crack down on miscreants such as us. Apparently, for at least the next 3 years we'll have to double up our reporting requirements, have no automatic carry over of unspent funds, and have to conduct 6 monthly onsite assessments of subcontractees. We've not been told all that yet by NIH, but no doubt there'll be another letter from Lauer on its way soon.

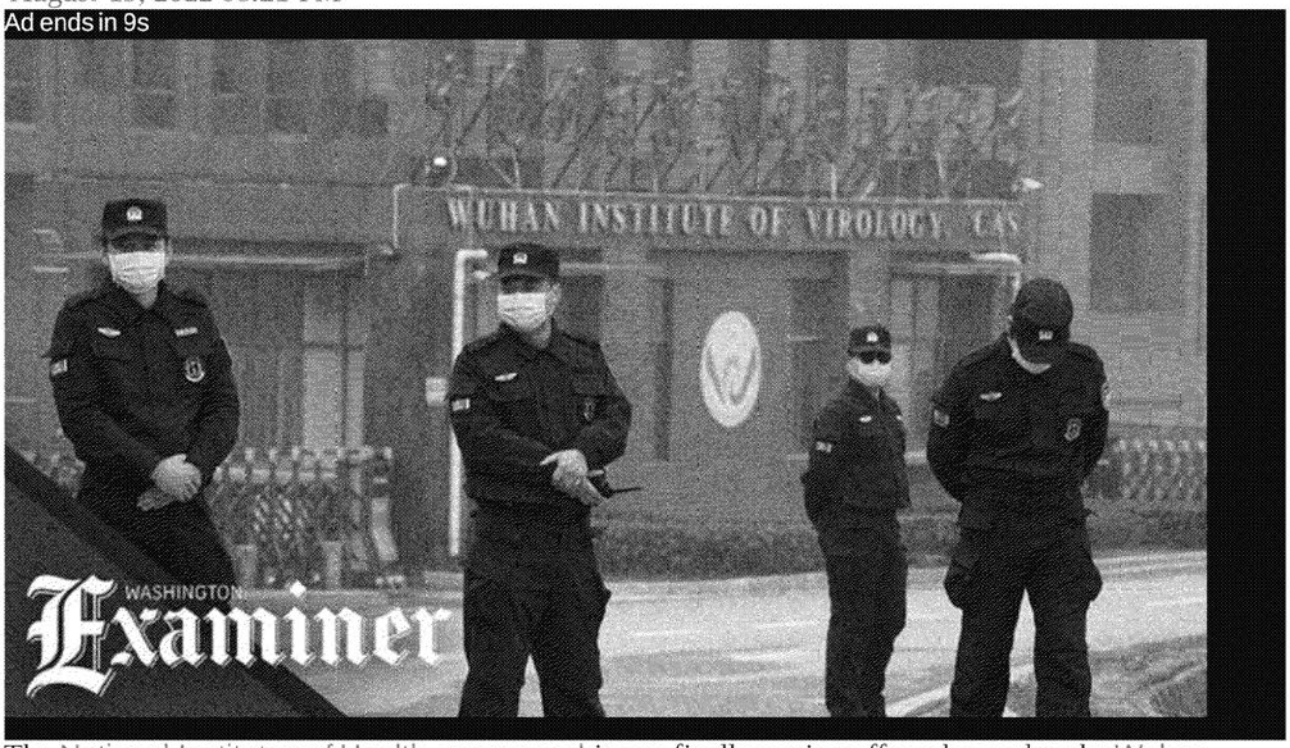
Here's the latest from NIH – as usual we received a Friday afternoon pdf letter from Michael Lauer that's full of legalistic language (attached). And as also 'usual', Lauer only sent this the same day he informed Republicans on an oversight committee, and either him or the Republicans then instantly made it public. There's already an article in the Washington Examiner about it (below)

They're basically terminating our subcontract to WIV because we were unable to get the lab notebooks they demanded (no surprise there, given the politics). They're also offering us the chance to renegotiate the grant. Sounds great, but by now of course the chances of any institution in China wanting to work with an organization targeted in this way are pretty slim. There's also the buried proviso that we have to arrange for 6-monthly inspections of our subcontractee's labs.

If we don't want to renegotiate, we have to bilaterally terminate.

After 2 and a half years of pressure from NIH, we're now back to where we were in April of 2020, when NIH informed us to suspend all work with WIV, but that we could carry on with the grant. This was then followed a few days later with full termination, then suspension with conditions, then more conditions, now this. Pretty depressing, awful, and utterly unnecessary.

Not sure what we'll do, but my gut feeling is we should continue and try to find a way forwards with other groups in China. It'll be a hard path, considering WIV are the premier bat virus group in China and our preferred partners, and the politics has made all of this completely toxic. But it's the honorable path, as a scientist, and I think we should at least try.



Here's the Washington Examiner article: https://www.washingtonexaminer.com/policy/healthcare/nih- ends-subaward-wuhan-lab-stonewalling

WUHAN LAB

NIH ends subaward to Wuhan lab after continued stonewalling

MORENS_SUBPOENA_011015
MORENS_NIH_021758
REL0000482283

by Jerry Dunleavy, Justice Department Reporter |
August 19, 2022 08:21 PM

The National Institutes of Health announced it was finally cutting off a subaward to the Wuhan Institute of Virology after it continued to refuse to hand over key information about the coronavirus research it conducted with U.S. tax dollars.

NIH Deputy Director Michael Lauer made the revelation in a letter Friday to House Oversight Committee Republicans, in which he said the Wuhan lab had refused to turn over lab notebooks and electronic files connected to its research funded through an NIH subaward given to it by the U.S.-based EcoHealth Alliance.

But Lauer indicated the NIH may continue funding EcoHealth's controversial bat coronavirus research despite the group's documented noncompliance issues, its close links to the Wuhan virology institute, and its history of funneling hundreds of thousands of U.S. tax dollars to the Chinese lab.

"NIH … identified one non-compliance under the ... award that cannot be remedied with specific award conditions," Lauer said Friday. "NIH has requested on two occasions that EHA [EcoHealth Alliance] provide NIH the laboratory notebooks and original electronic files from the research conducted at the WIV [Wuhan Institute of Virology]. To date, WIV has not provided these records."

Lauer added: "Today, NIH informed EHA that since WIV is unable to fulfill its duties for the subaward grant under R01AI110964, the WIV subaward is terminated for failure to meet award terms and conditions requiring provision of records to NIH upon request."

FBI INVESTIGATED NIH AWARD TO ECOHEALTH AND WUHAN LAB

The Office of the Director of National Intelligence released an assessment in 2021 stating that one U.S. intelligence agency assessed with "moderate confidence" that COVID-19 most likely emerged from the Chinese government lab in Wuhan, while four U.S. spy agencies and the National Intelligence Council believe with "low confidence" COVID-19 most likely has a natural origin.

The NIH's Lauer also said Friday that the National Institute of Allergy and Infectious Diseases, which has been led by Dr. Anthony Fauci for decades, "will begin to engage with EHA to renegotiate the specific aims and objectives of the R01 grant without the involvement of WIV … in light of the cooperation from EHA and the substantial subsequent improvements in administrative processes that EHA demonstrated."

Rep. James Comer (R-KY), the ranking member on House Oversight, hammered the NIH over this.

MORENS_SUBPOENA_011016
MORENS_NIH_021759
REL0000482283

"Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum," Comer said Friday. "It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract. EcoHealth conducted gain of function research on bat coronaviruses in Wuhan, knew about the Chinese Communist Party's coverup, and failed to inform the U.S. government."

Comer added: "EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money."

The NIH had awarded EcoHealth with a grant dubbed "R01AI110964" years ago, and EcoHealth then doled out three research subawards, including one to the Wuhan lab.

"The research approved under this grant sought to understand how bat coronaviruses evolve naturally in the environment to become more transmissible to the human population," the NIH said Friday in defending the award. "This type of research is a critical part of pandemic preparedness."

The grant to EcoHealth was suspended by the NIH in June 2020 due to "grant administrative non-compliance concerns." EcoHealth was reprimanded by the NIH in October when the agency found that the organization delayed revealing that a U.S.-funded experiment conducted with the Wuhan lab determined that mice with implanted human cells became sicker with an engineered version of bat coronavirus. The NIH found more EcoHealth violations in January.

Republicans say the findings showed EcoHealth was funding risky gain-of-function research in China .

EcoHealth leader Peter Daszak was a longtime collaborator with the Wuhan lab who steered hundreds of thousands of dollars in NIH funding to the Chinese lab and was also a key World Health Organization-China joint study team member in early 2021.

Daszak dismissed the lab leak hypothesis in March 2021 when he admitted he took Wuhan lab workers at their word. Meeting minutes from discussions between lab scientists in Wuhan and the WHO-China COVID-19 origins joint study team reveal lab leak concerns were referred to as "myths" and "conspiracy theories."

An advisory group assembled by the WHO said in June that the lab leak hypothesis needed further study.

The NIH said Friday that the prior problems it had identified with EcoHealth's handling of its coronavirus grant included "inadequate oversight in monitoring the activities of its subawardees, failure to report subawards to the General Services Administration's Federal Subaward Reporting System, and errors in indirect rate charges."

But Lauer nevertheless said EcoHealth might again soon start receiving U.S. tax funding for its bat coronavirus experiments — just without the Wuhan lab's continued involvement.

The NIH had been run until recently by Dr. Francis Collins, while Fauci still leads NIAID.

Scientists consulting with the U.S. government early in the pandemic believed COVID-19 originating from a lab in Wuhan was possible or even likely, but emails show Fauci and Collins worked behind the scenes to shut the hypothesis down.

Cheers,

Peter

We used distribution data from bats known to host SARSr-CoVs, human population data, and serological testing results to estimate that a median of ~66,000 people are infected by bat-origin SARSr-CoVs in South and Southeast Asia each year. Obviously, this suggests spillovers are a daily occurrence in the region and would make any possibility of a lab leak pale into insignificance, given that 1) only a few dozen people work in labs or in the field on these viruses, 2) they all wear PPE as opposed to villagers hunting bats etc.

Bizarre indeed, but this is how they do it – tangential links from you to your former postdoc to Zhengli to me, followed by accusations that you're linked to research which they (wrongly) claim is GoF, all used to try to undermine your appropriate pushback against all these other attacks.

It's exactly what the Union of Concerned Scientists called the 'disinformation playbook' that was used by big tobacco and anti-climate change activists (successfully I might add).

MORENS_SUBPOENA_011021
MORENS_NIH_021764
REL0000482283

The tipster pointed out that your grant to develop a SARS vaccine was in part motivated by the possibility that a lab accident or bioterrorist attack could result in a SARS outbreak.

Questions:

1. Could you please clarify why you believe the lab origin theory of SARS-CoV-2 is ridiculous pseudoscience, even though you did research under the presumption that a SARS-like virus escaping from a laboratory was possible? Taxpayers devoted $1.6 million in funding toward that project - was it under pseudoscientific pretenses?

2. Could you clarify your involvement in this research project underwritten by both your grant and EcoHealth Alliance's controversial "understanding the risk of bat coronavirus emergence" grant? Do you have a personal or professional relationship with Shi Zhengli? What about Peter Daszak? Have you ever funded or co-funded research at the Wuhan Institute of Virology?

Thank you,

Below is a really inflammatory op-ed, essentially giving free reign to bring the pitchforks out, should the lab leak theory be 'proven'. Given that in the US the people doing the 'proving' are the same intel agencies that Pompeo is quoted as saying "We lied, we cheated, we stole", then that's not a good omen for the safety of our fellow scientists, in particular yours truly!

If Covid Did Escape From a Wuhan Lab, Brace Yourself

The world's anger will be terrible to behold.

COMMENTS

Ever since President Joe Biden ordered U.S. intelligence agencies to investigate reports that the Covid-19 virus might have escaped from a laboratory in Wuhan, commentators have argued over what difference it makes if the theory turns out to be right. Here's why the answer matters: The discovery that the virus had a human origin would give the coronavirus saga what it's lacked: a villain.

And that's a problem.

If a virus that has killed nearly 600,000 people in the U.S. and close to 4 million around the world turns out to have escaped from a laboratory in China, the formless fear that has immobilized most of the world for the last year and a half, at last given a target, might coalesce into fury.

And fury, when widely shared, is hard to control.

Don't get me wrong. It's important to know the truth, and some degree of anger might be good for us. One of the many tragic features of the pandemic has been the way that efforts at public dialogue about causes, remedies, and, yes, whether the virus itself might be human-made, were for the most part stilted and lost, the angry murmurings of a people all but immobilized by anxiety.

MORENS_SUBPOENA_017216
MORENS_NIH_035407
REL0000482284

To be sure, we sought villains as best we could: The whole mess was Donald Trump's fault, the shutdowns were a power grab by blue elites, the real problem was bureaucratic incompetence. But this was mostly the performance of pain without adequate information.

We can include in this category the pretense that scientists were certain that Covid-19 was not of human origin — and that those who suggested otherwise were dangerous cranks. That fantasy was exploded by the meticulous reporting of the veteran science writer Nicholas Wade in an article published in May in the Bulletin of the Atomic Scientists. Wade's persuasive case that the novel coronavirus escaped containment at the Wuhan Institute of Virology — which was conducting research on altering viruses so they would more easily jump from animals to humans — has reopened a debate we should have been having all along. Biden's order is a consequence.
But here's where one might worry. Research on risk perception shows that we tend to fear human-made harms more than natural ones, even when the natural ones have greater likelihood or severity. Some research suggests that human-made harms make us angrier too.

The distinction makes sense. It's easy to hate, say, a terrorist group like ISIS. There's no point in hating an earthquake.

But anger generally doesn't do us any favors. Some people think better when they're angry; most think worse. Moreover, there's a well-known finding in social science that anger leads us to be irrationally optimistic about our ability to solve a problem.
It may be, as Ross Douthat has suggested, that a confirmation that the Covid-19 virus escaped from a Chinese laboratory would lead to a major propaganda advantage in the geopolitical battle over hearts and minds. Such victories matter. But they're not likely to satisfy the all-too-literal American mind, which, when roused to anger, invariably seeks more concrete satisfactions: invade this, regulate that, throw so-and-so in jail. Anger seeks catharsis, often in the urge to "do something." Lots of bad policy is driven that way.

The Sept. 11 experience offered a catharsis because the nation was able to strike back. On the other hand, the intensity of national fear and anger created an atmosphere in which it was difficult to engage in serious public debate about the merits of the invasions of Afghanistan and Iraq.

What about regulation? Perhaps evidence that Covid-19 was of human manufacture would bring about international consensus that all experiments on viruses that might jump to humans should be carried out at a higher level of biohazard safety. As Wade points out, however, the problem is often less what the rules demand than what researchers find convenient. (It's not as though deadly viruses have never escaped containment in the West.)

Besides, as the British astrophysicist Martin Rees reminds us in his 2003 book "Our Final Hour," rules are not universally followed. No matter how strictly we regulate the handling of dangerous microbes, Rees writes, "the chances of effective enforcement, worldwide, are no better than current enforcement of laws against illegal drugs." Just a single rule-breaker, he notes, "could trigger widespread disaster."

Which is to say that even if the Covid-19 virus didn't escape from an improperly contained lab, sooner or later one will.

MORENS_SUBPOENA_017217
MORENS_NIH_035408
REL0000482284

Which brings me to my final thought.

Biden's order to the intelligence agencies was a good thing. But the 90-day deadline smacks of political theater. The U.S. needed two decades to figure out what went wrong at Pearl Harbor. We had trouble tracking Osama bin Laden to a compound he had reportedly occupied for five years. That we will uncover the truth about the origin of the pandemic in three months seems ... unlikely.

If the Covid-19 virus does turn out to have escaped from a Wuhan laboratory, even by accident, the world will erupt in fury. The pressure to "do something about it" — to find a way to punish China for its negligence and its coverup — will be intense. So here's my modest suggestion, should that unhappy situation arise: Whatever we decide to do, let's take the time to think things through, rather than acting out of unreasoning anger.

Yes – really glad Eddie has spoken out in this way. The same reporter approached me and just out of having too much to do last weekend I didn't respond so I'm not quoted – I think that's actually better – it's great to have other scientists speaking out and I'll try to do this a bit more often!

You're right about the politics, and also about the threats – Eddie's getting attacked also by the Miles Guo group (G-News) – the person on who's yacht Steve Bannon was arrested!.

These folks are very active on social media, producing videos and cartoons that are watched by millions.

Rich – you'll be very amused to see that the G-News cartoonists have decide myself and Zhengli Shi in China should be given Nobel Prizes…but this time for 'Acting' – see attached picture…

Cheers,

Peter

Wuhan officials identified Huanan market as a pandemic risk at least five years before Covid emerged

Experts say market was either the site of an initial 'spillover' of Covid, or 'amplified' early circulation through a super-spreading event

By Sarah Newey, Global Health Security Correspondent 18 April 2021 • 5:00pm

Health experts in Wuhan knew the wet market at the centre of the coronavirus outbreak was a pandemic risk at least five years before Covid-19 emerged, a British scientist has revealed.

In 2014 Dr Eddie Holmes, an evolutionary biologist and virologist, was taken to the Huanan seafood market by members of the Wuhan Centre for Disease Control, who used it as an example of the type of place where a virus could "spillover" from animals to humans.

Dr Holmes, who now works at the University of Sydney, said the visit was part of a wider project to hunt for new pathogens with pandemic potential in China.

"The Wuhan CDC took us there, and here's the key bit, because the discussion was: 'where could a disease emerge?' Well, here's the place – that's why I went," Dr Holmes told *The Telegraph* in an interview.

"I've been to a few of these markets, but this was a big one – it felt like a disease incubator, exactly the sort of place you would expect a disease to emerge".

Credit: Eddie Holmes

Dr Holmes, who took pictures at the time, remembers the now shuttered market as a sprawling network of narrow covered streets in the heart of Wuhan. It was late afternoon and not particularly crowded, but there were "crates of wildlife stacked on top of each other", including fish, snakes, rodents and racoon dogs – a fox-like animal known to be susceptible to Covid-19.

Many of the creatures were alive, added Dr Holmes, who remembers seeing one bludgeoned in front of him.

"An animal had got out or something, and somebody was clubbing it," he said, mimicking the hand actions over Zoom. "I think it was a racoon dog, though I couldn't quite see. It was pretty confronting."

Dr Holmes added that he is unsure whether the Wuhan CDC ramped up disease surveillance or introduced new safety measures in the years preceding the pandemic, and the China CDC has not responded to *The Telegraph*.

The Huanan market gained global notoriety when the first cases of Covid-19 (initially reported as a "mystery pneumonia" on December 31, 2019) were found in people who worked and shopped there.

Of the initial 41 people hospitalised with pneumonia who were officially identified as having Covid, two-thirds were exposed to the market, which was closed and sealed off by the Wuhan authorities on January 1, 2020.

MORENS_SUBPOENA_019994
MORENS_NIH_039826
REL0000482308

Experts believe the site played a significant role in the initial circulation of Covid-19, either as the site of the initial "spillover" event where an animal virus jumps to humans, or as an "amplifier" of the early epidemic.

A report from the World Health Organization (WHO) on the origins of Sars-CoV-2 provided crucial details. Though it said "no firm conclusion" could be drawn on the precise role of Huanan market, it found the virus most likely jumped from bats to humans via an as-yet-unknown animal.

The wildlife trade in general, and wet markets in particular, have long been linked to the emergence of new pathogens. There is evidence Sars jumped to humans at markets in Guangdong, China in 2002 and data points to similarly a significant role in 2019.

In early 2020 Chinese researchers collected close to 1,000 samples from Huanan market – swabbing everything from rubbish bins, doors and stalls to stray cats and mice – and found widespread contamination "compatible with introduction of the virus through infected people, infected animals or contaminated products".

Meanwhile, of the first 168 Covid-19 cases, roughly a third had a connection to Huanan market. Genome sequences from some of those in this group found eight of the earliest samples were identical, confirming there was an outbreak there.

Yet the first person with a known link to Huanan market became ill on December 12, four days after the first known case. This suggests Covid-19 may have been spreading under the radar in several parts of Wuhan simultaneously before Huanan market amplified circulation.

The joint WHO-China team also found no evidence that live wildlife was still sold at the market – though noted that both Dr Holmes' pictures and "unverified photographs and videos in media reports" suggest otherwise – and none of 457 animal samples taken from the market between January and March 2020 tested positive for Sars-Cov-2.

The report added: "The manager informed the teams the market was cleaned twice a day, morning and evening. Pests and rats are sought out and killed; holes were closed. Rigorous cleaning was done once or twice a week. Even though there are rooms above some stalls, vendors were not allowed to live in the market."

But Dr Holmes and others, including members of the WHO team, believe more samples need to be taken to "follow the animals", and caution that finding wildlife involved in the early transmission chain is like finding a needle in a haystack.

MORENS_SUBPOENA_019995
MORENS_NIH_039827
REL0000482308

It is also possible that the virus was introduced to the market by an already infected person involved in earlier stages of the wildlife trade.

Live wild animals in crates stacked ontop of each other, taken in October 2014 during Dr Eddie Holmes' trip to the market Credit: Eddie Holmes

"We know how easily Sars-Cov-2 spread from minks to mink farmers in Europe," said Dr Dale Fisher, an expert in infectious diseases and chair of the Global Outbreak Alert and Response Network. "So it's likely this could happen on a farm, and the farmer was the index case who then took it to the market, where there was a super-spreading event.

"But evidence points towards wildlife. And whether it's been plague on rats, or Ebola on bats and primates, or Sars-1 on civet cats and bats, camels for Mers – historically these outbreaks all had species jumps and then amplification events," he told the *Telegraph*.

It is estimated that birds and mammals harbour roughly 700,000 viruses with the potential to jump to people, while 70 per cent of new emerging infectious diseases come from wild animals. Places where numerous species mix in close quarters with humans, with few biosecurity measures in place, are high risk.

Just this week, the WHO issued new guidance urging countries to crack down on wet markets and suspend the sale of captured live wild animals as an "emergency measure" to protect public health.

"In my mind, the wildlife trade is the most likely source of it. The role of that market is still uncertain, but there was clearly a lot of transmission and to me it smells like there's a strong link – we need to follow it through," Dr Holmes said.

"My concern is that the finger pointing has got so bad, will that happen? I think China just doesn't want it to be China… so then the question is, are we actually going to see all the data? I honestly don't know. But the more the politics gets into it, the less likely we will."

Subject: Fauci defending the funding of EcoHealth's grant with WIV in the Right wing press

Good to see Tony speaking up and defending NIAID's decision to fund this work (article attached as pdf). He's right – it was very highly scored.

My only question is…why not reinstate it!!!??? He could always specifically indicate "no chimeric virus work to be funded at WIV" or "only PCR studies" or some such. Just a thought…

Here's a key quote:

"Dr. Fauci attempted to explain the link between U.S. researchers and the Chinese laboratory clearly to Fox viewers and stress there was no 'risky research' involved.

'If you look at the research that was done, it was research that was highly recommended by peer review, our United States peer reviews. It got a very high score in the peer review system,' Fauci began.

'And the purpose of the research was very, very clear. It was to try to determine what was out there in the bat population that might be ultimately risky for us. It was done in the context of trying to find out what the precise environmental bat source was of SARS-CoV-1 so that we could prevent SARS-CoV-2.'

Dr. Fauci praised the 'qualified, highly respected Chinese scientists' that the National Institutes of Health had collaborated with at the Wuhan Institute of Virology and defended the funding of bat coronavirus research in China.

Fauci added: 'So, it was research that was done by qualified people. Right now, when there's all of this thing about China, that's a different situation now back then when you're dealing with qualified, highly respected Chinese scientists. So it isn't what was made out to be about dealing with really, really bad people. Because those scientists were very well-respected in the scientific community internationally.'"

Subject: RE: COVID origins issues and NASEM Forum on Microbial Threats

No relevant information I have heard of. It wouldn't surprise me as I know that Victor Dzau wants NAM to be engaged in these issues. I will ask my colleague Nicki Lurie if she is aware of any such initiative. She is on vacation in Europe now and may not be as rapidly responsive as she usually is.

Regarding the Academies, Victor is not only ambitious but also cautious and doesn't stick his head out very far. Marcia McNutt (NAS President) has been supportive of a rational science based inquiry into the origins and the separation of politics from science, sort of, but not very bold. John Anderson (NAE President) is the least engaged.

Jerry

Subject: COVID origins issues and NASEM Forum on Microbial Threats

Here's a request for any inside info you may have picked up.

MORENS_SUBPOENA_021154
MORENS_NIH_042001
REL0000482322

I'm the chair of the NASEM Forum on Microbial Threats. Jerry used to be a member or Co-Chair and (ironically) David Relman was the Chair before me. The Forum is planning a workshop on COVID-19 for early Fall. I'm not on the organizing committee but heard they were planning a section on 'origins', then were told from the top (I believe Victor Dzau of NAM) that because there is no new research on this, it's not something that would be good for the workshop to publicly consider right now. They've dropped that session. I actually agree with this decision, but it certainly adds to the feeling that the NAM is being very hesitant on this issue.

Then I got an email from staff asking if I'd like to avoid giving my usual opening comments for the workshop as chair, given the nasty publicity I've been getting. I pushed back (strongly) and pointed out that a key goal of the conspiracy theorists is to attack, discredit and silence scientists who's opinions don't support their political agenda. Staff were very nice and somewhat apologetic about this and I'm now giving my usual opening.

They also mentioned that the academies (maybe NAM, but could be NASEM) are planning something on origins – maybe a consensus study, workshop or just a statement. I don't have more info, but the reason I'm concerned is that 1) David Relman is a member of the NASEM Intelligence Community Studies Board (science-intel agency interface) and he may be trying to use that to 'investigate' the lab leak agenda; or 2) there may be an effort for an NASEM committee to investigate COVID-19 origins. I note that in my last letter from the NIH office of the director, they requested an inspection of the Wuhan lab either by NIH scientists or through the NASEM.

The way the NAM and NASEM operate is that USG agencies go to them, or they approach agencies with an idea for a consensus study or workshop and then they're funded to do one. It sounds likely that this is happening, and would likely end up as a forum for all the lab leak accusations and gain-of-function myths to be brought up by known scientists (e.g. Drs. Relman, Lipsitch, Ebright and others). This could end up putting me in the awful situation of either having to publicly defend EcoHealth's work and get attacked in the press for this, or decline to take part in a National Academy activity despite being a member. Not looking forward to that moment!

Have any of you heard anything about this?

Cheers,

Peter

Subject: Harold Varmus has been spotted in CT!

One of my Board members, Amy Attas, who's a veterinarian to the pets of people like Mike Bloomberg's wife, Elton John etc. goes to a monthly lunchtime talk series near her summer home in CT (I think). Harold Varmus spoke there a couple of Sunday's ago. Amy asked the first question along the lines "I'm on the Board of an organization working to prevent pandemics..what are the best strategies to prevent the next COVID?" His response: "Is that EcoHealth Alliance?" "If so, what they're doing is exactly what should be done..." He then rolled off a series of key goals to prevent pandemics.

Amy was delighted, and a number of other donors expressed an interest. Please pass on my regards and gratitude to Harold – this is exactly the sort of word of mouth endorsement we need right now, rather than the other sort we're getting from Fox News!

Cheers,

Peter

EXTERNAL SENDER

I totally agree with you that Tony was remarkable. I sent him a one word email, Bravo, and copied it to Patty Conrad so maybe he will see it as evidence of the support he has from the responsible scientific community.

Thanks for the response regarding the CNN reporters. I'll keep that in mind when I do talk to them and consider whether speaking with you might help them distinguish between good science and crap. I have no doubts about your expertise in science and knowing the difference between, well, good science and crap.

Harold is rather quiet – any sense of what he is up to?

Jerry:

Tony was excellent in confronting Paul! It's high time that these senators are told the truth directly.

As for speaking with the reporters, in general I am always prepared to do that, but in this particular case I don't feel my credentials are necessarily the best when dealing with specifics. I have very much been an

onlooker and not directly connected to any of the research itself. Peter Hotez and Peter D. are clearly much better informed and have the appropriate expertise. There are plenty of authors on the recent Lancet piece that would be good to include. I am happy to speak as an outsider, but would not want to be considered a knowledgeable expert.

EXTERNAL SENDER

I had a long talk with two CNN International reporters who are preparing a story essentially on the politics and the misinformation about the origins controversy. I was talking to them off the record but I decided they were legitimately exploring the issues and would likely be a voice of reason if they were given the necessary space to build their case and it was eventually shown.

I mentioned Peter Hotez to them, among some others, and while I mentioned Peter D as well I also said you were under constant attack and it might well be better to allow others to take up the fight on your behalf. GOF and the Goffers were part of the chat. I have agreed to be interviewed on the record and potentially to do a video session as they were potentially interested in using some of that as part of the report. Rich, I didn't specifically mention your name, but if you would be willing to speak with them I can do that when I next connect.

Subject: Tony Fauci's testimony today
Importance: High

I'm delighted to see Tony Fauci fighting to let everyone understand clear line between what is gain-of-function (work EcoHealth does NOT do), and what is not Gain of function (work EcoHealth did do with

Wuhan).

It's a shame it will generate publicity, but he did this so well today that I'm hoping it might help get rid of the willful misinformation the Republicans are engaging in…

Here's a news piece on it https://thehill.com/policy/healthcare/563874- fauci-paul-doesnt-know-what-hes-talking-about-and-i-want-to-say-that , and there's some pretty exciting video to watch. https://www.youtube.com/watch?v=pFoaBV_cTek

Well done David on your briefing and practice runs!

David – please pass this information on to Tony and Clifford if you possibly can,

The WHO DG, Dr. Tedros set up a 6am Monday morning meeting with the current WHO Origins team – the international experts who went to Wuhan to work with our China counterparts on COVID origins. He announced they'd be disbanding the team, setting up a separate structure and moving to a system whereby a new team will be formed to do Phase 2 of the work in China. The stated goal is to follow member state's wishes and improve transparency in the way the origins team is selected. Sadly it will reduce transparency because there will now be a 'behind closed doors' decision from the member states on who of the nominees are put forward to WHO, then another 'behind closed doors' decision from WHO on who is selected, with, we've been told, the DG of WHO having final say.

From my point of view it's a real problem because given the political pressure from the Right wing, it might prevent my future involvement in this work. This means my 17 years + of collaboration

MORENS_SUBPOENA_021160
MORENS_NIH_042007
REL0000482322

with the very people in China who we need to work with, will not be part of Phase 2 work – including designing the animal testing protocols that are my key expertise. Disbanding the current team will also significantly delay the work and this threatens to undermine our capacity to do the trace-back, as antibodies wane among wildlife farmers in rural China who we've proposed should be interviewed and tested in Phase 2, for example. The current team has a good working relationship with the China side and has made significant progress over the last few months, meeting weekly as an international expert group and working with our Chinese counterparts to update the WHO report, include new data and get phase 2 Terms of Reference thrashed out. We'd reached the beginnings of consensus on this.

It will also be seen as an implicitly political move on behalf of WHO, and one that projects a perception of undermining the hard work we did to produce buckets of new data in the WHO report. The rest of the team are very angry about the way we've been repeatedly undermined by politics, and we're working on a communications strategy right now.

David, I'm not sure who is the US representative for WHO Covid origins negotiations. It was publicly announced that Tony would represent the US at WHO, but it may be a State Dept or other HHS person. I think it's important that Tony and perhaps Clifford know what's happening.

Cheers,

Peter

Subject: Details of BSL-2/3/4 levels for viral cultures
From: Peter Daszak (b) (6)
To: Morens, David (NIH/NIAID) [E] b6 Keusch, Jerry b6 Rich Roberts b6
CC: Aleksei Chmura b6 >; Robert Kessler b6
Attachments: image001.gif; image002.jpg; Lab BSLs for pathogenic viruses.docx

Please have a look at the attached, ready for people asking you about comments from Ian Lipkin, Ralph Baric and others re China using BSL-2 level to culture bat-CoVs. This is now being used to suggest a lab-origin for SARS-CoV-2 is more valid. I list 7 reasons why this argument is flawed, and we cite a bunch of examples of viruses known to be lethal to people that are cultured at BSL-2 in the USA.

Hope all this helps, and thank you for your support and advice.

Each of these new conspiracy angles takes us multiple phone calls, a few hours of digging, and a not insignificant amount of emotional angst before we realize (as usual) that these are little more than hype, rhetoric and misinformation.

Cheers,

Peter

Didn't see that one. Vincent's right that EcoHealth was not part of any gain-of-function work. He's wrong that the work between Ralph and Zhengli was actually 'gain of function'. The chimeric virus (bat spike, SARS-CoV backbone) actually lost some replication capacity – more like 'loss of function'.

The interview video clip is one I recorded in Singapore in December 2019 at a Nipah meeting. I didn't use the phrase gain of function, and wasn't referring to work we did, as Vincent says. Quite ridiculous, but easy to fool the public with this…

Virologist: NIAID grantee funded Wuhan coronavirus studies used in gain-of-function research

In a tense exchange Tuesday with Sen. Rand Paul, longtime NIAID Director Anthony Fauci categorically and repeatedly denied his institute has funded gain-of-function research.

By Daniel Payne

Updated: May 15, 2021 - 11:44am

A prominent Columbia University virologist claims that in the years leading up to the COVID-19 pandemic a U.S. nonprofit funded coronavirus experiments in Wuhan, China the results of which were used in "gain-of-function" virology research at the University of North Carolina.

Dr. Vincent Racaniello made the claim amid ongoing controversy over a recently resurfaced interview between himself and Peter Daszak, the president of the U.S. infectious disease nonprofit EcoHealth Alliance.

Both EcoHealth Alliance and the scientist leading the research at UNC have been heavily funded over the years by the National Institute of Allergy and Infectious Diseases, which has been directed since 1984 by Dr. Anthony Fauci, the public face of the federal response to the COVID-19 pandemic under Presidents Trump and Biden.

Fauci categorically and repeatedly denied that NIAID has funded gain-of-function research in a tense exchange Tuesday with Sen. Rand Paul (R-Ky.) at a Senate hearing.

Racianello's half-hour interview with Daszak took place in early December 2019 at the Nipah Virus International Conference in Singapore. Significant attention has been given to a segment in which Daszak appears to allude to having participated in "gain-of-function" experiments, a type of procedure in which scientists increase a virus's pathogenicity and/or transmissibility in order to study its potential for human infection.

"You can manipulate [coronaviruses] in the lab pretty easily," Daszak says in the interview. "Spike protein drives a lot of what happens with the coronavirus, zoonotic risk. So you can get the sequence, you can build the protein — and we work with Ralph Baric at UNC to do this — insert into the backbone of another virus, and do, do some work in the lab."

Those remarks, when they resurfaced this week, caused considerable controversy due to Daszak's role in funneling hundreds of thousands of dollars through his EcoHealth Alliance to the Wuhan Institute of Virology to bankroll coronavirus experiments there. The Wuhan lab sits just a few miles from where the first detected outbreak of COVID-19 occurred.

Speculation has swirled over the last year as to what role, if any, the Wuhan lab may have played in the origin of the pandemic, including whether it was engaging in any gain-of-function experiments that may have posed a pandemic risk.

Experiments 'confer a new property to the original virus'

Racaniello said that Daszak in the December 2019 interview was indeed describing gain-of-function experiments.

"Here is the idea," he said in an email exchange this week. "You go into caves in China and sample bats for CoVs. You collect bat

MORENS_SUBPOENA_012643
MORENS_NIH_024031
REL0000482420

guano and sequence it to find the viruses. You don't actually have the viruses, just their genome sequences. You want to know if these viruses have the ability to infect human cells."

"Since you don't have the viruses," he continued, "you just take the spike sequence from all these viruses and put it into a coronavirus that you work with in the lab. Then you see if that recombinant coronavirus can infect human cells. It's all done under containment to prevent any release. If the spikes of the bat CoV can allow the CoV to infect human cells, then they have the potential to infect humans and we should be making antivirals against them to prevent a pandemic."

Those kinds of experiments, Racaniello said, "are considered 'gain of function' because they would confer a new property to the original virus."

That research, Racaniello said, "was done in the laboratory of Dr. Ralph Baric in [the University of] North Carolina and was not funded by EcoHealth Alliance." When pressed, Racaniello revealed that EcoHealth did have an indirect role in the funding of Baric's work.

"EcoHealth Alliance provided funds to Zengli Shi at the Wuhan Institute of Virology to conduct bat surveillance for SARS-like CoVs," he said. "Baric then received the spike sequences from Wuhan to do his experiments independently."

"Daszak and Baric did not work together on this project," he added.

Anna Marie Skalka, a professor emerita at the Fox Chase Cancer Center and one of the authors of the bestselling textbook "Principles of Virology," did not expressly deny that Baric's research constituted gain-of-function, though she claimed that the overall issue was more complex than that.

"I prefer to describe the research in broader terms, as gain-of-function seems too narrow and has acquired negative connotations," she said. "The aim of such research is to learn as much as possible about the gene/protein in question so that one can begin to develop possible therapeutic or vaccine-related approaches."

Queries to Daszak and Baric on Racaniello's claims went unanswered.

The assertions from Racaniello — a four-decade veteran of academic virology who along with Skalka is also an author of "Principles of Virology" — constitute the sharpest allegations yet that both EcoHealth and the Wuhan Institute of Virology were involved, even if adjacently, with gain-of-function research prior to the pandemic.

Baric's research, meanwhile, has been the recipient of millions of dollars in funding from the NIAID over the years, much of it focused on coronaviruses, including experiments in the "replication and pathogenesis" of those viruses.

Racaniello himself forcefully defended such research. "There is a very clear reason to do these experiments and if we had done them even more we could have prevented the current pandemic," he said.

EcoHealth, meanwhile, has been the focus of controversy for the past year due not merely to its alleged association with coronavirus experiments but also to the fact that its work was for years heavily funded by the federal government, specifically the National Institute of Allergy and Infectious Diseases.

EcoHealth routed hundreds of thousands of NIAID dollars to the Wuhan lab in the years leading up to the pandemic to conduct coronavirus research there. Experts and commentators alike have called for a major investigation into the lab to determine if SARS-Cov-2 may have accidentally leaked from the facility and launched the pandemic.

The federal funding for the Wuhan project was pulled last year near the outset of the pandemic. Daszak himself told NPR last year that the Wuhan experiments were "funded entirely through the NIH grant," as the news service put it.

The lab was the subject of part of the World Health Organization's investigation into the origins of COVID-19. That probe concluded earlier this year and determined that a lab-leak theory was unlikely, though world officials have called for additional investigations into the facility.

The international team of investigators reportedly only spent a single day at the Wuhan lab. Among the team's members — and the only U.S. representative on it — was Peter Daszak.

Yes, do it! This is important and i say modestly, game changing. The whole « origin » controversy needs to be rethought from the ground up

We have been too micro-focusing (as i have long said to hard push back) but the sarobecovirus and merbecovirus problems are geographically and virologically complex and require us to drop back and study the viral-host universe. Thst universe is huge, complicated , and holds surprises, in my view. d

nPeter, as i am perennially swamped with work that has nothing to do with COVID issues of importance, i am always catching up on reading the important stuff

Just now i poured a martini and-read word for word your “A strategy…” paper with first author Sánchez. Also Kevin and Lin-fa were coauthors. Wow!!!

This is dynamite and also beautifully written. I mean, Hemingway, Conrad, Nin, couldn't have written it better. Beautiful job and so important.

I think you need to promote this work, and emphasize that the conclusions are far reaching and a sort of call to arms.

Let us all keep pushing,
and keep our eyes on the
prize of getting to the bottom of it all

Another approach, I have contacted my Congresswoman and my two Senators imploring them to intervene with the Democratic members of the Select Subcommittee about the dangerous and consequential actions being taken against Peter, David and Tony. I have raised it to the level of an existential challenge to the survival of science, and a persecution without justification of the three of you. I don't know if it will resonate with them, but I will let you know if I hear anything back.

I have also provided Jocelyn Kaiser with material to write further about the SSCP actions and important ambiguities and misinformation in Tabak's testimony. Her response back to me was "Got it ". I don't know what that means other than she is pondering the issues.

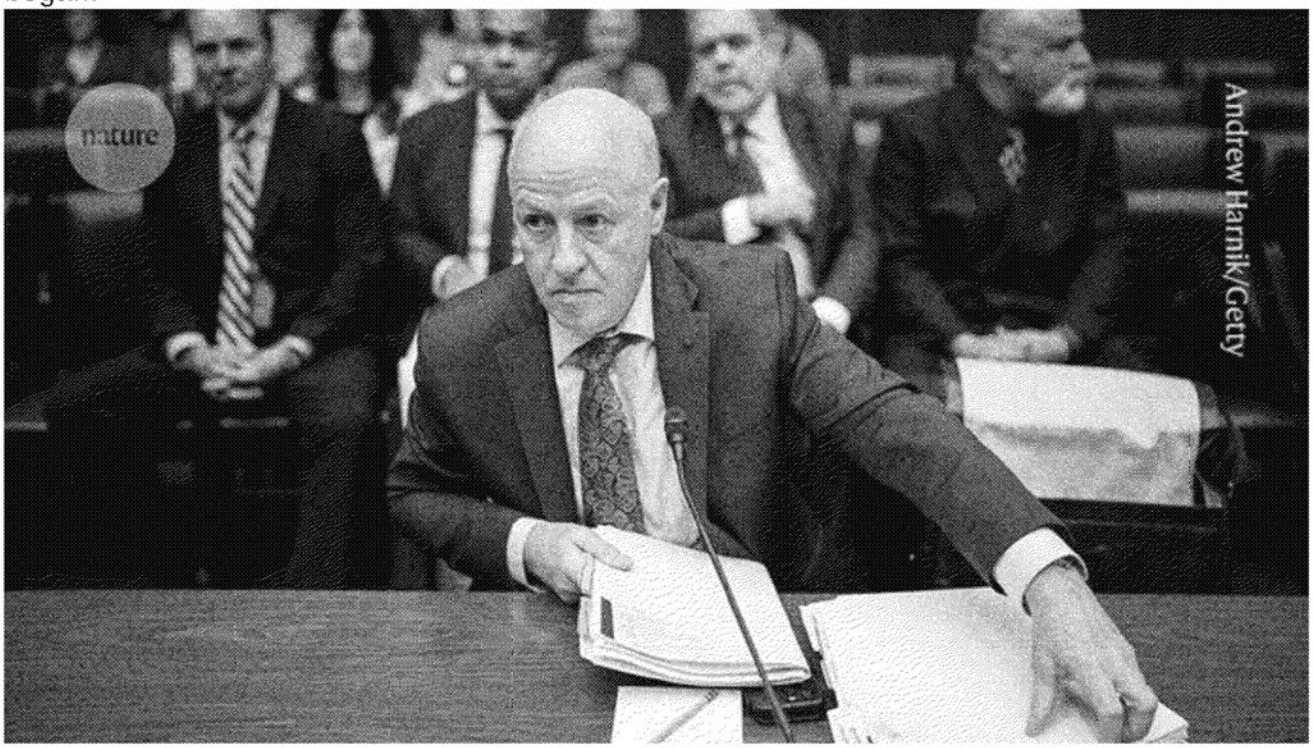
Subject: Disappointing tweet from Amy Maxmen re. a disappointing article in Nature.

CAUTION: This email is not from a BCM Source. Only click links or open attachments you know are safe.**

Shame to see Amy Maxmen following the trend of the article in Nature that seems to just parrot what the Democrats on the SSCP said - EcoHealth did something wrong, but they didn't cause COVID-19.



Of course, we were not given a chance to respond to allegations on the day, and now that they've moved forward with a Suspension pending debarment proceedings, we have to respond to the HHS first on a legal matter, then can talk publicly.

Amy's tweet is below, and my response (trying to be as diplomatic as possible).

Amy Maxmen, PhD
@amymaxmen
5h

EcoHealth Alliance didn't comply with NIH granting conditions, eg not sending regular updates on its research. Without repercussions, those rules are meaningless. https://nature.com/articles/d41586-024-01460-3… The problem is when public/media interprets this to say anything about where Covid began.

US halts funding to controversial virus-hunting group: what researchers think

From nature.com

b6

Peter Daszak
@PeterDaszak

EcoHealth Alliance has repeatedly refuted allegations that it "didn't comply" & has yet to respond to the HHS letter. Calling for "repercussions" seems premature until some level of due process has played out. Let's hear the argument against debarment before we all move on.

Cheers,

Peter

Hi Peter,

Thank you for your response. I recognize and greatly appreciate your extensive service to the National Academies over many years.

I still would appreciate an opportunity to talk with you. I will be on travel overseas next week. Perhaps we can find a time for a brief phone or zoom meeting the week of June 17?

My executive assistant Tasha Wood will follow up with your colleagues to find a convenient time for us to talk.
Best,

Greg

Dear Dr. Symmes,

Thank you for your email of May 31st and for the reminder of our meeting as part of the Committee to Advise the USGCRP, which I trust is doing well. My understanding is that the HHS letters to EcoHealth Alliance and myself are the initial step in a process during which we will have an opportunity to refute allegations, present evidence that our organization is a good steward of federal funding, and that debarment is not appropriate in this case. EcoHealth Alliance intends to contest debarment vigorously on behalf of the organization and myself. We have already amassed substantial evidence to refute the baseless allegations against us, and to show clearly that EcoHealth Alliance has 'present responsibility' to manage federal awards. There has been a rush to judgment by the House Select Subcommittee on the Coronavirus Pandemic and HHS, with a conspicuous lack of due process.

As you know, I have served the NASEM on numerous committees and in other roles over the past two decades, working hard on behalf of the Academies, both before and after becoming a member of the NAM. These duties were already disrupted when I was asked to suspend activities while being investigated for around 12 months, following a spurious politically-motivated letter from politicians bent on undermining science. I was completely exonerated by the NAM investigation and rapidly picked up my activities. There is nothing about the HHS process that should or does affect my ability to perform my duties to the NASEM to their fullest capacity. I therefore intend to continue with my duties until due process has been given an opportunity to play out.

Dear Dr. Daszak,

My name is Greg Symmes and I'm the Chief Program Officer of the National Academies of Sciences, Engineering, and Medicine. You may remember meeting me years ago during your service on the Committee to Advise the US Global Change Research Program, when I was executive director of the Academies' Division on Earth and Life Studies.

I'm reaching out to schedule a zoom call with you to discuss potential impact of the recent HHS decision on your service to the National Academies.

My executive assistant Tasha Wood will be in touch with your office to arrange a time for us to meet. Please let me know if there is someone in your office Tasha should work with to help with your schedule.

I look forward to meeting with you.

Best,
Greg Symmes

EXTERNAL SENDER

I love that idea Rich.

Truth is, our lawyers told us early on that the actions NIH took are likely illegal. They've looked at all prior cases of NIH terminated grants, suspending grants and appeals against them. There are precedents for winning these cases, e.g. Planned Parenthood and others. The only catch is that suing NIH would mean litigation that drags on for a few years, discovery actions that would demand all sorts of private correspondence, and ultimately a jury that might by now be contaminated with the lab leak narrative. They advised us that the best option is to push privately for the grant to be renegotiated, which I suppose is where we are now.

All of this is of course exacerbated by the other actions and attacks that add to a general narrative that EcoHealth must have been up to no good – this includes the NAM investigation that we're still waiting to hear about, and the OIG audit. There's also a lawsuit against us that we've tried not to talk publicly about, but it's real and we have to defend against it. A lawyer in Long Island who's sued EHA, myself and even my wife for a huge sum for causing COVID-19 that then infected him etc.

Cheers,

Peter

EXTERNAL SENDER

Thanks Rich - I've got to look at the positives in all of this and just carry on fighting, if only for my own health reasons. It's been a really horrible couple of years and I've found that the constant harassment can really get you down – it's been shocking to me how much of struggle this is with many days spent despairing over my own personal future and the future of EcoHealth. It's been tough on my family as well, and the other staff at EHA.

I'm determined not to give up though and will be going through all the options carefully. The other glimmer of hope is that any 'renegotiation' will be with NIAID staff, so I'll reach out to them ASAP. I think that if most of the funding is planned for the US, with just one subcontract to China, for a group that works on epidemiology, that might work. The other strategy would be to see if a shift to another country would work. I'm mindful that NIH (Lauer et al.) would be delighted if we just handed in the towel, and will probably be looking for excuses to consider our alternative plans out of scope.

On this issue of who is 'the pits' and who isn't at NIH, I think the list begins with Francis Collins, who committed the original sin of terminating our grant when he could have simply resisted. Second is his lackey Lauer who took it to another level of bumbling errors, illegal actions, and aggressive brinksmanship, but there are others also. Lawrence Tabak (now acting Director NIH) publicly stated that we were out of compliance and really threw us under the bus, and there are a group of legal advisors and Congressional staffers at the Office of the Director who have actively worked to publicly undermine us, sometimes with clear glee and delight.

For example, in one of the FoIA'd emails that Peter Aldhous at Buzzfeed unearthed, he spotted Michael Lauer sending details of our animal experiment oversight, which they then used to tighten the screw on us very publicly and unfairly. Lauer used the subject Header "A Gift" when he sent this to his legal and Congressional relations colleagues at NIH. That sort of gloating is pretty disgusting, and won't be forgotten by me. Peter Aldhous also dug up clear evidence that NIH requested an OIG audit as part of their efforts to tighten the screws on us, and get them off the hook. We're just negotiating the final results of that audit – a huge timesink that's been going on over a year now, has looked at grants to EHA over the last 8 years, and has only found $77,000 of mis-coded financial errors (including a $19 overpayment to a contractor, with $7 indirect costs; and a single $5 alcoholic beverage at a hotel mistakenly coded to our grant). Great use of taxpayer money and time and the total of these mis-coded finances is less than 1% of the grants they reviewed, and less than 0.01% of our budget over that period. Of course, when the report goes public in a few weeks, it'll be used by Republicans to demand we're de-funded and closed down (again).

Ironically, in the emails (below), Michael Lauer cc's Michelle Bulls, who's listed in his correspondence yesterday as the person we have to write to if we want to appeal their decision. Pretty sure she's not an objective overseer at this point.

Here's the article: https://www.buzzfeednews.com/article/peteraldhous/white- coat-waste-anthony-fauci-nih-ecohealth-alliance-lab

And here's the section (and you can click on the links to see the FoIA'd emails):

A heavily redacted series of emails from May 2021 centers on the July 2016 letter from the NIAID that had given EcoHealth permission to resume the chimera work. Accepting a suggestion made by Daszak himself, it stated that if any of the chimeric viruses showed unexpectedly rapid growth, he would "immediately stop all experiments with these viruses" and provide NIAID officials with information about the unexpected outcomes. Shortly after receiving the letter, Lauer sent it on to a senior attorney with the Department of Health and Human Services, assigned to the NIH, changing the subject line on the email thread to "Gift."

Daszak's problem was that the NIH determined that an experiment described in annual progress reports for the grant indicated that one of these viruses had made mice engineered to carry the human receptor targeted by SARS-like viruses sicker than expected and showed signs of rapid growth. "EcoHealth failed to report this finding right away," NIH deputy director Tabak later wrote in an October 2021 letter to James Comer, the ranking Republican member on the House of Representatives Committee on Oversight and Reform.

None of this amounts to a smoking gun linking EcoHealth and the Wuhan institute to the origins of COVID, as the viruses involved were very different to SARS-CoV-2. And in a letter to Lauer and Tabak after the latter's communication with Comer, Daszak contested the conclusion that the experiment did show rapid viral growth and argued that EcoHealth had complied with its reporting requirements.

But it gave Lauer evidence that he was looking for. EcoHealth is now under audit from the Office of Inspector General for the Department of Health and Human Services, an independent watchdog that monitors fraud, waste, and other problems, as part of a review of the NIH and "selected grantees" initiated on June 11, 2021. Documents received by BuzzFeed News through its FOIA lawsuit, including a timeline of events put together by Lauer dated June 13, 2021, indicate that the suggestion for an OIG audit of EcoHealth came from the NIH, just days after Lauer sent his "Gift" email.

The NIH declined to discuss Lauer's email and timeline, saying in a statement: "NIH doesn't comment on internal deliberation of grant awards."

Cheers,

Peter

EXTERNAL SENDER

I found a copy on Twitter of Lauer's letter to Rep Comer yesterday – word doc attached, recreated using screenshot jpegs, so hope it works.

It's good that they're publicly stating we've cooperated with NIH – this is related to their continued series of letters about our other grants – making us jump through all sorts of hoops just to continue our work. At the same time, they're clearly trying to show the aggressive Republicans in Congress that NIH is going to crack down on miscreants such as us. Apparently, for at least the next 3 years we'll have to double up our reporting requirements, have no automatic carry over of unspent funds, and have to conduct 6 monthly onsite assessments of subcontractees. We've not been told all that yet by NIH, but no doubt there'll be another letter from Lauer on its way soon.

Cheers,

Peter

Here's the latest from NIH – as usual we received a Friday afternoon pdf letter from Michael Lauer that's full of legalistic language (attached). And as also 'usual', Lauer only sent this the same day he informed Republicans on an oversight committee, and either him or the Republicans then instantly made it public. There's already an article in the Washington Examiner about it (below)

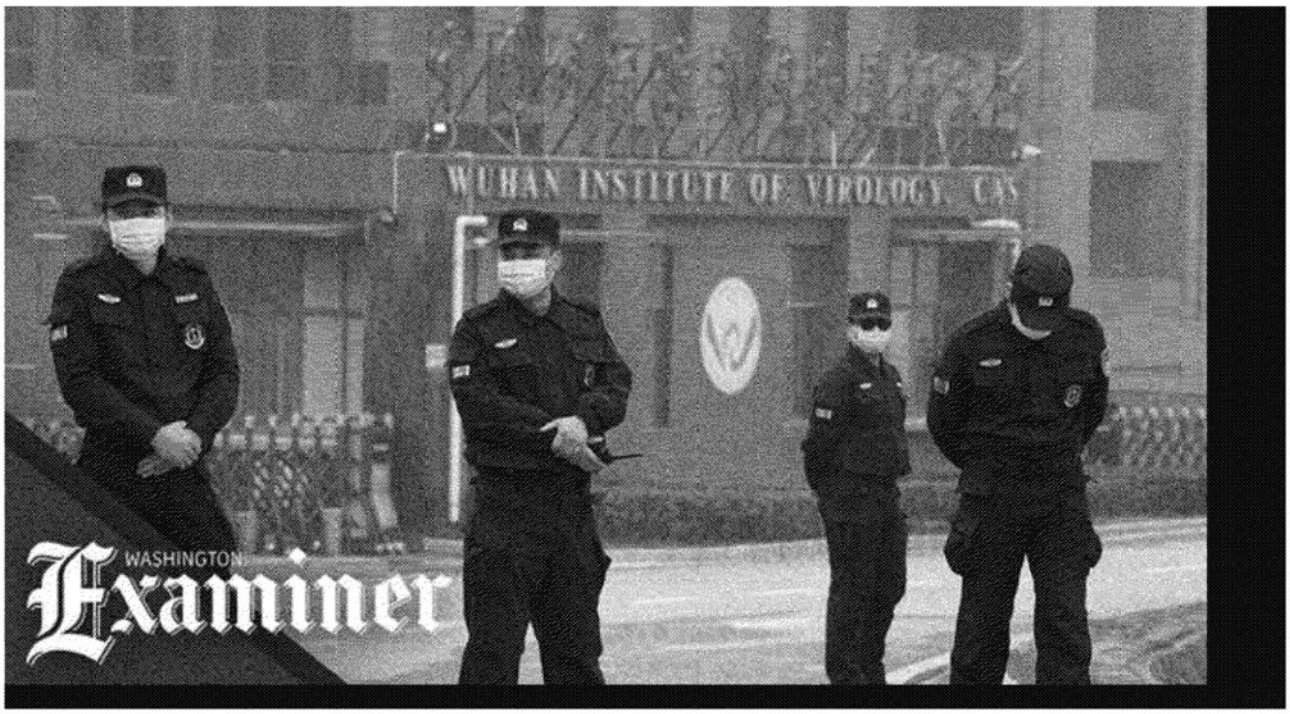
They're basically terminating our subcontract to WIV because we were unable to get the lab notebooks they demanded (no surprise there, given the politics). They're also offering us the chance to renegotiate the grant. Sounds great, but by now of course the chances of any institution in China wanting to work with an organization targeted in this way are pretty slim. There's also the buried proviso that we have to arrange for 6-monthly inspections of our subcontractee's labs.

If we don't want to renegotiate, we have to bilaterally terminate.

After 2 and a half years of pressure from NIH, we're now back to where we were in April of 2020, when NIH informed us to suspend all work with WIV, but that we could carry on with the grant. This was then followed a few days later with full termination, then suspension with conditions, then more conditions, now this. Pretty depressing, awful, and utterly unnecessary.

Not sure what we'll do, but my gut feeling is we should continue and try to find a way forwards with other groups in China. It'll be a hard path, considering WIV are the premier bat virus group in China and our preferred partners, and the politics has made all of this completely toxic. But it's the honorable path, as a scientist, and I think we should at least try.

Here's the Washington Examiner article: https://www.washingtonexaminer.com/policy/healthcare/nih-ends-subaward-wuhan-lab-stonewalling



WUHAN LAB

NIH ends subaward to Wuhan lab after continued stonewalling

by Jerry Dunleavy, Justice Department Reporter |

August 19, 2022 08:21 PM

Ad ends in 9s

The National Institutes of Health announced it was finally cutting off a subaward to the Wuhan Institute of Virology after it continued to refuse to hand over key information about the coronavirus research it conducted with U.S. tax dollars.

NIH Deputy Director Michael Lauer made the revelation in a letter Friday to House Oversight Committee Republicans, in which he said the Wuhan lab had refused to turn over lab notebooks and electronic files connected to its research funded through an NIH subaward given to it by the U.S.-based EcoHealth Alliance.

But Lauer indicated the NIH may continue funding EcoHealth's controversial bat coronavirus research despite the group's documented noncompliance issues, its close links to the Wuhan virology institute, and its history of funneling hundreds of thousands of U.S. tax dollars to the Chinese lab.

"NIH … identified one non-compliance under the ... award that cannot be remedied with specific award conditions," Lauer said Friday. "NIH has requested on two occasions that EHA [EcoHealth Alliance] provide NIH the laboratory notebooks and original electronic files from the research conducted at the WIV [Wuhan Institute of Virology]. To date, WIV has not provided these records."

Lauer added: "Today, NIH informed EHA that since WIV is unable to fulfill its duties for the subaward

MORENS_SUBPOENA_004249
MORENS_NIH_011229
REL0000482477

grant under R01AI110964, the WIV subaward is terminated for failure to meet award terms and conditions requiring provision of records to NIH upon request."

FBI INVESTIGATED NIH AWARD TO ECOHEALTH AND WUHAN LAB

The Office of the Director of National Intelligence released an assessment in 2021 stating that one U.S. intelligence agency assessed with "moderate confidence" that COVID-19 most likely emerged from the Chinese government lab in Wuhan, while four U.S. spy agencies and the National Intelligence Council believe with "low confidence" COVID-19 most likely has a natural origin.

The NIH's Lauer also said Friday that the National Institute of Allergy and Infectious Diseases, which has been led by Dr. Anthony Fauci for decades, "will begin to engage with EHA to renegotiate the specific aims and objectives of the R01 grant without the involvement of WIV … in light of the cooperation from EHA and the substantial subsequent improvements in administrative processes that EHA demonstrated."

Rep. James Comer (R-KY), the ranking member on House Oversight, hammered the NIH over this.

"Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum," Comer said Friday. "It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract. EcoHealth conducted gain of function research on bat coronaviruses in Wuhan, knew about the Chinese Communist Party's coverup, and failed to inform the U.S. government."

Comer added: "EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money."

The NIH had awarded EcoHealth with a grant dubbed "R01AI110964" years ago, and EcoHealth then doled out three research subawards, including one to the Wuhan lab.

"The research approved under this grant sought to understand how bat coronaviruses evolve naturally in the environment to become more transmissible to the human population," the NIH said Friday in defending t

CC: Aleksei Chmura [b6]>; Jeff Sturchio [b6]

Thanks for the note David – it will be worth going through all of the emails that they raised in their report and in the hearing as examples of alleged illegal behavior. They have been taken out of context, and it's quite likely that, as in this case, once the email chain is viewed, it will be clear that there is no illegal or immoral action.

From watching the first half of the hearing, you came across as a person who was embarrassed by using 'dark humor' and 'snarky language' in private emails to colleagues but never expected them to be shown publicly. At the same time you came across as someone who had a different interpretation of the meaning of NIH business, that is likely defensible given the unusual job description you have as advisor to NIAID Director.

The key issue is that as Sr. Advisor to the NIAID Director, you had no employment-related business in overseeing any of my grants, and by the time the grant was terminated on April 2020, all decisions on reinstatement were directed by NIH O/D, and outside of even Dr. Fauci's control. It is therefore illogical to presume that any discussions you may (or in this case may not) have had with me about ideas on how to reinstate a grant being controlled by NIH O/D were part of your job.

I'll be in the office today with Staff meetings and Board meetings and we'll all be thinking of you.

Cheers,

Peter

Peter. thanks for looking into this, as it was one of the most indefensible charges against me, and when told I had helped you write this letter I told them I don't remember doing so and if I did it i was wrong, as you saw if you watched the show yesterday.

Uncovering this item won't have any impact on clearing my name, but as I am really depressed this morning, it cheers me up a bit. Thank you for being a true friend and for taking the time to cheer me up in the midst of your far worse troubles

MORENS_NIH_044734
REL0000482503

Whatever mistakes I made, and however poor my judgment and understanding of nih do's and don'ts, I was trying to do the right thing to help you. One of the reasons i made what turned to be a very bad choice to not take the 5th, was so that i could push back against accusations based on incorrect interpretations. i am sure there are many other items like this. I know you know that on many occasions I explained to you all of the many things I couldn't do to help you directly, and also the things that I could do. But I will never get a chance to correct or explain them.

My worst mistake was writing jokey emails that will be used against Tony. I wish there was something I could do to help him at this point, but there isn't. Hopefully the harm to him will be minimal. My foolishness has harmed at least two people I consider innocent, which is actually worse than losing my job and facing prosecution.

But once I become retired, I will be able to do whatever I can to help friends such as you and to defend and speak up for science. And, being a historian myself, I fully expect we all will eventually be substantially if not completely vindicated

In the meantime, Hang in there and look for light at the end of the tunnel. Also, please give my best to rhe many fine and honorable people who work with you at EHA, and particularly Billy, Jon, and Kevin

> Today in David Morens' hearing, the SSCP asked questions about an email wherein David allegedly assisted me with the reinstatement of my R01. They refer to an email on Oct 24th 2021 in their report here: https://oversight.house.gov/release/new- covid-select-memo-details-allegations-of-wrongdoing-and-illegal-activity-by-dr-faucis-senior-scientific-advisor/
>
> It didn't sound correct to me, so I went through my email records and have located a chain that I began on 10/24/2021, that was me drafting a response to Michael Lauer's questions about the late year 5 report for the grant. This was NOT related to reinstating the grant – at that point, the grant was suspended and we were getting repeated questions about it, and there was not the slightest hint that it would be reinstated.
>
> As you'll see by looking at the 1st email attached above – I send an email to both of you asking for advice on how to word the response to Michael Lauer, because you both are knowledgeable on issues of virology and both have experience with the type of bureaucratic questions I was being asked by NIH Office of the Director. I didn't consider this a conflict for David, because he's not part of the official decision making on this grant – by that time all decisions since 2020 had been overseen by O/D NOT NIAID, and I was under clear instructions to communicate with NIH O/D. I don't think that even Dr. Fauci had any capacity to decide on this.
>
> Despite what's said in the SSCP report, and in David's hearing, I remembered, and it's shown in the email chains above, that David said he would suggest some 'wordsmithing', but in fact DID NOT. The emails clearly show that you spoke with others at NIAID, and that they suggested you should not be involved in this, and in fact you did not edit the letter, or even suggest edits. It's all there in the emails above.
>
> I don't know what value this has now, considering that the public hearing has been and gone, but I felt it was important to share these, in case any of us are asked about them – from what I see, you checked with your superiors and then diplomatically cut yourself out of the editing chain.

EXTERNAL SENDER

More attempts to discredit me from the Republicans.

Just forwarding this to Rich and Peter. The Republicans in the House Foreign Affairs Committee have released a 'Covid-19 origins report' in advance of the White House intel report. It re-hashes all the usual conspiracies with no new information at all. However, they are now accusing me of following orders from China in 'covering up' COVID's origins and asking for me to be subpoena'd. Today I've been called the 'Public Face of China's Disinformation Campaign' by one right wing press outlet, and I expect this will drive a follow up cycle of abuse and offense from the Murdoch Press. In fact, I've received multiple requests for comment from reporters already including Josh Rogin in the Washington Post, reporters in the Washington Examiner etc.

Here are some articles:

Not pleasant reading but thanks for sharing this link. It's a stream-of-consciousness diatribe that makes you think this guy is simply mentally ill, but actually he's a well-known right wing 'influencer', appearing on Steve Bannon's podcast, member of the Brownstone Institute and regular on other outlets. In the end, just probably a sad lonely person looking for outside validation. Still, pretty disturbing to read…

Cheers,

Peter

EXTERNAL SENDER

Wonderful that you're able to get information up the chain and I'm really relieved and hope that it will be useful and that this won't be weaponized politically.

The quote came out in the Financial Times on Saturday (attached PDF). The relevant quote is here:

'But he [Fauci] also admits that some of the work undertaken at the Wuhan lab using NIH money could have violated safety standards — even if he says responsibility for that lies with EcoHealth Alliance, the non-governmental group that performed the work. "We will have to go back and look at that," he said of accusations that some of the coronavirus work was undertaken at biosafety level two, roughly equivalent to that in a dentist's office. "But that is something that should have been monitored by EcoHealth Alliance." EcoHealth Alliance said: "As with all research organisations, EcoHealth Alliance must follow the local laws of the countries in which we work."'

Of course, for EHA this is very concerning because even though we've followed the appropriate rules, their complexity means that the public may not understand, and when you add comments like the journalists have above: "work…could have violated safety standards", it's just used to cast doubt and try and besmirch our name as usual.

Cheers,

Peter

To: NIAID OD AM <NIAIDODAM@niaid.nih.gov>; Billet, Courtney (NIH/NIAID) [E] <b6>
Routh, Jennifer (NIH/NIAID) [E] <b6>; Stover, Kathy (NIH/NIAID) [E] <b6>
Subject: ASF and all this may come up in interviews

In the recent Bulletin of the Atomic Scientists article, we have this quote

"It is clear that some or all of this work was being performed using a biosafety standard—biosafety level 2, the biosafety level of a standard US dentist's office—that would pose an unacceptably high risk of infection of laboratory staff upon contact with a virus having the transmission properties of SARS-CoV-2…."

My understanding is that human coronaviruses including sarbecoviruses are routinely worked at in BSL-2 around the world as are many other viruses that can cause problems for people. The BSL level designation is decided by each country and is not related to perceived pandemic potential but largely to risk to the BSL workers.

For example, BSL-4 designation generally means deadly virus, infectious by aerosol, no vaccine against it, and no treatment for it. So, although rabies is 100% fatal in humans, it can be prevented by a vaccine and prevented by a post exposure serum, and (probably if not totally) not infectious by aerosol, thus it is BSL-2 even though among the deadliest of human viruses. Working with non-human coronaviruses at BSL-2 is widespread since these viruses are not known to infect humans.

David, Alan and others may have additional thoughts.

It was an awful experience – Republicans repeatedly calling for us to be debarred, Democrats saying 'while ecohealth didn't cause covid, their behavior with Federal grant compliance raises serious questions as to whether they should receive federal funding in the future'.

I did a good job from what I'm hearing overall, on defending our work, and the issues they're coming after us on are of no real consequence (a late NIH report, margin notes in a draft proposal etc.), but used to paint a picture of a deceptive organization. I've spoken with Jeff about why the Dems are seemingly ready to throw us under a bus, and he believes it's partly because the SSCP has come up with nothing and this would be a 'scalp' for them to wave around. Secondly, the politics for the Dems are all about winning in November, so they're happy to defend NIH and point the finger at EcoHealth, even though many of the issues they highlighted were due to NIH bureaucratic sluggishness, rather than any genuine issue with EHA.

We're going to pick apart the democrat and Republican reports finding-by-finding, draft rebuttal statements and probably set up a press conference next week. The next phase will now be fighting to try to make sure we aren't debarred.

Cheers,

Peter

His testimony is full of similar comments. I think he's basically covering his ass, protecting himself from the harassment I've gone through.

It's ugly, and a shame he joined in throwing us under the bus with some of his comments.

Brave, honest, noble people are hard to come by, and often vilified themselves when they stand up against bullying, but all of you already know that!

I pushed back hard today against him saying that the biosafety standards in China were below the US – they weren't and they aren't – it's written into the mandatory rules in China and the BMBL - I tried to read chapter and verse, and I hope it helped in some way…

Cheers,

Peter

Ralph Baric, Whose Virology Techniques Were Used in Wuhan, Testified That Lab Leak Was Possible

The UNC coronavirologist who has collaborated on gain-of-function research with the Wuhan Institute of Virology's Shi Zhengli, told congressional investigators that he has long worried about biosafety protocols inside China. Though he thinks it's far more likely COVID-19 originated in nature, he said of a possible laboratory escape, "You can't rule that out."

Ralph Baric, researcher and lab leader at North Carolina's Gillings School of Global Public Health, sits for a photograph in Chapel Hill, North Carolina, U.S., on Friday, Feb. 14, 2020.ILLUSTRATION BY PAMELA WANG. Photo by Christopher Janaro/Bloomberg/Getty Images.

In 2015, **Ralph S. Baric,** arguably the world's most accomplished coronavirologist, published groundbreaking research with **Shi Zhengli,** the leading coronavirus researcher at the Wuhan Institute of Virology.

They had mixed components of different coronaviruses and created an artificial virus, or chimera, that could infect human cells. The research helped crystallize the threat posed by bat coronaviruses lurking in nature. But the experiments were dangerous too. In 2014, while their research was underway, the Obama administration enacted a pause on so-called gain-of-function research that could increase the virulence or transmissibility of certain viruses. Baric and Shi even flagged the dangers of the research themselves, writing, "Scientific review panels may deem similar studies…too risky to pursue."

The experiments were done in Baric's well-secured laboratory in Chapel Hill, North Carolina.

Afterward, however, Shi's team at the WIV continued to utilize Baric's cutting-edge research techniques. Their work was funded in part with a US research grant.

Baric testified that he had specifically warned Shi Zhengli that the WIV's critical coronavirus research

MORENS_NIH_044686
REL0000478110

was being conducted in labs with insufficient biosafety protections.

Amid competing theories about the origins of SARS-CoV-2, the virus that causes COVID-19—including whether it could have originated in a Wuhan laboratory—Baric has become a figure of intense interest. After all, he had pioneered techniques the WIV was using, including one that allows researchers to invisibly splice components of viruses together without leaving a trace.

For the last three years, as the COVID-19 origins debate has grown increasingly toxic, a small army of global sleuths and Freedom of Information petitioners have taken aim at Baric's emails and research documents, hoping to uncover information about the true genetic-engineering capabilities of the WIV scientists, the ongoing research they were pursuing, and the viral genome sequences they had in their possession prior to the pandemic.

Through it all, Baric has kept mostly silent—until now. On January 22, he gave a six-hour interview to investigators from two Republican-led House committees: the Oversight and Accountability's Select Subcommittee on the Coronavirus Pandemic, and Energy and Commerce's Subcommittee on Oversight and Investigations. Though the committees have not yet made his testimony public, *Vanity Fair* has exclusively reviewed his statements. While not formally under oath, Baric was required by federal law to answer truthfully. (Through a University of North Carolina-Chapel Hill spokesperson, Baric declined to comment for this article.)

While there is little in the 212-page transcript that is likely to markedly shift the debate on how COVID-19 originated, the picture that emerges is of an American scientist who is deeply wary of his Chinese counterparts and has no way of knowing if or how they may have made use of the groundbreaking research techniques he developed.

Perhaps most notably, Baric testified that he had specifically warned Shi Zhengli that the WIV's critical coronavirus research was being conducted in labs with insufficient biosafety protections. When he urged her to move the work to a more secure biosafety level 3 (BSL-3) lab, he testified that she did not heed his recommendation. Because the WIV continued to perform coronavirus research at what he considers an inappropriately low biosafety level, Baric said of a laboratory accident, "You can't rule that out.... You just can't."

"Clearly, the market was a conduit for expansion," Baric testified. "Is that where it started? I don't think so."

In an email turned over to the Select Subcommittee as part of its investigation, Baric told **Peter Daszak,** president of the scientific nonprofit EcoHealth Alliance, that it was "a load of BS" to suggest that the WIV conducted coronavirus research in labs with sufficient biosafety protocols.

Baric told congressional investigators that he believes it's far more likely that SARS-CoV-2 spilled over naturally from animals to humans, given the sheer abundance of viruses in nature. But he also said in his testimony that he disagrees with the most widely promulgated spillover argument: that the virus leapt from infected animals to people at the Huanan Seafood Wholesale Market, where it first burst into public view in December 2019. The argument does not hold up, he said, because genomic evidence suggests that COVID-19 was already circulating in the human population by mid-to-late October. "Clearly, the market was a conduit for expansion," he testified. "Is that where it started? I don't think so."

Baric also weighed in on a controversy that has pitted Dr. **Anthony Fauci** against Senator **Rand Paul** (R-KY), who has leveraged his credentials as an eye doctor to position himself as a crusader against America's scientific and medical establishments. In contentious Senate hearings, Fauci has repeatedly denied Paul's claims that the National Institute of Allergy and Infectious Diseases, which Fauci led at the time, had funded gain-of-function research at the WIV. However, Baric told investigators that the experiment in dispute, in which technicians created a chimeric virus that made lab mice sicker, was "absolutely" gain-of-function research: "You can't argue with that." He also said he felt that the experiment's results should have triggered regulatory review.

The federal grant money for the experiment in question, which was conducted at the WIV sometime between 2018 and 2019, was funneled through EcoHealth Alliance. It was Daszak, EcoHealth's president, who organized an open letter in the *Lancet* medical journal early in the pandemic that helped paint the lab-leak hypothesis as a baseless conspiracy theory. Today, the Select Subcommittee is expected to release a report that calls for NIH to recommend that EcoHealth Alliance, and Daszak personally, be

debarred from receiving federal funds. As part of its investigation into COVID-19's origins, the Select Subcommittee is holding a series of hearings. Daszak is scheduled to testify publicly today, and Fauci is set to do so on June 3.

America's intelligence agencies remain divided over whether SARS-CoV-2 came from a natural spillover or a lab accident. US Health and Human Services Secretary **Xavier Becerra** recently said the question may "never" be answered "unless China opens up some more."

The single biggest issue to jump from the pages of Baric's testimony is his persistent concern over unsafe research practices at the WIV. Some of Shi's research papers, he said, "actually stated that they were doing the culturing work under BSL-2." BSL-3 labs typically require negative pressure air flow, HEPA air filtration systems, and full Tyvek suits for lab workers—all to protect against leaks. BSL-2 laboratories do not require specialized air filtration or full gowns.

Throughout his interview, Baric took pains to emphasize to congressional investigators that he had not simply turned over his research techniques to his colleagues at the WIV. Referring to his 2015 research with Shi, he said, "Although we published the approaches for how to build molecular clones of coronaviruses, we never had anyone from Dr. Shi's lab or any of the Wuhan Institute of Virology come to our lab and train. We never taught them."

His trust was violated on at least one occasion, he said. In order to test the ability of different viruses to infect humans, Baric had engineered mice with lungs that contained a human gene. He said he shared these mice with the WIV under a contractual agreement that they only be used there. Then, during the pandemic, he said he discovered that his mice were being offered for sale by a commercial company. The profiteering, he told investigators, was "infuriating."

As Baric recounted to congressional investigators, Shi's earlier work was "very vague about safety conditions. They said they followed Chinese regulations." But in two subsequent papers, said Baric, "They actually stated that they were doing the culturing work under BSL-2.... And then they continued that even into September of 2020, which I thought was irresponsible." (Neither Shi Zhengli nor a spokesperson for the Wuhan Institute of Virology responded to requests for comment.)

Baric told the committee that, from his earliest days working with zoonotic coronaviruses, he always understood there was a real if "rare" chance that one could prove infectious to humans. "And if that's your hypothesis, then you do it under BSL-3," he said. "So I kind of set the standard in the United States."

But the WIV, he said, operated under a looser set of biosafety protocols. "Their regulations state pretty clearly that they don't consider culturing bat viruses at BSL-2 as a biosafety concern," he said. "I also had that verbally confirmed by Zhengli Shi at a meeting in Harbin, when I was telling her she should move it all to BSL-3 and the reasons why." (Less than a year into the pandemic, the Chinese government passed legislation that tightened the nation's laboratory safety practices.)

The dispute over biosafety arose again in 2018, as Baric and Shi worked with Daszak on a grant proposal to collect SARS-like bat coronaviruses and insert a genetic component called a furin cleavage site that would enable them to more easily infect human cells. The proposal has since drawn attention because, when SARS-CoV-2 subsequently emerged in Wuhan, it possessed a furin cleavage site, making it unique among SARS-related coronaviruses. The 2018 proposal was submitted by Daszak to the Pentagon research and development agency DARPA.

Last December, a Freedom of Information research group called U.S. Right to Know released margin comments from an early draft of the grant proposal. In one, Peter Daszak tagged his collaborators and said, "Ralph. Zhengli. If we win this contract, I do not propose that all of this work will necessarily be conducted by Ralph, but I do want to stress the US side of this proposal so that DARPA are comfortable with our team. Once we get the funds, we can then allocate who does what exact work, and I believe that a lot of these assays can be done in Wuhan as well."

The early draft stipulated that the research would be done at a BSL-2 level, making it "highly cost-effective." Baric objected to this in a margin comment of his own: "IN the US, these recombinant SARS CoV are studied under BSL3, not BSL2, especially important for those that are able to bind and replicate in primary human cells. In china, might be growin these virus under bsl2. US researchers will likely freak out." In the finished proposal, BSL-2 was changed to BSL-3.

Baric told congressional investigators that he wrote the margin comment to Daszak "to make sure he

pays attention." He added, "First, I'm informing him, just in case he doesn't know, that a lot of the virus discovery work and culturing work that the Chinese do with zoonotic coronaviruses is done at BSL-2…. I'm letting him know there's a difference."

After a congressional investigator observed, "It appears there may have been a willingness, not necessarily by you, to do some of this work in the BSL-2 in China," Baric responded, "There was no willingness on my part to do any of this work…. Let me make that clear." He subsequently clarified, "My role was to study a couple of the viruses that the Wuhan Institute of Virology found that they were willing to share with me."

DARPA rejected the grant, but questions have persisted over whether WIV scientists carried out the proposed research anyway. Baric told congressional investigators that he doesn't know whether the WIV continued the research or got other funding for it. He added that he does not believe SARS-CoV-2 was engineered and discounted a 2022 paper making that argument as "biostatistical BS." **Alex Washburne,** one of the paper's authors, told *Vanity Fair,* "Baric doesn't provide any scientific evidence or reasoning that would lead us to revisit our results or change our theory."

In May 2021, Baric signed an open letter in the journal *Science* affirming that the lab and natural origin hypotheses are both viable and calling for further investigation. A fellow scientist, Columbia University virologist **Ian Lipkin,** questioned him about why he signed the letter. In response, Baric told the subcommittee, "I sent him a couple of papers that the Chinese had published where they were doing virus discovery work under BSL-2 conditions, which is one of the main reasons why I felt that the potential laboratory escape hypothesis shouldn't be, in essence, put under the rug."

"You believe this was appropriate containment if you want but don't expect me to believe it," Baric wrote Daszak. "Moreover, don't insult my intelligence by trying to feed me this load of BS."

Baric's signing of that letter also precipitated a testy email exchange with Daszak over the WIV's safety standards, obtained by *Vanity Fair.* Daszak enumerated to Baric the various ways in which China's lab safety standards did not lag far behind US standards. He added, "We checked with Zhengli, who let us know that she used 'BSL-2 with negative pressure and appropriate PPE.'"

This brought a withering response from Baric. "Bsl2 with negative pressure, give me a break." He pointed out that even Shi's most recent papers never defined the safety precautions used. "Yes china has the right to set their own policy. You believe this was appropriate containment if you want but don't expect me to believe it. Moreover, don't insult my intelligence by trying to feed me this load of BS."

Reached for comment, Daszak told *Vanity Fair* that the WIV performed its animal infection experiments "at BSL-3, as per work at Dr. Baric's lab in the USA." He also stated that the research rejected by DARPA was "never done," and said that the proposal called for only work that "did not involve any infectious materials" to be done in a BSL-2 facility at the WIV. Regarding the Subcommittee's call for the NIH to recommend debarring him and EcoHealth Alliance from receiving federal funds, he said he hadn't yet seen the report and couldn't comment on it. However, he stated that EcoHealth Alliance has "cooperated fully and expeditiously with the NIH on additional oversight measures since 2020" and shared a letter from last October in which the NIH deemed the nonprofit compliant with oversight requirements.

Another signatory to the May 2021 letter was Dr. **Michael Worobey,** who has since become a leading proponent of the theory that the virus spilled over from infected animals at the Huanan Seafood Wholesale Market.

In 2022, Worobey and a team of international scientists published an influential research paper that used a geospatial analysis of early infections in Wuhan to make a case for the market spillover theory. Using data collected by Chinese scientists, Worobey's team later also published evidence in a preprint that virus-susceptible mammals, such as raccoon dogs, were present at the market.

When prominent virologists state that the preponderance of evidence points to a natural origin, they are often referring to Worobey's research. Baric, for his part, told congressional investigators that Worobey's geospatial study has a "major problem" with its timeline. He told the subcommittee, "The only thing we have really solid data [for] is that the market was the site of amplification in late December, January. That's still two months from the origin date, based on a molecular clock, which means it was circulating somewhere before it got there. And the question is, where was it?"

Baric said the earliest cases are "almost impossible" to document because many were asymptomatic. "It's

MORENS_NIH_044689
REL0000478110

a fundamental problem with the papers that are reported to prove—they write it too strong, I think, but they're very passionate about their data. And to be fair to them, it is the best data that's out there." He went on to critique the papers' claim of two independent jumps from different infected animals at the market based on the presence of two different lineages of the virus. "It's a stretch," he said, adding that his view is shared by "a lot of virologists that look at that data and go, mmm."

Calling the evidence for a market origin "powerful," Worobey told *Vanity Fair* that he thinks the first jump from animals to humans happened in November. Baric, he said, "possesses essentially no expertise in the subjects of the papers he is commenting on…. It is irresponsible for him to share these views with anyone without also making it clear that he is in no better position than the average educated person to judge this work."

In his testimony, Baric was equivocal on the question of whether WIV scientists could have possessed SARS-CoV-2, or a very close progenitor, prior to the pandemic. There "was evidence that they were building chimeras" and "doing some discovery work about the functions of spike genes of zoonotic strains that they discovered later on, but I don't know if they did any of the engineering or anything."

Without further disclosure from China, the answer may be unknowable. As Baric told congressional investigators, "If you had access to the laboratory notebooks, if you had access to the safety records of the Wuhan Institute of Virology, if you had access to the sequence databases, the level of assurance that you would have would be greater. No question."

"Which we didn't really have?" a congressional investigator asked.

"Which we don't really have," Baric responded. "That's very true."

The GAO was asked by the Biden administration to look into political interference in science by the white house under Trump. They interviewed me repeatedly last year and this year about the termination of our R01 grant.

This is the first report from them on the topic. It's massively disappointing, of course, because it just comes up with broad recommendations on what agencies should do to protect themselves against political interference. However, if you read the email below, this is the first of two reports, and the second one should hopefully go into more detail about the NIH actions on EcoHealth's grant.

Cheers,

Peter

Subject: New GAO Report on Scientific Integrity at HHS

Dear Peter,

Thank you for participating in our report on scientific integrity at HHS. Our completed report can be accessed here. Please feel free to

MORENS_SUBPOENA_002903
MORENS_NIH_009419
REL0000478186

share it with your network and colleagues. We plan to issue an additional report that will examine the key characteristics that can insulate agencies from political interference, and how, if at all, the selected HHS agencies have experienced potential political interference while carrying out their missions.

Thank you again for your time and providing information on this important topic.

Sincerely,

Rob Marek

Tucker Carlson: Fauci, the WHO, and mainstream media lied about COVID origins for more than a year

Published 6 hours ago

'Even as of now, the US government has not launched and broad and serious investigation into where the coronavirus came from'

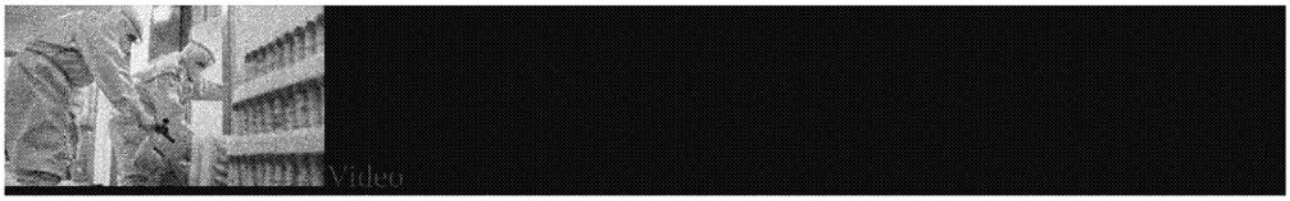
By Tucker Carlson | Fox News

MORENS_SUBPOENA_019710
MORENS_NIH_039327
REL0000478203

Actually, it looks like this virus did come from a lab in China. Nearly a year and a half into the pandemic, that's the new consensus in the American media. Boy, these things change fast. There are holdouts of course. Just today, over at the Washington Post, a China shill called Michael Gerson wrote a hilariously overwrought column entitled:

"The right is dwelling on slanderous myths about the origins of COVID-19." The radical right! Slanderous myths! Russian QAnon sleeper cells slandering the Chinese government! It's pretty funny. The good news is, it's almost over. You're probably not going to see a lot more columns like that going forward. The nonsense is finally dying down.

At other parts of Michael Gerson's own newspaper, we've learned, they're working on new stories about how the virus did in fact escape from the lab in Wuhan. So, the debate among serious people over the origins of COVID appears to be pretty much winding up. Pretty much every sane person acknowledges at this point that the government of China likely caused the single worst man-made disaster in human history. As if we need more evidence, over the weekend, the Wall Street Journal reported that the first people infected with COVID-19 were probably researchers at the Wuhan Institute of Virology. In November of 2019, three of them were taken to the hospital with symptoms. The Journal did solid reporting, but it wasn't entirely new. Back in January of this year, the State Department issued a fact sheet telling the entire country the same thing.



They said the first COVID patients were not hungry patrons of the local wet market, reckless diners who gorged themselves on pangolin and bats. No, they weren't. The first patients were researchers at the Wuhan Institute of Virology. Clearly, they'd been infected at work, while working on the

MORENS_SUBPOENA_019711
MORENS_NIH_039328
REL0000478203

virus. If you were trying to understand where COVID came from, and you should be if you want to prevent future pandemics, that State Department in January told you a lot. Yet it was ignored.

In fact on Monday, Tony Fauci himself — the man in charge of our whole response to COVID-19 — told CBS News that he never even heard about the State Department's findings on the Wuhan lab. He had no idea.

In other words, Fauci's own employers, the U.S. government, publicly released compelling evidence that the virus that he has devoted his life to fighting, did not come food, but instead escaped from the very bio lab that Tony Fauci has sent American tax dollars to fund.

Yet somehow Tony Fauci didn't know this. He didn't know it till he read this weekend's Wall Street Journal. It was news to him. Bolt from the sky. Totally new information.

Can we really believe that? No, of course, we can't. In fact, we have heard that on or about November 19, 2019, right around the time those Chinese researchers became the world's first COVID patients, the government of Thailand contacted the CDC and Tony Fauci's office to say its intelligence service had picked up "biological anomalies" around the lab in Wuhan. In other words, there had been a leak.

We can't confirm this, though we believe it to be true. We do know that several other allied foreign governments, including the governments of France and Australia, have gathered evidence showing the virus escaped from a Chinese lab. Yet Tony Fauci, who runs the whole thing, didn't know any of this? Come on. Of course he did.

Fauci has known from the beginning the virus may very well have come from that lab. Many people have known that. Fauci just lied about it for more than a year. In May of 2020, in an interview with the willing dupes at National Geographic, he told you that, as one of the world's most eminent scientists, there's really no chance COVID-19 was engineered by human hands.

MORENS_SUBPOENA_019712
MORENS_NIH_039329
REL0000478203

FAUCI: If you look at the evolution of the virus in bats and what exists now, it's very, very strongly leaning towards that could not have been artificially or deliberately manipulated. The way the mutations have naturally evolved. A number of very qualified evolutionary biologists have said that everything about the stepwise evolution over time strongly indicates that it evolved in the wild, then jumped species.

"A number of very qualified evolutionary biologists." Really? Where are those scientists today? Is there, for example, a single working virologist on planet earth who'd come on this show right now and dismiss the Wuhan lab leak idea out of hand as ridiculous — or quote "outrageous," as Francis Collins of the NIH once did?

We doubt there's a single working virologist who would dare to do that. But not so long ago, the entire scientific and public health establishments did that very thing. So, what's changed? Not the science. The science remains precisely the same. Only the politics have changed.

And that gets you thinking. Now that we know what we know about the Wuhan lab — and we know that, of course, Fauci has known it too for a very long time, how could he not — it's pretty remarkable to go back and look at Fauci's public statements about COVID and the government of China.

Keep in mind, he knew that it was at least possible that this virus came from that Wuhan Lab. Yet he did this interview with our David Asman with Fox Business in January of 2020. Keep in mind that Tony Fauci was perfectly aware that China may have created this virus, and he knew for a fact that the government of China was lying, covering its tracks, and pushing the world health organization to do the same. Imperiling the entire planet as they did that. Tony Fauci did that, yet he said this anyway:

DAVID ASMAN: Dr. Fauci - China has been known to fiddle with their stats before. Do you trust what they are telling us about this illness?
FAUCI: From what I can see they really are being much more transparent.

You read that, you look back over the last year in light of what we now know, and you ask yourself, how does Tony Fauci still have a job? Seriously. What kind of country gives this much power to

someone who's proven himself to be serially dishonest and incompetent? It's scary we'd allow that. Especially in public health. Meanwhile, and this is the most galling part, those few journalists and scientists who told the truth about what happened in Wuhan were punished for telling the truth. They were attacked by CNN, censored by Facebook, denounced by their colleagues. They were destroyed in some cases. Where's their apology? Who's paying into their reparations fund? No one of course.

Here's someone who deserves to be rehabilitated immediately. His name is Professor Stephen Mosher. He's an expert on China and a very brave person. You'd need to be to say what he said in February of 2020, back when mass lockdowns seemed like something they only did in China, Mosher came on this show and told the truth:

MOSHER: Well, I think it escaped from the lab because we have the Chinese government basically telling us that it did…Wuhan is the only level four laboratory in all of China. So that's where you would put a dangerous pathogen, whether you were genetically engineering it to be a weapon or not, that's where you would be experimenting on it. So it makes sense that the epicenter of the epidemic, that the lab there would be the source of that virus.

So you read that, and you think that guy was on to something. He was smart, he was honest, he connected the dots. For his trouble, for telling the truth, Steven Mosher was immediately denounced as a conspiracy nut. Meanwhile, the liars and China's shills got richer and more powerful.

The WHO, which followed China's instructions and told the world that COVID wasn't really transmissible by air, now has the full support of the Biden administration. In fact, Joe Biden rejoined the WHO, with no conditions. This is despite the fact American intelligence can prove that the WHO lied, and people died as a result of those lies. Even as of now, the U.S. government has not launched any broad and serious investigation into where the coronavirus came from. If you can imagine.

At the same time, they're telling us we need a 9/11-style commission to understand every facet of the January 6th events at the capitol. But the pandemic that killed three million people and destroyed the west? Which it has. Never mind. We'll let someone else figure it out.

CC: David Morens b6 >; Peter Daszak b6 >; Roberts, Rich b6 >; Aleksei Chmura b6 >;

The problem apparently is influenced by several things: a) some scientifically strong outside candidates have either refused to consider or dropped out given the politics, among other issues, b) the lead inside candidate is apparently a disruptive personality, c) the administration has a lot of other things to deal with that apparently override (I can't use that other word) in importance this appointment.

But this is madness and so obviously politically driven. Had there been a strong NIH leader in place in April 2020 NIH would not have caved in and cancelled Peter's grant. That's when the slope became slippery.

Rich, you may be on this already but it seems to me this is a critical time for the Nobel laureates to speak up, and echo Tony's characterization of Rant Paul as knowing nothing about public health, and my favorite phrase that he is an ophthalmologist who cannot see the difference between evidence-based decisions and ideologically driven "don't bother me with information, my decision stands".

EXCLUSIVE: Sen. Rand Paul, Rep. Chip Roy To Introduce Legislation To Eliminate Fauci's NIAID

Photo by Chip Somodevilla/Getty Images
● Henry Rodgers Chief National Correspondent
March 23, 2023 9:44 AM ET
Republican Kentucky Sen. Rand Paul and Texas Rep. Chip Roy will introduce legislation Thursday that would eliminate the National Institute of Allergy and Infectious Diseases (NIAID).
The Daily Caller first obtained a copy of the bill, which is titled the NIH Reform Act. The bill would specifically replace the NIAID with three separate national research institutes that would be led by directors subject to Senate confirmation and limited to no more than two 5-year terms.

MORENS_NIH_012631
REL0000478281

The three new institutes would be the National Institute of Allergic Diseases, the National Institute of Infectious Diseases, and the National Institute of Immunologic Diseases. The directors of each new institute would be appointed by the president, subject to Senate confirmation, and limited to no more than two 5-year terms.

"We've learned a lot over the past few years, but one lesson in particular is that no one person should be deemed 'dictator-in-chief.' No one person should have unilateral authority to make decisions for millions of Americans," Paul told the Daily Caller before introducing the legislation. **(RELATED: Rand Paul Introduces Legislation To Repeal Federal Mask Mandate For Public Transportation)**

"To ensure that ineffective, unscientific lockdowns and mandates are never foisted on the American people ever again, I've introduced this bill to eliminate Dr. Anthony Fauci's previous position as Director of the National Institute of Allergy and Infectious Diseases and divide the role into three separate new institutes. This will create accountability and oversight into a taxpayer funded position that has largely abused its power and has been responsible for many failures and misinformation during the COVID-19 pandemic," he added.

READ THE LEGISLATION HERE:

(DAILY CALLER OBTAINED) — ... by Henry Rodgers

"From the earliest days of the pandemic, unaccountable public health bureaucracies proved themselves far more adept at ruining lives than saving them. Never again should a single individual, like Dr. Anthony Fauci, wield unchecked power and influence over the lives of the American people. Breaking up Dr. Fauci's taxpayer funded bully pulpit into three separate agencies — and requiring Senate confirmation for all their future directors — is one of many actions necessary to allow the American people to hold public health agencies accountable," Roy, who introduced an identical House version of the bill, said in a statement. **(RELATED: EXCLUSIVE: Sen. Rand Paul Demands NIH Preserve All Documents, Communications In Fauci's Possession)**

The legislation is currently cosponsored by Utah Sen. Mike Lee, Tennessee Sen. Marsha Blackburn, Indiana Sen. Mike Braun and Missouri Sen. Josh Hawley.

EXC: Fauci Underling Serves On Board for Wuhan Lab Journal.

- May 18, 2021
- Natalie Winters

The Wuhan Institute of Virology's scientific journal – which has discussed controversial "gain-of-

MORENS_SUBPOENA_012613
MORENS_NIH_024001
REL0000478282

function" research – counts scientists from Dr. Anthony Fauci's National Institute of Allergy and Infectious Diseases (NIAID) on its editorial board.

The Editor-in-Chief of the journal – *Virologica Sinica* – is Shi Zhengli, the Director of the Wuhan Institute of Virology's Center for Emerging Infectious Diseases. Eight additional researchers from the Wuhan lab – believed by many to be the source of COVID-19 – serve on the editorial board.

Another member of the journal's editorial board, however, has ties to Dr. Fauci's National Institute of Allergy and Infectious Diseases (NIAID).

Jens Kuhn, the Director of Virology at the Integrated Research Facility which is "part of the NIAID's Division of Clinical Research (DCR) within NIH" according to the agency, is listed as a member of the journal's editorial board.

His professional bio notes he "specializes in highly virulent viral human and animal pathogens" as one of "two Principal Scientists" at the NIAID-funded venture:

"I am a Principal at Tunnell Government Services (TGS), tasked as one of two Principal Scientists and the Director of Virology at NIH/NIAID/DCR's Biosafety Level 4 facility, the Integrated Research Facility at Fort Detrick (IRF-Frederick) in MD, USA. I specialize in highly virulent viral human and animal pathogens, biodefense, bioengagement in the BMENA region and NIS countries, and biological arms control."

Editorial Board members.

Beyond establishing additional ties between Fauci's NIAID and the Wuhan Institute of Virology – including multiple conferences involving scientists from both entities – the journal has also discussed gain-of-function research. These unearthed

MORENS_SUBPOENA_012614
MORENS_NIH_024002
REL0000478282

connections follow Fauci insisting his agency never participated in gain of function research at the Chinese lab during an exchange with Senator Rand Paul.
A 2017 article from Virologica Sinica notes:
*"To identify the DENV entry factors, Amara's group carried out a **gain-of-function** complementary DNA(cDNA) screen for host proteins that allow the minimally susceptible cell line 293T to be infectable by DENV (Carnec et al., 2015)"*
"Simultaneous gain-of-function and loss-offunction assays were performed by transfecting cells with or without related miRNA inhibitors. After 24 h, Act-D was added into the culture medium," one study notes.
Another study references the practice, commenting "two main approaches can be undertaken in such screens: gain-of-function, in which a library of overexpressed proteins is used in order to induce or amplify restriction."

You are right

I will point out that the problems in NIH OD, and the problems in NIAID are very different. In the past, the 27

MORENS_SUBPOENA_015487
MORENS_NIH_032380
REL0000478291

Institutes/Centers have always functioned independently, and some, including some small ones, have done pretty well when not being interfered with

Our problems in niaid are unique to us, and will take years of steady vision to fix.....

On Jan 25, 2023, at 10:38 AM, David Morens <b6> wrote:

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

MORENS_SUBPOENA_015488
MORENS_NIH_032381
REL0000478291

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Greetings all,

What an incredible meeting of minds last week! It was great to hear from such a diverse range of people on such an important topic. We so appreciate everyone's time and effort. I have pages of notes and am looking forward to reviewing others as well. As Dr. Hotez mentioned, we have this seed funding from the Mitchell Foundation and the potential for more once plans develop. Dr. Hotez and I will both be in New York City May 30th. If available, could this convening group meet to discuss next steps? Happy to offer some times for a zoom call if that date doesn't work for an in person meeting.

Thank you!

Not pleasant reading but thanks for sharing this link. It's a stream-of-consciousness diatribe that makes you think this guy is simply mentally ill, but actually he's a well-known right wing 'influencer', appearing on Steve Bannon's podcast, member of the Brownstone Institute and regular on other outlets. In the end, just probably a sad lonely person looking for outside validation. Still, pretty disturbing to read…

Cheers,

Peter

Sorry to do this but I'm under pressure here and Jeff sachs' latest discrediting of our name publicly is not helping. Apparently a letters been sent to my board calling on them to fire me.

It's being reported in the NY Post today. Let me know if you can't read it on this link.

https://www.google.com/amp/s/nypost.com/2021/10/01/calls- grow-for-ouster-of-wuhan-lab-tied-daszak-as-head-of-nyc-health-nonprofit/amp/

My board chair is Nancye green - she's v supportive but everyone has limits. Her email address is [b6]

Would you be willing to write an email to her this week to express your support for me and disgust at the way we are being attacked? It might be good to also mention that ecohealth has a critical mission that needs to stay the course through these ugly politics.

Sorry to be so blatant but I'm worried that this level of attack is hard to stand up against.

Cheers,

Peter

Thanks David.

As I mentioned to some of you on the chain, we're getting disturbing information that the Republicans will be calling for EcoHealth to be debarred. We're also hearing that the Democrats will issue a report tomorrow that says:

"EcoHealth Alliance did not cause the pandemic, but that it had questionable behavior when it comes to complying with federal funding rules which raises questions about whether the organization should receive federal funding.

The instances where questionable behavior is alleged include:

- The 2-year delay in submitting Year 5 report for the NIAID grant that ended in 2019 and the claim, which the report says it's not backed by evidence, that there was a tech issue when EcoHealth Alliance tried to submit the report within the deadline;
- Whether Peter properly represented to NIAID whether the work on WIV1 could be considered gain of function;
- Whether virus growth above 1 log should have been reported and when;
- Whether Peter misrepresented who was in possession of bat coronavirus samples ahead of the NIAID grant suspended in 2020 being restarted;
- The lack of transparency about the Lancet letter in February 2020.

This is obviously a really bad turn of events, but not unexpected considering the way the Democrat staffers attacked me during my transcribed interview. They are obviously focused on protecting NIH, Fauci and therefore Biden. It's a shame they're willing to throw us under the bus in the process..

Dear Peter, Tony, Akiko, and Michael,

I cannot tell you how many members approached me to say how moved, inspired, and informed they were by your presentation yesterday. I've been responding to emails all day from members who want to find some way to help. I had thought that there would be wider understanding of what you all were enduring; I did not anticipate how many eyes were opened to the persecution of people who speak out for the public good, even when the information is difficult to take in.

I will definitely keep you all informed as we move forward. I think the four of you would make an excellent sounding board for ideas, as I am sure that some strategies could have the potential to backfire if we are not very very careful in how we approach the issue.

I am not so naive as to think that we can reach everyone - too many opinions are baked in, often for nefarious reasons. However, I do have faith that the majority of Americans will respond to reason.

Marty and Becca can comment on the extent to which CHR can help with this issue. I certainly value their input as they have such a long history of dealing with persecution of scientists. Domestic cases have to date been outside of their scope, and your cases are all somewhat different than the majority of CHR interventions. Your persecution is coming from the public, whereas CHR mostly deals with foreign government actions. If CHR decides that this is beyond their remit, then we definitely will need to find some other unit at the NAS to take this on.

And Peter: thanks for the heads up about the Mitchell Foundation having an interest in supporting work to address this issue. Happy to talk to you more about it.

My gratitude to you all,

Marcia

On Thu, Apr 4, 2024, 22:04 Folkers, Greg (NIH/NIAID) [C] [b6] wrote:

> # EcoHealth Alliance Statement Regarding April 4, 2024 Announcement by the House Energy &

Commerce Committee

April 4, 2024 – EcoHealth Alliance (EHA) can confirm that Dr. Peter Daszak, EHA President & CEO, will testify voluntarily before the Select Subcommittee on the Coronavirus Pandemic (SSCP) of the U. S. House of Representatives on May 1, 2024. Dr. Daszak's public testimony follows on a voluntarily transcribed interview he provided to the SSCP late last year.

The Energy & Commerce Committee's announcement about this hearing continues to misrepresent the work of EcoHealth Alliance and makes several inaccurate allegations about Dr. Daszak's previous public statements. Dr. Daszak looks forward to answering the Committee's questions, clarifying the areas of misunderstanding, and informing them about the vital research that EcoHealth Alliance conducts globally.

EcoHealth Alliance's mission is to conduct research on emerging disease threats to the US, identify the underlying causes of pandemics, develop solutions to prevent them, and benefit conservation. The public nature of our work and our long-standing collaborations with Chinese scientists made us a target for speculation about the origins of COVID-19, beginning in early 2020 and continuing to this day. EcoHealth Alliance's work is a matter of public record, via dozens of grant reports, scientific publications, media interviews and public lectures given before, during and after the emergence of COVID-19. EcoHealth Alliance scientists have worked in partnership with US Federal Agencies since the early 2000s to identify emerging disease threats in hotspots around the world before they migrate to the United States. EcoHealth Alliance's research thus has direct benefits for the health of the American people, strengthens national security, and enhances sustainable economic growth in our allies around the world.

Add to that a preprint we'll be posting next week that suggests 50,000 – 400,000 people are actually infected by bat SARSr-CoVs in SE Asia each year, and a comment from the international members of the WHO team that'll be in Nature this week or next.

As long as these articles keep up their 'drip, drip' with actual new data and analyses, all the lab leak hypothesis has is re-hashing of the same innuendo-filled vitriol.

Thanks Peter,

Totally agree that It's quite sad to see the attacks on scientists and science from Wade. It's the very basis for the "lab leak" hypothesis, so no surprise.

Wade is old enough to know this, but anyone that thinks that Jeremy Farrar and Tony Fauci are part of the "problem" has literally [in the case of Tony] not been paying attention for 50 years.

Looking forward to Wade and his ilk going ballistic as two new papers favoring natural origin appear shortly in *Cell* and *Science.*

External Sender. Be aware of links, attachments and requests.

Nicholas Wade's at it again – another miserable innuendo-filled attack on science and the process by which scientists email, talk and come to decisions. Nothing new of course, just trash journalism published in a pseudo-scientific journal. Pretty shameless smear on some of us – no facts of course, no sue-able accusations, just snipey comments and excerpts from Social Media. It's as if we can't now be scientists and actually colleagues who break bread and share a glass any more.

https://thebulletin.org/2021/08/how-covid-19s-origins-were-obscured-by-the-east-and-the-west/

The irony is in the ending – he claims the lab leak is an albatross hanging around China's neck that they won't be able to shake off until they open up the lab videos, books, freezers etc. The truth is his and others continued attacks are what put the albatross there in the first place. Does anyone really believe that if China gave access to all the above and no further evidence was found, that these folks would simply say "OK, it wasn't a lab leak after all"!!!

Cheers,

Peter

How COVID-19's origins were obscured, by the East and the West

By Nicholas Wade | August 17, 2021

MORENS_SUBPOENA_021648
MORENS_NIH_042526
REL0000478369

A bus carrying a team of experts from the World Health Organization departs an airport in Wuhan on Jan. 14, 2021, after arriving in the Chinese city to investigate the origins of the coronavirus pandemic. That investigation is widely seen as having been obstructed by Chinese authorities. (Photo by Kyodo News via Getty Images)

Some 20 months after the Covid-19 pandemic first broke out, its origins remain obscure. A vigorous campaign of concealment by the Chinese authorities is the principal reason. But China received considerable help, strange to say, from senior medical research officials in the United Kingdom and United States who mishandled and effectively derailed the initial inquiry into the virus's origins.

The mishandling began at a pivotal teleconference held on February 1, 2020. The organizer was Jeremy Farrar, director of the Wellcome Trust, a large medical research charity in London. News of the conference emerged with the release this

June of emails from the office of Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases (NIAID). Farrar supplied further information in his book *Spike*, published on July 22.

The conference was held to discuss the unanimous view of a group of virologists that the SARS2 virus had been manipulated in a lab. Yet within a few days of the meeting, the virologists abruptly reversed their conclusion. The meeting's participants were later involved in two letters to scientific journals that stated the virus must have emerged naturally and that condemned any suggestion of manipulation as a conspiracy theory. These two letters, to *The Lancet* and *Nature Medicine*, shaped the views of the mainstream media for more than a year.

Letters published by *The Lancet* and *Nature Medicine* in early 2020.

Even today, no one can say for sure whether the SARS2 virus emerged naturally or escaped from a lab. Much less could anyone have been sure back then. If the conferees had stuck to known facts, they would have left the question open to the two hypotheses, and the full exploration of the virus's origins might not have been sidetracked for over a year.

More significant, the Chinese government would have found it much harder, if not impossible, to manipulate the World Health Organization (WHO) into setting terms of reference that favored China's obstructive goals and kept WHO inspectors who visited China this February from accessing records vital to understanding the origin of

the pandemic. China now insists those terms of reference cannot be changed, blocking further investigation into the origin of the SARS2 virus. "The two groups that produced the infamous letters in *The Lancet* and *Nature Medicine* paved the way for the Chinese government and helped enormously to facilitate all of that," says Milton Leitenberg, an arms control expert at the University of Maryland. The reversal of the virologists' conclusion about SARS2's artificial origin is thus a matter of some significance.

At 10:32 p.m. on the evening before the February 1 conference, Fauci had received an electrifying memo from Kristian G. Andersen, a virologist at the Scripps Research institute in California. Andersen reported that the virus seemed to be man-made. "The unusual features of the virus make up a really small part of the genome," he wrote, referring presumably to a genetic component known as a furin cleavage site, which greatly enhances the virus's infectivity, "so one has to look really closely at all the sequences to see that some of the features (potentially) look engineered."

_A key email from Kristian Andersen to Anthony Fauci.

Andersen went on to note that "after discussions earlier today, Eddie, Bob, Mike and myself all find the genome inconsistent with expectations from evolutionary theory"—meaning that, in their unanimous view, the virus didn't come from nature. "Those opinions could still change," Andersen added. Eddie is Edward C. Holmes of the University of Sydney. Bob is Robert F. Garry of Tulane University. Mike is Michael Farzan at Scripps Research.

The message sent Fauci into a whirlwind of activity. "You will have tasks today that must be done," he emailed his deputy director, Hugh Auchincloss, two hours later at 12:29 am on February 1. One of these urgent tasks evidently concerned NIAID funds that had been passed, via the EcoHealth Alliance of New York, to Zhengli Shi, China's leading bat virus expert, at the Wuhan Institute of Virology. Fauci was doubtless anxious to check whether his agency's funding of Shi's work had complied with US law, which banned funding gain-of-function research from 2014 to 2017 and required it be reported to a government panel thereafter. "Gain of function" refers to research in which a pathogen's ability to cause disease is enhanced. Auchincloss replied a few hours later that efforts were underway to ascertain "if we have any distant ties to this work abroad."

Meanwhile Farrar, who had independently heard of the Andersen team's conclusion from Holmes, says in *Spike* that he arranged a teleconference set for 7 p.m. London time, convenient for both Washington and Australia, where Holmes was based.

The participants included Fauci and possibly his nominal boss, Francis Collins, the director of the National Institutes of Health. (Farrar says in *Spike* that Collins was present, but Collins's name is not on the list of invitees in the Fauci emails.) Officials on the UK side were Farrar and Patrick Vallance, the chief scientific adviser to the UK government. The others were mostly virologists, including Andersen, Holmes, and Andrew Rambaut of the University of Edinburgh.

Far from being selected at random, the conferees were associated through a complicated web of relationships, a sort of virologists' old boy network that included senior medical officials in China. Farrar was well acquainted with George Fu Gao, the head of China's counterpart of the US Centers for Disease Control and Prevention. He has described Gao as an "old friend," who in fact had called a month earlier, on December 31, 2019, to tell Farrar about the initial cases in Wuhan of what turned out to be Covid-19. Farrar says in his book *Spike* that on the weekend of the teleconference, he called another highly placed Chinese official, Chen Zhu, China's minister of health from 2007 to 2013, to tell him of "rumours that the novel coronavirus could be the result of a lab accident." As for Holmes, he has published many papers both with Farrar and with Gao and has been a guest professor at Gao's CDC from 2014 until 2020.

Because of these varied connections, it seems likely that Chinese authorities knew about the conference almost from the moment it occurred and, if so, would have had the opportunity to influence deliberations that followed it.

At the conference there was a notable imbalance of power between the virologists and the officials. Fauci and Farrar together control a large portion of the funds available for virological research in the Western world. A virologist keen to continue

his career would be very attentive to their wishes. Two of the conference participants had multimillion-dollar grant proposals under final review with NIAID at the time of the call.

Almost all references to what was discussed at the teleconference have been redacted from the Fauci emails under exceptions to the Freedom of Information Act. The conference would doubtless have included explanation from Andersen and Holmes as to why they had concluded the previous evening that the virus had been altered through laboratory manipulation. “Kristen and Eddie have shared this and will talk through it on the call,” Farrar writes in one of the Fauci emails.

RELATED:

The known knowns, known unknowns, and unknown unknowns of COVID-19

_A Jeremy Farrar email about the teleconference.

Whatever was said at the meeting, it was followed by a remarkable and almost immediate about-face. By at most three days later, Andersen had executed a 180 degree turn in his views about the virus. In an email of February 4, 2020 to Peter Daszak, president of the EcoHealth Alliance, which had directed NIAID funds to Shi, Andersen wrote, “The main crackpot theories going around at the moment relate to this virus being somehow engineered with intent and that is demonstrably not the

case." The email was obtained by U.S. Right to Know, an investigatory group.

Participants have not explained what was said at the meeting or found in the days immediately following it to induce the change of mind. Media offices at the Wellcome Trust and NIAID declined to comment on this article. Andersen, Holmes and Rambaut did not reply to emails seeking an account of the reversal.

Farrar, not Fauci, seems to have been the leader in the teleconference's deliberations. "This is not my area of expertise so I have backed off and am leaving it all to Jeremy," Fauci wrote on February 13 to a CDC official. US officials were not to take the lead in this pivotal inquiry.

Fauci's "leaving it all to Jeremy" email.

Farrar had a direct hand in the two letters that went out to the *Lancet* and *Nature Medicine*. He was a signatory of the *Lancet* letter, a draft of which Daszak, the organizer of the letter, began circulating just five days after the conference. The letter sought to squelch all discussion of the possibility that the virus had escaped from a lab by deriding it as a conspiracy theory. When Daszak wrote an article in the

Guardian elaborating on the same theme, Farrar promoted it with a tweet, saying "as always worth reading @PeterDaszak."

Farrar also recruited the five authors who drew up the *Nature Medicine* letter, his spokesman told the writer Ian Birrell. (The spokesman referred to the *Lancet* letter but evidently meant the *Nature Medicine* letter, which has five authors.) The *Nature Medicine* letter, accepted on March 6 and published on March 17, 2020, presented a detailed and influential case that the virus had emerged naturally from animals. Its authors were Andersen, Rambaut, W. Ian Lipkin, Holmes and Garry.

In his book *Spike*, Farrar portrays the events between the February 1 conference and publication of the two medical journal letters as a judicious process in which he held an agnostic view and played no role other than asking questions. "On a spectrum if 0 is nature and 100 is release—I am honestly at 50!" Farrar says he emailed to Fauci and Collins a day after the conference. But if that were honestly so, he fails to explain his switch from 50 to 0 when signing the *Lancet* letter a few days later.

According to *Spike*, it wasn't until March, "after the addition of important new information, endless analyses, intense discussions and many sleepless nights" that Andersen and his four fellow virologists "were ready to pronounce on the origins of the novel coronavirus." Why then was Andersen, the virologists' leader, ready to pronounce just 3 days after the conference that lab release was a conspiracy theory? Farrar's account does not match with the available facts.

Nor does Andersen's. In a June interview with the *New York Times,* he painted a picture that includes a change of mind on the possible engineering of the virus "in a matter of days, while we worked around the clock," and then that quick reversal being buttressed by drawn-out research.

"This is a textbook example of the scientific method, where a preliminary hypothesis is rejected in favor of a competing hypothesis as more data become available and analyses are completed," he said in a statement released by Scripps Research after his Jan 31 email to Fauci had become public. "I cautioned in that same email that we would need to look at the question much more closely and that our opinions could change within a few days based on new data and analyses—which they did," Anderson said in the *New York Times* interview. In that same interview, he also said that "more extensive analyses, significant additional data and thorough investigations to compare genomic diversity more broadly across coronaviruses led to the peer-reviewed study published in *Nature Medicine*."

These later data and analyses would not have been available three days after the conference, the date of Andersen's volte-face email to Daszak. And they would not have been available to Farrar as he signed the *Lancet* letter, which was published just 17 days after the teleconference.

More puzzling is Andersen's statement that in his preliminary studies "the genome of RaTG13, a SARS-related coronavirus found in bats, wasn't yet available." In fact its full sequence had been deposited by Shi in a data bank on January 24, 2020, a week before Andersen's report to Fauci, and Farrar says in *Spike* that he had seen the sequence by the time of the conference. RaTG13 is the closest known relative of SARS2, and the fact that it lacks the furin cleavage site found in SARS2 would have been a major reason for the Andersen group to suppose that this genetic element had

been inserted into SARS2 in a lab.

Given his role in leading the February 1 teleconference, in presiding over the virologists' 180 degree change of views, and in arranging or influencing the *Lancet* and *Nature Medicine* letters, Farrar was evidently the driving force of the campaign to persuade the public that the SARS2 virus could not possibly have leaked from a lab. This was an unfortunate position for any scientist to take, given that he was assuring the public of something he could not be sure was true.

Farrar now says in *Spike* that, although natural emergence is more likely, "nobody is yet in a position to rule out an alternative." But his campaign sought very vigorously to do exactly that. "We stand together to strongly condemn conspiracy theories suggesting that COVID-19 does not have a natural origin," Farrar and his cosignatories wrote in the *Lancet* on February 18, 2020. This lapse in scientific judgment reflects also on the other senior participants in the conference who saw what was happening but apparently took no steps to insist that scientific truth should take precedence over unjustifiable professions of certainty.

RELATED:

Caltech's David Baltimore discusses the debate over origins of SARS-CoV-2

The decision to quash any notion of lab escape seems to have brought relief all round. At least until the tide of opinion began to change a year later, Fauci and Collins didn't have to endure unpleasant questions about why they had been funding hazardous research in minimally safe conditions at the Wuhan Institute of Virology.

"I just wanted to say a personal thank you on behalf of our staff and collaborators, for publicly standing up and stating that the scientific evidence supports a natural origin for COVID-19 from a bat-to-human spillover, not a lab release from the Wuhan Institute of Virology," Daszak emailed Fauci after a White House press briefing on April 17.

In August 2020 the NIAID announced it would award $82 million over five years to 10 participants in its new network for detecting infectious diseases. Among the lucky winners: Daszak, Andersen, and his associate Robert Garry.

The perturbing lab leak theory raised by Andersen and his colleagues on January 31, 2020 had been safely laid to rest. Farrar and his colleagues had succeeded in the one goal also pursued by the autocrats in Beijing, that of suppressing discussion of whether the SARS2 virus might have escaped from the Wuhan lab.

Beijing's way of squelching inquiry about the virus was, unintentionally, somewhat more obvious than the methods used in London. Chinese authorities tried so hard to stamp out information about the virus's origin that they left a rather clumsy trail of footprints pointing to where they didn't want people to go.

One of the more informative suppressions of data was the closure of China's main database on bat and other viruses. Zhengli Shi, China's leading expert on bat coronaviruses, told the BBC that it was taken off line because of numerous hacking attempts. It's conceivable that in January 2020, after the pandemic broke out, people

without authorized access might have tried to hack into the database. But in fact the database went off line on September 12, 2019. Who would have wanted to hack into a bat virus database back then? More likely, that is the date at which Chinese authorities realized they had a virus escape problem.

In February of last year, President Xi referred to the need to ensure biosafety and biosecurity, and the Chinese Communist Party followed by tightening up their biosafety rules in October 2020, accelerating a long planned revision. "To me, the fact that the CCP enacted a major series of laboratory biosafety regulations this past year is an indication that China's political leadership believes that a lab accident is likely to have caused the pandemic," says a biosurveillance expert who has monitored China's disease outbreak reporting for the past two decades.

Major clues as to what happened are evident in Shi's various pronouncements about the virus. The omissions and untruths in these statements are specific enough to outline the very body of facts the censors have sought to conceal.

Wuhan Institute of Virology researcher Shi Zhengli spoke about SARS during a Yixi event (comparable to a TED talk) on June 23, 2018. (Yixi video)

MORENS_SUBPOENA_021657
MORENS_NIH_042535
REL0000478369

In looking at Shi's questionable statements, it's only fair to keep in mind that they may have been compelled. Her train of deceptions began immediately after the genetic sequence of the SARS2 virus was published on January 10, 2020, by Yong-zhen Zhang of Fudan University, against the wishes of Chinese authorities who subsequently closed his lab for a time. Where did this strange new virus come from? Shi wanted or was told to establish SARS2's pedigree as a bat virus, with an ancestry analogous to that of SARS1, the bat virus that caused an epidemic in 2002. In an important paper published on February 3, 2020, Shi reported that the genome of SARS2 is 96 percent similar to that of a bat virus, RaTG13, "which was previously detected in [the bat species] *Rhinolophus affinis* from Yunnan province."

Shi neglected to mention a salient difference between the two viruses, namely that SARS2 possessed a furin cleavage site and RaTG13 did not. Alina Chan, of the Broad Institute in Cambridge, has likened the omission to describing a unicorn by reporting all its horse-like features, but neglecting to mention the horn. Evidently the Chinese authorities were highly sensitive to the furin cleavage site's presence.

Shi also failed to say when and where she had discovered the RaTG13 virus, surely important data for the closest known relative of SARS2. In fact, she had found RaTG13 in 2013, in an abandoned mine in Tongguan—the same place where six miners had fallen sick the year before. At that time, she analyzed just one of its genes and reported the virus under another name, BtCoV/4991. Daszak, the holder of her NIAID grant, told the London Times, perhaps on misinformation from Shi, that the virus was then thrown in a freezer and forgotten about until 2020. This was untrue—the virus was of much greater interest. Shi had analyzed its full genome, probably by 2018, but did not publish it. It was only when she needed a bat virus pedigree for SARS2 that Shi released information about the virus, which she now renamed RaTG13. The fact that BtCoV/4991 and RaTG13 were one and the same was discovered by Monali Rahalkar and Rahul Bahulikar, two internet-sleuthing researchers in Pune, India.

It's not acceptable practice among scientists to report something already published under a different name as if were new. Shi's February paper had the goal of portraying SARS2 as just another bat virus while concealing the true provenance of its closest known relative—a cave known to harbor lethal viruses.

When RaTG13's connection to the Tongguan mine was pointed out, Shi still tried to conceal the lethality of the mine's bat viruses, saying the miners had died of a fungus infection. This untruth was corrected when a master's thesis by a Chinese doctor, Li Xu, was unearthed by the internet sleuth who calls himself TheSeeker268. The thesis reported that the miners had died of a SARS-related virus with symptoms identical to those of Covid-19 and with CT scans similar to those of Covid patients. The only evident difference between that virus's effects and those of SARS2 is that the miners' virus was not readily transmissible from one person to another.

The specificity of what Shi's statements concealed—the furin cleavage site, RaTG13's identity with BatCoV/4991, the latter's origin in the mine where six miners were infected, the death of the three miners from infection by a virus with symptoms very similar to those of SARS2—all point to the involvement of these elements in a scenario the Chinese authorities are determined to cloak. That scenario may have been the storage or generation of the SARS2 virus in Shi's lab from one of the many viruses recovered from the Tongguan cave.

The Chinese government's persistent stonewalling and Shi's pattern of evasions do not amount to proof that the SARS2 virus escaped from her lab. But they seem less like the actions of innocent people and more like attempts to cover up a fatal accident, one that has caused the deaths of maybe 10 million people and counting.

Perhaps proof will one day emerge that the virus emerged naturally. If not, the likelihood that SARS2 escaped from a researcher's laboratory is an albatross that will hang round China's neck in perpetuity. China's only hope of release from this terrible encumbrance lies in opening its laboratory doors and either establishing its innocence or admitting its fateful error.

Cheers,

Peter

Jason, not sure whose office politics is worse, but there is many a day I'd rather be in Australia, even if I had to drink that awful beer Fosters. (To quote Grouco Marx as he help up a glass of questionable beer: "last time I saw something like this, they had to shoot the horse")…. But I do have fond memories of Australia, and two of my closest freiends, both ex-students of mine, are out in Perth, the only large city there (if oy can call it that) I have never been, although it's high on my bucket list if this damn pandemic ever ends. He's an American public health physician and she's an Australian-Tongan PhD virologist, both wondeful smart people.

Thanks, David.

I just got off a video conf call with the current editor in NY (the one asking all the latest questions). He's very nice and I feel like he gets its. He thinks it's a fascinating story.

Problem we have in journalism is that there are some people who aren't interested in actual journalism and telling stories; they want to climb to the top and manage people. I rejected the latter route 10 years ago, but am so grateful that I still get to meet so many remarkable people, visit cool places and see all aspects of humanity.

A difficulty working for a NY-based organization is that it's assumed that all the best people are in NYC, so being in Melbourne (where I need to be to be close to my kids in Adelaide), is that folks consider Australia a backwater and, by association, I mustn't be all that important/valuable. But my new role as "global biosecurity czar" is helping somewhat.

Ahhhhh... Office politics!

Jason, all I can say is that it must be harder to be a journalist than a scientist.... I had no idea someone at your level would get pushed back.

Usually i get from one to 4 reviewer responses to a ms. and three of those are out to lunch. Occasionally i get a reviewer who really understands the work: half of those are helpful, the other half are trashers.

Maybe it's like being in the government where i am: there is endless push back, but the push-backers are brainless idiots who don't know what they are talking about.

Do you ever get to a point where the editors leave you alone on the science? Or do they all think they are science geniuses? d

> When you look back at what's happened here, it seems that in trying to deflect blame for the pandemic, which became increasingly vicious as the cataclysmic nature of the Covid-19 pandemic unfolded around March-April 2020, China tried to conceal a very obvious, very plausible source of the pandemic: it's flourishing wildlife trade (worth about $90 billion in 2016).
>
> It was an obvious cause of the pandemic because an almost identical scenario triggered an international outbreak caused by a very similar coronavirus (SARS) in 2003-04. But in attempting to cover up the wildlife trade, and making like there were never any wild animals being sold in Wuhan's wet markets, things began to backfire on

China; questions were raised about the nearby lab studying these coronaviruses. The more geopolitical, heated and vicious the arguments and accusations became, the less cooperative China became. In response, the more intent/adamant some groups have become in their belief that China is covering up a lab-leak. It's become a vicious circle. If China isn't coming clean on the wild animals, what else is it trying to hide?? China's defensiveness means we may never get the cooperation needed to find the answers. If China had been honest and transparent about the wild animals in the wet markets, it might not be in this mess now.

Anyway, here are my response to your queries in green.

By the way, I wonder if the current headline:

Delayed Paper Gives Credence to Wuhan Market Covid Origin Story

doesn't convey much more than what we had 2 months earlier when we reported Xiao's findings: China Markets Sold Mink, Civets, Stoking Natural Origins Theory

Perhaps Obscured China Paper Scuppered Chance to Trace Covid Origins

would hits "China", "Covid" and "Origins" in a way that won't alienate people who already believe it was a lab-leak

<><><><>

According to the report, minks, civets, raccoon dogs and other mammals known to harbor coronaviruses were sold in plain sight for years in shops across the city, including the now infamous Huanan wet market, to which many of the earliest Covid cases were traced. The evidence collected over 30 months by **Xiao Xiao** a I'D NAME HIM HERE [[i don't know that naming a researcher

no one has ever heard of adds much]]researcher working at a lab affiliated with China's Ministry of Education was hastily drafted into a manuscript and submitted to a scientific journal [Joel, we cannot name the first journal they delivered it to because the authors decline to give us the name, saying it may affect their future chances of being published] in February 2020, just weeks before the outbreak was declared a pandemic.

<><><><>

While the study received wide attention when it was eventually released by a different publisher [Publisher (Springer Nature) and publication (Scientific Reports) are different. Might add confusion DO YOU WANT TO ADD NAME HERE?], its long and torturous journey to publication gave **Chinese officials an opportunity to weave alternative narratives in which the virus may have come from abroad, even from a U.S. Army biological research facility**. [the stuff in bold is not contested and we go on to show how that happened, documenting with links when available]I TWEAKED WORDING HERE BUT THIS STILL ISN'T QUITE RIGHT. IF THE REPORT HAD BEEN PUBLISHED EARLIER CHINESE OFFICIALS COULD STILL HAVE DONE WHAT THEY DID—THEY COULD HAVE JUST SAID THE REPORT WAS SHODDY, OR WHATEVER, AND THEY ALSO COULD HAVE JUST IGNORED IT. I disagree. The evidence that Xiao et al provide was meticulously documented and supported by photographs that would have been difficult/impossible for China to dismiss (as older published photos and media reports had been). What's more, Newman understands that Xiao collected blood-sucking ticks from the wild animals he studiously cataloged. His frozen tick samples could be tested for blood/antibodies/virus , which could be extremely helpful in identifying infected species PRIOR to December 2019. The WHO team knew nothing of this, so couldn't have asked China for this research or any results, had they actually done the research. The delay in the publication of Xiao's paper delayed the evidence that there were live animals sold in the Huanan market. The WHO researchers couldn't have asked about tests on wildlife that ostensibly were never there. Likewise, Chinese authorities couldn't have done the tests on

animals that didn't exist. The problem is that in January and February 2020, it was widely assumed the animals HAD been there and that the necessary tests and tracing of animals (the sampling of animals on farms they were raised on, testing of farm workers, animal hunters, transporters and traders **had all been done** by researchers in China -- the very things that ultimately led to the discovery of the origins of SARS and of MERS viruses. **None of these things were done** (or at least, there is nothing publicly available to show that they were done) **because the animals "weren't there"**. Now that we all know they were there, China as lost considerable face. The issue has become so political than there is much less/?no willingness to cooperate and conduct the additional research that the WHO-led team recommended. Ideally, Xiao's ticks should be studied, but it's doubtful that will now happen (I wouldn't be surprised if he's been ordered to incinerate them!) Hope this is clear.

<><><><><>

An international team of experts convened by the WHO traveled to Wuhan earlier this year to seek answers—a trip that might have yielded different results if the scientists had known about the work of Xiao Xiao, a virologist whose roles straddled epidemiology and animal research at the government-funded Key Laboratory of Southwest China Wildlife Resources Conservation and at Hubei University of Traditional Chinese Medicine.‘MIGHT HAVE YIELDED DIFFERENT RESULTS’ SEEMS HIGHLY SPECULATIVE. WHAT RESULTS DID IT YIELD? I’D CUT THIS GRAF

As mentioned above, the WHO-convened team of researchers was told by market authorities, vendors and regular market visitors that there were no live animals sold in the Huanan market. That undermined completely the premise that the Huanan market was the kind of place where live animals from different species are stacked in cages, with urine and fecal material drips from one cage to the one below it, where there are splatters of blood and guts from animals, and lots of potential for the spread of diseases from one species to another (including Homo sapiens).

Instead, the market (and one other one known to have been selling live wild animals in 2019) was presented as selling only frozen wild animals and aquatic species and things unlikely to be the source of SARS-CoV-2. The WHO researchers were told there were frozen ferret badgers and other wildlife found in freezers. Some of the carcasses actually came from Yunnan, the province where the closest coronavirus related to SARS-CoV-2 was found in bats -- thus establishing a potential route from Yunnan to Wuhan in wildlife. That was actually important. When the researchers showed their Chinese counterparts photos of caged raccoon dogs taken in the Huanan market by Prof. Edward Holmes five or six years earlier, they were told by Chinese scientists that the photos may have been faked, and that the market had ceased selling such live animals anyway. The WHO researchers saw no evidence (empty cages, animal pelts, etc) to dispute what the Chinese scientists told them, although they did smell "animals" -- but were told they were smelling rotten meat, sewage etc. Three people associated with the WHO-led mission told me that they didn't believe the information they were given by anyone associated with the market. But since there was no evidence to the contrary, they were unable to push the Chinese scientists further on this. T**he fact that the mission concluded that frozen, not live wild animals were sold in the market undermined the thesis that Covid resulted from an animal spillover**. And the absence of strong evidence pointing to a spill over from wild animals to humans made the lab-leak theory look, in relative terms, more plausible.

<><><><><><>

Six months and two revisions later, the journal's publishers rejected the paper. "They did not think it would have widespread appeal," says Newman, who declined to name the publication [do you want us to say why he won't name it? I don't think it's necessary. There's no upside for scientists to make a publisher look bad (most journals are published by a handful of publishers)] "It caused us, especially our Chinese co-authors, concern that these data would not be taken seriously."

<><><><><><>

The manuscript underwent a third revision to include data on China's pangolin trade networks (an earlier study, later contested, had implicated pangolins in the virus's spread to humans)WHO ASKED THAT THIS INFO BE INCLUDED? (I did, because we're trying to explain here why WHO missed the significance of Xiao's evidence. The WHO was slammed by other papers being submitted PLUS Xiao's paper had a weird title. That title seemed relevant to the authors back in January-February 2020, when pangolins were considered a possible SARS-CoV-2-spreading culprit. But in October 2020, pangolins were off the hook, so the title would have seem irrelevant/unimportant at first glance at WHO). It was then sent to the online journal *Scientific Reports*.

<><><><><><>

The China-based researchers had reason to be cautious. In February 2020, the China Center for Disease Control (CCDC lets not use "CCDC". It's not commonly used like the U.S. "CDC" is, and it's going to force readers to go back and figure out what the "CCDC" is) prohibited scientists working on Covid-relate

<><><><><><><>

~~CCDC~~ Disease detectives arriving from Beijing (think this makes it clear that these are China's disease "feds" arriving) on the first day of 2020 ordered environmental samples to be collected from drains and other surfaces at the market. Some 585 specimens were tested, of which 33 turned out to be positive for SARS-CoV-2. "All current evidence points to wild animals sold illegally," China CDC Director George Gao and colleagues wrote in the agency's weekly bulletin in late January. All but two of the positive specimens came from a cavernous and poorly-ventilated section of the market's western wing, where many shops sold animals.

<><><><><><><><>

~~The information void kindled a raging political debate that's already caused a trade war between China and Australia, as nations~~ demand to know ~~how Covid emerged.~~

Australia in April 2020 called for a global inquiryinto the origins of the pandemic, including China's handling of the initial outbreak. Days later, then-U.S. Secretary of State Mike Pompeo used part of his Earth Day message to call on China to close its wet markets to "reduce risks to human health inside and outside of China."

Based on a discussion today with someone with knowledge of the WHO-led mission to Wuhan in Jan-Feb 2021, a significant catalyst for China's defensiveness is the emergence of **claims for reparations** that extended from the finger-pointing at China's wet markets. These surfaced in April 2020, and have continued as recently as June 2021 (when Trump pushed for it again at a rally in the Midwest)

SO IS THIS THE POINT AT WHICH CHINA, WHICH SEEMINGLY ACCEPTED THE WET MARKET HYPOTHESIS, BEGAN TRYING TO CREATE A DIFFERENT NARRATIVE? (I think it was incremental. I believe China was embarrassed that its citizens were still buying wild animals in wet markets to eat -- a well-known hazard for zoonotic disease transmission that China tried unsuccessfully to outlaw almost 20 years ago. But that embarrassment/humiliation morphed into rigid denial and obfuscation when governments began openly blaming the Chinese Communist Party and agitating for China to pay reparations for the pandemic. See these clips:

- USA Today: Blame the Chinese Communist Party for the coronavirus crisis: Coronavirus crisis proves communism is still a grave threat to the entire world. If Beijing had just been honest, the pandemic could be preventable. April 5, 2020

In response, Geng Shuang, a spokesman for China's Foreign Ministry, denied "wildlife wet markets" existed in the country. Government researchersCAN

WE BE MORE SPECIFIC? Twenty-two researchers from mostly nationally-funded laboratories (I think it's the Chinese equivalent of the NIH in the U.S.) and institutes attached to the Chinese Academy of Sciences) now dismiss the market hypothesis completely. “SARS-CoV-2 could not have possibly evolved in an animal market in a big city and even less likely in a laboratory,” they wrote in a paper released last month ahead of publicationWHERE/WHEN WILL IT BE PUBLISHED? It was released as a "pre-print" on a Chinese academic repository ahead of publication that appears to be managed/owned by the Chinese Academy of Sciences. Papers are usually released in pre-print form before they have been accepted for publication or peer-reviewed as a way of expediting public access to the information. In this case, there is no information to suggest if, where or when the paper will be published.

<><><><><><><><><>

A more recent paperBY WHOM? (China CDC's Gao and eight other scientists mostly from the Chinese of Academy of Sciences' institutes) contends that the virus may have been imported from multiple locations worldwide, including parts of Europe where mink are raised in areas inhabited also by horseshoe bats known to harbor coronaviruses. “The official narrative changed not because the evidence changed,” says Robert Garry, a professor of microbiology and immunology at Tulane University’s School of Medicine in New Orleans “A spillover from a wet market was what caused SARS, and, embarrassingly for China, those wet markets were never shut down.” Garry is the co-author of one of the earliest papers on the origins of Covid but wasn’t involved in the research on Wuhan’s markets.

<><><><><><><><><>

I DON’T REALLY UNDERSTAND WHAT POINT THIS GRAF IS TRYING TO MAKE. This is intended to demonstrate the kind of gaslighting that has occurred. Some of the WHO-led researchers are veterinarians and zoologists -- they know what animals smell like,

and could smell their lingering presence a year later, but were told essentially that it was impossible that they were smelling animals because **there "were no live animals there"**.) The researchers noted a mixed smell of animals and disinfectant in some areas of the market, but they were told by the market's manager that they were probably smelling the lingering stench of rotten meat and sewage, according to a joint WHO-China report. [should we add "according to Laing Wannian etc here? Liang Wannian was the leader of the Chinese research team collaborating jointly with the WHO-led research team. The source for the above description are in the annexes to the official joint WHO-China report released at the end of March 2021.]

<><><><><><><>

Earlier the same day, the international research team visited Wuhan's larger Baishazhou market, where Xiao had regularly surveyed two sellers of live wild animals. Yet the group was told only frozen food, ingredients, and kitchenware were on offer there. Liang Wannian, an epidemiologist who led the Chinese experts collaborating with the WHO-convened team, says his group had no knowledge of Xiao's data either. [if the above information on what the delegation saw all comes from this same source, maybe we should include his name higher up (The source for the description of what the origins researchers saw on Jan. 31, 2021, comes from the official 120-page joint WHO-China report and its 193-page annexes, not from Liang. Since we are essentially accusing China of concealing the information that Xiao documented, we asked Liang at a press conference in late July 2021 when the Chinese team first knew about Xiao's findings -- that the Huanan market and three others in Wuhan were selling live animals permissive to SARS-CoV-2 infection -- and what research China has done subsequently as a follow-up on this information? Liang gave a very long-winded response in Chinese in which he said essentially "we didn't have that information in January-February 2021 when the research team was in Wuhan". I think it's important we keep this to demonstrate that we have tried to ascertain what China knew/has done and have given the Chinese researchers the opportunity to respond. In

addition, I have emailed China CDC Director George Gao at least twice and not received any response.]

<><><><><><><><>

Among the earliest clusters of infections recorded in Wuhan, one involved three Covid cases among staff working at a stall in Huanan. One of the employees, a 32-year-old who fell ill on Dec. 19, traded goods back and forth between the Huanan and Baishazhou markets.

WHERE DOES THIS FACT COME FROM? NOT THE REPORT, RIGHT? WHEN DID IT FIRST BECOME KNOWN? This information was from the joint WHO-China report released in March 2021, however, the WHO-led researchers went to the Baishazhou market more as a demonstration by the China team of what a perfectly functioning large food market looks like. The WHO-led team was oblivious to Xiao's research that showed there were at least two stalls in Baishazhou that had been selling live wild animals for human consuption. So this detail and its significance was lost on the WHO researchers at the time.)

<><><><><><>

A confirmed case linking two markets that sold wild animals is “very intriguing,”says Stephen Goldstein, a research associate in evolutionary virology at the University of Utah in Salt Lake City. But tracing any contact the employee might have had with infected wildlife is impossible now that the animals are long gone.WOULD TIMELY PUBLICATION OF THE REPORT HAVE CHANGED THIS? It's unlikely that Xiao et al's paper would have been *published* soon after It was drafted in February 2020, but it could have been *released* as a pre-print ahead of publication and peer-review that same month. That would have **confirmed** what almost everyone had suspected: that there **was** a flourishing wildlife trade in Wuhan that provides a plausible pathway by which coronavirus-infected wildlife from Yunnan and beyond could have introduced the virus to the city, sparking the Covid outbreak. It's also possible that swift

recognition of these potential wild-animal vectors could have allowed scientists to test them for the virus and for antibodies against the virus while they were still alive (perhaps not the ones from Huanan, but wildlife in the three other Wuhan markets). Because of the statements the Chinese authorities had been making in January and February that strongly supported the animal spill over theory, it was assumed that this research was being done. Of course, the pandemic was raging then, so it would have been challenging. But, because of the denial by Chinese researchers that wild animals were being sold in Wuhan wet markets before the pandemic, there was never that level of follow up. At least, if there was, it was never made public.)

<><><><><><><>

"It seems to me, at a minimum, that local or regional authorities kept that informationWHAT INFORMATION? (that Wuhan had a flourishing live wild animal business going on in its wet markets before the pandemic) quiet deliberately," Goldstein says. "It's incredible to me that people theorize about one type of cover-up, but an obvious cover-up is staring them right in the face."

By the way – Allegations that me sending information to David Morens is somehow corrupt are outrageous. Tony Fauci was busy working with the White House COVID taskforce at the time, trying to halt the worse pandemic since the 1918 influenza outbreak. I would have happy emailed him directly, but pretty sure he wasn't checking each of his 50,000 emails a day!

Cheers,

Peter

Subject: Today's news...

Had a very successful EcoHealth Alliance benefit last night – sorry some of you couldn't be there.

Michael Mann was our main honoree, and he was great! We raised well above our expectation – all critical to keeping us afloat given the increased pressure we're under right now.

Speaking of which – here's the latest attempt from the SSCP to smear David Morens, EcoHealth Alliance and others as being involved in a 'cover up'

https://nypost.com/2024/04/19/us- news/ex-fauci-adviser-shared-confidential-nih-info-with-ecohealth-about-covid-biosafety-levels-docs/

Basically, they've found an email from me to David, Jerry others when the allegations that EcoHealth expts were conducted at an insufficient BSL level first came out. Tony Fauci was interviewed and said that he would look into it. I sent David M. a review I'd done of the BSL rules for Bat CoVs in various countries, which clearly show that we were operating at the correct biosafety levels.

Cheers,

Peter

Importance: High

Good to talk with you yesterday Michael. We got more negative press yesterday, this time related to emails that allegedly show coverups and inappropriate behavior among scientists. The Republicans released only the subject line and addresses etc. (https://oversight.house.gov/release/wenstrup- reveals-emails-from-whistleblower-alleging-additional-attempts-by-fauci-advisor-to-subvert-transparency-about-covid-19-origins/), leading to BS stories in the usual right wing press. We released the full text of the emails today:

https://www.ecohealthalliance.org/2024/04/ecohealth- alliance-releases-emails-that-are-the-subject-of-false-allegations-in-the-press

These are all from me to senior NIAID staffmember David Morens and former NIH Center Director Jerry Keusch, trying to make sense of the termination of our grant by Trump, and to find a way to get it reinstated. In the end NIH did reinstate the grant (May 2023). One of the chains shows emails that refer to the pressure from Michael Lauer, and the fact NIH instructed me not to talk with our program officer (Erik Stemmy) and direct all communications to Grants Management (Emily Linde). That was another highly unusual move from NIH and is part of the pattern that I was talking with you about.

Here is that particular set of emails: https://www.ecohealthalliance.org/wp-content/uploads/2024/04/Emails- 01.pdf

To: Peter Daszak b6
Subject: Re: Confidential - NIH still hampering EcoHealth's ability to conduct work 4 years since the termination of our grant

Peter,

Let's set up a time to talk next week (Wednesday or later best for me). On first glance, it strikes me that I'm glad I'm not in the grants-application business, because the bureaucratic behavior here seems incomprehensible, at least to a layman.

What's the overarching theme in their relations with you? Is it pressure from the lab-leak crowd, the FOIAing from Tobias, which as far as I can tell has yielded nothing of any substance? A spillover from the Trump era?

I read the Science piece, which was thorough in detailing what was done to the Chinese

MORENS_NIH_044603
REL0000478370

researchers but silent on what provoked it....what was the question I was left with--Why did NIH do all this?

MH

> Hi Michael, I'm just contacting you off the record in case you or others are interested in reporting on what's going on at NIH with respect to EHA's grants. We were trying to deal with this privately, without it becoming public, but we found out last week that some of our recent correspondence with Emily Erbelding asking for her help is in a batch of FoIA's emails that will be released to Jimmy Tobias in the next couple of weeks. Tobias is in the habit of simply dumping these on the internet, so we wanted to get these to a bona fide reporter before that happens.
>
> As you probably know, our organization has been funded by NIAID for around 20 years, conducting successful research on emerging diseases, and working closely with communities, scientists and governments in emerging disease hotspot countries to try to reduce the risk of disease emergence. Prior to the termination of our R01 grant in April 2020 that would have had the Wuhan Institute of Virology as a subrecipient, we had never had any issues with NIH or NIAID, and had been lauded by program officers for our cutting edge research into viral emergence, and the many papers in Science, Nature, NEJM and others based on NIH funding.
>
> After the termination of our grant, the HHS OIG was called in to audit our work and NIH's oversight. They reported back after an 18 month audit with recommendations for both us, and for NIH, most of which were minor and easily addressed. We rapidly complied and NIH's DFAS group confirmed that all audit findings were resolved. However, we continued to receive further actions from the Office of the Director (Michael Lauer, who *Science* wrote about re. NIH's actions on grantees with China connections https://www.science.org/content/article/pall- suspicion-nihs-secretive-china-initiative-destroyed-scores-academic-careers), and the NIH group that manages oversight (OPERA) directly under Michael Lauer. In April 2023, Michelle Bulls from Opera and Emily Linde from NIAID placed 4 Specific Award Conditions (SACs) on our grants. At the time, Michael Lauer had contacted Tufts University who oversaw our IACUC approvals to conduct wildlife sampling because EHA doesn't have an animal facility. This led to Tufts canceling our interinstitutional agreement. The only way for us to proceed was to request an Animal Welfare Assurance from OLAW (based at NIH), but this was denied because of these SACs. One of the SACs stated that all of our subcontracts must be reviewed and revised by NIH reviews. We worked extremely hard to rapidly respond (often within days) to every single request, despite many of them being contradictory or having no material impact on the contracts. In the original letter NIH set a deadline of September 2023 to resolve the SACs, which due to repeated delays by NIH grants management staff in responding to us, continued further requests and shifting of the goalposts means we still do not have resolution. Furthermore, grants management are now suggesting that we are beyond the period of work and our subcontractees won't be able to be reimbursed. Additionally, during the past 12 months, NIH has only reimbursed EcoHealth for around $50K of the now nearly $2 million we are expecting and have expended.
>
> As you can imagine, this puts us in a very difficult position, with institutions like UNC and Uniformed Services University likely to be outraged that their funding is threatened,

and with us unable to do our work fully – work that has been reviewed, scored well, and is critical to pandemic prevention. We've tried every possible avenue to get a fair and reasonable rapid resolution. We've informed Emily Erbelding of these issues (hence the FoIA'd email), and Program staff at NIAID remain supportive of our work, but we still have no resolution. Every time we try to seek a meeting or resolution, we get a hard response from NIH that we're out of compliance and they set further deadlines and further minor issues for us to fix. Right now I believe we're probably in greater compliance with NIH rules and just about any other institution in the US, given the level of scrutiny we've gone through. I've attached some of the many recent letters between NIH OPERA, NIAID Grants managements and EcoHealth Alliance to give you an indication of the levels of detailed work that we've gone through to try and resolve these issues.

We don't know the reasons why this is happening – all our subcontracts prior to April 2023 covered every single requirement in NIH's grants management guidance, subrecipients had to sign that they would adhere to these. The stonewalling, and shifting of goalposts by NIH is linked to emails that they send us stating that we're 'delinquent' or 'out of compliance', or that they're 'concerned' etc. and seem to us designed ready to be FoIA'd (which they are being) or to be used when NIH has to show Congressional Republicans that EcoHealth is being treated in the way they are calling for. Meanwhile, important findings can't be reported, including a novel SARS-CoV-2 related virus able to bind well to human ACE2 that we have found in one of our country sites, but are now unable to publish because our subrecipient is concerned they don't yet have an approved contract. This is hurting our ability to conduct pandemic prevention work, and the US's ability to be informed about public health threats that could emerge and threaten our citizens.

If you want to report on this, I'm happy to talk on-the-record on some issues, and there are others who are aware of these problems that I can put you in touch with, including at NIH and senior people from outside.

Cheers,

Peter

Yes, amen..... and as i have been saying to Peter, the more that scientists hide from the wrath of these people, the more we encourage them. These guys play hardball, so my question to leaders like you is what can we scientists do, within the context of our commitment to evidence, objectivity, and fairness, and our unwillingness to fight dirty, as we stand up for the truth and call their bluffs?

I don't know. I just don't know, but feel we can be doing more, not only personally but through different scientific organizations, especially if working together in common. That did not happen much 10 years ago with the H5N1 gain of function debacle. At the time, so many scientists said, this is terrible, we have to do something.... But not me, i don't want to get death threats, or lose my grants, or be harassed by politicians or reporters, or get into contentious stressful arguments or be attacked in editorials.....

Tony played it very cool and appeared to be uninvolved, but in fact did much behind the scenes to put the fire out. It took several years, and was draining to all of us. d

This is interesting because like you, Peter, Eddie and his family have been under frightening death threats. when i approached him last summer about signing on as a co author he declined out of fear, but did help behind the scenes. he must be rethinking what role he should play. he also has the qualification of not being an American and is perhaps our leading viral phylogeneticists, who has trained some of the other leading phylogeneticists. d

Wuhan officials identified Huanan market as a pandemic risk at least five years before Covid emerged

Experts say market was either the site of an initial 'spillover' of Covid, or 'amplified' early circulation through a super-spreading event

By Sarah Newey, Global Health Security Correspondent 18 April 2021 • 5:00pm

Health experts in Wuhan knew the wet market at the centre of the coronavirus outbreak was a pandemic risk at least five years before Covid-19 emerged, a British scientist has revealed.

In 2014 Dr Eddie Holmes, an evolutionary biologist and virologist, was taken to the Huanan seafood market by members of the Wuhan Centre for Disease Control, who used it as an example of the type of place where a virus could "spillover" from animals to humans.

MORENS_SUBPOENA_019825
MORENS_NIH_039560
REL0000478462

Dr Holmes, who now works at the University of Sydney, said the visit was part of a wider project to hunt for new pathogens with pandemic potential in China.

"The Wuhan CDC took us there, and here's the key bit, because the discussion was: 'where could a disease emerge?' Well, here's the place – that's why I went," Dr Holmes told *The Telegraph* in an interview.

"I've been to a few of these markets, but this was a big one – it felt like a disease incubator, exactly the sort of place you would expect a disease to emerge".

Live animals held in Wuhan's Huanan market in October 2014, taken by Dr Eddie Holmes during a visit to the site Credit: Eddie Holmes

Dr Holmes, who took pictures at the time, remembers the now shuttered market as a sprawling network of narrow covered streets in the heart of Wuhan. It was late afternoon and not particularly crowded, but there were "crates of wildlife stacked on top of each other", including fish, snakes, rodents and racoon dogs – a fox-like animal known to be susceptible to Covid-19.

Many of the creatures were alive, added Dr Holmes, who remembers seeing one bludgeoned in front of him.

"An animal had got out or something, and somebody was clubbing it," he said, mimicking the hand actions over Zoom. "I think it was a racoon dog, though I couldn't quite see. It was pretty confronting."

Dr Holmes added that he is unsure whether the Wuhan CDC ramped up disease surveillance or introduced new safety measures in the years preceding the pandemic, and the China CDC has not responded to *The Telegraph*.

The Huanan market gained global notoriety when the first cases of Covid-19 (initially reported as a "mystery pneumonia" on December 31, 2019) were found in people who worked and shopped there.

Of the initial 41 people hospitalised with pneumonia who were officially identified as having Covid, two-thirds were exposed to the market, which was closed and sealed off by the Wuhan authorities on January 1, 2020.

Experts believe the site played a significant role in the initial circulation of Covid-19, either as the site of the initial "spillover" event where an animal virus jumps to humans, or as an "amplifier" of the early epidemic.

A report from the World Health Organization (WHO) on the origins of Sars-CoV-2 provided crucial details. Though it said "no firm conclusion" could be drawn on the precise role of Huanan market, it found the virus most likely jumped from bats to humans via an as-yet-unknown animal.

The wildlife trade in general, and wet markets in particular, have long been linked to the emergence of new pathogens. There is evidence Sars jumped to humans at markets in Guangdong, China in 2002 and data points to similarly a significant role in 2019.

In early 2020 Chinese researchers collected close to 1,000 samples from Huanan market – swabbing everything from rubbish bins, doors and stalls to stray cats and mice – and found widespread contamination "compatible with introduction of the virus through infected people, infected animals or contaminated products".

Meanwhile, of the first 168 Covid-19 cases, roughly a third had a connection to Huanan market. Genome sequences from some of those in this group found eight of the earliest samples were identical, confirming there was an outbreak there.

Yet the first person with a known link to Huanan market became ill on December 12, four days after the first known case. This suggests Covid-19 may have been spreading under the radar in several parts of Wuhan simultaneously before Huanan market amplified circulation.

The joint WHO-China team also found no evidence that live wildlife was still sold at the market – though noted that both Dr Holmes' pictures and "unverified photographs and videos in media reports" suggest otherwise – and none of 457 animal samples taken from the market between January and March 2020 tested positive for Sars-Cov-2.

The report added: "The manager informed the teams the market was cleaned twice a day, morning and evening. Pests and rats are sought out and killed; holes were closed. Rigorous cleaning was done once or twice a week. Even though there are rooms above some stalls, vendors were not allowed to live in the market."

But Dr Holmes and others, including members of the WHO team, believe more samples need to be taken to "follow the animals", and caution that finding wildlife involved in the early transmission chain is like finding a needle in a haystack.

MORENS_SUBPOENA_019827
MORENS_NIH_039562
REL0000478462

It is also possible that the virus was introduced to the market by an already infected person involved in earlier stages of the wildlife trade.

Live wild animals in crates stacked ontop of each other, taken in October 2014 during Dr Eddie Holmes' trip to the market Credit: Eddie Holmes

"We know how easily Sars-Cov-2 spread from minks to mink farmers in Europe," said Dr Dale Fisher, an expert in infectious diseases and chair of the Global Outbreak Alert and Response Network. "So it's likely this could happen on a farm, and the farmer was the index case who then took it to the market, where there was a super-spreading event.

"But evidence points towards wildlife. And whether it's been plague on rats, or Ebola on bats and primates, or Sars-1 on civet cats and bats, camels for Mers – historically these outbreaks all had species jumps and then amplification events," he told the *Telegraph*.

It is estimated that birds and mammals harbour roughly 700,000 viruses with the potential to jump to people, while 70 per cent of new emerging infectious diseases come from wild animals. Places where numerous species mix in close quarters with humans, with few biosecurity measures in place, are high risk.

Just this week, the WHO issued new guidance urging countries to crack down on wet markets and suspend the sale of captured live wild animals as an "emergency measure" to protect public health.

"In my mind, the wildlife trade is the most likely source of it. The role of that market is still uncertain, but there was clearly a lot of transmission and to me it smells like there's a strong link – we need to follow it through," Dr Holmes said.

"My concern is that the finger pointing has got so bad, will that happen? I think China just doesn't want it to be China… so then the question is, are we actually going to see all the data? I honestly don't know. But the more the politics gets into it, the less likely we will."

Biden receives inconclusive intelligence report on covid origins

The report falls short of concluding whether the coronavirus jumped from animal to human, or might have accidentally escaped from a lab in China

By
Ellen Nakashima
,
Yasmeen Abutaleb
and
Joel Achenbach

Today at 10:32 p.m. EDT
260

President Biden on Tuesday received a classified report from the intelligence community that was inconclusive about the origins of the novel coronavirus, including whether the pathogen jumped from an animal to a human as part of a natural process, or escaped from a lab in central China, according to two U.S. officials familiar with the matter.

The intelligence community will seek within days to declassify elements of the report for potential public release, officials said.

The assessment is the result of a 90-day sprint after Biden tasked his intelligence agencies in May to produce a report "that could bring us closer to a definitive conclusion" on the origins of a virus that has killed more than 4 million people globally and wrecked national economies. But despite analyzing a raft of existing intelligence and searching for new clues, intelligence officials fell short of a consensus, said the officials, who spoke on the condition of anonymity because the report is not yet public.

The debate over the virus's origins has become increasingly rancorous since former president Donald Trump said last year that the virus originated in a Chinese lab. Efforts to understand the virus's provenance have been complicated by Chinese authorities' steadfast refusal to allow a more intensive inquiry by international

investigators.
Biden's directive came after he received a May report from the agencies saying that they had "coalesced around two likely scenarios" but had not reached a conclusion. He disclosed that two agencies leaned toward the hypothesis that the virus emerged from human contact with an infected animal, while a third leaned toward the lab accident scenario.
The leader of the intelligence community, Director of National Intelligence Avril Haines, cautioned in June that the agencies might not solve the mystery. "We're hoping to find a smoking gun," she told Yahoo News in an interview. But, she said, "it's challenging to do that," adding that "it might happen, but it might not."
The review involved dozens of analysts and intelligence officials across multiple agencies, Haines told Yahoo. She said she deployed "red cells," or groups to test analysts' assumptions and ensure the intelligence is scrutinized from every angle.
Another official said the intelligence community is "not necessarily best equipped to solve this problem," which is fundamentally an issue of science. Although spy services are "positioned to collect on a range of foreign actors," the official said, they are not necessarily poised to dive into global health data sets.
Biden himself, in his first visit to the Office of the Director of National Intelligence in July, voiced the need for a more robust group to track pathogens. "You're going to have to increase your ranks with people with significant scientific capacity relative to pathogens," he said at the time.
Officials in the Biden administration hammered China's lack of transparency ahead of a World Health Organization report on the origins of the coronavirus. (JM Rieger/The Washington Post)
Many scientists familiar with the origin debate have been skeptical that the 90-day review would settle it, and some have said the inquiry could require years of research.
"We should not even be thinking about closing the book or backing off, but rather ratcheting up the effort," David Relman, a Stanford University microbiologist who has pushed for a broad investigation of all origin hypotheses, said late Tuesday in an email.
The notion that the virus may have escaped from a lab got sharply increased interest this spring after 18 scientists wrote a letter to the journal Science in May saying that all possible origins needed to be investigated, including a laboratory accident.
Proponents of that theory point to classified information, first disclosed in the waning days of the Trump administration, that three unidentified workers from the Wuhan Institute of Virology — one of the world's preeminent research institutions studying coronaviruses — went to the hospital in November 2019 with flu-like symptoms. In China, people visit the hospital for routine and mild illnesses.
Throughout 2020, that hypothesis became enmeshed in election-year politics. Trump's assertion that the virus emanated from a lab came as he and other administration officials were blaming China for the global outbreak and trying to deflect attention from their botched handling of the virus at home.
Many scientists, however, noted that viruses have a long history of jumping from animals to humans. There are many plausible scenarios in which that might have occurred, including the possibility the virus spread from wild and domestically raised animals sold in crowded markets. Many early cases were clustered around a seafood market where traces of the virus were later detected on surfaces.
That zoonosis theory was bolstered by a June 7 report, published in the journal Nature, documenting 38 species of animals sold in 17 markets in Wuhan before the pandemic. The authors said many of the animals suffered from poor hygiene and were known to carry zoonotic diseases.
"We now know for sure that [coronavirus] susceptible animals were in fact sold at the markets in Wuhan, which changes the calculus tremendously," Robert Garry, a Tulane University microbiologist who strongly supports the zoonosis theory, said in an email.
Experts in viral genome evolution also determined that the novel coronavirus almost certainly was not engineered as a bioweapon because it has several naturally occurring features seen in many other coronaviruses. But even scientists favoring a natural origin have said that without definitive evidence of animal-to-human transmission, it is not possible to rule out the possibility that a laboratory accident led to the outbreak.
And many questions remain unanswered. The animal that carried this virus before it infected people has not been identified — a process that has taken years in previous disease outbreak investigations. Nor have the lab-leak advocates found any direct evidence that SARS-CoV-2 was inside a laboratory in Wuhan before the pandemic, although the lab has not released its records, which have been sought by scientists and governments

around the world.
A delegation of investigators from the World Health Organization made a brief visit to the Wuhan laboratory in February and later declared that there were multiple possible origins, with a natural zoonosis most likely and a lab leak "extremely unlikely."
But the WHO director general, Tedros Adhanom Ghebreyesus, undercut that conclusion, saying it would be premature to rule out the lab-leak theory. The WHO effort was also criticized by some international scientists and researchers, who called for further investigation.
White House press secretary Jen Psaki on Monday said the public would be told the report's outcome. "I don't know what format that will take at this point in time," she said.

Cheers,

Peter

Seems to lay things out well. I feel sorry for the int'l team. They didn't decide on/agree to the terms of reference, so the response from the DG on the final report (which he waited for until weighing in) seems disingenuous to me.

From: Paul Geitner (BLOOMBERG/ NEWSROOM:) At: 08/23/21 16:40:56 UTC+10:00
To: Jason Gale (BLOOMBERG/ NEWSROOM:)
Subject: Re:Fwd:Economist - Shared Article 'Putting it all together'

"The virus mystery" broadcast on August 12th, drew uncommonly wide attention for a Danish television documentary. That was because it featured Peter Ben Embarek, an expert on food security and zoonotic diseases, casting doubt on the conclusions of a "joint study" on the origins of the covid-19 pandemic carried out earlier this year under the auspices of the World Health Organisation (who). Dr Ben Embarek was the senior who figure who went to China as part of that study.

In March the joint study reported that it was "extremely unlikely" that the virus had been released in a laboratory accident. Dr Ben Embarek revealed that this conclusion did not come from a balanced assessment of all the relevant evidence but from a steadfast refusal by the Chinese members of the joint study to support anything stronger. Indeed they only allowed even that minimal assessment on the condition that the report did not call for further investigation into the question. He also pointed out that the idea that the point of spillover was someone collecting bat samples for research purposes belongs in the "likely" basket, along with other human interactions with wild bats.

Problems in the joint study had long been clear. Within the
who one source describes it as "riddled with compromises and sloppiness". Tedros Adhanom Ghebreyesus, the
who's director-general, was uneasy about the way it was carried out. He pushed back at the marginalisation of the lab-leak hypothesis, particularly when the final report was released in March. He has since called for further investigations into it, as well as into other possibilities.

The further unravelling of the joint study matters because, more than a year and a half after the covid-19 outbreak in Wuhan, a city in Hubei, was first recognised as the work of a new pathogen, there has been nothing like a thorough international investigation of how that pathogen,
sars-cov-2, got into humans and spread round the world. The pandemic's death toll stands at 9m-18m, according to a model which *The Economist* has built on the basis of excess-mortality reports and other indicators. The question of how it started matters both for the relatives of the dead and for those who wish to prevent such an outbreak happening again. China's efforts to stop the world from answering it are both shabby and, to an extent, self-defeating. The more the truth seems hidden, the more it seems suspicious.

Earnest calls for an international investigation into the origins of covid-19 began in April 2020, voiced most clearly by Scott Morrison, the prime minister of Australia. The next month the World Health Assembly, the gathering of government representatives which serves as the
who's decision-making body, passed a motion calling for a study into the origins of the pandemic. But in order to be acceptable to China—which had reacted furiously to Mr Morrison's original suggestion—the work was set up as a joint research project between two teams of scientists, one Chinese, one international. And it was to be based on "scientific and collaborative field missions", rather than a targeted and forensic inquiry into

all the relevant circumstances.

The terms of reference, which were subsequently negotiated behind closed doors, allowed the Chinese hosts to frame the joint study's work in the way which best suited them. The study was set up to build on pre-existing Chinese research, not to delve into unvetted data. Investigating the laboratories that had been working with coronaviruses like sars-cov-2 in Wuhan was not part of its terms of reference.

After a lot of wrangling, the international team got to China in January this year. Data about the first reported covid-19 cases, those from December 2019, were one subject of friction with their hosts. The Chinese had reported 174 such cases, but would not share the underlying data on which those reports were based. Hearing that these vital data were not being made available worried Dr Tedros enough that he lobbied the Chinese government for access. The authorities declined, citing concerns over citizens' privacy. It could have been anonymised.

Elsewhere the team appears to have been knowingly misled. Take, for example, the live-animal trade at the Huanan seafood and wildlife market, a site associated with a number of Wuhan's earliest recorded cases of covid-19. In its final report, the study group took at face value claims there was no credible evidence that live mammals were sold there in 2019. A lot of eyewitness accounts gainsay that; so does a study published in *Scientific Reports*, a journal, this summer.

One report and no more

The *Scientific Reports* paper found that 18 species of mammal had been for sale in Wuhan between May 2017 and November 2019; gunshot wounds and trapping injuries suggested that almost a third of them were taken from the wild. Although the paper was published only recently, it was submitted to the journal in October 2020. Chinese law requires that all covid-19 research be reviewed by the government before it is sent to a journal. Some Chinese authorities would have known of its contents before the team arrived.

The market is not the only way for animals and the pathogens they carry to get into Wuhan. The horseshoe bats in which the closest wild relatives to sars-cov-2 have been found do not live anywhere near the city, but the two laboratories there that were known to have engaged in coronavirus research received samples from bat caves around the country. The joint-study team was not allowed to investigate the procedures around, or documentation of, this research; when it visited the laboratories the team was shown presentations on safety procedures but no more.

When the researchers left Wuhan the who 's Geneva headquarters told them that their report needed to be laid out scientifically and could express dissenting opinions; the international members and the Chinese members did not have to reach a consensus. However, according to sources within the who , the team felt committed to producing a joint report with their Chinese counterparts. Dr Tedros was so unhappy with what finally emerged from the processes that he nobbled the report as it left the starting blocks, rejecting its contention that the possibility of a lab leak needed no further investigation.

On May 26th President Joe Biden ordered America's intelligence services to report on the pandemic's origins in 90 days (time will be up on August 24th). When he and his fellow g7 leaders met in June they joined in calling for a timely, transparent and science-based follow-up study. On July 16th Dr Tedros laid out the next steps which the who wants to see taken. They include further work on the Wuhan animal markets, studies of early cases and audits of local laboratories.

MORENS_SUBPOENA_021938
MORENS_NIH_042820
REL0000478682

The Chinese government has reacted angrily to the idea of further studies on its territory. Zeng Yixin, the vice-minister of China's National Health Commission, said he was "shocked" by the plan to investigate a lab leak, saying it was "impossible" to accept. According to the *Global Times*, a tub-thumping tabloid run by the Communist Party, 55 countries have sent written complaints about the proposal for further investigations to the who
. Dr Tedros, elected director-general with China's support in 2017 and derided by President Donald Trump as China's puppet, may now face a Chinese-backed candidate when he looks for reappointment later this year.

In the absence of any hope that China will co-operate, sources of data beyond its control have become increasingly important. One area of interest is genetic sequence data. Another is early cases exported from China.

See what you did there

An online open-source-intelligence group which calls itself
drastic
has been scouring sequencing data to get insight into activities at the Wuhan Institute of Virology (wiv). When researchers publish sequences they typically post the raw data from which those sequences are assembled to public databases such as the sequence-read archive at America's National Centre for Biotechnology Information. Contamination events in the laboratory, or within sequencing machines themselves, mean these data sometimes contain sequences not meant to be there. In theory such evidence could reveal nefarious goings-on.

Such work, while promising, takes a lot of resources. If you have the sort of supercomputers available to America's national labs it gets easier. Gilles Demaneuf, a data scientist who works with
drastic
, says he has a hunch the American intelligence community's 90-day study is working the same angle. It is conceivable that the intelligence services might have been able to filch raw sequence reads directly from Chinese sequencing machines, thus picking up even more data.

Sequencing data only offers a way forward if the virus did indeed leak out of a lab, something which remains a possibility but which is far from proven. The study of early cases should be useful whatever route it took; the closer you get to understanding the when and where of the crossing-over from animal to human, the easier it should be to learn something of the how.

On the basis of information provided by China the joint study concluded it was unlikely for there to have been any substantial transmission in Wuhan before December 2019. That is unlikely to be true. For one thing the *South China Morning Post*, a newspaper based in Hong Kong, obtained government documents in 2020 which showed one to five new cases a day in Wuhan from November 17th 2019 onwards. Further evidence has strengthened the possibility that the virus could have been in circulation much earlier than the official story allows.

That circulation need not have been limited to China. There is increasing evidence suggesting early infections elsewhere. These cases would have been exported from China; no virologists doubt that Hubei was where the virus got going within humans. But if circulation in Hubei goes back further than thought and cannot be directly assessed through studies there, the presence of cases elsewhere offers an alternative way to get an idea of the timing. If a specific travel link were identified, that might help identify a group in Hubei which was infected early on.

A recent study of blood samples from 9,144 adults in 12 different regions of France found seven which contained antibodies against sars-cov-2, all of them taken in November 2019. An Italian lung-cancer screening trial has found samples taken in September 2019 which

seem to contain anti-sars-cov-2 antibodies. Another antibody study suggests the virus was circulating at a low level in northern Italy at the same time, notably in Lombardy, a region which has close connections to Wuhan through the garment trade, and saw Europe's first major outbreak of covid-19 in March 2020.

Antibody tests can give false positives. In a preprint published on August 6th by the *Lancet*, researchers in Lombardy reported on looking instead for sars-cov-2 gene sequences. Examining 289 swabs and urine tests taken from people who had presented with a rash as far back as the second half of 2019, they found sars-cov-2 sequences in 13, the earliest of which was taken on September 12th.

Sudhir Kumar of Temple University in Philadelphia says the *Lancet* preprint is likely to inspire other investigators to go back and look at retrospective hospital samples. That should help his own research into the origins of the virus. A family tree Dr Kumar and his colleagues have built from vast numbers of published sars-cov-2 genomes allows them to predict the sequence of the progenitor virus from which they are all descended. This sequence differs in three places from that found in the earliest samples taken from patients in Wuhan, meaning there had been enough spread for a certain amount of viral mutation to take place before December. Dr Kumar says that an analysis of the Lombardy sequences suggests that the timeline for the origin of the virus in China might now extend back to the late summer.

More systematic international research into these early infections and their circumstances is needed. Maria Van Kerkhove, head of emerging diseases and zoonoses at the who, suggests it may be possible to prioritise work in areas which saw the earliest outbreaks in America, France, Italy and Spain. "I think the floodgates will open one day," says Dr Kumar.

A last line of light

An early origin would fit with the timeline that lab-leak proponents tend to favour. Early this August, the minority Republican staff on the House foreign-affairs committee released an 84-page report arguing this case. It makes much of a small but deadly disease outbreak which took place at an abandoned copper mine in Yunnan in 2012. As drastic showed last year, a virus studied at WIV which had been taken from that mine is the closest known relative to sars-cov-2.

The report sees importance in the removal, on September 12th 2019, of a database containing details of sequences and samples from the wiv. This is read as the beginning of a cover-up, and thus as the point when the authorities first knew something had gone amiss, arguing for a leak in late August or early September. The wiv says it was a response to cyber-attacks.

A leak is not the only research-related possibility. The first person infected could have been someone employed by the wiv or another lab to collect bats and samples—the prospect to which Dr Ben Embarek pointed in his television interview. And it is important to remember that some other form of spillover outside the lab, either directly from a bat or by way of some other species, may well be to blame.

China clearly does not want lab-leaks investigated; but that does not mean it knows one happened. It is also being misleading about Huanan market, denying access to early-case data and obfuscating in various other non-lab-leak-specific ways. The most obvious explanation is that it does not really want any definitive answer to the question. An unsanitary market, a reckless bat-catcher or a hapless spelunker would not be as bad in terms of blame as a source in a government laboratory. But any definite answer to the origin question probably leaves China looking bad, unless it can find a way to blame

someone else. To that end China has called for an investigation of Fort Detrick in Maryland, historically the home of American bioweapons research; state media regularly publish speculations about its involvement.
The possibility of spillover from wild bats does not have to be studied in China. Yunnan abuts onto Laos, Myanmar and Vietnam, and bats are not sticklers in matters of territory. Samples taken outside China could provide a good idea of viral diversity the other side of the border. A thorough evaluation of the existing farm-animal and wildlife trade in the region would also be useful.
Yet there is an inherent risk in such work that needs to be considered. Efforts to uncover the roots of covid-19 by seeking out a natural reservoir of something very like sars-cov-2 would, by definition, expose people to the sort of risks that can seed pandemics. Ironically, the very possibility of a lab leak raises questions about how most safely to pursue investigations into other possibilities.

When he called for further inquiries in July, Dr Tedros also announced the formation of a new permanent group of pathogen hunters, the International Scientific Advisory Group for Origins of Novel Pathogens (sago). He wants it to organise further studies of sars-cov-2. But it will also need to look at more general questions for the future—such as how to be sure that, come what may, studies of pathogens involved in past disease outbreaks never create further outbreaks of their own.

That's so true. When I was a Ph.D student, I was also dabbling in describing new species of coccidial parasites from animals in pet stores in London. Many a weekend spent staring down a microscope at fecal samples while my then girlfriend, now wife would be staring at her human monoclonal antibody cell cultures.. good times.

Cheers,

Peter

Peter, I still need to get more educated on furin cleavage sites in coronaviruses. A few articles, e.g., the one attached, claim that in the evolutionary history of multiple different coronaviruses, FCS's do appear independently, although this is less common in sarbecoviruses. Is that your understanding?

[Peter Daszak:] yes – it seems to be uncommon

And is there any idea what determinants might favor insertion of these sites. Also, do we know about the levels of expression of furin in cells of mammals that might be sarbecovirus co-hosts? I assume that all such mammals have furin activity similar to humns, but is that known?

[Peter Daszak:] not really known well, or discussed that I've seen.

I ask this because the notion that a furin cleavage site indicates human engineered origin needs to be rebutted or at least countered. This is one of several of the Wade points that will appear, to the layman, to be damning. David

[Peter Daszak:] This has been rebutted regularly since January 2020. It was the key reason that this whole lab leak idea was discussed at the White House level in the first place. It was missed by Zhengli in her Nature paper. Likewise, Ralph Baric missed it when he first looked at the SARS-CoV-2 genome sequences in early Jan. Apparently Trevor Bedford & Eddie Holmes pointed it out to Jeremy Farrar, saying it could indicate lab origin (i.e. a virus that gained a furin cleavage site during cell culture). Jeremy mentioned it to Fauci, who mentioned it to Bob Kadlec (if I remember correctly) at the WH. They then convened a panel via NAM to discuss that included me, Ralph and the others. Ralph pointed out that it could have been acquired naturally during human-to-human transmission. I pointed out that it could have been acquired during transmission through an intermediate host. We all pointed out that influenza, and other CoVs have these, although rare. That ad hoc committee then transformed into the NASEM COVID-19 rapid response committee that became largely ignored under Trump and has now

MORENS_SUBPOENA_014754
MORENS_NIH_030407
REL0000478687

basically ended.

There have been lots of active virologists rebutting the theory that the presence of a furin cleavage insertion indicates lab leak because these are found in nature, and because close relatives of SARS-CoV-2 have insertions albeit slightly different sequences at the same site. Here are some links with rebuttals or discussion:

> ***Kristian Andersen pointing out that the furin cleavage site is seen repeatedly across the CoV phylogenetic tree:*** *https://twitter.com/K_G_Andersen/status/1330565966745403392?s=20*

> ***Interesting article from Vincent Racaniello pointing out other Human CoVs (which are thought to have originated in bats by the way) also have insertions at this site:*** *https://www.virology.ws/2020/05/14/sars-cov-2-furin-cleavage-site-revisited/*

As you can see when you read these, people who know about these things do not find them unusual and certainly don't believe it demonstrates (or even could be considered leaning towards) a lab origin. Unfortunately, it's just scientifically complicated enough to convince the intelligent reader. Throw in phrases like "Gain of function" or "Seamless ligation" and then sprinkle "lab biosafety concerns from state dept cables", and voila, you have a very exciting story – good enough for a science fiction novel, but absolutely not science fact!

T

> Appreciate your comments David. Please read the letter I just sent to Rich Roberts. I've made some quick comments to refute some of the stuff in the Wade piece. RE. the furin cleavage site – there's nothing special about it and it does not suggest a lab origin. MERS-CoV, feline CoV and some rat CoVs all have similar insertions. Simple explanations for its presence in SARS-CoV-2 could be:
>
> > It was present in a bat-CoV (one of the many thousands awaiting our discovery), and we selected for its spillover by having 14 million people working in wildlife farms in china in places where bats live. Given a continued exposure to myriad bat-CoVs, one with a furin cleavage site would be more likely to emerge
> >
> > It evolved in people early on in the COVID outbreak. WHO report and modeling suggest spillover occurred in last few months of 2019. It could have easily been selected for as the virus spread from human-to-human during that early period
> >
> > It evolved after a progenitor bat-CoV spilled over into wildlife in farms in S. China. SARS-CoV-2 spillover into mink in Europe led to rapid evolution of strains that bore similarities to pangolin-CoVs. Mink strains then re-infected people in the Netherlands. Now, there's a report of mink clearing the virus, showing antibodies to SARS-CoV-2 and being reinfected later – all good evidence that farms full of raccoon dogs, ferret badgers and civets in S. China could have had circulation of SARS-CoV-2 for many months prior to it emerging.

Peter, I agree, and I think we should try to not use the term GOF, notly because it suggests something nefarious, but also, at least as I would define it, it doesnt apply to your work, as you just said. In my mind it doesn;'t apply to Ralph's work either.

Secondly, I re-read the Wade article carefully, and did NOT conclude that just about everything he said was wrong. I think it is the best researched, and most literate and thorough media article on the subject. BUT. I think it is biased and uses cherry-picked facts. Moreover, it tries to pretend non-bias in a disingenuous way.

In short, high order sophistry.

I am also troubled by David Baltimore's opinion that finding a furn-cleavage site indicates human manipulation. I suspect that may not be true, since these viruses hyper-circulate in bats and spillover into mammals and people frequently, and also frequently recombine in spike protein sequences. But I am not knowledgeable about such things. In this context, the idea of David Robertson, cited in the Wade article, is of particular interest: the idea that the precursor virus had become a "generalist" by long evolving through bats and mammals including humans. Something analogous happens with arboviruses, e.g., dengue, which serially pass through humans and mosquitos every couple weeks, and have to be well adapted to two very different alternating hosts.... d

MORENS_SUBPOENA_014756
MORENS_NIH_030409
REL0000478687

be reasonably called “Gain of function”. The only recombinant viruses were bat-CoVs, with spike proteins of other bat-CoVs. None had enhanced transmissibility or cell infectivity. None are known to be infectious to people.

I believe the whole ‘gain of function’ phrasing used to describe the Wuhan CoV research is just a ruse to scare a gullible public – journalists today have been using phrases like “making viruses more dangerous in the lab in Wuhan” etc. None of this is true.

EXTERNAL SENDER

Peter, I just tsalked to Ms. Eban for an hour, and connected her with Jim LeDuc and Jeff T. I also sent her a paper I and others wrote with David Baltimore 10 years ago about the BENEFITS of GOF research vis a vis the 1918 flu virus. To wit, the growing up of the virus and studying it in primate challenges, and in vitro, yielding hugely important info on flu pathogenesis.

Rich, this relates to my own feeling that GOF is a double-edged sword, so to speak, that while we must work to prevent dangerous use of virologic techniques, totally agree on that point, we must also consider that every infection of a cell, in tissue culture, organ culture, experimental animals, humans, whatever, is in essence a GOF experiment (and also a loss of fuinction experiment, since host adaptation usually results in ftness penalties), without which we would have no viral vaccines except vaccinia, and arguably not even that.

Her interest in David B results from his comments in the Wade article about the SARS-CoV-2 furin cleavage site, about which I am a tiny bit skeptical, not fully understanding the complexities of cleavage site evolutions in RNA viruses. I asked Jeff and his folks to comment. He and I had a discussion about David's comments yesterday, but I will let him follow up on that, since he has been thinking about RNA virus cleavge sites with respect to flu A and other viruses for over 20 years. It seems to be more complicated than one might think..

The Wade article also cites some ideas by a guy named David Robertson. Do you know him? I do not. But he posits that the SARS-CoV-2 precursor may have become a "generalist" by circulating between bats and mammals, maybe even humans. No eviodence for this, but the idea makes alot of sense to me. Plausible in my mind, what do u think?

David

The letter to Blinken includes the following statement:

"…the release of these documents from the Department could help to refute contradictory statements that have been made regarding the possibility of a laboratory leak from the WIV." This could be taken in a positive sense, that the documents will refute the lab release hypothesis, although I don't think that's how they mean it.

Regarding what Peter previously said about Shi's use of the phrase blah blah, which will surely be characterized as dismissive and therefore put into a negative perspective. I have access to a senior endowed full professor of Chinese politics at Harvard and I asked about the meaning of blah blah when a Chinese native speaker uses it while speaking English. Here is the answer:

"In my experience many Chinese mistakenly use "blah, blah" as equivalent to the Chinese term "deng, deng" which means "and so forth" and has no negative connotation."

So Peter was right, and now we know the Chinese term it is trying to translate, however awkwardly. This might be useful in any conversation with a report about her remarks or the Republicans letter.

Jerry

Peter, i will reply eventually when i get some time, but until then, note yet another Josh Rogin editorial in this morning's Post, this time disclosing the Republican letter to Tony, which i have not yet seen and may or may not see. D

Sorry for yet another email, but this one is so bizarre it's almost funny. It's a letter from the House E&C Committee Republicans to Blinken asking him to release the classified intel that people in the Wuhan lab were sick prior to COVID, and that the WIV does military research. It quotes some comments from a recent talk my collaborator Zhengli Shi from the Wuhan Institute of Virology, gave during a lecture at Rutgers. Some of the online conspiracists heard about the talk in advance and they packed the audience – some of their questions from the chat were read out. Her response included a very common "blah blah" phrase used in China when speaking English – here's the quote:

During a March 23, 2021 seminar at Rutgers University, a WHO advisory committee member asked Dr. Shi if [knew].. whether "the U.S. government claims of classified Chinese military research being carried out at the WIV [are] correct, and if so, did you have full awareness of and access to all aspects of this research?"[4]

Dr. Shi answered: From my knowledge, all our research work is open, is transparent. At the beginning of COVID-19, we heard the rumors that claimed our laboratory would have some project blah blah with army blah blah . . . but this is not correct, because I am the director and responsible for research activity. I don't know any kind of research work performed in this lab.[5]

This is ridiculous, of course, and they're obviously using that quote to suggest Dr. Shi doesn't take these questions seriously, but it's actually a racist trope – people in China use the phrase "blah blah" to simply mean "and so on, and so forth". Just unfortunate…

Subject: New: Letter from Republican Rep. Gallagher to Dr. Fauci re. WIV and gain of function
Importance: High

David,

A Republican representative sent a letter to Tony Fauci today asking some pretty simple questions that are clearly designed to play to their political base.

If Tony Fauci is going to respond to the attached letter that was made public today, I hope he's ready to point out that the work we did was NOT gain of function. This phrase has been bandied about now for a few months and is utterly incorrect.

If he decides to draft a response, I'd be happy to do a quick briefing with you and him to explain the work that has been done up to now with WIV, and was planned to be done on our NIAID grant.

Cheers,

Peter

The Task Force paper is now in production. I won't have a real estimated date for publication until the galleys are available and then its 2-3 weeks. So probably end of the month, at best around the time of UNGA.

Now you should remind Horton about his promise to control Sachs. Its shameful how ineffective he, Horton, has been and how slovenly he is with accuracy and science.

We (the Independent Task Force) are addressing the dissemination of our report to be as forceful and as fast as possible when the paper appears.

Jerry

Yes I think it may be released as soon as next week, with press conferences I believe in NY around the time of UNGA (as originally planned). I was not invited to participate.

Two weeks ago, Richard Horton in a zoom agreed to address my concerns about Jeff's specific attacks on me, he was supposed to respond by last week. But nothing so far, so I'm not optimistic. Best Peter

Peter:

Here is the letter that went out to all the NLs who signed the original petition.

"Dear …..,

Most, if not all of you, will have received a communication from Andre Goffinet who is trying hard to add to the rumors that the virus causing COVID-19 leaked from a lab in the Virology Institute in Wuhan. A recent, apparently well-argued article by Nicholas Wade (attached) professes neutrality, but really just tries by innuendo to promote this view that the virus leaked from the Wuhan lab. One victim of this Chinese lab origin campaign is Peter Daszak whom we all supported when he lost his grant. He has been harassed continually, received death threats and is hounded by the Republicans in Congress. All because he has been working for years to study bat viruses in collaboration with scientists at the Wuhan Institute of Virology. I attach a short piece that Peter wrote about recent events, including a rebuttal of some of Wade's claims and a separate document outlining the events that took place and are relevant to the termination of his grant.

Finally, I might add that Goffinet wrote to me about a month ago, implying that because I have organized conferences in China I might too be part of the conspiracy to present the Chinese view of events. As a result, he would like you to believe that I solicited your help merely to support Peter and the Chinese. This is simply untrue. He failed to mention that the clear purpose of our statement was to decry the political interference in stopping the funding of a peer-reviewed grant.

Rich"

Already a number of people have written back – all supporting you.

Peter, I still need to get more educated on furin cleavage sites in coronaviruses. A few articles, e.g., the one attached, claim that in the evolutionary history of multiple different coronaviruses, FCS's do appear independently, although this is less common in sarbecoviruses. Is that your understanding?

[Peter Daszak:] yes – it seems to be uncommon

And is there any idea what determinants might favor insertion of these sites. Also, do we know about the levels of expression of furin in cells of mammals that might be sarbecovirus co-hosts? I assume that all such mammals have furin activity similar to humns, but is that known?

[Peter Daszak:] not really known well, or discussed that I've seen.

I ask this because the notion that a furin cleavage site indicates human engineered origin needs to be rebutted or at least countered. This is one of several of the Wade points that will appear, to the layman, to be damning. David

[Peter Daszak:] This has been rebutted regularly since January 2020. It was the key reason that this whole lab leak idea was discussed at the White House level in the first place. It was missed by Zhengli in her Nature paper. Likewise, Ralph Baric missed it when he first looked at the SARS-CoV-2 genome sequences in early Jan. Apparently Trevor Bedford & Eddie Holmes pointed it out to Jeremy Farrar, saying it could indicate lab origin (i.e. a virus that gained a furin cleavage site during cell culture). Jeremy mentioned it to Fauci, who mentioned it to Bob Kadlec (if I remember correctly) at the WH. They then convened a panel via NAM to discuss that included me, Ralph and the others. Ralph pointed out that it could have been acquired naturally during human-to-human transmission. I pointed out that it could have been acquired during transmission through an intermediate host. We all pointed out that influenza, and other CoVs have these, although rare. That ad hoc committee then transformed into the NASEM COVID-19 rapid response committee that became largely ignored under Trump and has now basically ended.

There have been lots of active virologists rebutting the theory that the presence of a furin cleavage insertion indicates lab leak because these are found in nature, and because close relatives of SARS-CoV-2 have insertions albeit slightly different sequences at the same site. Here are some links with rebuttals or discussion:

> ***Kristian Andersen pointing out that the furin cleavage site is seen repeatedly across the CoV phylogenetic tree:*** *https://twitter.com/K_G_Andersen/status/1330565966745403392?s=20*
>
> ***The article on Virological.org that he refers to:*** *https://virological.org/t/naturally-occurring-indels-in-multiple-coronavirus-spikes/560*

MORENS_SUBPOENA_014655
MORENS_NIH_029439
REL0000478698

Florian Krammer arguing on Twitter with a lab-leak conspiracist: *https://twitter.com/florian_krammer/status/1390347972458725380?s=20*

Interesting article showing that the RmYN02 similar site suggests natural evolutionary origin: *https://virological.org/t/the-sarbecovirus-origin-of-sars-cov-2-s-furin-cleavage-site/536*

Interesting article from Vincent Racaniello pointing out other Human CoVs (which are thought to have originated in bats by the way) also have insertions at this site: *https://www.virology.ws/2020/05/14/sars-cov-2-furin-cleavage-site-revisited/*

As you can see when you read these, people who know about these things do not find them unusual and certainly don't believe it demonstrates (or even could be considered leaning towards) a lab origin. Unfortunately, it's just scientifically complicated enough to convince the intelligent reader. Throw in phrases like "Gain of function" or "Seamless ligation" and then sprinkle "lab biosafety concerns from state dept cables", and voila, you have a very exciting story – good enough for a science fiction novel, but absolutely not science fact!

T

On 5/8/2021 2:26 PM, Peter Daszak wrote:

> Appreciate your comments David. Please read the letter I just sent to Rich Roberts. I've made some quick comments to refute some of the stuff in the Wade piece. RE. the furin cleavage site – there's nothing special about it and it does not suggest a lab origin. MERS-CoV, feline CoV and some rat CoVs all have similar insertions. Simple explanations for its presence in SARS-CoV-2 could be:
>
> > It was present in a bat-CoV (one of the many thousands awaiting our discovery), and we selected for its spillover by having 14 million people working in wildlife farms in china in places where bats live. Given a continued exposure to myriad bat-CoVs, one with a furin cleavage site would be more likely to emerge
> >
> > It evolved in people early on in the COVID outbreak. WHO report and modeling suggest spillover occurred in last few months of 2019. It could have easily been selected for as the virus spread from human-to-human during that early period
> >
> > It evolved after a progenitor bat-CoV spilled over into wildlife in farms in S. China. SARS-CoV-2 spillover into mink in Europe led to rapid evolution of strains that bore similarities to pangolin-CoVs. Mink strains then re-infected people in the Netherlands. Now, there's a report of mink clearing the virus, showing antibodies to SARS-CoV-2 and being reinfected later – all good evidence that farms full of raccoon dogs, ferret badgers and civets in S. China could have had circulation of SARS-CoV-2 for many months prior to it emerging.
>
> Hope this all helps. One day, the research will be done and all this will be demonstrated. Unfortunately, the one group that had access to China to do this work (EcoHealth) is currently blocked from doing it!

Cheers,

Peter

Subject: Re: Another letter - almost amusing - from House E&C Committee Republicans re. Zhengli's "Blah Blah" comment

Peter, I agree, and I think we should try to not use the term GOF, notly because it suggests something nefarious, but also, at least as I would define it, it doesnt apply to your work, as you just said. In my mind it doesn;'t apply to Ralph's work either.

Secondly, I re-read the Wade article carefully, and did NOT conclude that just about everything he said was wrong. I think it is the best researched, and most literate and thorough media article on the subject. BUT. I think it is biased and uses cherry-picked facts. Moreover, it tries to pretend non-bias in a disingenuous way.

In short, high order sophistry.

I am also troubled by David Baltimore's opinion that finding a furn-cleavage site indicates human manipulation. I suspect that may not be true, since these viruses hyper-circulate in bats and spillover into mammals and people frequently, and also frequently recombine in spike protein sequences. But I am not knowledgeable about such things. In this context, the idea of David Robertson, cited in the Wade article, is of particular interest: the idea that the precursor virus had become a "generalist" by long evolving through bats and mammals including humans. Something analogous happens with arboviruses, e.g., dengue, which serially pass through humans and mosquitos every couple weeks, and have to be well adapted to two very different alternating hosts.... d

On 5/8/2021 1:51 AM, Peter Daszak wrote:

> I also think it's important to let the journalist know that nothing in the work we were doing in China could be reasonably called "Gain of function". The only recombinant viruses were bat-CoVs, with spike proteins of other bat-CoVs. None had enhanced transmissibility or cell infectivity. None are known to be infectious to people.
>
> I believe the whole 'gain of function' phrasing used to describe the Wuhan CoV research is just a ruse to scare a gullible public – journalists today have been using phrases like "making viruses more dangerous in the lab in Wuhan" etc. None of this is true.

Cheers,

Peter

Probably not too helpful to describe every growth of a virus in a lab is a GOF experiment.

EXTERNAL SENDER

Peter, I just tsalked to Ms. Eban for an hour, and connected her with Jim LeDuc and Jeff T. I

MORENS_SUBPOENA_014658
MORENS_NIH_029442
REL0000478698

also sent her a paper I and others wrote with David Baltimore 10 years ago about the BENEFITS of GOF research vis a vis the 1918 flu virus. To wit, the growing up of the virus and studying it in primate challenges, and in vitro, yielding hugely important info on flu pathogenesis.

Rich, this relates to my own feeling that GOF is a double-edged sword, so to speak, that while we must work to prevent dangerous use of virologic techniques, totally agree on that point, we must also consider that every infection of a cell, in tissue culture, organ culture, experimental animals, humans, whatever, is in essence a GOF experiment (and also a loss of fuinction experiment, since host adaptation usually results in ftness penalties), without which we would have no viral vaccines except vaccinia, and arguably not even that.

Her interest in David B results from his comments in the Wade article about the SARS-CoV-2 furin cleavage site, about which I am a tiny bit skeptical, not fully understanding the complexities of cleavage site evolutions in RNA viruses. I asked Jeff and his folks to comment. He and I had a discussion about David's comments yesterday, but I will let him follow up on that, since he has been thinking about RNA virus cleavge sites with respect to flu A and other viruses for over 20 years. It seems to be more complicated than one might think..

The Wade article also cites some ideas by a guy named David Robertson. Do you know him? I do not. But he posits that the SARS-CoV-2 precursor may have become a "generalist " by circulating between bats and mammals, maybe even humans. No eviodence for this, but the idea makes alot of sense to me. Plausible in my mind, what do u think?

David

The letter to Blinken includes the following statement:

"…the release of these documents from the Department could help to refute contradictory statements that have been made regarding the possibility of a laboratory leak from the WIV." This could be taken in a positive sense, that the documents will refute the lab release hypothesis, although I don't think that's how they mean it.

Regarding what Peter previously said about Shi's use of the phrase blah blah, which will surely be characterized as dismissive and therefore put into a negative perspective. I have access to a senior endowed full professor of Chinese politics at Harvard and I asked about the meaning of blah blah when a Chinese native speaker uses it while speaking English. Here is the answer:

"In my experience many Chinese mistakenly use "blah, blah" as equivalent to the Chinese term "deng, deng" which means "and so forth" and has no negative connotation."

So Peter was right, and now we know the Chinese term it is trying to translate, however awkwardly. This might be useful in any conversation with a report about her remarks or the Republicans letter.

Jerry

Sorry for yet another email, but this one is so bizarre it's almost funny. It's a letter from the House E&C Committee Republicans to Blinken asking him to release the classified intel that people in the Wuhan lab were sick prior to COVID, and that the WIV does military research. It quotes some comments from a recent talk my collaborator Zhengli Shi from the Wuhan Institute of Virology, gave during a lecture at Rutgers. Some of the online conspiracists heard about the talk in advance and they packed the audience – some of their questions from the chat were read out. Her response included a very common "blah blah" phrase used in China when speaking English – here's the quote:

During a March 23, 2021 seminar at Rutgers University, a WHO advisory committee member asked Dr. Shi if [knew].. whether "the U.S. government claims of classified Chinese military research being carried out at the WIV [are] correct, and if so, did you have full awareness of and access to all aspects of this research?"[4]

Dr. Shi answered: From my knowledge, all our research work is open, is transparent. At the beginning of COVID-19, we heard the rumors that claimed our laboratory would have some project blah blah with army blah blah . . . but this is not correct, because I am the director and responsible for research activity. I don't know any kind of research work performed in this lab.[5]

This is ridiculous, of course, and they're obviously using that quote to suggest Dr. Shi doesn't take these questions seriously, but it's actually a racist trope – people in China use the phrase "blah blah" to simply mean "and so on, and so forth". Just unfortunate…

Subject: New: Letter from Republican Rep. Gallagher to Dr. Fauci re. WIV and gain of function
Importance: High

David,

A Republican representative sent a letter to Tony Fauci today asking some pretty simple questions that are clearly designed to play to their political base.

If Tony Fauci is going to respond to the attached letter that was made public today, I hope he's ready to point out that the work we did was NOT gain of function. This phrase has been bandied about now for a few months and is utterly incorrect.

If he decides to draft a response, I'd be happy to do a quick briefing with you and him to explain the work that has been done up to now with WIV, and was planned to be done on our NIAID grant.

Cheers,

Peter

Peter, i must say, and i mean this with respect and aloha, i do agree with Rich and Harold that this may be a time for you to lay low yourself, and let others go to bst for you

I know that must be hard when u are being pilloried, but my sense is that we are at a time when you need to be the victim being saved by noble champions

Will noble champions step up? This is a place where Harold, Rich, Jerry, Victor and others must step in. You can't do this yourself, the assholes are too powerful

Let's all of us work behind the scenes to reverse this injustice. I don't know how, but my boxing gloves are on and laced up.

Great to read this chain. I also spoke with Rich Roberts and will be sending a 2 pager with all the NIH/EHA letters and responses in a timeline, and links to all the political action going on.

I agree with your assessments (both of you) – this is a threat to science, and it's not going away – it's now become more centralized with Biden maintaining a tough-on-China stance, and there are loud people on the left (e.g. Jamie Metzl) and within science (Relman, Lipsitch, Ebright) who are feeding political action and the call for commissions. Note that only yesterday there were two actions of note – the bill on China interference was pass in Senate Committee (Foreign Affairs), with Michael Lauer testifying, and the bill from the nutter Right re. declassifying intelligence on Wuhan.

We need to continue this multi-pronged effort to defend science, even though, as Tony suggested, Harold also, and my Board Chair, I will continue to try to avoid any publicity on this issue at all…

Cheers,

Peter

I'm purposely not including Rich on this note because I don't want to be seen as pressuring him further. I think he will follow up, he has as good a connection to Harold as I do, and if necessary I will follow up. Harold has consistently stayed in the background when I have asked him about doing certain things or writing certain commentaries etc. but he has not been reluctant to speak rather frankly about Francis and the Lauer affair when he believed it was necessary or he was directly

MORENS_SUBPOENA_019473
MORENS_NIH_039044
REL0000478737

approached by the reporters at Science, for example. I did try to get Jon Cohen and Meredith Wadman moving on a new article but as you know they both declined at this point because it was not news. I think that was a cop out decision, and depending on what Rich has to day I might just copy Harold on that and see if he is willing to contact them because they will most likely have a different response to him than to me.
We just have to stay on this, not panic, and not waiver from the ultimate goal. Timing is always critical. So is the messenger. Lander may be the right person, and Harold has indicated to me that he has been in contact with Eric on this issue.

Hi Jerry and colleagues, just spent 40 minutes on Zoom with Tony and one of two possibilities: either we are all unnecessarily alarmed, or else he is not taking the threats seriously

He said repeatedly, in a low key jocular way, that no one could mess with him or niaid since we haven't done anything wrong, apparently not counting as "messing with us" the fact that we had an important research project terminated in an unprecedented manner for political reasons.

He also repeated alot of macho comments about how there is always a guy with an AR-15 right outside his door (true, and sometimes two other armed secret service guys) and everywhere he goes outside the office he has at least two bodyguards, also true...9

I hope he is right that the wackos won't gain any further traction, but i am not so sure. For one thing, there was huge collateral damage a few years back with the H5N1 gain of function mess. It is true that neither Tony nor other NIH staff got into any trouble, but thousands of professional hours were wasted over several years time and, far more importantly, the research moratorium, which went in for years, caused labs across the country to close, or move into other areas, caused lab people on grants to lose their jobs, and grad students to lose their dissertation work and postdocs to lose their projects. It was a mess that ought not to be forgotten

If i had to bet, i would guess that beneath Tony's macho I-am-not-worried reaction he really is concerned. And whatever the case he should be very concerned about what happened to Peter, to our research portfolio in an extremely important area, and to scientific independence

He did not know about either the Miller Commission or the letter from Rep Rogers which i emailed to him on gmail later

I also commented that Lauer's letters to you Peter, and the Rogers letter to you, had alot of overlap and seemed to reflect input of at least one scientist, whether or not one of our grantees. In other words, i feel that regarding those letters someone or someones are working in cahoots with the politicians who wish to

MORENS_SUBPOENA_019474
MORENS_NIH_039045
REL0000478737

do harm to NIH He didn't seem particularly troubled by that.

In the end he said thanks for filling me in and asked me to call him on his private cell phone (which is what i normally do anyway) if i hear anything that might be important

So, i am not sure where things stand. I absolutely DO feel that it would be a good thing if one of you luminaries were to approach him and try to make sure he understood what is going on out there, and perhaps discuss what the larger community of scientists can do to lock arms in unity and push back. David,
Thanks for the note, and I recognize what you say is what I know about Tony. He is a remarkable person, but like all of us he isn't perfect. I think your strategy to lay out the issues and let him run with it to decide what can be effectively addressed and with what strategy.

Rich's suggestion to talk to Harold is on track, and it would be great Rich if you were to do that. I know that they have a very close and positive history of working together, that Harold is very strategic in his thinking, he prefers to work in the background (something I have confirmed multiple times this past year as I have asked for his advice on things I could take on), and that he will be really frank in talking to Rich. Harold has very recently told me that he has worked closely with Rich on a number of issues related to the concerns we all have.

Let us know how the chat goes tomorrow. I think you have the right perspective heading in to it, and lots of good information at your fingertips.
Jerry

Hi:

If I am to do something I would talk to Harold first. I'll see what he has to say as a possible path forward.

EXTERNAL SENDER

Jerry, The way it works with Tony, at least at my level, is you can't suggest he do anything. If you do, he won't do it on principle. The trick is to make him think of doing something himself, and then he will ask you to help him do it

My strategy tomorrow is to tell him that alarming things are at work, to the point that many scientists (our grantees and others) have become increasingly worried and are looking for the way forward. In that context i will share with him verbally Peter's information, and offer to get to him any of the materials he wants to see, or connect him directly with Peter, who he very much respects

I have not heard that he has engaged Harold, or the National Academies, or the professional societies, although i might not know if he did. He is very much a loner about things like this. He prides himself on being like teflon, but I am worried that he may not be as invulnerable as he may think

Our Chief of Staff, Greg Folkers (who has Masters degrees in both journalism and PH), is among the only folks here, partly excepting Cliff Lane, in whom Tony confides when the subject is difficult or personal, only rarely to me.... and Greg told me today that he thinks Tony is getting worried that the brown stuff is about to hit the fan, and that he may have become a major target

There is very little i can do to help because i am a mere scientist, not a NL, or member of the NAM, or head of a prestigious society (the only kinds of people Tony will usually engage with, as he is very proud).

So if he doesn't become more proactive, what remains is for scientists and science orgs at the

MORENS_SUBPOENA_019476
MORENS_NIH_039047
REL0000478737

very highest level to come together forcefully to push back against the craziness

Who would be willing to approach him directly and "talk turkey"? Harold? Rich? You? Victor? A couple of you?

Tony will be well aware of this kind of push back. That's not the issue for you tomorrow. Its really how to get the scientific societies engaged once again in the campaign for clarity and resolution of the breech in integrity and the grants management beginning a year ago.

Maybe there would be a moment to suggest that he talk to Harold Varmus about strategy?

Jerry, i am traveling without much news access, but this is really depressing. My concern has grown to alarm and i am afraid to think what comes next

We seem to have arrived at that Orwellian point where all investigations of important matters have to exclude participation of the subject experts, since being a subject expert is disqualifying on the grounds that all expertise is inherently biasing.

Before George Orwell, we had Lewis Carroll telling us this. We are in grave danger of going down-the-rabbit-hole-with-Alice.....

of NIH/OD. He didn't say much to me, and I didn't take that as a signal that he was on the darker side of the divide.

I saw the results of a focus group of Trump supporters reported on today: https://www.washingtonpost.com/health/2021/04/20/vaccine-hesitant-republicans/ A bit of text in this report is about Tony.

"Every participant said they preferred hearing from politicians over the medical expert, who has been pilloried by conservative media for months over his coronavirus warnings. The data have shown that unfortunately Dr. Fauci has been politicized, and we need different messengers, because even the right messages coming from the wrong messengers aren't always helpful," Castrucci said, noting his foundation's polling [de Beaumont Foundation] found Americans trust their personal doctors more than the government's top infectious-disease doctor".

This is the fundamental problem we have, as the politicians will only use this as an echo chamber to amplify their support from their public supporters and constituents. It does point back to the scientific societies which have weighed in previously, but no more impact than we have had as individuals. It doesn't stop this approach, its just that we need some deus ex machina to help us. Is that going to be Eric Lander? What's happening with his approval? I haven't heard much of late.

Importance: High

Thanks for the email David - comments below. Also please see the attached word doc with links to some of the political actions that I'm concerned about. Tell Tony that this is very early days, with most of these coming from the Right, and many that can be headed off at the pass by positive outreach to Democrats, which I believe people will be doing.

I've also put in a link to the new " Covid Commission Planning Group (Covid

CPG)" that has no official role from USG, but boldly states as its core mission "to prepare the way for a National Covid Commission". Members include David Relman & Marc Lipsitch and I have heard from many on the conspiracy theory chatter networks online that this will focus partly on advocating for reduction in biosafety labs, viral work in wildlife, and gain-of-function.

Please feel free to share any docs that I've sent to you, with Tony. Hopefully you can do that in a way that avoids FoIA, and if not possible, just show him stuff on screen share on Zoom.

Please also see comments below...

Cheers,

Peter

Subject: Zoom meeting with Tony tomorrow

Peter, i am on leave in Florida for my granddaughters graduation from Florida State

Tomorrow at 130 i will be having a zoom call with Tony to tip him off on some of the info you sent in your recent email

I want to be sure about what info or docs you would or would not want me to share

[Peter Daszak:] Any and all

Other than what i see on tv, the jousting with Rand Paul and Jim Jordan, for example, i do not know how much of this Tony is aware of. To my knowledge he doesn't share it with anyone up here

I think issues he will be most concerned about are not your grant, although i add i am sure he would do anything he could to restore the funds and get the hellhounds of your back, but rather 1) the possibility that people like Rep Rodgers and her committee are about to turn up the heat and put Tony, personally, in their crosshairs, and 2) the possibility the NIH funded scientists or other esteemed scientists, are in cahoots with politicians wanting to attack him or niaid
[Peter Daszak:] agreed

As background, we all went through the original version of this crap about 10 years ago with the original GOF attacks surrounding H5N1. As Tony's scientific advisor, i spent much of the year, along with Jeff T, helping brief him and get him up to speed, which he did. At the time, David Relman, who had been one of Tony's favorites, was leading the charge, and we all wondered why a young guy with so much promise would choose demagoguery over
science. Lipsitch was only a minor player at that time, but relished his attack role and seem to become more alarmist as time went on. Now these guys are in the NAM. How did that happen???? Ebright has always been a crackpot, in the mold of Peter Duseberg, remember him?, and no one took him seriously except some of the press who didn't know any better
[Peter Daszak:] I had the unfortunate issue of voting on Marc Lipsitch's membership of NAM. He's an accomplished scientist. He's also very opinionated, arrogant and pushy on whatever issue he believes in. I voted on his science acumen.

I was unclear from your email on a couple points you might clarify. Obviously the Rodgers letter asking you to produce all those dox not only overlaps with the Lauer letter to you, but could not have been written without the help of a virologist.
[Peter Daszak:] I have it on good authority (Ebright's Twitter account) that he was involved. They are also getting pressured from Jamie Metzl who's working with the internet conspiracy networks actively to promote their "Research"

Actually, given that there are a few points in the letter that someone knowledgable about coronavirus virology would have corrected, my suspicion is that the letter was put together with the help of a legitimate scientist who needs to do more homework on coronaviruses.
[Peter Daszak:] you're right..! Metzl isn't a virologist, neither's Ebright. The internet 'researchers' are led by a banker and some junior scientists, many from human genetics, mol boil world.

Do you agree, and do you think that person was Ebright? Do you think Relman, Lipsitch, Imperiale, or other current or former grantees might have been involved?

I am not sure we ever funded Ebright, but we did fund the others. I would like to think that Relman et all are only mouthing off to the press, but do you think there is more to it than that, eg, that any of them are working with the politicians?
[Peter Daszak:] David Relman is talking with reporters a lot about this, including casting aspersions on my motives for speaking out about this virus

emerging via wildlife-to-human spillover (he's quoted as saying my motives are to protect the research I've been doing and reputations of our collaborators). Ebright is very actively (and obnoxiously) critical on social media calling me a 'Grifter' on a weekly basis and promoting unsubstantiated arguments for a lab leak. I had to look up what 'grifter' meant at first...

Your earlier comments about this proposed investigative committee, and the possible role of these folks in it, are alarming. Can you be more specific about where this stands and what is being done to forward it and to squelch it?
[Peter Daszak:] Nothing's being done to squelch it, and neither should it be - there will be other committees that also pop up. My concern is their bold claim that they're laying the groundwork for a 9/11 type commission (and have a 9/11 commission person involved). It may be that just by saying that a lot, and having well known people involved, they end up forming one. They're clearly politically connected and are advocating for this politically. Jerry and I also proposed this in our paper published in Health Affairs, but we assumed this would be led by NAM or some other well-respected institution.

When i speak with Tony i do not want to step into the politics of all this, as that's not my job and he wouldn't want me to. If he needs further info it might be best to connect you two, in an off the record manner. Would that be OK? We are getting FOIA'd non stop, so it's most important that Tony not have anything on the record that could come back to bite
[Peter Daszak:] Totally agree. Tell him I'm happy to speak with him at any time and will do so in a way that's not FoIA-ble. One thing I could do is either on a zoom call or by sending you a document, is lay out responses to the Mendendez questions so that the arguments are known and well-supported. For example, everyone's saying that this is a 'gain-of-function' issue, but actually that's not the case - we worked on bat viruses, not human pathogens. The expts produced loss of function, not gain of function, all appropriate conditions and approvals were demonstrably checked and correctly
answered.

Finally, i didn't read all of the Menendez bill-in-committee, which is longer than Les misérables, but what's the gist? Do you think that in their zeal to take a hard stance against the PRC, these Democrats are purposely, or accidentally, getting sucked into the evil-WIV scenario? Is there real danger here?
[Peter Daszak:] The Menendez bill is the only one that stands a chance so far of becoming law because it's bipartisan. The WIV, gain-of-function stuff is thrown in as a very small part of it. The draft wording only calls for a report from NIH after 180 days on these issues, and they are easily addressed. However, if it does pass and the anti-China mood hardens in the US, it may end up with calls to testify and the Republicans may use that to undermine NIH, and in particular Tony, given the rabid GoF myth they've been
building.

Anything you think might be helpful, I'd appreciate

TY, david

Unless she herself raises the issue about the state of his mental health, I think that gets really tricky. We know Jeff is being unreasonable in his position, and it's distressing to watch him hold onto it, but in my conversations with him he sounds otherwise fairly lucid. So while it certainly may be cognitive decline I would be hard pressed to say that's the basis from my conversations with him. Being a jerk can be a sign of dementia, but there may be other factors. Tough call

Hi Peter H,

The issue with Sonia is not Jeff's positions but his mental health and perhaps failing cognitive capacity. If there are early warning signs that she needs to recognize and then discuss with his primary care doc it may help to get the family involved in helping Jeff to acknowledge that something is not right and begin further assessments and maybe even interventions. No easy task for an ego like his - this would be an even worse blow than seeing his contemporary Joe Stiglitz and his junior Michael Kremer both receive a Nobel in economics - his Nobel.

That's separate for pushing back on his dogged attempt to push one perspective in an increasingly concrete and poorly supported by actual evidence manner.

Jerry

Subject: RE: Jeff Sachs is at it again!

Rich and I have already spoken about my call with Ian. He feels there is nothing he can do. His concerns are the following, some of which he has made abundantly clear in various articles and interviews.

1. The viability of the lab-leak hypothesis is a self-imposed injury by scientists, pointing to the conversation between Jeremy Farrar, Francis Collins, Christian Andersen et al in February 2020, and the denial and then the FOIA.

2. Peter is conflicted (appearance, not necessarily reality) and should not have accepted appointment to the Lancet Commission, the WHO team etc. He (Ian) would not have if he had been asked.

3. There is no way to get Sachs to "stand down".

4. The two science papers by Worobey et al are "crap epidemiology".

There is no viable way for me to push any further with Ian. On the issue of the reputation of Columbia University I am thinking about contacting Waafa El-Sadr, Vince Racaniello, and the Nobel laureate economist Joe Stiglitz, all of whom I know well enough to contact. The secondary issue is Sachs' cognitive health, as he becomes ever more focused, concrete in his thinking, and unable to take in and evaluate new information. He is a broken record, for sure, very possibly because he is a record in the process of breaking. Are others concerned? Concerned enough to

MORENS_SUBPOENA_009208
MORENS_NIH_019610
REL0000478762

be in touch with and supportive of his wife and family be expressing concern for his public face, reputation, and legacy?

I'm thinking it over before doing anything more. Thoughts?

Jerry

> Damagingly, he states that our rationale for hiding the truth is because we don't want to be guilty for millions of deaths. That is exactly the comment I get when people send me death threats (more every week now that these stories are in the news). It's a pretty straightforward incitement to violence for these people.
>
> He states that he doesn't trust scientists because we hide our work, when in fact we've published it in papers, and our proposals (even those that are not funded) are now public.
>
> He equates this work with nuclear weapons research
>
> He criticizes NIH for redacting 290 pages of attachments. Anyone who's bothered to look at that will see that NIH was circulating a DRAFT version of their COVID-19 research strategy that was released a few days later having been corrected and edited. It was simply an attachment to an email. There's no way that a govt agency should be circulating uncorrected versions of a strategic plan – that's just commonsense.

> Why the Chair of the Lancet's COVID-19 Commission Thinks The US
> Government Is Preventing a Real Investigation Into the Pandemic
>
> Prof. Jeffrey Sachs says he is "pretty convinced [COVID-19] came out of US lab biotechnology" and warns that there is dangerous virus research taking place without public oversight.
>
> Current Affairs
>
> filed 02 August 2022 in THE VIRUS
>
> Prof. Jeffrey Sachs is the Director of the Center for Sustainable Development at Columbia University and the President of the UN Sustainable Development Solutions Network. He has also served as the chair of the COVID-19 commission for leading medical journal the Lancet. Through his investigations as the head of the COVID-19 commission, Prof. Sachs has come to the conclusion that there is extremely dangerous biotechnology research being kept from public view, that the United States was supporting much of this research, and that it is very possible that SARS-CoV-2, the virus responsible for COVID-19, originated through dangerous virus research gone awry.
>
> Prof. Sachs recently co-authored a paper in the Proceedings of the National Academy of Sciences calling for an independent inquiry into the virus's origins. He believes that there is clear proof that the National Institutes of Health and many members of the scientific community have been impeding a serious investigation of the origins of COVID-19 and deflecting attention away from the hypothesis that risky U.S.-supported research may have led to millions of deaths. If that hypothesis is true, the implications would be earth-shaking, because it might mean that esteemed members of the scientific community bore responsibility for a global calamity. In this interview, Prof. Sachs explains how he, as the head of the COVID-19 commission for a leading medical journal, came to the conclusion that powerful actors were preventing a real investigation from taking place. He also explains why it is so important to get to the bottom of the origins of COVID: because, he says, there is extremely dangerous research taking place with little accountability, and the public has a right to know since we are the ones whose lives are being put at risk without our consent.
>
> NATHAN ROBINSON:
>
> I want to quote something that you said recently:
>
> "I chaired the commission for the Lancet for two years on COVID. I'm pretty convinced it came out of U.S. lab biotechnology, not out of nature, just to mention. After two years of intensive work on this. So it's a blunder in my view of biotech, not an accident of a natural spillover. We don't know for sure, I should be absolutely clear. But there's enough evidence that it should be looked into. And it's not being investigated, not in the United States, not anywhere. And I think for real reasons that they don't want to look underneath the rug, the statement."
>
> The statement that you made there is a controversial one. Just to read a couple of quotes from the New York Times in the last year:
>
> "In a review of recent studies and comparisons to other outbreaks, a group of virologists contends that there is more evidence to support a natural spillover from animals to humans."
>
> "Scientists released a pair of extensive studies over the weekend that point to a large food and live animal market in Wuhan, China, as the origin of the coronavirus pandemic."
>
> So I want to start by asking you just to tell us a little bit about the investigation that you were part of and what led you to think that what I just quoted is a misleading statement of the state of the evidence.
>
> JEFFREY SACHS:
>
> Well, the funny thing is those scientists who are saying that said the same thing on February 4, 2020, before they had done any research at all. And they published the same statement in March 2020, before they had any facts at all.

So they're creating a narrative. And they're denying the alternative hypothesis without looking closely at it. That's the basic point.
>
> Now, what is the alternative hypothesis? The alternative hypothesis is quite straightforward. And that is that there was a lot of research underway in the United States and China on taking SARS-like viruses, manipulating them in the laboratory, and creating potentially far more dangerous viruses. And the particular virus that causes COVID-19, called SARS-Cov-2, is notable because it has a piece of its genetic makeup that makes the virus more dangerous. And that piece of the genome is called the "furin cleavage site." Now, what's interesting, and concerning if I may say so, is that the research that was underway very actively and being promoted, was to insert furin cleavage sites into SARS-like viruses to see what would happen. Oops!
>
> Well, that is what may have happened. And what has been true from the start is that that very real possibility, which a lot of scientists know, has not been looked at closely, even though it's absolutely clear that it could have happened that way. They're not looking. They just keep telling us, "Look at the market, look at the market, look at the market!" But they don't address this alternative. They don't even look at the data. They don't even ask questions. And the truth is from the beginning, they haven't asked the real questions.
>
> But not quite the beginning. Because at the beginning, which we could date from the first phone call of the National Institutes of Health (NIH) with a group of virologists on February 1, 2020, the virologists said "Oh my god, that is strange, that could well be a laboratory creation. What is that furin cleavage site doing in there?" Because scientists knew that was part of an active ongoing research program. And yet, by February 3, the same group is saying "No, no, it's natural, it's natural." By February 4, they start to draft the papers that are telling the public, "Don't worry, it's natural." By March, they write a paper—totally spurious, in my view—called the proximal origins paper that is the most cited bio paper in 2020. It said: it is absolutely natural. [Note: the paper's conclusion is "we do not believe that any type of laboratory-based scenario is plausible."] But they didn't have any of the data that you read about in the New York Times. They didn't have any of this. They just said the labs weren't working on this alternative. But you know what, they don't know what the labs were working on, because they never asked, and NIH hasn't told us.
>
> ROBINSON:
>
> Let me ask you if we can distinguish between what we know for certain and what is speculative because we just haven't got the data. So we do know that there was—correct me if I'm wrong—research proposed that would have dealt with this category of viruses and would have modified them in ways that would have made them potentially more lethal. Do we know whether that kind of research was in fact actually ongoing somewhere?
>
> SACHS:
>
> We have enormous reason to believe that it was. And clearly, we haven't even asked that question. But we have a lot of reason to believe that it was, because the scientists that were doing that research loved that research. And they explained to us publicly why it's so important. And they wrote editorials about why this research must continue. And they made grant proposals saying that it should continue. And for those of us in the business of writing grant proposals, the fact that a particular grant proposal that's deeply troubling was turned down doesn't mean that it wasn't carried out afterwards. But where is NIH saying, "Yeah, that's an interesting question. Why don't we get the evidence?" It doesn't even ask that question.
>
> And the scientists like those that talk about the Huanan market, they don't even discuss that research that was underway. That is just misdirection, to my mind. It's like sleight of hand art. Don't look over there. Look over here. But we know that there was a tremendous amount of this research underway. We have interviews by the lead scientists. We have these research proposals. I know the intention of doing this research from discussions. I've read so many studies of the importance of this research claimed by the scientists. And yet I see NIH with its head in the ground. "Oh, no, nothing here to look at." And then I see the scientists. "Oh, nothing here to look at. We know it's the market. Did we find an animal? No. Do we have an explanation of where that furin cleavage site came in? No. We don't have an explanation of the timing, which doesn't quite look right. Oh, but don't look over there, because there's nothing there, they keep telling us. Well, that's a little silly.
>
> So my point is, there is a huge amount of reason to believe that that research was underway. Because there are published papers on this. There are interviews on this. There are research proposals. But NIH isn't talking. It's not asking. And these scientists have never asked either. From the very first day, they have kept hidden from view the

MORENS_SUBPOENA_009214
MORENS_NIH_019616
REL0000478762

alternative. And when they discuss the alternative, they don't discuss the research program. They discuss complete straw men about the lab, not the actual kind of research that was underway, which was to stick furin cleavage sites into SARS-like viruses in a way that could have created SARS-Cov-2.
>
> What I'm calling for is not the conclusion. I'm calling for the investigation. Finally, after two and a half years of this, it's time to fess up that it might have come out of a lab and here's the data that we need to know to find out whether it did.
>
> ROBINSON:
>
> One of the things that struck me that I didn't know when I started writing about this and actually doing some some research is realizing that in the years leading up to the pandemic, there was a huge controversy about whether it was wise to modify viruses in the course of research in ways that could make a virus more infectious or more lethal. And some people were arguing that this kind of research was insane. And some people were warning that in the case of a lab accident—an accident, mind you, not as an intentional "bioweapon"—a simple human error could cause a real catastrophe.
>
> SACHS:
>
> That is exactly right. There were several kinds of experiments of manipulation of the genes of dangerous viruses. And this raised a lot of alarm. And there was actually a moratorium in 2014. But the champions of this kind of research pushed on, they applied for waivers, which they got, and finally the moratorium came off in 2017. And they said how important it is to do this dangerous kind of research, because they claimed, "Well, there are lots of viruses out there. And we don't know when they're going to become highly pathogenic, and we need to develop drugs and vaccines against a wide spectrum of them. So we have to test all these viruses that we can find, to see whether they have high spillover potential." But they weren't actually aiming to just test viruses that they were collecting in nature. They were aiming to modify those viruses. Because the scientists knew that a SARS-like virus without a furin cleavage site wouldn't be that dangerous. But they wanted to test their drugs and vaccines and theories against dangerous viruses. Their proposal was to take hundreds, by the way—or least they talked about in one proposal more than 180 previously unreported strains—and test them for their so-called "spillover potential." How effective would they be? And to look: do they have a furin cleavage site, or technically what's called a proteolytic cleavage site? And if not, put them in. For heaven's sake. My God! Are you kidding?
>
> Okay, but we didn't even ask the question from the first day: did you guys do that? Tell us what you did. Could you give us your lab notebooks? We're kind of curious. Instead, these people who are writing these New York Times articles right now and publishing these pieces about the market, from the first day—without asking about the experiments—they said, "Nope, it's natural." That's why I don't trust them. Because they've never looked at the alternative hypothesis. And their hypothesis has so many gaps, so many holes in it. But they don't even try to look at the alternative hypothesis.
>
> ROBINSON:
>
> I think it's very important to make clear that the "alternative hypothesis" is mainly a hypothesis about an accident, and scientific hubris. It's important to distinguish the kooky theories from the incredibly plausible theories. Because what you're talking about is people who did not appreciate the dangers of what they were doing.
>
> SACHS:
>
> In fact, it's very interesting. The alternative that is the right one to look at is part of a very extensive research program that was underway from 2015 onward, funded by the NIH, by Tony Fauci, in particular NIAID [National Institute of Allergy and Infectious Diseases], and it was to examine the spillover potential of SARS-like viruses. The champions of this research explained in detail their proposals. But after the event, we'd never asked them, "So what were you actually doing? What experiments did you do? What do you know?" We somehow never asked. It was better just to sweep it under the rug, which is what Fauci and the NIH have done up until this point. Maybe they could tell us, "Oh, full exoneration," but they haven't told us that at all. They haven't shown us anything.
>
> So there's nothing "kooky" about it, because it's precisely what the scientists were doing. And then you can listen to the scientists on tape describing why they think the research program is so important, because they say these are dangerous viruses, and therefore we have to prepare broad spectrum vaccines and drugs. They explain

it's not good enough to test one or two viruses. We have to test all of them. And then they came to realize, as I said earlier, that just having a SARS-like virus, if it doesn't have this piece of the gene, it's almost surely not going to be that effective. So they got around to the idea. "Well, let's put these in," if you can imagine that. To my mind, it's mind-boggling.
>
>
>
> But they were proud of this, because it's actually genius at a technological level. Can you imagine: you can take a sequence of letters, which defines the genome, you can recreate the virus just from the letters. You don't even have to have the biological virus in hand, you just need the sequence. Then you can say "I'm going to add these four letters RRAR, the furin cleavage site, or maybe it's eight, RRARSVAS, this is a sequence of eight amino acids—I'm going to stick it in there right at the S1 S2 junction of the spike protein, because I know from my research program that will make it more pathogenic, that is more disease-causing. And then I can see whether my drug candidates like remdesivir, or some other candidate works against it. That is their idea. There's nothing kooky about our claim: Hey, what were you doing? Because they told us that they wanted to do these projects. And they told us that they were wanting to do these projects in the months leading up to this outbreak. And then what is absolutely strange is that even though scientists knew right from the start, that is very weird to have that RRAR furin cleavage site in there—never saw that before in a SARS-like virus, and that that could well have come from a lab—hush, hush. Don't talk about it. Don't even discuss it. Just say right from the beginning: This is natural. Of course, it's natural. Everything else is kooky.
>
> So you saw a narrative being created. And the scientists are not acting like scientists. Because when you're acting like a scientist, you're pursuing alternative hypotheses. And the scientists just wrote recently an op-ed saying the only evidence that this came out of a lab that's been put forward is that it came in a city, Wuhan, where an institute was located. Well, that's a lie. That is not the only coincidence that leads to this theory. What leads to this alternative hypothesis is the detailed research program the NIH funded that was underway in the years leading up to the outbreak. So I see the scientists absolutely trying to create a narrative and take our eyes off of another issue.
>
> Now, again, let me emphasize, we don't have definitive evidence of either hypothesis. But what we do have is definitive evidence that officialdom has tried to keep our eyes away from the lab creation hypothesis.
>
> ROBINSON:
>
> You mentioned the lab in Wuhan. It's not just that there was a lab in Wuhan doing research on viruses. But there were ties between the lab and those pursuing this program. What do we know about the research that was actually occurring there?
>
> SACHS:
>
> We know that at the Wuhan Institute of Virology, the scientists there had been trained by American scientists to use advanced bioengineering methodologies. And in particular, we have scientists in North Carolina, Texas, and so forth who do this kind of research, believe in it, argue for it, and say that they don't want any regulations on it and so on. And they were in close contact with Wuhan Institute of Virology, and they were part of a joint research group that was stitched together by something called EcoHealth Alliance. And EcoHealth Alliance was the kind of marriage maker between the American scientists and the Chinese scientists. That was the vehicle for funding from the U.S. government, especially from the National Institutes of Health, and especially from Tony Fauci's unit, the NIAID. There were years of grants, there were grant proposals. We don't know exactly what was done. But we have enough reason to know that we should be asking exactly what was done. And we know definitively that from the beginning, NIH has been running from telling us what has been done. They're not telling us the truth, that they had reason to fear from the start that this came out of a lab. And that to this day, they have reason to suspect it, but they're not talking.
>
> ROBINSON:
>
> A shocking thing to me was that the head of the EcoHealth Alliance was on the World Health Organization team that actually investigated the origins of COVID and concluded that it wasn't the lab.
>
> SACHS:
>

MORENS_SUBPOENA_009216
MORENS_NIH_019618
REL0000478762

> Well, more than that: I appointed him—this was Peter Daszak—I appointed him to chair the task force of the pandemic commission that I was running for the Lancet. And he headed a task force on the origins. I thought, naively at the beginning, "Well, here's a guy who is so connected, he would know." And then I realized he was not telling me the truth. And it took me some months, but the more I saw it, the more I resented it.
>
> And so I told him, "Look, you have to leave." And then the other scientists in that task force attacked me for being anti-scientific. And I asked them: "What are your connections with all of this?" They didn't tell me. Then when the Freedom of Information Act released some of these documents that NIH had been hiding from the public, I saw that people that were attacking me were also part of this thing. So I disbanded that whole task force. So my own experience was to witness close up how they're not talking. And they're trying to keep our eyes on something else. And away from even asking the questions that we're talking about. We don't have the answers. But we have good reasons to ask. And we have good reasons to know that NIH is not doing its job properly right now.
>
> ROBINSON:
>
> So you're saying that Daszak and others did not disclose to you pretty serious conflicts of interest? Since, on the hypothesis that it had something to do with this kind of research, that would have implicated Daszak himself in the origins of the crisis?
>
> SACHS:
>
> Well, he could have explained to me right from the beginning that there was a big research program and that they were manipulating the viruses, and here's how. He could have given me the research proposals. And when I asked him for one of the research proposals, he said, "No, my lawyer says I can't give it to you." I said, "What? You're heading a commission. We're a transparent commission. You're telling me your lawyer says you can't give me your project proposal." I said, "Well, then you can't be on this commission. This is not even a close call."
>
> But there were so many other things. He was just filled with misdirection. I don't know whether he understands or not, maybe he doesn't understand. But the things he said just were absolutely not right.
>
> ROBINSON:
>
> When people hear you say, "They're sweeping it under the rug, they don't want to look," one question that may come to their minds is "Well, why? Why would people not be interested in getting to the truth?" But the alternate hypothesis from the natural spillover that you're talking about could have serious repercussions. It would implicate a lot of people in potentially millions of deaths. So there's a lot at stake here for the scientific community. Which explains why there would be an interest in directing people away from this possibility.
>
> SACHS:
>
> There are at least two reasons why they might be doing what they're doing. One is, as you say, the implications are huge. Imagine if this came out of a lab. And we have, by some estimates, about 18 million dead worldwide from this. That's not the official count. But that's the estimated excess mortality from COVID. Well, the implications of that—the ethical, the moral, the geopolitical—everything is enormous.
>
> But there's a second matter that is really important, too. One thing that is rather clear to me is that there is so much dangerous research underway right now under the umbrella of biodefense or other things that we don't know about, that is not being properly controlled. This is for sure. And that's happening around the world. And governments say "don't poke your nose into that." That's our business, not your business. But it's actually our business. It's our business to understand what is going on with this. This is not to be kept secret. We don't trust you.
>
> Let me put it this way: I don't trust them right now. I want to know. Because even what we know of the dangerous research is enough to raise a lot of questions of responsibility for the future. And to pose the question: "Hey, what other viruses are you guys working on? What should we know?" Because no matter what the truth is on SARS-Cov-2, what is pretty clear is we've got so much technological capacity to engineer dangerous pathogens right now. And a lot of that is being done. And it's classified. It's secret, and we don't know what it is. And I don't like that feeling at all. I don't recommend it for us and for the world.
>

> ROBINSON:
>
> Well, you've rather answered the question of why it's important to get to the bottom of this. Because one of the excuses you hear is, "Well, who really cares? Does it matter? It was an animal, it was a lab, whatever it is, it's here." But what you're saying is, "No, we actually need to know where this started." Because this isn't going to be the only one, whatever the origins are. And we don't want people to die from future viruses. This is critically important. If we're going to save millions of lives, we have to find out the answer.
>
> SACHS:
>
> I can tell you one thing that I've learned from talking to a lot of scientists in the last couple of years: the technological capacity to do dangerous things using this biotechnology is extraordinary right now. So I want to know what's being done. I want to know what other governments are doing, too, not just ours. I want some global control over this stuff.
>
> We've kind of understood the nuclear risk—even that, of course, is in a lot of ways hidden from view. But this is a clear and present risk. And there's reason to believe we're actually in the midst of it, not just hypothetically. So come on: it's time to open the books everywhere. It's time to find out. Maybe it was the marketplace. Maybe it wasn't a lab. But we need to get real answers, now. Not the kind of misdirection that's been going in since February 2020. Enough nonsense! Enough New York Times stories saying, "Oh, it's this, it's that," without looking closely at the very plausible laboratory hypothesis.
>
> ROBINSON:
>
> It seems from what you're saying that as the head of the Lancet's COVID-19 commission, you didn't feel you were able to get satisfactory answers or see the data you wanted. What kind of investigation do we need and who ought to do it?
>
> SACHS:
>
> The most interesting things that I got as chair of the Lancet commission came from Freedom of Information Act (FOIA) lawsuits and whistleblower leaks from inside the U.S. government. Isn't that terrible? NIH was actually asked at one point: give us your research program on SARS-like viruses. And you know what they did? They released the cover page and redacted 290 pages. They gave us a cover page and 290 blank pages! That's NIH, for heaven's sake. That's not some corporation. That is the U.S. government charged with keeping us healthy.
>
> What I found is that we have a lot of data which we're not finding right now. And I don't want to have to rely on FOIA and leaks, though those can be incredibly informative. I want clear, independent scientific investigation and transparency. One way to do this would be a bipartisan congressional oversight investigation that had subpoena power. Give us your lab records, your notebooks, your data files of virus strains, and so forth. There are many questions that we need independent scientists to define, to tell us exactly the kinds of information. But we know right now we're operating in an environment in which the government is working to hide the data that we need to make a real assessment.

So far Ann Moscona from ASV seems on board we can start with her? And the two names she suggested?

I have not been at all successful in my outreach. I sent notes to Stef Bertuzzi at ASM, Mary Woolley at Research!America, and Carlos del Rio who is the foreign secretary for NAM (and the interim Dean at Emory Medical School) last Thursday after our call and I have not heard from any of them. I can get back to this middle of next week and if I haven't heard back by email I will call them directly. I can understand why Carlos might be suddenly overwhelmed with new responsibilities, which was one reason I thought about getting in touch first by email. But I don't think that applies to Stef or Mary.

The more the merrier as we say in the UK!

I think our goal should be to really get a lot of support from all segments of society. We definitely should avoid the claim that we are just being elitists.

EXTERNAL SENDER

Would engaging with the AAAS Committee on Scientific Freedom and Responsibility be useful? Here's some information on the CSFR from the AAAS website:

Committee on Scientific Freedom and Responsibility

The Committee on Scientific Freedom and Responsibility (CSFR) was established in 1976 by AAAS. The Committee Charter is as follows:

The Council recognizes that the CSFR, as a standing committee of the AAAS, plays a significant as well as potentially controversial role for the Association. The increasing complexity of the interactions among science, technology, and the public interest raise new issues and problems concerning the human rights, freedom of scientific inquiry, and professional responsibilities of scientists and engineers. The Association affirms at the outset that scientific freedom is grounded in basic human rights and implies special responsibilities to extend and disseminate knowledge for the good of humanity. With these perspectives in mind, and within the resources allocated by the Board of Directors, the Committee on Scientific Freedom and Responsibility is charged with the following duties on behalf of the Association:

1. To formulate and recommend principles and procedures to guide the Association in a continuing review of issues that affect scientific freedom and scientific responsibility, and to search for means that will effectively bring these issues to the attention of both scientists and others.
1. To monitor whether the actions and policies of the government of the United States, the governments of other nations, and of private organizations circumscribe or restrict

the freedom of scientists or their ability to carry out their responsibilities.

1. To collect information on restrictions of scientific freedom and of the ability of scientists to carry out their responsibilities, and to make such information available to scientists, scientific societies, and others who may be interested in taking action to counter these restrictions.
1. To encourage and assist the AAAS, its affiliates, and other scientific groups to develop statements of principles governing professional conduct, and to establish policies, procedures, and educational activities designed to encourage scientists to accept their professional responsibilities both with regard to safeguarding the integrity of science and with regard to the application of science in the promotion of human rights and general welfare.
1. To encourage and assist the AAAS and its affiliates to develop policies and procedures to protect scientists against infringements of scientific freedom; to collect information about the procedures of affiliated societies for dealing with documented allegations of such infringements; to facilitate communication among the societies with a view to strengthening of these procedures; and, in exceptional circumstances and within the criteria developed by the Committee, to conduct an analytic review of cases where the ramifications are deemed to be especially significant for the scientific community at large.
1. To report annually to the Association, through the Council–and, as appropriate, to other scientific and technological communities and to the general public–the activities of the Committee and its general assessment of significant developments during the year that affect scientific freedom and scientific responsibility and that call for examination, discussion and possible action.

As part of the attempt to fulfill its mandate, the CSFR in 1977 established a Science and Human Rights Subcommittee, specifically to address issues of human rights as they occur in relation to all these duties.

Adopted by the Committee for Scientific Freedom and Responsibility February 9, 1996.

Adopted by the AAAS Council on February 16, 1997.

LeBron was not great on the vaccine issue, he refused to rebuke Kyrie Irving, citing "freedom of choice". We need a strong NIH Director, and more forceful statements from the National Academies. I speak with Holden pretty regularly who gets it and is concerned. When I pick up my Purple Heart AAAS Scientific Freedom Medal on March 5, he'll be there and hopefully we can strategize then. So far only AAAS and to some extent AMA and AAMC seem interested or worried.

Many thanks Rich!

On Feb 9, 2023, at 2:21 PM, Roberts, Rich <roberts@neb.com> wrote:

Hi:

I have spoken with several people about the idea of a campaign to protect science and most seem on board with the idea, but a little short on ways to implement it in a way that might get wide public acceptance.

I spoke with Keith Yamamoto at some length. He is extremely supportive. He did have some insights about the NIH Directorship. He said that Biden had taken over the selection personally and no-one else seemed to be involved. His view and mine is that that means it is dead for now. He had been talking with Harold Varmus and Bob Horvitz, both of whom are very concerned about the Republican attacks on science. I will be talking with both of them tomorrow afternoon.

I spoke with John Deutsch (ex-President of MIT) and he is supportive, but has no clear ideas of how to proceed. He did say that we should talk with Holden Thorp (as we had discussed) and get AAAS involved. I had contacted Holden previously and he and I have a talk scheduled for next week.

Some of the more interesting suggestions that have emerged are that we should try to garner support from individuals and organizations that are not viewed by the general public, or politicians, as belong to the "elite" segment of society. I am thinking that someone like LeBron James could be an excellent spokesperson if we can reach him and his views are pro-science. He seems like a decent person and so maybe he is Pro-science. There are others who fit that category such as other sports stars and even some Hollywood people. I believe George Clooney would be favorable and maybe Harrison Ford, whom I met many years ago.

Subject: Notes from our call
Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress

Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack

- How should we reach out to build a coalition?
    - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:
    - AAAS
    - AIDS Vaccine Advocacy Coalition
    - American Public Health Association (Georges Benjamin)
    - American Society of Tropical Medicine and Hygiene (Dan Bausch, Karen Goraleski, Kent Kester)
    - Association of Public & Land-Grant Universities
    - Georgia Global Health Alliance
    - Bay Area Global Health Alliance
    - Consortium of Universities for Global Health
    - COVID Collaborative
    - Global Health Council
    - Global Health Technologies Coalition
    - Infectious Diseases Society of America Carlos del Rio (Jerry will reach out)
    - International AIDS Vaccine Initiative
    - Nobel Laureates Campaigns
    - Pandemic Action Network
    - PATH
    - Research!America – Reach back out – Jerry will
    - Union of Concerned Scientists
    - Washington Global Health Alliance
    - 156 virologists letter
    - NAM
    - NAS
    - NL Campaigns (to be kept informed of progress by Rich)
    - CUGH
    - The pandemic action coalition
    - FASEB
    - Global Health technologies coalition
    - APLU (KHG has connection)
    - Wellcome Trust (Paul Schreier is the interim head).
    - Dr. Tony Fauci
    - Felicia Goodrum (Arizona) and Stacey Schultz-Cherry (St. Judes)
    - OSTP
    - ASV – Anne Moscona (President-Elect)

Cheers,

Peter

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

MORENS_SUBPOENA_018558
MORENS_NIH_037555
REL0000478770

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media.

MORENS_SUBPOENA_018559
MORENS_NIH_037556
REL0000478770

According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee (HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.

I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?

Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad,* and that made me public enemy number one or two with the anti-vaccine activists. What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.

The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.

The hardest thing yet is really trying to describe the anti-vaccine ecosystem,

MORENS_SUBPOENA_018560
MORENS_NIH_037557
REL0000478770

because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.

All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous

MORENS_SUBPOENA_018561
MORENS_NIH_037558
REL0000478770

movements?
Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?
Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.
Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?
Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.
It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.
After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox

MORENS_SUBPOENA_018562
MORENS_NIH_037559
REL0000478770

News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines.

So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism,* you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's

MORENS_SUBPOENA_018564
MORENS_NIH_037561
REL0000478770

not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things

MORENS_SUBPOENA_018565
MORENS_NIH_037562
REL0000478770

about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the

MORENS_SUBPOENA_018573
MORENS_NIH_037570
REL0000478770

evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious attack. They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.

The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.

"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.

Sponsor Message

He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.

Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.

"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message

"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.

He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture

MORENS_SUBPOENA_018574
MORENS_NIH_037571
REL0000478770

of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an

experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by Miner Flux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

On Jan 24, 2023, at 11:02 AM, Peter Daszak [b6] wrote:

Thinking about our conversation next week on building a coalition to push back against some of the anti-science movement, I noticed that, following David Relman's and Mark Lipsitch's coining of the phrase 'risky research', that Science journal has now started using it. It's a slightly worrying trend, because in the online chatter, and in the Right Wing press, even conducting surveillance of wildlife for potential zoonoses is regularly called 'Risky Research'.

When we wrote our Independent taskforce report, we used the phrase 'smart surveillance' as a counter, but not sure that's being picked up at all!

Here is Relman's article in December last yr:
https://www.science.org/doi/10.1126/science.adf6020

And here is the new piece in Science (full text below):
https://www.science.org/content/article/us- announces-more-new-rules-potentially-risky-research

U.S. Announces More New Rules for Potentially Risky Research
Policies target studies involving the H5N1 influenza virus and 14 other 'especially dangerous' agents

- 21 FEB 2013
- BYDAVID MALAKOFF

Greater scrutiny. U.S.-funded researchers working with 15 especially dangerous agents, such as the Ebola virus (*above*), face new regulatory hurdles. CENTERS FOR DISEASE CONTROL AND PREVENTION

Researchers interested in conducting studies with 15 potentially dangerous agents and toxins—including the H5N1 avian influenza virus—face some new hurdles in getting funding from the U.S. government. Federal officials today released two policy documents that lay out stricter requirements for institutional and government oversight of studies that pose especially problematic safety concerns.

One policy, released by the U.S. Department of Health and Human Services (HHS), applies only to scientists seeking funds for experiments that might create new strains of the H5N1 virus that can move between mammals in respiratory droplets. (The virus normally infects birds.) Experts fear that such mammal-transmissible H5N1 viruses could spark a deadly human pandemic if they escape from a laboratory or are intentionally released by terrorists. U.S. officials outline the new policy today in *Science*.

The other document, released by the White House's Office of Science and Technology Policy (OSTP), asks for public comment on proposed new rules for scientists, universities, and other institutions working with a broader set of 15 especially dangerous agents and toxins—including H5N1—that could be used to cause harm. Existing U.S. rules, released in March 2012, require federal agencies to review funding proposals that involve the 15 agents for "dual use research of concern," or DURC. The draft policy would require additional reviews by scientists and their institutions. Universities would also need to establish procedures for developing plans for mitigating risks associated with such dual-use studies.

Both policies are direct responses to a global controversy that emerged in late 2011 after two laboratories, one in the United States and one in the Netherlands, announced they had engineered mammal-transmissible H5N1 viruses. The research sparked disagreement over whether the results should be published and whether scientists should be conducting such research at all. H5N1 researchers imposed a yearlong voluntary moratorium on their work, which ended last month, while governments worked out new oversight rules.

Both of the policies announced today are expected to apply to a relatively small slice of biological research. Officials have said that just a handful of U.S.-funded researchers are engaged in H5N1 research that would fall under the new policy. The new DURC policy would have a broader impact, officials say, covering perhaps several hundred laboratories known to work with the 15 agents. All but one of the agents are already regulated under a separate set of safety and security rules governing "select agents."

Under the proposed rules, scientists would be asked to determine whether a proposed study met the definition of DURC—for example, whether the experiment might make a toxin more deadly or confer resistance to treatments, and whether the results "could be directly misapplied to pose a significant threat" to the public. Universities would also be required to establish a new committee—or use an existing one—to do DURC reviews, and appoint an "Institutional Contact for Dual Use Research," or ICDUR, to oversee potentially problematic projects. Universities would have 30 days to inform a funding agency that they were reviewing a proposal and 90 days to submit a draft plan for mitigating any risks.

The plan also calls on institutions to make its DURC review procedures "accessible to the public." But the government doesn't want institutions to publish "details of particular cases or the minutes of the DURC review entity's proceedings." That might be a hard rule to enforce in states with expansive freedom of information laws covering publicly funded institutions, said Franca Jones, OSTP's assistant director for chemical and biological countermeasures, in a teleconference with reporters today. It is just one of the difficult issues in the draft policy that officials are hoping the public will comment on, she said. Comments are due by 23 April.

The draft policy is drawing mixed reactions from university groups. "At first blush, there is a need for biosecurity regulation of select agents," says Carrie Wolinetz of the Association of American Universities in Washington, D.C. But existing select agent rules are fairly strict, she noted, and "imposing a second review system [for DURC] on agents that are already heavily regulated may be of marginal benefit."

H5N1 researchers are likely to be happier with the new HHS rules, which were revised following a December 2012 meeting on the topic. The new language removes any mention of classifying problematic studies or results, for instance,

MORENS_NIH_031652
REL0000478796

instead clarifying that HHS will support only research that can be shared publicly. The final rule also drops language that called on researchers to show that the virus they wanted to create could evolve in nature "in the foreseeable future." Instead, researchers need only to provide evidence that the virus could "be produced through a natural evolutionary process."
Officials say they will regularly review and revise both new policies as needed.
***Update 4:32 p.m., 21 February:** This item has been updated to clarify the definition of DURC.*

Cheers,

Peter

Just looking at the chat. Thanks David for starting it. I downloaded the new paper and look forward to sitting down to read it. I have thought there were a number of areas where NIAID vaccine research policy was off-center, for example how long it took to focus attention on a universal non-seasonal influenza A vaccine. We lost a lot of time by the decision to go with the status quo.

My NEIDL colleague Nahid Bhadelia is working with Ashish Jha at the WH on coronavirus policy. I will ask her to talk to Ashish about raising a fire under the woodpile the administration leadership is quietly resting and to get busy with the job of finding the next Harold Varmus. Its 18 years since he left and there has been no comparable leader, and during that time the reputation of NIH has been tarnished by one after another leader. Larry Taback is just the latest. Of course it could have been worse, CDC as the example, but that's no comfort.

Peter H, you should keep this in mind. The time to step forward may not be now but do stay tuned to the sounds coming out of HHS and the WH.

Jerry

Yes, sadly, you are right. We are in for alot more shit

In terms of us looking for a new director, since this is not a political appointment position, niaid has much leeway in doing what we want, subject to HHS and NIH oversight/coordination, but not outright control

There seems to be secrecy around the process of finding a new director, which is not the way we have done things in the past. The job description is not what i would have written, eg, in specifying someone who is politically savvy. We have 27 IC directors here at nih and i can't recall any prior search looking for someone with political chops.

I am afraid we could end up with a pliant nih insider rather than an outsider with strong science credentials. The model is former NCI director Harold Varmus who was perceived as too big to mess with, and used that reputation to push back against all kinds of BS

There is no guarantee that anything will happen soon. Hugh is Acting Director but is taking a hands off, just-keep-the-ship-afloat approach so far. I hope he will be more proactive, as he is smart and capable, and has alot of management expertise

But internally there is absolute silence about what if anything is happening. I know all the senior leaders here, and none are involved in any search "above board", at least. Several have implied to me that they are as much in the dark as everyone else. If so, that is not good news because it raises the possibility of a covert and possibly politically oriented process

That is one reason i encouraged you to apply: an nih outsider who has political skills and a scientific reputation, as well as skill in pushing back against the BS. If you think of all possible scientists who would be good in the job, the list is not long, or at least my list isn't. If you know anyone please urge him or her to apply asap!

On Jan 21, 2023, at 8:39 AM, David Morens b6 wrote:

Hi all, my apologies for being out of touch;

had some non fatal health issues and surgery yesterday morning, but should be back to work part time this week

There is a front page story in the Wash Post this morning about GOF and the NEIDL. You should all read

Since Tony stepped down 12/31, I have been mulling the implications for me being able to speak up more

Our deputy director, Hugh Auchincloss, is a good and reasonable guy, but i have not yet spoken to him about how muzzled i am expected to be going forward. I think the party line at nih is to be very fearful of the crazies in and out of congress, and in practice our guidelines of never speaking to the press unless approved by HHS or the White House remains in effect. That is why 95% of my interactions with the press are on background and off the record. (Incidentally, although i have spoken to Joel Achenbach on background numerous times in the past, i did not speak to him for today's article).

Here is how it works. Our press office knows that whereas Tony has the patter and nuance down pat, I will say pretty much exactly what i think scientifically, and therefore they do whatever they can ethically to cut me off from sensitive issues, knowing that HHS will cut me off if they don't

But I plan to sit down with Hugh and ask him to let me use my judgement in these issues. There is no govt reason anymore for me being forbidden to even speak with colleagues such as you all

And an interesting thing happened recently that i think bodes well. As you all know, over the last 15-20 years or so i have written 40-50 scientific papers with Tony, mostly reviews and commentaries that provide springboards for him to talk to the press. Usually i propose the topics and he says yes or no.

Ever since the GOF thing broke 15 years ago, with Ron F and Yoshi K publishing their two papers on H5N1, GOF has been a no no for me/us to write about. And so far, still is a no no. Another subject that has been a no no is my conclusion that our whole scientific enterprise to make

MORENS_NIH_031660
REL0000478796

vaccines against respiratory viruses is off base scientifically, and needs to be reoriented

A few months ago, Tony surprised me be giving me the go-ahead to write a review that says as much, implicitly criticizing what we at nIH and others do in terms of vaccine development approaches. Many others at NIH told me that we dare not write that. But about 10 days ago the paper came out in Cell Host and Microbes, with Tony's name on it, and has been greeted very positively by many high level folks in and out of govt

This gives me SOME hope that us discussing GOF head on might be possible, by which i don't necessarily mean talking to the press, but by writing in science articles why it is that the whole concept of GOF is being (often willfully) misunderstood. The aim would be to have statements by govt scientists that change the terms of the dialog, ie, be more proactive rather than letting the crazies control the dialog

I wrote such a paper with Jeff Taubenberger 10 years ago, which has sat unpublished in a file cabinet ever since, and could easily resurrect it with updates addressing SARS-CoV-2....

So..... I am hoping that I will no longer be bound and gagged from from enjoying my first amendment right to speak to you all about scientific matters if importance. It's a new year and time to move forward by being more proactive

Sorry, was occupied yesterday with family so I have just caught up with this and the Ossoff/Johnson letter. As I noted earlier I will send a letter to Ossoff with my concern that he has co-signed a letter with Johnson and request his explanation. I don't for an instant think I will get a reply, and I don't (and never will) vote in Georgia. I did sent a few contributions to his campaign but I am not in the category of an influencer.

For NAM, I suggest your advisors consider whether or not you can respond back to Fuentes-Afflick to ask what they intend to do about the failure of the house members to maintain confidentiality that you and allegedly NAM has. It seems to me they deserve a rebuttal. I don't know if there has been any attention paid to the Fox news piece, and maybe its not time to work on a favorable public response, but I would certainly be willing to take it up with Jon Cohen at Science.

Jerry

Subject: Response from NAM FW: confidential
Importance: High

Dear all,

Please read below the response from the NAM membership secretary.

They are, so far, sticking to their goal of investigating a subset of these BS allegations. They're allowing me to communicate with honorable people such as yourselves, and giving me an extension to June 12th.

It looks like this is a response to both my formal letter and the follow up email I sent them where I complained about their communications with the Republicans who sent this letter (it's in the chain below).

I'll work with Jeff to draft a response to this, but then I'll have to get ready for the awful prospect of actually refuting the allegations with documents to back that up. They won't allow me to meet with the committee.

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

From: Fuentes-Afflick, Elena b6
Sent: Saturday, April 30, 2022 2:06 PM
To: Peter Daszak b6 g >; Dzau, Victor J. b6 Kim, Se b6
Subject: confidential

Dr. Daszak,

Thank you for your note of April 22nd. I was traveling and apologize for my delayed response. I have reviewed your letter in detail and will respond to each point.

First, when the NAM receives any allegation of misconduct against a member, we have to follow an independent process that is outlined in the policy document you received. We have undertaken an initial evaluation by an assessment panel which eliminated many of the allegations but recommended a subset of the allegations to be further investigated by the conduct review committee. The list of allegations was shared with you.

I accept your request for a deadline extension to June 12th. You may enlist the assistance of others and I encourage you to request that they honor the confidentiality of the process.

Point 1: To date, the NAM has not conducted its own investigation of the allegations. We have identified a subset of materials for further investigation which were referenced in the April 11, 2022 letter.

Point 2: I apologize for not providing information about the conflicts evaluation. We conducted a thorough evaluation of the conflicts of the assessment panel and conduct review committee members and none were identified.

Point 3: We identified selected references from the list provided in the original letter with the allegations and added one reference that is publicly available on the NIAID's website. These materials and any response you provide are the only materials that the Conduct Review Committee will consider.

Point 4: I should have asked if you have the results of an external investigation related to the allegations under consideration. If you have any such results, please share them.

Point 5: You are correct that our policy does not include a provision to meet with the conduct review committee and I cannot offer you this option. I invite you to submit additional materials if you believe they are relevant.

I want to assure you, personally, that the confidentiality requirement and following our process are my top

priorities. I have discussed this with all individuals involved and have not shared information with anyone other than the assessment panel and conduct review committee members. My communication with the representatives of those who wrote the original letter was to confirm receipt of the materials and explain that we would be following our conduct review process.

I would be happy to connect with you, by phone or Zoom, to discuss.

Best,
Elena Fuentes-Afflick, MD, MPH

Subject: Reporter inquiries re. the confidential NAM process of dealing with alleged code of conduct violations

Dear Victor, Elena and Kim,

I was very concerned to have received three separate press inquiries today regarding a story in *Fox News* (https://www.foxnews.com/politics/house- republicans-ecohealth-alliance-concealed-data). I am not planning to respond to these questions.

As you can see in the *Fox News* article, yet another partisan political letter has been made public with unsubstantiated and clearly politically motivated allegations against our organization and myself. In the article, an aide to Representative McMorris Rodgers states that "*After receiving our letter, NAM notified us they had opened an internal review of Daszak's behavior, per our request…We believe this letter about EcoHealth's potential false statements and fraud is relevant to the ongoing investigation the NAM is conducting into Peter Daszak, so we have sent NAM a copy of this letter as well.*"

In your letters to me, and by phone, you reassured me repeatedly that the process of deciding whether to investigate these allegations was confidential on the NAM side, and you urged me to also treat correspondence with NAM on this issue as confidential, which I have. However, it appears that this is not the case, in that NAM has informed the Republican staff of intent to review my 'behavior' and that this has now been made public, as I indicated could happen in my letter to you last week, April 22, 2022.

It seems rather evident that the letters you have received are part of an ongoing and systematic political campaign to destroy EcoHealth Alliance's reputation and my own, with the ultimate target of undermining the NIH, Dr. Fauci, and the Biden White House. They are hyper-partisan and disingenuous in their goals, in that the letters and the fact they are simultaneously made public on *Fox News* and *Twitter*, are clearly designed to push a false narrative. EcoHealth Alliance has repeatedly and publicly refuted such allegations in our responses to NIH that have since been made public (e.g. https://www.wsj.com/articles/coronavirus- study-of-bats-in-china-met-nih-grant-requirements-ecohealth-says-11635441406) and in carefully given interviews with the press (e.g. https://www.science.org/content/article/we- ve-done-nothing-wrong-ecohealth-leader-fights-charges-his-research-helped-spark-covid-19 and https://theintercept.com/2022/03/11/covid- nih-ecohealth-peter-daszak-

interview/).

Given the developments today, I urge you to reconsider your decision to investigate these allegations, which have nothing to do with my adherence to the rules of conduct of NAM members, and to respond to the Republican accusers to state that they do not rise to the level whereby an investigation is warranted. I believe this is justified by the one-sided political nature of the attacks, the lack of prima facie evidence for the allegations, and the fact that your communications have already been made public in defiance of the confidentiality of the matter that NAM and EcoHealth Alliance have maintained. I'm very concerned that this public witch hunt will be damaging not just for myself and our organization, which has consistently produced cutting edge research on emerging diseases that has been fundamental to a series of NAM publications, but that it will also be damaging to NAM and the Academies in general. If you do not stand up to these politicized attacks at this point, they will surely continue and drag in other members of the Academies who have been publicly criticized and accused by the same politicians for the last two years, and who are being continually attacked by various fringe groups espousing conjectural hypotheses about the origins of SARS-CoV-2, in spite of the increasing scientific evidence supporting the spillover from bats through an intermediary host to humans.

This active political interference with stewardship of science, the integrity of science, and the pursuit of knowledge by scientists, goes well beyond EcoHealth Alliance and threatens the integrity of the entire U.S. scientific enterprise. It is no different except in volume than the incontrovertible political interference by Donald Trump in the scientific enterprise at NIH in April 2020, which prompted you to issue a public statement about the separation of politics from science in response. Your words and those of Marcia McNutt ring even more true at this point: *"Any efforts to discredit the best science and scientists threaten the health and welfare of us all"* (https://www.nationalacademies.org/news/2020/09/nas- and-nam-presidents-alarmed-by-political-interference-in-science-amid-pandemic). EcoHealth Alliance, myself, the NIH, Tony Fauci, NAM and you are in the cross-hairs now because NIH failed to protect science and scientists from Trump's overtly political, and sadly successful, effort to close down research that was politically inconvenient. I worry that this is just the beginning of the goal of this anti-science agenda, and for that reason it demands brave, bold, and decisive action.

Yours sincerely,

Peter

Wonderful that you're able to get information up the chain and I'm really relieved and hope that it will be useful and that this won't be weaponized politically.

The quote came out in the Financial Times on Saturday (attached PDF). The relevant quote is here:

'But he [Fauci] also admits that some of the work undertaken at the Wuhan lab using NIH money could have violated safety standards — even if he says responsibility for that lies with EcoHealth Alliance, the non-governmental group that performed the work. "We will have to go back and look at that," he said of accusations that some of the coronavirus work was undertaken at biosafety level two, roughly equivalent to that in a dentist's office. "But that is something that should have been monitored by EcoHealth Alliance." EcoHealth Alliance said: "As with all research organisations, EcoHealth Alliance must follow the local laws of the countries in which we work."'

Of course, for EHA this is very concerning because even though we've followed the appropriate rules, their complexity means that the public may not understand, and when you add comments like the journalists have above: "work…could have violated safety standards", it's just used to cast doubt and try and besmirch our name as usual.

Cheers,

Peter

Subject: ASF and all this may come up in interviews

In the recent Bulletin of the Atomic Scientists article, we have this quote

"It is clear that some or all of this work was being performed using a biosafety standard—biosafety level 2, the biosafety level of a standard US dentist's office—that would pose an unacceptably high risk of infection of laboratory staff upon contact with a virus having the transmission properties of SARS-CoV-2…."

My understanding is that human coronaviruses including sarbecoviruses are routinely worked at in BSL-2 around the world as are many other viruses that can cause problems for people. The BSL level designation is decided by each country and is not related to perceived pandemic potential but largely to risk to the BSL workers.

For example, BSL-4 designation generally means deadly virus, infectious by aerosol, no vaccine against it, and no treatment for it. So, although rabies is 100% fatal in humans, it can be prevented by a vaccine and prevented by a post exposure serum, and (probably if not totally) not infectious by aerosol, thus it is BSL-2 even though among the deadliest of human viruses. Working with non-human coronaviruses at BSL-2 is widespread since these viruses are not known to infect humans.

David, Alan and others may have additional thoughts.

Attached is a fact sheet that I think comes from Ec~Health

EXTERNAL SENDER

One of my Board members, Amy Attas, who's a veterinarian to the pets of people like Mike Bloomberg's wife, Elton John etc. goes to a monthly lunchtime talk series near her summer home in CT (I think). Harold Varmus spoke there a couple of Sunday's ago. Amy asked the first question along the lines "I'm on the Board of an organization working to prevent pandemics..what are the best strategies to prevent the next COVID?" His response: "Is that EcoHealth Alliance?" "If so, what they're doing is exactly what should be done..." He then rolled off a series of key goals to prevent pandemics.

Amy was delighted, and a number of other donors expressed an interest. Please pass on my regards and gratitude to Harold – this is exactly the sort of word of mouth endorsement we need right now, rather than the other sort we're getting from Fox News!

Cheers,

Peter

I totally agree with you that Tony was remarkable. I sent him a one word email, Bravo, and copied it to Patty Conrad so maybe he will see it as evidence of the support he has from the responsible scientific community.

Thanks for the response regarding the CNN reporters. I'll keep that in mind when I do talk to them and consider whether speaking with you might help them distinguish between good science and crap. I have no doubts about your expertise in science and knowing the difference between, well, good science and crap.

Harold is rather quiet – any sense of what he is up to?

I had a long talk with two CNN International reporters who are preparing a story essentially on the politics and the misinformation about the origins controversy. I was talking to them off the record but I decided they were legitimately exploring the issues and would likely be a voice of reason if they were given the necessary space to build their case and it was eventually shown.

I mentioned Peter Hotez to them, among some others, and while I mentioned Peter D as well I also said you were under constant attack and it might well be better to allow others to take up the fight on your behalf. GOF and the Goffers were part of the chat. I have agreed to be interviewed on the record and potentially to do a video session as they were potentially interested in using some of that as part of the report. Rich, I didn't specifically mention your name, but if you would be willing to speak with them I can do that when I next connect.

David – please pass this information on to Tony and Clifford if you possibly can,

The WHO DG, Dr. Tedros set up a 6am Monday morning meeting with the current WHO Origins team – the international experts who went to Wuhan to work with our China counterparts on COVID origins. He announced they'd be disbanding the team, setting up a separate structure and moving to a system whereby a new team will be formed to do Phase 2 of the work in China. The stated goal is to follow member state's wishes and improve transparency in the way the origins team is selected. Sadly it will reduce transparency because there will now be a 'behind closed doors' decision from the member states on who of the nominees are put forward to WHO, then another 'behind closed doors' decision from WHO on who is selected, with, we've been told, the DG of WHO having final say.

From my point of view it's a real problem because given the political pressure from the Right wing, it might prevent my future involvement in this work. This means my 17 years + of collaboration with the very people in China who we need to work with, will not be part of Phase 2 work – including designing the animal testing protocols that are my key expertise. Disbanding the current team will also significantly delay the work and this threatens to undermine our capacity to do the trace-back, as antibodies wane among wildlife farmers in rural China who we've proposed should be interviewed and tested in Phase 2, for example. The current team has a good working relationship with the China side and has made significant progress over the last few months, meeting weekly as an international expert group and working with our Chinese counterparts to update the WHO report, include new data and get phase 2 Terms of Reference thrashed out. We'd reached the beginnings of consensus on this.

It will also be seen as an implicitly political move on behalf of WHO, and one that projects a perception of undermining the hard work we did to produce buckets of new data in the WHO report. The rest of the team are very angry about the way we've been repeatedly undermined by politics, and we're working on a communications strategy right now.

MORENS_NIH_041746
REL0000478866

David, I'm not sure who is the US representative for WHO Covid origins negotiations. It was publicly announced that Tony would represent the US at WHO, but it may be a State Dept or other HHS person. I think it's important that Tony and perhaps Clifford know what's happening.

Cheers,

Peter

Subject: Circular Letter to Member States - Origins of SARS-CoV-2

Dear all,

It was a pleasure to meet you on Monday. Please find attached for your information and on behalf of the DG our communication to member states, shared with them as a circular letter this evening. Please don't hesitate to reach out to us for follow up discussions.
Please keep this confidential during the next days. We will have a member state briefing and discussion on this subject on Friday.

With my best regards,
Catharina

P.S. I hope I have the correct list of emails addresses.

Attachments: NIH 2020-foia-log.pdf; NIH 2021 foia-log.pdf; NIH 2022-foia-log.pdf

I found a place on the NIH website where they do an annual report of all FoIA requests: https://www.nih.gov/institutes-nih/nih-office-director/office-communications-public-liaison/freedom-information-act-office/nih-foia-log

It's quite shocking – there are something like 2000+ a year for 2020, 21, 22 – that's ~5.49 per day!!

Even worse are the topics – things like "Every email from Tony Fauci with the words "Christmas" "Holiday" "Thanksgiving"" as well as every possible conspiracy theory from hydroxychloroquine to windfarms!

I've attached pdfs for the past 3 years. It looks like about every 5th one or so for 2022 is related to EcoHealth alliance, WIV, Daszak, etc.

What a shocker! No wonder we're all so busy here plowing through the same emails over and over again!

Cheers,

Peter

They've finally re-upped their letters from December, now that they're actually in power.

We've already responded to confirm receipt, tell them we'll comply with information, and explain we need an extension and reduction in scope (their deadline is 1 week!).

Fox News asked for comment 30 mins after we received the letter, so there will be the usual BS in the press.

They've also asked for similar docs and testimony from Francis Collins, Xiaver Beccara, Avril Haines from "Intelligence" (they can't be that intelligent if they're still buying into the lab origin BS) and Tony Fauci (just testimony): https://oversight.house.gov/release/wenstrup- comer-launch-first-select-subcommittee-investigation-into-covid-origins-and-u-s-taxpayer-dollars-funneled-to-the-wuhan-lab%EF%BF%BC/

Seems like EcoHealth (and me specifically) will be the unfortunate scapegoat in their political theater!

Would engaging with the AAAS Committee on Scientific Freedom and Responsibility be useful? Here's some information on the CSFR from the AAAS website:

Committee on Scientific Freedom and Responsibility

The Committee on Scientific Freedom and Responsibility (CSFR) was established in 1976 by AAAS. The Committee Charter is as follows:

The Council recognizes that the CSFR, as a standing committee of the AAAS, plays a significant as well as potentially controversial role for the Association. The increasing complexity of the interactions among science, technology, and the public interest raise new issues and problems concerning the human rights, freedom of scientific inquiry, and professional responsibilities of scientists and engineers. The Association affirms at the outset that scientific freedom is grounded in basic human rights and implies special responsibilities to extend and disseminate knowledge for the good of humanity. With these perspectives in mind, and within the resources allocated by the Board of Directors, the Committee on Scientific Freedom and Responsibility is charged with the following duties on behalf of the Association:

To formulate and recommend principles and procedures to guide the Association in a continuing review of issues that affect scientific freedom and scientific responsibility, and to search for means that will effectively bring these issues to the attention of both scientists and others.

To monitor whether the actions and policies of the government of the United States, the governments of other nations, and of private organizations circumscribe or restrict the freedom of scientists or their ability to carry out their responsibilities.

To collect information on restrictions of scientific freedom and of the ability of scientists to carry out their responsibilities, and to make such information available to scientists, scientific societies, and others who may be interested in taking action to counter these restrictions.

To encourage and assist the AAAS, its affiliates, and other scientific groups to develop statements of principles governing professional conduct, and to establish policies, procedures, and educational activities designed to encourage scientists to accept their professional responsibilities both with regard to

MORENS_SUBPOENA_018960
MORENS_NIH_038446
REL0000478887

safeguarding the integrity of science and with regard to the application of science in the promotion of human rights and general welfare.

To encourage and assist the AAAS and its affiliates to develop policies and procedures to protect scientists against infringements of scientific freedom; to collect information about the procedures of affiliated societies for dealing with documented allegations of such infringements; to facilitate communication among the societies with a view to strengthening of these procedures; and, in exceptional circumstances and within the criteria developed by the Committee, to conduct an analytic review of cases where the ramifications are deemed to be especially significant for the scientific community at large.

To report annually to the Association, through the Council–and, as appropriate, to other scientific and technological communities and to the general public–the activities of the Committee and its general assessment of significant developments during the year that affect scientific freedom and scientific responsibility and that call for examination, discussion and possible action.

As part of the attempt to fulfill its mandate, the CSFR in 1977 established a Science and Human Rights Subcommittee, specifically to address issues of human rights as they occur in relation to all these duties.

Adopted by the Committee for Scientific Freedom and Responsibility February 9, 1996.

Adopted by the AAAS Council on February 16, 1997.

Subject: Re: Follow up from our call

LeBron was not great on the vaccine issue, he refused to rebuke Kyrie Irving, citing "freedom of choice". We need a strong NIH Director, and more forceful statements from the National Academies. I speak with Holden pretty regularly who gets it and is concerned. When I pick up my Purple Heart AAAS Scientific Freedom Medal on March 5, he'll be there and hopefully we can strategize then. So far only AAAS and to some extent AMA and AAMC seem interested or worried.

Many thanks Rich!

On Feb 9, 2023, at 2:21 PM, Roberts, Rich b6 wrote:

Hi:

I have spoken with several people about the idea of a campaign to protect science and most seem on board with the idea, but a little short on ways to implement it in a way that might get wide public acceptance.

I spoke with Keith Yamamoto at some length. He is extremely supportive. He did have some insights about the NIH Directorship. He said that Biden had taken over the selection personally and no-one else seemed to be involved. His view and mine is that that means it is dead for now. He had

MORENS_SUBPOENA_018963
MORENS_NIH_038449
REL0000478887

been talking with Harold Varmus and Bob Horvitz, both of whom are very concerned about the Republican attacks on science. I will be talking with both of them tomorrow afternoon.

I spoke with John Deutsch (ex-President of MIT) and he is supportive, but has no clear ideas of how to proceed. He did say that we should talk with Holden Thorp (as we had discussed) and get AAAS involved. I had contacted Holden previously and he and I have a talk scheduled for next week.

Some of the more interesting suggestions that have emerged are that we should try to garner support from individuals and organizations that are not viewed by the general public, or politicians, as belong to the "elite" segment of society. I am thinking that someone like LeBron James could be an excellent spokesperson if we can reach him and his views are pro-science. He seems like a decent person and so maybe he is Pro-science. There are others who fit that category such as other sports stars and even some Hollywood people. I believe George Clooney would be favorable and maybe Harrison Ford, whom I met many years ago.

Subject: Notes from our call
Importance: High

Attached are notes and action items (also cc'd below), as well as the concept note which I've expanded with more names of orgs to add:

Towards a Coalition to Protect Pandemic Preparedness Research

Notes from call 2/1/23
Rich Roberts, Peter Hotez, Jerry Keusch, David Morens, Jeff Sturchio, Peter Daszak, Aleksei Chmura

Action items:

Rich will speak with:
- Harold Varmus to sound him out re. this issue
- Holden Thorpe to find out the best way to engage AAAS (Sudip Parikh CEO)
- NAS: Rich will be in DC in March talking with Marcia McNutt, Nobel Foundation & NAS – will see if Nobel Foundation will endorse this effort if NAS supports it

Jerry Keusch will reach out to:
- ASM – Stephano Bertuzzi

David Morens will reach out to Tony Fauci to ask advice on how we should progress

Peter Hotez will talk with:
- Head of OSTP (Peter will speak with them in March)
- ASV – Anne Moscona (President-Elect)

Peter Daszak will contact as many of the others as possible, writing on behalf of all of us, so as to avoid concerns that people might have re EcoHealth being in the line of fire.

Next steps
- each of us will reach out to different contacts
- re-convene by conference call in 3 weeks or so (Peter D. will set up), around Feb 22nd.
- In-person meeting at EHA NYC afternoon of April 27th.

Summary of discussion:

- What could the goals of the coalition be, and what should they not be
  - Overall goal to have a 'coalition of the willing' form, organized by an independent group (hopefully AAAS, or similar level) to defend pandemic prevention research that is under attack
- How should we reach out to build a coalition?
  - Making contact with key people from each of the above, trying to set up a conference call, convened by a leading independent group (e.g. AAAS) where multiple contacts come together and the discussion is led by the independent group.
- Who should we try to engage: Academies, academic societies, pro-science pressure groups, senior figures in the field, funders, and governmental leaders. Initial list:

MORENS_SUBPOENA_018965

Dear All,

I'm looking forward to our discussion today at 1pm. Attached is a concept note that Jeff Sturchio drafted to frame some ideas around what we might try to do.

I've also attached a rough agenda for us.

Here are the details of the zoom call, and I look forward to speaking with you all later on:

Viral spread: Peter Hotez on the increase of anti-science aggression on social media

By Sara Goudarzi | January 30, 2023

Peter Hotez (Image courtesy of Agapito Sanchez, Baylor College of Medicine)

Last November, Twitter announced it will no longer enforce "the COVID-19 misleading information policy." The platform also allowed previously banned users to rejoin the site. Since then, anti-vaccination messaging has gained renewed energy, distressing scientists and researchers who have been combatting misinformation and disinformation on social media. According to research, there's a strong relationship between anti-vaccination efforts on social media and vaccine hesitancy, and while millions of people were saved by having taken the COVID-19 vaccines, hundreds of thousands of Americans died after refusing it.

Peter Hotez, a physician-scientist, dean of the National School of Tropical Medicine, and a professor in the departments of Pediatrics and Molecular Virology and Microbiology at Baylor College of Medicine, is no stranger to anti-vaccination attitudes. He has fought against misleading medical information for years. But now, he says, anti-science sentiments have been weaponized by businessmen and politicians seeking profits and power.

In the 1940s and 1950s, the House Un-American Activities Committee

MORENS_SUBPOENA_018970
MORENS_NIH_038456
REL0000478887

(HUAC) investigated and discredited several scientists who worked on the Manhattan Project. Hotez expects congressional committees under Republican control to engage in a similar targeting of scientists in an attempt to accumulate influence and foster a sense of belonging—a signature of authoritarian regimes—among their constituents. In his view, this anti-vaccine, anti-science movement, versions of which are spreading to other countries, could destabilize the global vaccine ecosystem.
I spoke with Hotez about the role of social media in spreading misleading information on vaccines and stoking anti-science aggression in many dimensions. *The resulting discussion has been edited for length and clarity.*

Sara Goudarzi: You've been on Twitter for more than a decade and often use it as a tool to communicate health and science facts, such as the importance of vaccinations. How in your experience has the social media platform changed during this time?
Peter Hotez: Well, it's become a lot more adversarial as the anti-vaccine movement has shifted. The anti-vaccine movement began in earnest around 20 years ago in the United States around false assertions that vaccines cause autism. The way I got involved was because I have a daughter with autism, and I wrote the book *Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad*, and that made me public enemy number one or two with the anti-vaccine activists. What I would do at that time of social media was use their statements in their attacks against me as a teachable moment, to expose what the anti-vaccine movement was all about and how they were monetizing the internet with books on Amazon and nutritional supplements and the phony autism cures. So, rather than simply block people who were attacking me, I would retweet them with a little description of what they were doing. People found it very interesting because it was teaching them how an anti-science movement works, and they started coming to my Twitter for that purpose.
The game changer was about nine years ago, when [vaccine disinformation] became a political movement around health and medical freedom. You saw a different set of actors come into this, and it became a lot more aggressive; people's political allegiance became tied to not giving their kids vaccinations, and that has just come off the rails with COVID-19. And I'd like to point out that 200,000 Americans now have needlessly lost their lives because they refused the COVID vaccine.
The hardest thing yet is really trying to describe the anti-vaccine ecosystem, because too often it's still couched in the old autism thing that they call infodemic or give it euphemisms like misinformation or disinformation. That is, as though it's some random stuff appearing on social media, when in fact, it's organized, politically motivated, and deliberate. It has a system in place, and what I do now is use that to actually describe who the actors that comprise that ecosystem are—elected leaders in the House Freedom Caucus, certain senators, and local leaders amplified in Fox News with designated contrarians from the far right think tanks.
All our training to be a scientist says you're not supposed to talk about Republicans, Democrats, liberals, or conservatives; you're supposed to be politically neutral. But what do you do when the anti-science, anti-vaccine

aggression is predominantly coming along the partisan lines from the far right? How do you articulate that without basically saying, "the reason I'm doing this is to save lives?" It's no longer a theoretical discussion; Americans have lost their lives because they believed the politics, and to be able to articulate that is really threading a needle there.

Goudarzi: With Twitter's moderators practically gone, the platform's announcement that it will no longer enforce measures to combat misleading information regarding COVID-19 and will give amnesty to previously banned users, there seems to be a rise in anti-vaccination sentiment.

Hotez: It's blown up. It's gotten much tougher: Anything I put out there gets immediately pounced on, and I can trace the origins to four or five either elected leaders or these contrarians from far right think tanks and elsewhere who blow dog whistles. They will put out a (typically false or exaggerated) statement against me, and then I'll receive hundreds and hundreds of tweets or emails specifically targeting me. About half of them look like bots because the person sending it is an empty face with a gazillion numbers attached to the Twitter handle. But others are real people tuning into Fox News every night who totally fall into the rabbit hole because they seem to worship these contrarians. The other piece to this is a lot of Nazi imagery and fantasies, a lot of antisemitism, because they know I'm a Jewish scientist. And that's yet another dimension to all of this.

Goudarzi: How do you think this affects patients in healthcare settings? Have you had personal experience with those who decided not to get vaccinated because of information on the internet or social media indicating the shots are dangerous?

Hotez: I've had sort of the opposite experience, where patients were in the rabbit hole, had seen my postings, see me as credible, and because of me are taking the vaccine, which is kind of nice and spurs me on to keep going at this. But more and more I've also had the other extreme as well, which is based on what they see on social media: People will take the time to write me a threatening email or make a call to the lab or to the office. Then I have to bring in law enforcement through the Texas Medical Center Police or the Houston Police Department and the Anti-Defamation League (because they have a list of individuals who are known to make these types of threats). It's taken this very, very dark turn as a consequence.

Goudarzi: Anti-vaccination movements are nothing new and go back to the late 1700s, even before the development of the smallpox vaccine and then the 1800s and again in the 1990s and 2000s. Do you think social media has allowed the latest movement to gain even more steam than previous movements?

Hotez: I wrote an article about the whole history of [anti-vax movements] in *Journal of Clinical Investigation*. I think it really accelerated in the early 2000s with autism, in part aided by social media—it was new then but was starting up. Now, I think social media has really been an enabler. It's not only social media; I think amazon.com was a big contributor. If you search for books on vaccinations, what's out there is a horror show. My books are among the top-rated on vaccines, and they're probably ranked about number 30 or 40, because it's all preceded by the phony-baloney, anti-vaccine COVID conspiracy books. So, it's Amazon and social media. And Fox News is having a huge impact. This has been documented by Media

MORENS_SUBPOENA_018972
MORENS_NIH_038458
REL0000478887

Matters, the watchdog group, as well as this very interesting paper that came out of ETH Zurich, which is like the MIT of Central Europe.

Goudarzi: Do you think Amazon is purposefully placing these books higher up in search results, or are search results just a reflection of how much steam the movement has gained?
Hotez: I don't know. Amazon is probably amoral. I don't think they think about this one way or the other, but whatever sells. So, it's whatever people are buying—that's how they're ranking it.
Goudarzi: Are you seeing a difference in the attitudes towards COVID-19 vaccines versus say the flu or MMR vaccines?
Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.
It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.
After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.
As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science

aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism,* you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far

MORENS_SUBPOENA_018974
MORENS_NIH_038460
REL0000478887

right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has

MORENS_SUBPOENA_018975
MORENS_NIH_038461
REL0000478887

clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"
And that's, again, how they weaponize communication.
Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.
Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.
Goudarzi: But you still think the advantages outweighed the disadvantages?
Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.
Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?
Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.
Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?
Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter,

and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

EXTERNAL SENDER

I forgot about that Rich. But I'm assuming it wasn't you that came up with somewhat colonial name!!???

In all seriousness, while it's good for virologists to push back against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Cheers,

Peter

Peter:

In the interests of compete disclosure, I was a member of the "Cambridge Working Group". Our concern was about the deliberate attempts to make the flu virus more infectious. It was the deliberate nature of the experiments that was troubling, not virus research in general.

EXTERNAL SENDER

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

POLICY-ISH

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident or malicious attack. They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.

Sponsor Message

He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message

"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

MORENS_SUBPOENA_018983
MORENS_NIH_038469
REL0000478887

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to merit that kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,'" says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

MORENS_SUBPOENA_018984
MORENS_NIH_038470
REL0000478887

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

Subject: RE: Tweet by Miner Flux on Twitter

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

I don't know what influence they will have, should they choose to act, but they do have access to the higher levels, and that is important.

Subject: Re: Tweet by MinerFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position
That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same time, we had the ability to hire a top scientist from the outside, my good friend the (b) (6) (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Subject: Music from my relatives in Ukraine

EXTERNAL SENDER

David – I'm very glad you spoke with Betsy McKay. Your talk of the Russian classics spurred me to share the following clips with you all. My father, who was Ukrainian, was conscripted by the Nazis when they invaded Ukraine early in WW2. He managed to escape, cross the frontline and hand himself over to the British, came to the UK as a prisoner of war, and eventually became a UK citizen and married by mom, who was English. My dad was very musical – taught me classical guitar, spoke 7 languages, played many instruments and sang in a Ukrainian choir in the UK. My younger brother became an opera singer and my dad's brother who stayed in Ukraine became a leading viola player and head of the Lviv Conservatory. We still have a lot of relatives in Ukraine, almost all of whom are professional musicians – my cousins are conductors, composers, opera singers. Their children are concert pianists, viola players, singers. Sadly, as of last week, they are now refugees and soldiers.

Here is my (b) (6), playing viola on these two youtube clips. He took up a rifle in 2014 during the Russian incursion in the East, then returned to performing. Last week he volunteered again, and is now fighting on the frontline North of Kyiv again – he was alive as of yesterday.
Here he is playing Bach: (b) (6)
And a really technical piece "Gypsy Airs" by Sarasate (b) (6)

Here is (b) (6) playing piano. She managed to get out on Day 1 of the invasion, escape over to Hungary and is now safely in Sweden with (b) (6)

I also wanted to share this beautiful piece of Ukrainian music. It's called "Chuyesh Brati myi" or "Listen, my brother". I first heard this when we buried my father in Manchester and the remaining members of the choir he conducted at the time gathered around his graveside as we lowered him in and sang this in their classical Ukrainian voices. The song famously speaks of the cranes flying high in the sky as they return from their migration to their homeland near the Dniepr River. You can hear the choir singing the sound of the cranes "Cru, Cru, Cru!". The words say "Listen my brother to the sound of the cranes, Cru, Cru, Cru, as they return to their homeland. Myself, I shall die in this foreign land, never to see my homeland again"….
https://www.youtube.com/watch?v=ZRAUrKtu7ZM

Hope you enjoy these snapshots, and hope you're as moved as I always am with the last piece.

We're in touch with the rest of the family every day via Facebook and mobile phone. They're in (b) (6) and safe for now, but won't evacuate despite what looks clearly like a repetition of a Syria or Grozny type of annihilation, even my (b) (6) we're trying to persuade them to get out every day…

Cheers,

Peter

Subject: Re: Story in the Intercept today

Peter, remember that the truth is on your side. Don't let anyone make you hide

I spoke to Betsy McKay of WSJ for 1 1/2 hours Tue. We totally bonded for the first half hour and after that had a good chat in which i really let it all hang out, including telling her that guys like Ebright were evil pieces of shit not to be listened to. Well, i didn't put it that way but i did spell it out to her that spenting even 1 second in Ebrightland was false equivalency

When she called i had taken the afternoon off for a mental heslth break and, with a double martini, was listening to Shostokovich's 13th symphony, Babi Yar, on my stereo. I mentioned that, and she gushed that she majored in Russian culture, lived in Moscow for 10 years, loved Shostokovich, and knew all about Babi Yar and Ukranian history. We spend the next 20 minutes discussing all the stuff I read as a kid like Dostoevsky, Tolstoy, Pushkin, Lermontov, Gogol, and all the music of the "Mighty Handful", especially Rimsky and Mussorgsky. (It's on my bucket list to see all 17 Rimsky operas live or on DVD (some are not performed and not available on recordings), and i may be one of the few people in the world to have heard Mussorgsky's first opera Zhenit'ba (The Marriage), never performed live but privately recorded around 1950). I also told her of my work in Russia and experiences in Siberia.

Bottom line we hit it off, we spoke about you and EHA and especially the NIH situation. Later she sent me Russian news items about the recent Rusdian trashing of the Babi Yar memorial outside Kyiv. So.... I hope it will be a good piece she does, with my comments strictly on background.

I keep wondering how long itwill be until even the evil twits will realize that "there is no there there" and they are just embarrassing themselves. In the meantime, I say keep pushing with the knowledge and confidence that right is on your side. This too shall pass, and Dom Perignon will flow to the righteous.

>
> Responding to your email below David, you're right about the best defense being offense. I end up going through a process with these attacks. First day I feel like giving up on science. Then after a while, sometimes a few days of moping around, I get my aggression back and start trying to find ways to counter. As a strategy, I'm gradually talking to a few of the nastier journalists who have been attacking us, and I'm working on approaching some of the Republicans who are trying to defund us, and will have a better chance of doing that if they win the mid-terms.

First attempt came this week when *The Intercept* told us they were planning a story and sent a list of ridiculous questions about some typos in our reports on the terminated R01 – the issues that the House E&C Republicans sent to NIH last week (attached). *The Intercept* has filed FoIAs on our NIH grants back to 2001 and is currently in court to challenge NIH about handing over information on FoIA requests. Their play is to file a story every time Republicans on the Hill rip into EcoHealth or NIH then report in a dramatic way without our side of the story, usually quoting Ebright and Larry Gostin. I spent an hour and a half answering their questions on zoom and explaining how every allegation levelled at EHA about our NIH work can be answered by understanding the process of doing normal science. They've now put a story out that is less damaging than we believe it would have been, and has them turning their ire a bit more onto NIH O/D rather than us – not great for that to happen, but better than just lots of innuendo about our motives. There's still plenty of mudslinging particularly from Ebright who believes the typos in our report represent "Serious violations". The story's here: https://theintercept.com/2022/03/03/wuhan- coronavirus-research-nih-ecohealth/

I'm also working with Jon Cohen (Science) and Betsy McKay (WSJ) to send them every document we receive from NIH O/D and our responses. Both seem to be building up to doing a story and both recognize that this is a load of garbage being churned up for political purposes.

Amusingly, I sent Jon Cohen the Intercept story and he said it broke the ultimate rule of journalism – it was too boring to reach the end.

By the way David – I removed Holly Irving from the email chain because it's a NIAID address and can be FoIA'd

Cheers,

Peter

Subject: Re: open letter: United States and the investigation of COVID origin—letter from American scientists and policy specialists

Peter and colleagues, this is all really horrible, but what else is new? I once advised you to read the Arthur Miller play The Crucible (or see the great film) and now i add: read the transcript of the trial of Jeanne d'Arc..... In terms of demagoguery and evil there is nothing new under the sun, and there will always be people who take pleasure in trying to destroy people who are their betters, especially their moral betters....

It will be small consolation to hear the following but in my face to face meeting with Tony this morning, he once again brought up, as he usually does, your plight (Peter) and bemoaned all the crap he and you and others are ensnared in. He seems not to believe it is all happening and today was particularly upset about continued drum beating about lab leaks, specifically mentioning one I won't name whose father is a noted NIH virologist. I won't repeat the expletives we exchanged. I am beginning to feel more and more like a therapist lately.... He doesn't know how to stop this, nor do I.

I have said this before, and you all have disagreed, maybe you are right, probably u are, but i sometimes think the best defense is a good offense. That's what we tried to do in our COVID origin paper in spring 2020, but obviously few listened. Since the facts are on our side, and since there is zero proof of a lab leak or engineering, it's always possible to ask the assholes: prove it or shut up. That they have no proof and no evidence, they have an Achilles heel that can be struck.

If this was about a person rather than a scientific fact, these guys would be in court for slander

Just keep hanging in there. I wish there was more i can do, and, if i get cut lose from NIH, there may be

> I'm glad you'll mention this to Randy. These particular politicians are willing to cast aspersions on anyone's character for political gain.
>
> I'm also glad you're going to decline to sign the letter you attached. It seems Richard Ebright's dream is to have me up on the stand under oath with him doing the questioning. Of course, none of this would get to the bottom of anything, and it would just serve to drive more politics in the way of doing science.
>
> The truth of all of this is that there is no real debate over the origins. A lab leak is a possible scenario, but extremely unlikely based on the zero evidence put forward by anyone. On the other hand, we now have 11 peer-reviewed or under-review papers (and counting) that point towards the natural origins. I've listed them out in the attached doc, as well as the lab leak papers I could find (all of which are opinion pieces of non-peer-reviewed).

The real debate is purely political - Republicans using this as a way to target NIH and just regurgitating fact-free innuendo-filled conspiracies with EcoHealth's work at the center. Richard Ebright, I hear, is working with Rand Paul and others to feed them these half-baked ideas and make them sound science-y enough to convince the public.

I can hear the villagers sharpening their pitchforks....

Cheers,

Peter

Peter:

Sorry to hear about the latest attacks. Please don't let them get you down. Just recognize the loonies who send them for what they are.

I'll let Randy Schekman know he was included too. It is sad to see the lengths that people will go to for the sake of political points. Witness the latest nonsense in Ukraine.

I attach a document I just received from Ebright. Needless to say I won't be signing, but I hope to convince some others not to also.

Thanks Peter – the worst of it is the way fellow scientists are just not getting in touch any more (apart from you, the heroic 4 muskateers). I've been quietly uninvited from committees I was asked to serve on, quietly left out of co-authorship for papers I was originally asked to help, and I know that USAID, NIH and DoD DTRA are avoiding us at the moment, even while we depend on them for funding.

At the same time according to the right wing attacks we're somehow supposed to defend ourselves publicly, hand over all our data, testify to our crimes, respond to interviews, etc.

Erstwhile good scientists are feeding this as well – the Fox news link below has a video at the top of the page with Jay Battacharya accusing Fauci, Collins, Jeremy Farrar etc. of shutting down the lab leak ideas. Their FoIA'd emails, from my point of view, show them trying to avoid amplifying a conspiracy about the wuhan lab, not shutting down valid lines of inquiry. Of course, as Fox attacks Fauci, we're right in the middle of the line of fire.

Dear All,

I'm so sorry to darken your doorsteps again with news of more awful attacks from the Republicans. This time it's the House Energy and Commerce Republicans – the same ones who asked for me to be kicked out of the NAM (still not heard from the NAM by the way).

They've now sent a letter to NIH (Tabak) accusing EHA of fraud because we're allegedly double-dipping on funding (USAID and NIH), and not declaring private funding, specifically the anonymous donation that you helped organize Rich. Of course, this was after the NIH terminated our funding, so is utterly irrelevant, but they give the impression that we used the attacks to raise funds. Well, we've lot substantial funding since then, so that's also not true.

MORENS_SUBPOENA_015723
MORENS_NIH_033410
REL0000478897

Here is the news story on Fox:
https://www.foxnews.com/politics/covid- origins-republicans-pressure-nih-risky-research

The letter to Tabak is attached. It specifically names you Rich, and insinuates that we were busy making money out of this miserable situation.

Here are the facts:

- The research work we conducted in China on coronaviruses was funded by NIH, with support for One Health capacity building and emerging viral risk analysis supported later by USAID.
- NIH and USAID undertook an assessment of any potential overlap in funding, and decided that there was none.
- We reported to each agency about the work we did and acknowledged funding on all scientific papers from this work.
- No non-federal funding was used to support this coronavirus research in China prior to the abrupt termination of our NIH funding on April 24th 2020, after which we had to use used non-federal funding to pay for staff time to publish this information and make it available to the world.
- We remain committed to doing everything we can to continue getting the work we conducted in China prior to COVID-19 out into the public domain, for the benefit of citizens in the USA and globally.

This week alone we were notified about 2 separate FoIAs to USAID for our emails and proposals. We've got daily requests from reporters who are trying to generate negative press. We've got a former disgruntled employee accusing us of being a CIA front on right-wing podcasts, and a barrage of online threats and harassment, many of them from well-known right-leaning social commentators with hundreds of thousands of followers (including Glenn Beck – 2 video podcasts on EHA and Eric Weinstein).

Meanwhile, I'm being quietly sidelined by all the societies, agencies and academies that used to ask me to give talks, join committees etc. The NAM hasn't even let me know whether they're going to 'investigate' me or not, so I'm in limbo there too.

I've had 2 years of this and at this point, I'm really worried about my future in science, our organization's future, my own job, my family and my health.

Cheers,

Peter

Rep. Roy demands answers regarding partnership between American scientist and the Wuhan Institute of Virology

July 7, 2022
Press Release

WASHINGTON— On Wednesday, Rep. Chip Roy (TX-21) sent a letter to Dr. James Le Duc, former director of the Galveston National Laboratory to get answers about recently uncovered documents indicating a partnership with the Wuhan Institute of Virology.

"As more evidence seems to suggest that SARS-CoV-2 originated from the WIV and cannot conclusively be ruled out as the source, it is essential to have a clear understanding of knowledge transfers between China and the United States," the letter reads. "It is concerning that any public institution receiving federal government funding would enter into a cooperation agreement with an entity controlled by the Chinese Communist Party (CCP). Further, though UTMB may not be alone, it raises serious concerns that a prominent recipient of federal taxpayer dollars would enter into an agreement with any foreign entity—but especially an adversary—with such a glaring 'memory hole' provision that authorizes research materials and files to be destroyed upon request," it adds.

MORENS_SUBPOENA_008169
MORENS_NIH_017827
REL0000478899

Recently, the U.S. Right to Know non-profit group uncovered concerning documents revealing a partnership established by Dr. Le Duc and the Wuhan Institute of Virology. A Memorandum of Understanding (MoU) dated October 20, 2017 contains a 'memory hole' provision that would have allowed Wuhan Lab personnel to request files and materials be destroyed. On its face, this seems to violate record retention laws and requirements on grant recipients at the NIH.
"As Congress looks to safeguard Americans from national security risks, it is essential that we understand why federal grant recipients are entering into partnerships with institutions in adversarial countries and under what circumstances. Therefore, we request information from you regarding the interactions and agreements between UTMB and the WIV under your leadership," the letter reads.

Congressman Roy is committed to fighting for Congressional oversight over the origins of COVID-19 and the level of participation U.S. scientists have with adversarial governments, including the Chinese Communist Party.
Full text of the letter can be found here.

Please read the email from Research!America below, and my response. Rich kindly put me in touch with them to see if they can help EcoHealth right now with NIH. I'm extremely grateful for your help Rich, and for Ellie Dehoney contacting NIH, but the response is not good. I feel real jeopardy right now with Dr. Fauci & Francis Collins under attack, and people focusing on the idea that our public comments that a lab leak is extremely unlikely (which it is) have made us a target. What's made us a target is Trump canceling our grant, followed by a relentless 1.5 year attack by politically motivated actors and organizations. I'm worried that they've effectively won at this point. I can't speak out publicly, no one within the Federal Govt seems willing to defend us, and our funders are being pressured and will begin to withdraw.

Add to this today's news that the HHS Inspector General will be looking into the grant to see if it was managed correctly (it was), and further political action from Rep. Ernst, who's latching onto the idea that an organization with a suspended grant should be defunded of all federal funding and has a bill ready that will close us down - https://www.ernst.senate.gov/public/index.cfm/2021/6/ernst- pushes-to-cut-off-u-s-taxpayer-funding-of-organizations-like-a-wuhan-lab-linked-nonprofit-that-disregard-federal-law.

To: 'Ellie Dehoney' [b6]; 'Roberts, Rich' (b) (6)
Cc: 'Jessica Scott' [b6]; 'Jacqueline Lagoy' [b6]
Subject: EcoHealth's scapegoating
Importance: High

Thanks for trying Ellie. We cut back on press interviews a couple of months ago, and haven't spoken to a major outlet in a few weeks. However, there are dozens of quotes from me over the past year and a half where I gave my opinion, based on deep knowledge of the facts, on the likely pathways of COVID's emergence. Unfortunately, we were the only US organization

working in China to investigate coronavirus risk continually for the last 17 years, so the press came to us for answers. Add to that my misfortune on being asked by the WHO to help them on their COVID origins mission. I agreed, despite significant hardship, and now am being pilloried for reporting what we found. Our task on the WHO mission was to ascertain how likely each different pathway was, and that's where the quote probably comes from – we found it 'extremely unlikely' that it came from a lab, and published that in our report. Any good scientist worth their salt would have come to the same conclusion, and Dr. Fauci stated he believes it came from nature recently in Congress. The rationale is simple - there remains no evidence whatsoever for a lab leak, but substantial evidence for emergence via human-wildlife interactions. To be now effectively canceled, simply because logic doesn't fit people's politics is just cruel and the essence of an anti-science agenda.

I'm frankly devastated at the thought of our organization being made a scapegoat by the federal govt and its agencies. I've spent my whole career working on the origins of pandemics – it's our organization's mission. As you rightly stated, we raised the flag over and over again about the risk of these viruses emerging, as did our collaborators in China. We spoke to the White House, to the PPFST, to agencies like USAID, NIH, CDC, and to the WHO. Some listened, some funded us to do this work. Others did not. It seems that right now, our future is in the hands of NIH to defend us, and from what I'm seeing and hearing, they're protecting themselves at our expense. That's plain wrong. Someone needs to call this out, and help us, and right now I'm at a loss where to go.

Cheers,

Peter

Subject: RE: Peter Daszak

Hi Peter and Rich, I heard back from Mike Lauer and Larry Tabak; they have asked me/Research!America to please stay out of this. I don't know, but believe they feel as trapped as you feel, Peter, and that we can only make things worse.

I read the recent NYT article in which you were quoted saying that it is unlikely COVID-19 originated at the lab. Several comments questioned why you were asked, which is a reasonable criticism of the NYT. The paper should not have asked you, or anyone who has a relationship with the lab, whether the lab could have been involved in any way. The NYT set you up. What choice did you have? Had you refused to comment, the NYT could well have noted your refusal in the article and that would have fed the beast; had you answered in any other way that you did, you would have been going against your own views, and you have too much integrity to do that).

MORENS_SUBPOENA_016590
MORENS_NIH_034732
REL0000478907

Take or leave this advice, but in my opinion, should anyone ask you again to comment on anything having to do with the Wuhan Lab, you should say that you are not the judge or jury of an investigation that has nothing to do with EcoHealth's work with the Wuhan lab or any facet of your work. Your lab tries to stop the transmission of coronaviruses by researching animal to human transmission. You raised alarms bells about this type of transmission more than a decade ago, and your commitment to preventing pandemics has never wavered. As a matter of fact, that would be a good theme of an op ed. One thing the group of Nobel laureates could do is write an op ed that focuses on the costs of making a scapegoat of the very institute that sounded the alarm on the possibility of a global coronavirus pandemic. It's easy to demonize people and institutions; it's hard to fight global health threats. The federal government reports to the American public. The American public should demand that the federal government empower EcoHealth to prevent the next pandemic, not buy into any action by the federal government or the media to make a scapegoat of it.

Attached is some background information that I hope's useful.

1) A document that I update regularly to track all actions related to this issue. Please note this is highly confidential because it includes statements and details that have not been released publicly and that are the focus of an ongoing GAO investigation into political interference in agencies by the Trump administration, and may end up being part of a legal case or action.

The NIH grant that Trump terminated

MORENS_SUBPOENA_016591
MORENS_NIH_034733
REL0000478907

Political activity of direct relevance to EHA's work
Successful applications of the work we've done in China (e.g. Remdesivir, other therapeutics/vaccines)

2) A URL of the video from a 2004 60 minutes piece where I raise the concern about potential future emergence of a SARS-related virus that spreads rapidly and causing widespread mortality in the process. It's why we were doing this work in China, and it's why it scored so highly in our renewal application – critical to our nation's health and national security. The comment begins at roughly the 12 mins 30 second mark.
https://www.youtube.com/watch?v=1O79e2bwC8s

I looked again at that most recent E&C committee letter. None of the issues that they raise are of any real legal value, and we have arguments lined up for all of them that clearly show that what we did with our funding was legal, and of such value that we were strongly encouraged to renew, and received a top 3% score. It's really awful they're trying to muddy our name with this sort of innuendo.

Cheers,

Peter

Peter:

I spoke this morning with Ellie Dehoney from Research!America. I had contacted them because I thought they might be able to help get your NIH grant restored and also to seek their advice about how to try and combat the rhetoric surrounding the lab-leak hypothesis and its consequences for you. They have very good ties and insight into the politics in Washington and she would be very interested in helping. Would you have some time to speak with her? She would like to get educated on EcoHealth and the research you have done in the past and would plan on doing if the grant can be restored. She was also curious if you had reached out to your Senators, because she though they might be able to help. She apparently has good contacts with them.

Subject: RE: Study from 2007 shows SARS-infected civets on farms in Hubei

From: Peter Daszak [b6]

To: Wang Linfa [b6] Edward Holmes [b6] >; Jason Gale [b6]

CC: Stephen Goldstein [b6] [b6] [b6] [b6] [b6] [b6] [b6] Robert Kessler [b6]; David Morens [b6]

Yes – saw that paper Jason – really interesting

I looked through the paper and it's yet another game changer. So far, in the last few weeks/months, we've got the following new evidence supporting emergence via bat-to-intermediate host-to-human origin for COVID-19 (I've probably missed something):

- Multiple new, SARS-CoV-2 related CoVs in SE Asia (Cambodia, Thailand, Japan, China etc.). I know of other work in review describing other related viruses in SE Asia also. We're also finding further novel SARS-CoV-2 related bat viruses in Malaysia, Thailand.
- New evidence that live animals of the type that carry CoVs were present in the Wuhan markets (including Huanan).
- Evidence from other bat SARSr-CoVs that mutations occur where there FCS is found (eg. RmYN02) https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7211627/
- a rat alpha-CoV with an FCS in wildlife farms, hotels and train stations in S. China, showing that FCS insertions are more common in nature than previously thought. https://journals.asm.org/doi/epdf/10.1128/JVI.01173- 21
- Epidemiological analysis of early cases supporting early origin close to Huanan market, not WIV https://www.cell.com/cell/fulltext/S0092- 8674(21)00991-0
- Phylogenetic analyses suggesting there may have been multiple introductions into the human population, supporting presence of a virus circulating in animals rather than a lab leak (@virology paper)
- Our work showing a very large interface for bat SARSr-CoV spillover in a v. densly population region, and potential for large numbers of missing cases each year https://www.medrxiv.org/content/10.1101/2021.09.09.21263359v1
- This paper showing ACE2 binding for bat SARS-CoV-2 related CoVs. https://www.researchsquare.com/article/rs- 871965/v1

On the lab leak side, we have convoluted accusations based on interpretations of intent about how Chinese scientists submitted genomes, wrote the papers, or how me and other scientists had collaborations with Chinese scientists. But, as far as new evidence goes, I could only find this:

- None

Of course, the momentum on the lab leak side will continue, with books by Sharri Markison, Alina Chan/Matt Ridley, Op Eds that criticize scientists, 70+ FoIAs by one organization alone, many other FoIAs on their way, 900 pages of FoIA'd grants and reports from EHA/NIAID showing zero evidence of lab leak.

This rate of research even in a pandemic is remarkable and suggests that we'll pretty quickly have such overwhelming evidence for the 'natural' origins that most people will move on from the lab leak.

(Off-the-record) However, the damage they leave behind is already horrific and will be worse by the time they decide to find another issue to focus on.

Cheers,

Peter

Almost identical SARS-CoV-2 RBD in several bat sarbecoviruses! This is as close as you can get for a natural RBD origin!

Also, the paper concluded that SARS-CoV-2 genome fragments are found in different sarbecoviruses, very similar to the PloS Path paper for SARS-CoV-1.

All we need is to find a sarbecovirus with a furin cleavage site and no more debate on the natural origin of SARS-CoV-2!

David. What's the best way for me to contact Tony. I don't know what he could achieve in trying to get Collins to do what is right here but he can have a lot of influence on Biden and Eric Lander. I will raise what our mutual mentor, Shelly Wolff, would have done - make it clear this is egregious and get the Govt to do what is right.

>>
>>
>> Dear Robert, David, and Jerry,
>>
>>
>>
>> Sorry to send this, but please read the email below and you'll see that a bill filed by a Republican congressman from PA then became a single line amendment attached to the Defense Appropriations bill, and actually passed the House last night.
>>
>>
>>
>> We're very worried here because we rely on Federal funding and this puts our organization in great threat. Any advice is welcome. We're reaching out to Senators Gillibrand and Schumer, but I'm really worried that if they are too busy to get involved for a small non-profit with no political clout, we'll be drummed out of business.
>>
>>
>>
>> If you have colleagues who know how to deal with this sort of issue, and are willing to help, we would be extremely grateful for any advice, suggestions and support. I realize you've all spent social and political capital helping our organization since we were first targeted by Pres. Trump, but this is truly an existential threat to us, considering 80-90% of our budget is from federal grants and contracts.

>> Subject: Urgent - Amendment to defund EcoHealth Alliance was passed by the House last night and now moves to the Senate
>> Importance: High
>>
>>
>>
>> Dear Jamison and Gilbert,
>>
>>
>>
>> You were kind enough to talk with us a couple of months ago about attacks on our New York City-based 501c3 non-profit from the hard right wing regarding the work we've done in the past trying to protect us from new emerging diseases coming out of China and other hotspots. As you remember, this work was largely funded by NIH, DoD and USAID and has become a target for Republican-led attacks on the Biden administration.
>>
>>
>>
>> We're very concerned that one of the House Republicans, Congressman Reschenthaler, filed a bill titled HR591 "Defund EcoHealth Alliance Bill" in Jan. 2021 and managed to get this attached as Amendment 148 to the National Defense Authorization Act (HR 4350). The five other co-sponsors are all Republicans: Van Drew, Perry, Harshbarger, Keller, and Budd: https://rules.house.gov/bill/117/hr- 4350. The House passed the NDAA last night (https://armedservices.house.gov/ndaa) and unfortunately this Amendment is now progressing with it.
>>
>>
>>
>> EcoHealth Alliance is a non-profit based in Midtown Manhattan that employs around 50 people whose jobs depend on the funding we receive each year. If this amendment continues forwards, we stand to all lose our

jobs and close down the organization. This amendment is based on a false premise that our organization acted wrongly and was involved in the origin of the COVID pandemic. In fact it's the opposite, we worked with federal approval to help protect US citizens against this and other pandemic risks. If passed, it would penalize an organization doing public good, without any due process or consideration of the facts. Also of great concern is that this amendment would set a precedent that any single member of Congress can specifically block funding to an organization or institution through a simple amendment, bypassing all political norms.
>>
>>
>>
>> We are urgently hoping that you will be able to make Sen. Gillibrand aware of our issue and move to strike out this amendment at the first possible opportunity. We are at this point very worried for our staff, and our work around the world protecting the US against the next pandemic.

>> As you may know, I'm the President of EcoHealth Alliance, based here in NYC, and also Chair of the NASEM Forum on Microbial Threats and member of the National Academy of Medicine. I mentioned the latter, because I received a very kind letter from Senator Gillibrand when I was voted onto the NAM a couple of years ago – it's now framed on my wall!
>>
>>
>>
>> You may have heard our organization's name (EcoHealth Alliance) and mine being mentioned in the press recently in the general discussion of identifying the origins of COVID-19. For the last 17 years, we've worked closely with colleagues in China to get ahead of emerging viruses, including by collaborating with their premier virologists at the Wuhan Institute of Virology. Unfortunately, this work has become a very public target politically following over a year of conspiracy theories online that have now gone mainstream about the possibility COVID emerged as a leak from a biosafety laboratory in Wuhan. This was amplified a few weeks ago with testimony by Dr. Fauci and the release of FoIA'd emails that have put our organization in the cross-hairs of efforts to attack the current administration. This includes proposals by some minority members for bills that would significant harm our international work to prevent pandemics, as well as directly defund our organization.
>>
>>
>>
>> I've attached a letter in Lancet that came out last week that helps provide some context of the way this issue is being viewed by serious scientists, but as you can imagine we're worried about the impact on work that we believe is critical to preventing future pandemics. I wondered if you would be interested in my giving you a short briefing on this issue, to explain in more detail what the evidence behind these theories is, and to get your take on the political issues we are concerned about?

*****CAUTION:*** This email is not from a BCM Source. Only click links or open attachments you know are safe.**

I'll also report that the paper you cofunded with EcoHealth Alliance dealt with rWIV1-SHC014S, a chimeric virus shown to be very dangerous to mice with human airway cells, which biosafety experts consider to be gain of function, and which is already under GOP congressional investigators' microscope. Were you aware of this? Should you have disclosed this to your followers on Twitter and The Lancet Commission?

Please clarify if this is incorrect.

Thank you,
Emily

Yes – I'm on an email chain with Bob Garry and people in China. The lead author of the China paper where the sequences come from says they deleted them because they were low quality, not full genomes and that they're not expert enough in bioinformatics to think that there was valid info in them. Bloom went into the NIH system and recovered deleted them from the cloud.

I read the paper last night – it doesn't really change any opinion about the origin – the WHO report shows that there was significant spread in Dec and that other cities were involved. This adds to that, and as you say provides further evidence that this is likely natural origin. All the 'detective' stuff and suspicions about ulterior motives is in my opinion totally unnecessary, at the least 'rude', and just sort of weird. Jesse Bloom has been on Twitter arguing for the lab leak for a good few months now, so I think he's got a general belief that Chinese scientists can't be trusted. I don't think that political stuff or suspicions of motives belongs in a paper.

Cheers,

Peter

When I saw this I asked him to immediately contact Kristian Anderson and Eddie Holmes, and he has already contacted KA, while I contacted Eddie myself. They are both horrified, to use Eddie's word. If this gets picked up by the crazies there is no telling what will happen.

This is a good argument for banning pre-prints, since the damage will be done before the paper is retracted or shot down.

If there is an upside to this, legitimate scientists, even while hiding from the crazies, are starting to get really pissed off. Eddie says he is planning to write a very geeky sciency review that covers the whole origin issue from a phylogeny basis, and without the politics. Kristian is apparently upset, and Jason also contacted Robert Garry, who I don't know personally, and he had some really choice words to unload….

On May 7, 2024, at 11:24 AM, Peter Daszak <[b6]> wrote:

Just heard today that a 5 year $2.5 million award to analyze disease dynamics in wildlife farms in Southeast Asia we were in the process of finalizing with USDA via the NSF/NIH Ecology and Evolution of Infectious Diseases program is now "impossible" for them to fund. We received a very high score on review, were told it was highly competitive, received notice from USDA that it was 'recommended for funding', and over the past few weeks met repeatedly with the program staff at USDA to finalize all the forms. They were communicating positively with us requesting further paper work as recently as last week, now suddenly we've been told the following:

"Good morning. I must bring you some unfortunate news. Due to unforeseen circumstances, it has become impossible for USDA NIFA to provide support for the project that we discussed. I have had to retract my recommendation. I apologize for the inconvenience this will have caused you."

We're trying to set up calls to find out more information, but it's well known that you don't have funding from an agency until the notice of award and that they can pull out for reasons like budget shortfalls etc. I doubt there's anything we can do. This is similar to an issue we had last year with an joint-PI NIH grant to Colorado State University with us having a substantial role and funding. The program officer spoke with the CSU PI and said they should reduce our budget because if we get 'debarred' NIH will lose its budget. We fought back, CSU scientists pushed back, and we got our Notice of Award.

It's just outrageous that the Republicans can de facto de-fund and organization on a whim. We are not debarred, and we're looking into the rules for debarment and this is normally for issues like fraud, criminal convictions related to grant management, tax evasion etc. I strongly doubt that we would be debarred over a late report that we have substantial evidence we tried to submit.

What worries me is that we are now going to have a multi-year impact on our organization, whether or not we are debarred, and whether or not we actually did anything wrong. I'm also devastated at the impact this will have on my reputation (already in tatters at this point) and my career.

Extremely upsetting and disappointing!

Cheers,

Peter

All:

This is just Wenstrup and the Rs spiking the ball after a hearing in which they refused to let Peter answer the questions posed to him. All of the alleged "evidence" of EHA's supposed transgressions is based on misrepresentation and selective citation of the documentary evidence and false assumptions about the science involved (e.g., since when does a Republican Congresswoman with an MBA and no scientific training get to decide what the definition of gain-of-function research should be?). The only people showing contempt for the American people on Wednesday were the members of Congress and staff who used this hearing as a vehicle to propagate a malicious political narrative that falsely and unfairly blamed Peter Daszak and EHA for research that never happened and outcomes that are chimerical figments of their imagination.

As ever,
Jeff

Missouri Attorney General's Office

A federal judge on Friday dismissed Missouri Attorney General Eric Schmitt's lawsuit blaming China for COVID-19.

Attorney General Eric Schmitt's lawsuit blaming China for COVID-19 was dismissed Friday when a federal judge ruled his court has no jurisdiction over foreign governments.

U.S. District Judge Stephen Limbaugh, in a 38-page ruling, wrote that a federal law setting rules for when a sovereign foreign entity could be sued in U.S. courts doesn't allow any part of the lawsuit filed by Schmitt in April 2020 to continue.

"All in all, the court has no choice but to dismiss this novel complaint for lack of subject matter jurisdiction," Limbaugh wrote.

Schmitt's office filed a notice of appeal immediately after Limbaugh made his ruling.

When Schmitt filed the lawsuit, he claimed China was responsible for allowing the novel coronavirus to cause a global pandemic by covering up the initial infections in Wuhan.

"The Chinese government lied to the world about the danger and contagious nature of COVID-19, silenced whistleblowers, and did little to stop the spread of the disease," Schmitt said in a news release when the lawsuit was filed. "They must be held accountable for their actions."

It took more than a year to get any of the nine defendants served with notice of the lawsuit and $12,000 to translate the complaint into Chinese.

The lawsuit was the first of its kind in the U.S. attempting to hold the Chinese government and the Chinese Communist Party liable for COVID-19, Chris Nuelle, a spokesman for Schmitt's office, said in an email statement to The Independent.

"The office disagrees with the court's decision to let China off the hook, and today promptly filed a notice of appeal in this case to continue Attorney General Schmitt's efforts to hold China accountable – we look forward to prevailing on appeal," Nuelle wrote. "Our fight continues on to make China pay."

Schmitt, attorney general since 2019, is a candidate in the Republican primary for U.S. Senate and has touted the lawsuit as an example of his willingness to confront Chinese power if elected.

Soon after it was filed, legal experts predicted that it would fail.

Chimène Keitner, an international law professor at the University of California at Hastings College of Law, told the Washington Post in April 2020 that she did not "see any portion of this lawsuit succeeding under the law as it currently stands."

Along with the Chinese government and the Communist Party, the lawsuit named three national Chinese government agencies, the governments of Hubei Province and Wuhan, the Wuhan Institute of Virology and the Chinese Academy of Sciences.

"After the complaint was filed, plaintiff attempted Hague Convention service, but China posted notice on its web site that it was refusing service under Article 13 of the Convention, which allows signatories to refuse service that would violate sovereignty," Limbaugh wrote.

The Hague Convention is an international agreement that creates a central agency in each signatory nation for accepting service of court papers on behalf of its citizens and entities. By refusing service, the government agencies are immune from being held liable, Limbaugh wrote.

The only remaining question, Limbaugh wrote, was whether Schmitt was correct in describing the Communist Party, the Wuhan Institute of Virology and the Chinese Academy of Sciences as non-government entities.

Schmitt's complaint alleges that the Communist Party controls everything in China. While it is technically a separate legal entity in China, it has effective total control, making it part of the government, Limbaugh wrote.

Limbaugh listed the allegations – failure to contain the virus within China, lying about transmissibility and delaying, censoring, or withholding critical information and noted it is "not the type of conduct by which a private party engages in 'trade and traffic or commerce' and thus it is not commercial activity."

Schmitt's argument that the actions of the institute and the academy fit commercial activity exceptions in the law, is not convincing, Limbaugh wrote. The alleged conduct has to have a "direct effect" on commercial activity, he wrote.

"The court cannot conclude that the core misconduct had an immediate consequence – a 'direct effect' – in the United States," Limbaugh wrote. "Many intervening events would necessarily have occurred before the mishandling and coverup resulted in COVID cases inside the United States."

Jon Cohen was in touch with me last week as he was trying to reach Peter without success. I said it was understandable given the attacks. He got back to me and said let him know when Peter D can talk. I would be happy to get back to Jon Cohen, but Peter H, if you want to contact Jon bring me into it as would represent two different task forces and I would be happy to talk to him about what's going on with the Commission. I don't think it is the time now for Peter to be directly involved in such conversations, and Robert and Jeff Sturchio can comment on that as necessary.

Jerry

Just mortified by this.

https://www.thetimes.co.uk/article/the- rise-and-fall-of-british-virus-hunter-peter-daszak-05q8brpz7

The rise and fall of British virus hunter Peter Daszak

The scientist who led opposition to the claim that Covid leaked from a Wuhan lab is engulfed in controversy after it was revealed his charity had funded the institute at the centre of the row

Peter Daszak became the face of the WHO mission to find the origins of the coronavirus

On January 18, Peter Daszak, born and raised in the mill and mining town of Dukinfield, near Manchester, awoke to a winter's dawn in central China, 5,500 miles away. "Sunrise in Wuhan — my early morning view on day 4 of quarantine — beautiful," he tweeted, with a photograph of skyscrapers against a hazy orange sky.

His presence there in a delegation from the World Health Organisation (WHO) on a mission of global significance showed a remarkable rise for the 55-year-old parasitologist with a PhD from the University of East London.

Ostensibly he was visiting the city to find the truth about where the coronavirus pandemic began before it swept across the world — killing nearly four million people. Five months later, however, the trip to Wuhan has placed Daszak at the centre of a growing web of controversy. The wry Mancunian humour that singled him out from fellow scientists of international renown has dried up.

"When you see him on the television now, he's not the funny northerner," said one old friend and colleague. "There's so much nastiness and vitriol out there, this must have been a challenging time for him."

Daszak faces questions about a crucial conflict of interest in four interlocking aspects of his professional life: his role on the WHO-led mission to Wuhan; his relationship with the Wuhan

MORENS_SUBPOENA_020670
MORENS_NIH_041381
REL0000478930

virologist Shi Zhengli, known as the "bat woman"; his presidency of a federally funded American charity that gave money to her laboratory; and his chairmanship of a commission investigating the pandemic's possible origins for The Lancet medical journal.

The Lancet commission, supported by the United Nations sustainable development solutions network, is looking, among other things, at the explosive question of whether the virus escaped accidentally from Shi's Wuhan Institute of Virology (WIV), which Daszak — like China — has consistently denied.

Critics ask how Daszak can objectively investigate something he has such fixed views about, in a lab his charity has funded. The WIV appears to have received almost $600,000 of a $3.7 million grant awarded to Daszak's EcoHealth Alliance in 2014 by the US Department for Health and Human Services for the purposes of "understanding the risk of bat coronavirus emergence".

Last week The Lancet acknowledged the conflict of interest by announcing that Daszak had recused himself from its commission. It said that in future "technical work will be conducted by independent experts who were not themselves directly involved in US-China research activities that are under scrutiny".

It was a heavy blow, and not the first time Daszak's impartiality has been in question. He strongly attacked the lab leak theory before, during and after the WHO mission, which concluded that it was "extremely unlikely". In an episode of the US TV show *60 Minutes* in March, he faced a grilling about his "conflict of interest". And in April a US congressional committee requested evidence from EcoHealth Alliance about its funding.

SPONSORED

Yet little is known about the figure in the middle of this maelstrom. How did the boy from Manchester become the president of a charity bankrolled by the Pentagon and America's National Institutes of Health (NIH), the face of the WHO mission, the Wuhan lab's biggest cheerleader and now one of the most controversial characters in the pandemic saga?

Daszak lives in New York state's wealthy Rockland county, 30 miles northwest of Manhattan. Seven years ago he and his wife Janet bought a sprawling house in two acres for $665,000. In 2019 he was paid $354,065 by EcoHealth Alliance, based in Manhattan.

MORENS_SUBPOENA_020671
MORENS_NIH_041382
REL0000478930

It is a world away from Dukinfield, where Daszak's Anglo-Welsh mother and Ukrainian father Bohdan raised their family. One son, John, a year younger than Peter, became a tenor with the English National Opera. But Peter Daszak's passions lay elsewhere: his childhood dreams were of becoming a "zoologist in the Amazon", he told the podcast *This Week In Virology* in 2019. "I think that once you get hooked on research and finding new things out, there's something that plays to a fundamental need to discover in the human psyche."

Daszak started off with a BSc in zoology at the University of Bangor in Wales — a teacher recalls that he was "really bright" — before his PhD and postdoctoral research. At Kingston University one project proved to be a springboard. With a colleague, Andrew Cunningham, he discovered the cause of a mass die-off of frogs from Australia to Panama, unexplained for a decade. Daszak suggested that the fungus responsible was linked to the wildlife trade in bullfrogs, sold as pets or food. This was the first step in a career focused on the interaction between humans, nature and viruses.

He moved to America with his wife, an immunologist, when she got a job in Georgia. His frog fame followed him, and over the next few years his research on emerging infectious disease gained attention, partly due to outbreaks of several rare and deadly diseases in humans, including Nipah virus, ebola and Sars.

In 2001 he joined the Wildlife Trust, a small, privately funded charity that would later become EcoHealth Alliance. Throughout the ensuing decade, Daszak was adept at promoting his projects. In an interview on America's National Public Radio in 2004 he compared his frog research to a Monty Python sketch: "John Cleese goes into the pet shop and says, 'Yeah, this parrot's dead.' 'Well, actually, sir, it's just resting.' And they just looked like frogs that were resting, who were perfectly OK, but dead."

In an episode of the TV programme *60 Minutes* the same year, clad in head-to-toe khaki on a boat speeding towards the remote Malaysian island of Pulau Tioman, Daszak was referred to as a "virus hunter" off to search for bats suspected of harbouring the Nipah virus. He says: "Almost 75% of the emerging diseases in humans actually come from wildlife ... or domestic animals," he warns. "We are looking for the next HIV, the next Sars." This nascent area of scientific study, now known as conservation medicine, shaped the next 16 years of Daszak's career.

MORENS_SUBPOENA_020672
MORENS_NIH_041383
REL0000478930

By 2010 Daszak was busily fund- raising for the newly reconfigured EcoHealth Alliance. Millions of dollars worth of grants rolled in: 87.6 per cent of it from US government sources in 2019, including the NIH and the Pentagon.

According to one prominent scientist, who asked not to be named, Daszak did not have a laboratory of his own, nor was he performing his own research, as most grant recipients did. What he did have, however, was a network of partnerships with other laboratories, including Shi's WIV.

With Shi, Daszak helped to co-ordinate visits to remote mines in China to look for bat coronaviruses to study in the lab in the hope of getting ahead of natural spillovers into local populations. Then in late 2019 the pandemic erupted in Wuhan.

When President Donald Trump first suggested in January 2020 that the virus had leaked from Shi's lab, Daszak was quick to leverage connections and lobby colleagues to push the counternarrative that it came directly from animals.

In February 2020, he organised an open letter in The Lancet with 26 scientists, condemning "conspiracy theories suggesting that Covid-19 does not have a natural origin". He also wrote an article in The Guardian in June last year under the headline: "Ignore the conspiracy theories: scientists know Covid-19 wasn't created in a lab".

When it was suggested to him by *60 Minutes* in March that, as a member of the WHO mission, he had technically been investigating his own colleagues at the Wuhan lab, Daszak said: "I'm on the WHO team for a reason ... and if you're going to work in China on coronaviruses and try and understand their origins you should involve the people who know the most about that, and for better or for worse I do."

Last week in an update on The Lancet site, Daszak wrote that his organisation collaborated with a range of universities and governmental health and environmental science organisations in China. He said that neither the EcoHealth Alliance nor he personally received funding from the Chinese government.

Despite Daszak's best efforts, President Joe Biden lent credence to the lab-leak theory when he approved a full investigation into it last month.

MORENS_SUBPOENA_020673
MORENS_NIH_041384
REL0000478930

Suddenly Daszak's vehement attacks on the hypothesis appeared to some to be less about the science and more about a serious conflict of interest — one that a growing number seem unwilling to ignore any longer.

Cheers,

Peter

Peter:

Thanks for the update. The interview with Zakaria went quite well, although I am always inclined to tell people we will never know the true origin of the coronavirus unless it was deliberately introduced by either China or the CIA and the perpetrator confesses. Probably too controversial to mention on the air.

I concur that Ebright is a loose cannon. Good on some issues, but overall a bit of a crackpot.

Subject: some annoying press this week attacking EcoHealth and myself..

EXTERNAL SENDER

Dear colleagues,

It's been a busy week in the press…

A piece today in the Daily Caller that claims EcoHealth's R01 for work in China (the one Francis Collins terminated) should have been reviewed by the P3CO committee (heavily citing Richard Ebright), even though NIH spokesperson states in the article why it clearly shouldn't have been. Just another hit job I guess, but gives you an idea of what Ebright is pushing for – tighter restrictions on research, canceling funding for virus discovery work, banning gain of function, broadening the definition of gain of function etc. etc.

https://dailycaller.com/2021/04/04/nih- gain-of-function-anthony-fauci-review-board-wuhan-lab/

There's also an op-ed from Josh Rogin that quotes Ebright in Washington Post that tries to undermine our efforts to get the GVP funded.

https://www.washingtonpost.com/opinions/what- if-the-former-cdc-director-is-right-about-the-wuhan-labs/2021/04/01/9fe1d658-9329-11eb-9668-89be11273c09_story.html

On a more positive note, I was live on Fareed Zakaria's show on CNN this morning:

https://twitter.com/FareedZakaria/status/1378772853953327115?s=20

Thanks for your comments on the response letter to NIH. I've edited accordingly but am waiting for a couple of suggestions from our lawyers and will probably send it out Tuesday…

Cheers,

Peter

On Mon, Apr 25, 2022 at 4:38 PM Peter Daszak [b6] g > wrote:

Today the Republicans on the House Energy and Commerce Committee are making a series of allegations about the motives behind our reporting to NIH – the timing of our reports and their content – including accusing us of 'potential fraud'.

The story is here https://www.foxnews.com/politics/house- republicans-ecohealth-alliance-concealed-data.

One important point in the article is that they are publicly stating now that NAM are investigating me: "After receiving our letter, NAM notified us they had opened an internal review of Daszak's behavior, per our request," an Energy and Commerce committee aide told Fox News Digital. "We believe this letter about EcoHealth's potential false statements and fraud is relevant to the ongoing investigation the NAM is conducting into Peter Daszak, so we have sent NAM a copy of this letter as well."

Of course, the allegations in this 17 page letter (attached) are essentially a re-hashing of earlier attacks, most of them spurious, easily explained by the process of doing science, and based on false allegations of

motives coupled with a heavy dose of innuendo and hearsay. Some of the allegations are verging on the bizarre – e.g. a whole paragraph on the cropping of a figure in one report whereby the word 'dead' from 'dead point' is partially cut out. Of course, they don't accuse us of lying and fraud, just comment that "it appears the word "dead" was taken out to conceal the deaths from the peer reviewers, which raises scientific and ethical concerns."

The letter is attached – it's from just the Republicans on the committee to the NIH, the HHS OIG, and the National Academy of Medicine.

Cheers,

Peter

The GAO was asked by the Biden administration to look into political interference in science by the white house under Trump. They interviewed me repeatedly last year and this year about the termination of our R01 grant.

https://www.gao.gov/products/gao- 22-104613

This is the first report from them on the topic. It's massively disappointing, of course, because it just comes up with broad recommendations on what agencies should do to protect themselves against political interference. However, if you read the email below, this is the first of two reports, and the second one should hopefully go into more detail about the NIH actions on EcoHealth's

grant.

Subject: New GAO Report on Scientific Integrity at HHS

Dear Peter,

Thank you for participating in our report on scientific integrity at HHS. Our completed report can be accessed here. Please feel free to share it with your network and colleagues. We plan to issue an additional report that will examine the key characteristics that can insulate agencies from political interference, and how, if at all, the selected HHS agencies have experienced potential political interference while carrying out their missions.

Thank you again for your time and providing information on this important topic.

Sincerely,

Rob Marek

Thanks for sharing David. Please cc Robert Kessler in on these in case he also misses them. I'm also cc'ing Jeff Sturchio who's working with us to navigate the media attacks at the moment.

This reporter contacted me, and I refused to talk, even though I suspected he would do a decent job. I think I'm the person he says 'supports this sort of research but has been worn down by death threats'.

I actually like the tenor of the story – it's factually correct and points out the danger of people like Lipsitch and Ebright using a false premise to support their efforts to re-litigate 'gain of function'. It's good to see Lipsitch having to be factually correct here and agree that Rand Paul massively overstated their case!

One of the reasons I didn't speak with this reporter, by the way is that the journal (The Intercept) is one of the orgs that's FoIA'd 38 of EcoHealth's NIH grants and annual reports going back to 2001– just wasn't sure I could trust their motives!

Cheers,

Peter

Rand Paul's Attack on Anthony Fauci Chills Scientific Debate Over Gain-of-Function Research

By politicizing the debate over virus-modifying research, the senator has thrilled conservatives but discouraged scientists from weighing in.

Robert Mackey

July 27 2021, 10:14 a.m.

A decadelong debate over pandemic preparedness that has divided some of the world's leading biologists into opposing camps, for and against so-called gain-of-function research — in which deadly pathogens that could cause pandemics are artificially enhanced for study in the lab — has all but ground to a halt in the past week, thanks to Sen. Rand Paul.

That's because the Republican senator from Kentucky politicized the argument last week, by cherry-picking expert opinions from critics of the research who call it too risky to pursue, to publicly accuse Dr. Anthony Fauci of lying to Congress, when he said that his National Institute of Allergy and Infectious Diseases had never funded gain-of-function studies at the Wuhan Institute of Virology in China.

Paul's made-for-television broadside against Fauci thrilled Fox News hosts and colleagues like Rep. Jim Jordan, the Ohio Republican who has also pushed the debunked conspiracy theory that research financed by Fauci's agency, which some experts describe as gain-of-function, could have led to the development of SARS-CoV-2, the deadly coronavirus that causes the disease Covid-19, in the Wuhan lab. Fauci rejected Paul's claim that research carried out in Wuhan before 2017 with some support from the NIAID met the definition of gain-of-function and pointedly explained that it was impossible to make SARS-CoV-2 from the coronavirus used in that study.

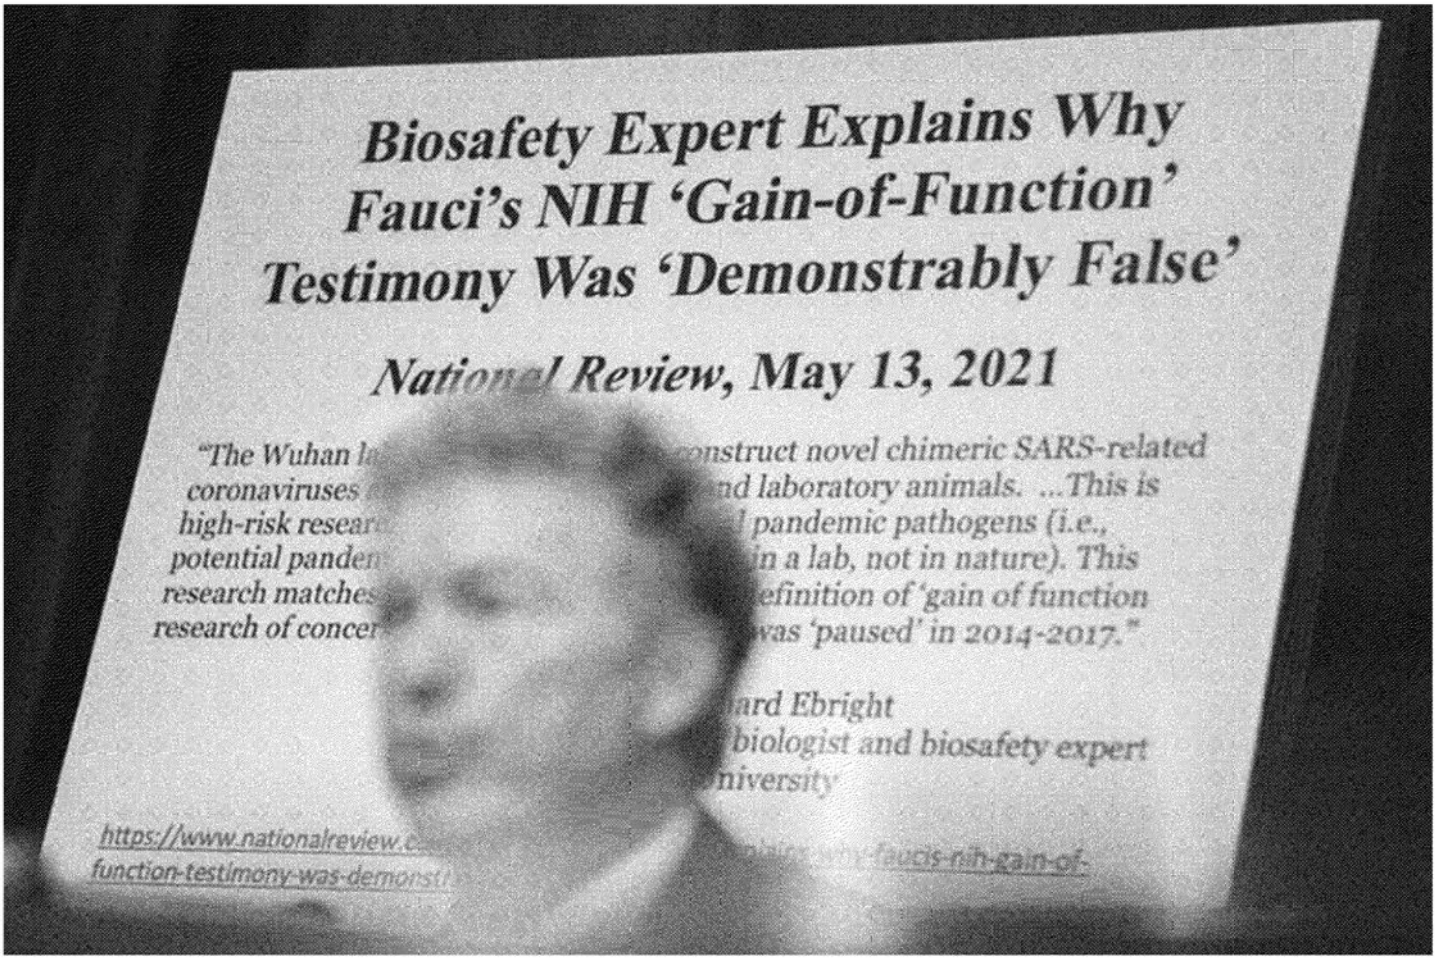
Almost as soon as the heated exchange concluded, the senator's staff uploaded a truncated version of the video on his YouTube channel under the headline, "Dr. Fauci Caught Lying about NIH Funding in Wuhan."

That video was edited by Paul's staff so that it ends before Fauci responded to the senator's harangue by saying, "I totally resent the lie that you are now propagating, senator, because if you look at the viruses that were used in the experiments … it is molecularly impossible … to result in SARS-CoV-2."

On social networks, Republican operatives unconcerned with the facts — like Richard Grenell, the Twitter troll who served as Donald Trump's director of national intelligence for three months — cheered on Paul's attack.

But Paul's false claim that Fauci's supposed support for gain-of-function studies gave him "responsibility for 4 million people dying around the world from a pandemic," and the ensuing frenzy in the conservative media, also caused some previously outspoken biologists who have made the case against such experiments to fall silent.

In the wake of Paul's attack on Fauci, several prominent scientists who question the wisdom and safety of gain-of-function experiments — in which biologists deliberately create pandemic-causing pathogens in the lab in order to better prepare to combat them should they evolve in nature — refused to speak to me on the record. One after another, they said Paul's patently false claim that Fauci was to blame for the pandemic, and his selective outrage at gain-of-function research only when conducted in China, made it all but impossible for them to say anything about the pre-pandemic experiments in Wuhan without being vilified by partisans.



One biologist who supports such research told me that he would have liked the opportunity to correct what he called misinformation about the experiments, but had been worn down by death threats.

To recap, at a hearing in May, Paul first accused Fauci of having supported gain-of-function research in Wuhan, which the senator, who is also a doctor, misleadingly defined as "experimenting to enhance the coronavirus's ability to infect humans." In fact, the coronavirus that researchers experimented on between 2014 and 2017 at the Wuhan Institute, with some financial support from the NIAID, was from a strain found in bats that is not closely enough related to SARS-CoV-2 to have been used to fabricate the virus that causes Covid-19 in a lab.

Fauci also insisted that his agency, which is part of the National Institutes of Health, had never funded gain-of-function research in Wuhan.

When Fauci returned to the senate committee last week, Paul confronted him with the words of Richard Ebright, a molecular biologist at Rutgers University and a longtime critic of gain-of-function studies, who told the conservative magazine National Review that Fauci's testimony in May was "demonstrably false," since, in Ebright's opinion, the experiments at the Wuhan Institute, indirectly funded by the NIAID as part of a project to head off a pandemic, were "unequivocally" gain-of-function in nature.

MORENS_SUBPOENA_022814
MORENS_NIH_043818
REL0000478943

Sen. Rand Paul, a Kentucky Republican, used a visual aid to accuse Dr. Anthony Fauci of lying to Congress during a Senate Health, Education, Labor, and Pensions Committee hearing on July 20, 2021.
Photo: Stefani Reynolds-Pool/Getty Images

Fauci insisted that the biologist Paul cited was simply wrong, saying experts at the National Institutes of Health had evaluated the Wuhan project and concluded that the experiments there did not meet the criteria for gain-of-function research used by the United States government.

The exchange between Paul and Fauci got even more heated when the senator seemed to imply that this research funded by Fauci's agency could have led to the development of SARS-CoV-2, the deadly coronavirus that causes Covid-19, in the Wuhan lab.

As Fauci correctly noted, that speculation was wildly misleading, since it was "molecularly impossible" for the type of coronavirus used in the pre-2017 experiments to have been manipulated in the lab to create SARS-CoV-2.

On that point, even some of the most outspoken critics of gain-of-function research on potential pandemic pathogens agree with Fauci. Kevin Esvelt, an MIT biologist who told PolitiFact in May that the experiments conducted in the Wuhan study should be considered gain-of-function also emphasized that those experiments "definitely did NOT lead to the creation of SARS-CoV-2." (Esvelt, who worries that viruses developed through gain-of-function experiments in a lab could one day be used as weapons, told "The Open Mind" on PBS in March that whether the virus that caused the Covid-19 pandemic came from an animal or came from a lab, "it was not designed to be a weapon — because anyone good enough to make this thing could make a more devastating weapon.")

MORENS_NIH_043819
REL0000478943

Read Our Complete CoverageThe Coronavirus Crisis

Paul was also rebuked in May by Marc Lipsitch, a microbiologist and professor of epidemiology at Harvard University who brought together hundreds of scientists and experts in law and ethics in 2014 to call for a moratorium on gain-of-function experiments that could create highly transmissible, novel strains of dangerous viruses in laboratories.

Lipsitch wrote in a Twitter thread that in his attack on Fauci in May, Paul had "FALSELY" claimed that the working group Lipsitch assembled had "characterized work at the Wuhan Institute of Virology as gain-of-function." While he and many members of the working group "support proper investigation of SARS-CoV-2 origins including the lab leak hypothesis and continue to oppose many forms of GOF research," he added, "it is just fabrication to say we have made any statement as a group about work in Wuhan."

Fauci did not get a chance to explain during the hearing what the scientific basis was for the determination by NIAID biologists that the experiments conducted at the Wuhan Institute of Virology, described in a paper published in 2017, were not subject to a temporary pause on the funding of gain-of-function research imposed during the Obama administration in 2014, which was lifted in 2017 after Trump became president.

But in a statement provided to The Intercept on Monday, NIAID explained the reasoning behind its review of the experiments conducted at the Wuhan Institute on behalf of EcoHealth Alliance, a nonprofit in New York that works with researchers in China to study viruses that have the potential to jump from bats to humans. The agency wrote that its scientists had concluded the pre-2017 experiments in Wuhan were not barred by the temporary pause on gain-of-function research, "because they were not reasonably expected to increase transmissibility or virulence of these viruses in humans."

"Under the grant, EcoHealth Alliance proposed research to create chimeric viruses by placing a small portion of newly identified, evolutionarily distant, bat coronaviruses into another well characterized bat coronavirus that has never been demonstrated to infect humans called WIV1," NIAID wrote. "The purpose of this work was to examine whether the newly discovered viruses were able to use the human ACE2 receptor like WIV1 and other SARS-related coronaviruses already do. In the context of these experiments, this well-characterized bat coronavirus would be considered the parental strain against which the function of the new chimeric viruses would be assessed. With this comparison, the newly created chimeric viruses did not gain any function relative to the parental strain; the chimeric viruses did not replicate in cell culture any better than the parental WIV1. In addition, research that had been published in peer-reviewed scientific journals demonstrated that viruses similar to those proposed under the grant had reduced pathogenicity as compared to the parental viruses. For these reasons, it was not reasonably anticipated that the viruses involved in research under the grant would have enhanced pathogenicity and/or transmissibility in mammals via the respiratory route, and therefore did not meet the criteria for gain-of-function research described in the research funding pause."

Subject: Can we have a call to discuss how to build momentum to push back against the Republican's anti-science 'investigation' agenda?

From: Peter Daszak [b6]

To: Hotez, Peter Jay [b6] David Morens [b6] Rich Roberts [b6] >; Gerald Keusch [b6]

CC: Aleksei Chmura [b6] >; Jeff Sturchio [b6] Alison Andre [b6] >;

Happy new year everyone!

It's been a while since we all connected, and after a hectic build up to the holidays (I was on 3, multi-week trips to Southeast Asia between Sept and Dec), I wanted to get back in touch with you and let you know what's happening. As you know, we received a letter from Reps. Comer and Jordan mid-December demanding documents and on-the-record interviews as part of their 'investigations' they're planning into COVID origins. The White House received similar letters demanding docs and interviews with the HHS Secretary, multiple people from NIH (incl. David Morens) and others. They pushed back because the Republicans weren't even in power, and we've now heard from the staffers that they're getting ready to send new letters over to us all. None of us are sure how actively or rapidly they'll get to their COVID investigation, or if this will involve public hearings. They've got a lot of other issues, and a priority to target Hunter Biden's laptop, as well as new issues like the debt ceiling and classified documents. However, we do expect that they will get to it eventually, and that the Republicans in the House will be aggressively targeting EcoHealth Alliance (and probably other organizations) with efforts to defund us.
This all adds to a growing anti-science movement that Peter Hotez has been highlighting in articles and online recently around COVID origins, the mask mandates, vaccine mandates and other anti-vaxx and 'anti-expert' type attacks. The Republicans will want to turn up the heat to keep all of this in the press so it helps them in their attacks on Biden, Fauci etc. It's pure politics, but has a real threat of damage to us, and to the research we all value. At the very least, we expect to see substantial efforts to legislate against so-called gain-of-function work, and **as of yet, zero pushback from the scientific community writ large – the societies, academies, universities**. The media are jumping in. Everyone wants to write an article about COVID origin and given the aggression on social media, these are being amplified rapidly and getting into the public eye. Just in the last couple of days:

- A long-winded whiny article from *The Intercept* about FoIA'd emails that basically show how scientists discussed the lab hypothesis early on, but David Relman (at the end of the article) claims shows they were rushing to judgement: https://theintercept.com/2023/01/19/covid- origin-nih-emails/
- Article from Washington Post that links Boston Univ's NEIDL's 'risky research' to Wuhan's 'risky research' and to the origin of COVID https://www.washingtonpost.com/health/2023/01/18/lab- leak-theory-virologist/
- A report from the GAO yesterday that mildly criticizes NIH's oversight of Gain of Function review: https://www.gao.gov/assets/gao- 23-105455.pdf
- Three days ago a paper from North Carolina from a Republican perspective that criticizes Ralph Baric's lab.. https://www.carolinajournal.com/opinion/nc- can-be-a-leader-in-safe-biotech-research/

The problem I see is that the Republicans are getting what they want – keeping the lab leak hypothesis and anti-science sentiments in the mainstream press and setting the stage for the McCarthy-style witch hunts that Peter Hotez has been talking about. We are actively reaching out to Democrats in Senate and Congress to try to build up their energy to defend against this, but we are just one small organization, and I'm worried about how successful we can be. I've been talking with Jeff Sturchio about renewing our efforts to try and build a coalition to counter this, involving the societies, activist groups like Research! America, university coalitions like the Consortium of Universities for Global Health (CUGH), ASTMH, APHA, NL Campaigns, The pandemic Action coalition, etc.

Will you all be willing to have a one hour call in the next week or two to do some initial brainstorming of this, namely:

- Who to involve
- How to go about setting up a 'coalition'
- What the goals should be, e.g. a position paper laying out reasons why research on pandemic prevention and preparedness is necessary, Op Eds, briefing notes, a website, visiting staffers on the Hill etc.
- How to do this without drawing political pressure

I'm cc'ing Alison Andre, who can work with your schedules to make this happen, and am really looking forward to talking with you all again.

Cheers,

Peter

Thank you Jerry, it was so great seeing you and everyone! Did you get a chance to see John David, that was nice as well.

I thought the evening was a great show of support for Peter Daszak and the EcoHealth Alliance, especially from the Board. I think that was probably the best part of the gala, the unbridled enthusiasm for the mission, it was nice to see.

The meeting at the RF in the afternoon was impactful and meaningful. I think we have some momentum to move forward on a coalition. So let's meet next week by zoom.

Warmest regards, Peter

The Coming Tidal Wave of Right Wing Covid Lawsuits

Lawyers have found a way to cash in on outrage over mask mandates and vaccines.

Kiera Butler10 hours ago

In late March, I watched as some 300 lawyers, doctors, and activists assembled in the aggressively beige conference wing of the Midtown Atlanta Hilton for the inaugural Covid Litigation Conference. A promotional flier promised that the event would "provide attendees with the resources they need to begin taking on Covid cases for the first time or to expand the range of Covid claims that they currently handle." An unsuspecting lawyer could have been forgiven for expecting tips on how to help clients who had been disabled by Covid that they caught at their factory jobs, for instance, or those whose medical bills their insurance refused to pay.

But those kinds of cases were entirely absent from the agenda. Rather, the topic was a very particular kind of litigation: How best to advance the movement that organizers called "medical freedom." In other words, how to sue the people who created and enforced public health measures like vaccine and mask requirements, policies against Covid misinformation, and treatment protocols for hospitalized Covid patients.

The conference organizers wore t-shirts emblazoned with the slogan "Misinformation Superspreader." Steve Kirsch, a Silicon Valley entrepreneur, philanthropist, and a main organizer of the event, told me that the slogan was a cheeky reference to what he saw as the unfair labeling of anti-vaccine activists as peddlers of misinformation. "We said, 'Okay if that's what they're calling us," he explained, "let's kind of make fun of it." Indeed, many of the attendees seemed to see themselves as underdogs, scrapping against government and pharmaceutical behemoths.

What those underdogs didn't mention during the sessions, though, is their friends in high places: specifically, federal judges who seem to be sympathetic to their aversion to pandemic policies. Pointing to some of the victories that medical freedom lawyers have enjoyed in US District courts, Dorit Reiss, a public health lawyer and law professor at the University of California College of the Law, noted, "They're having some success in the federal system in front of Trump-appointed judges, and they're very much forum shopping right now." Adam Winkler, a constitutional law scholar at the University of California-Los Angeles, agreed. "The courts have issued a lot of what were once thought to be outlandish kinds of rulings with regard to any number of issues like abortion and affirmative action," he said. "I'd expect that encourages people to bind hope to the prospects of lawsuits that they would otherwise seem certain to lose."

When I arrived, I didn't think I'd get past the Misinformation Superspreaders and make it into the ballroom where the event was taking place. The media liaison for the conference, Trevor FitzGibbon, asked me if I was there to write about disinformation, and he seemed to balk at my affirmative answer. When I said I worked for *Mother Jones*, he noticeably brightened. He had come up in the PR business working for prominent progressive candidates and groups, he explained, including Barack Obama, MoveOn, and Planned Parenthood, which I took to mean that he considered us to be politically kindred spirits. And then he let me into the ballroom.

Once inside, I watched as one indignant panelist after another enumerated their grievances. At the Hospital Negligence Panel, doctors who refused to deviate from CDC protocol to treat Covid patients with unproven drugs like the antiparasitic medication ivermectin and

MORENS_SUBPOENA_005368
MORENS_NIH_013418
REL0000478945

antimalarial hydroxychloroquine were the targets of rage. The Education Mandates session featured the mother of a California teenager who had defied her school's mask requirement, showing up at school without a mask for weeks on end in 2021, and standing outside the school for hours every day after she was kicked out. The panelists batted around ideas: Could the refusal to wear a mask be considered free speech? Could putting a kid in detention for not wearing a mask count as false imprisonment?

In his speech, Kirsch, the conference organizer, told the story of how, at the beginning of the pandemic, he had invested $1 million of his own money toward studying existing drugs as potential Covid treatments. Somewhere along the way, he became convinced that the Covid vaccines were dangerous. Last year, he founded the Vaccine Safety Research Foundation, whose goal, according to its website, is "to advance COVID-19 vaccine safety through scientific research, public education, and advocacy, and to support the vaccine injured." After his speech, Kirsch told me that he sees litigation as a way to force the federal government agencies to release data that he believes they're concealing about the dangers of the Covid vaccines. He said he is sure that "the only reason that we're not allowed to see any of the data is because it's bad."

Many of the other speakers seemed to share Kirsch's belief that the public isn't seeing the whole picture of Covid. In a constitutional law panel, Robert Barnes, an attorney who previously represented both Kenosha shooter Kyle Rittenhouse and Sandy Hook conspiracy theorist Alex Jones, said, "Pfizer makes the Mexican drug cartels look like a street corner dealer by comparison." To hold the public health crowd accountable, he implored the lawyers at the ballroom tables to "knock down the doors of every court we can."

But not just any court. Medical freedom activists have already started enjoying some successes in front of conservative judges. At the local level, several have sided with plaintiffs who've sued hospitals for refusing to give patients ivermectin. But it's been on the federal level, with Trump-appointed judges, where they've enjoyed some of their most significant successes. In 2021, Texas Attorney General Ken Paxton sued the Biden administration over a proposed policy that would have required Covid vaccinations for all Head Start employees. In March 2023, Judge James Wesley Hendrix of the Northern District of Texas, a Trump appointee, struck down the proposed policy. In January 2022, a group of government workers sued the Biden Administration over the president's vaccination requirements for all federal employees; in 2022, Judge Jeffrey Vincent Brown, whom Trump appointed in 2019, ruled in their favor. That ruling was briefly overturned, but in 2023, the 5th US Circuit Court of Appeals in New Orleans upheld it; the opinion was written by Trump appointee Judge Andrew Oldham.

In August 2022, a group of physicians sued the Biden Administration over its efforts to hold social media companies accountable for platforming physicians who spread misinformation about Covid. The plaintiffs, two of whom created the 2020 Great Barrington Declaration to oppose pandemic protections, accused the federal government of violating their First Amendment rights. "The US government used its vast power over social media and big tech to censor legitimate scientific and policy discussion about Covid during the pandemic," Jay Bhattacharya wrote in a statement. That case is still ongoing, but in March, Trump-appointed judge Terry Doughty, in the Western District of Louisiana, denied a motion to dismiss it. "The US government used its vast power over social media and big tech to censor legitimate scientific and policy discussion about Covid during the pandemic."

There is more to come. Several of the conference speakers have embarked on a Covid litigation bonanza of late. Mark Meuser, a member of the Future Litigation and Censorship panels, boasts on his website that he "has been involved in 22 lawsuits brought against [California Governor Gavin] Newsom for his unconstitutional usurpation of power as a result of COVID-19." In the exhibition area, I visited the booth of Children's Health Defense, the anti-vaccine organization helmed by the new presidential hopeful Robert F. Kennedy, Jr., who announced his bid to replace Joe Biden in April. A flier that highlighted some of the dozens of lawsuits that the group had recently filed reveals its eagerness to sue the government, at both local and federal levels. It's suing California over a law that prohibits doctors from spreading misinformation; the *Washington Post* and other news outlets over their efforts to stop the spread of misinformation; and the CDC for access to reports of "unusual or unexpected patterns of adverse events reporting that can signal safety problems with a vaccine." Sen. Elizabeth Warren (D-Mass.) is getting sued for calling for a review of the Amazon algorithms that allegedly promoted anti-vaccine books, and Facebook parent

MORENS_SUBPOENA_005369
MORENS_NIH_013419
REL0000478945

company Meta is being sued for "collusion with the US government to censor CHD social media content." Add to the long list of defendants Rutgers University for its vaccine mandate for students and staff.

Law professor Reiss is dubious about the prospects for some of those lawsuits, especially those in which individuals sue a private company for censorship. The First Amendment, she noted, also protects "the freedom of private companies like Twitter and YouTube to kick them off." Nor was the idea of students suing universities, a winning strategy. "You don't have the right to go to a specific university," she said. "And if you don't like the university policies, universities are on pretty solid grounds denying you admission."

Yet she noted that some of the victories the medical freedom movement has racked up so far could pave the way for future legislation that would last long beyond the Covid era—and possibly transform established public health practices. In fact, that's already happening: Several panelists suggested making vaccination status a protected class like race or sex—which means that it would be illegal to discriminate against someone on the basis of whether or not they had received immunizations. In 2021, Montana became the first state to pass such a law. In February of this year, Idaho followed suit. Employers there who require vaccination against Covid can now be fined $1,000 per violation. A similar bill in Florida is currently under consideration.

Another potential opening for medical freedom advocates, Reiss said, is a broader interpretation of laws about religious exemptions to vaccine mandates, which most states allow. With the current Supreme Court's expansion of what is included within the definition of freedom of religion, she worried they may include religious objections to vaccines. "If they go there, it will make it a lot harder to prevent the abuse of religious exemption," she said. On April 18, a few weeks after I spoke to Reiss, a US district judge ruled that Mississippi must change its current policy to allow religious exemptions for vaccine mandates. (The judge, Halil Suleyman Ozerden, had been nominated by Trump in 2019 to serve on the 5th Circuit Court of Appeals, but key Republicans questioned his conservative bona fides and he was never confirmed.)

With all this coming litigation, some of the conference sponsors saw a business opportunity. While the speakers inside the ballroom railed against big pharma and the CDC, just outside, representatives from law-firm-adjacent companies handed out business cards. Zena Obebe, the CEO of Hill Redaction Services, told me, "We wanted to get in front of those litigation lawyers and say, 'Hey, you can use us for the medical records.'" She expects to see many more Covid-related cases soon, explaining, "There's a huge influx that's coming down the pipeline."

Though Covid was the official topic of the conference, many of the people I talked to made detours into other subjects. Their involvement in the medical freedom movement, they said, had caused the scales to fall from their eyes. Kirsch, the conference organizer, explained that before the pandemic, he had never been skeptical of routine childhood vaccinations, but over the past few years, he has come to believe they cause autism (a theory that has been extensively discredited but one cherished by RFK, Jr. whose campaign, Kirsch says, he looks forward to supporting). So fervent is his newfound aversion to immunizations, he told me, that he now believes "nobody should ever" even vaccinate their pets.

For FitzGibbon, the comms guy, his involvement with the medical freedom movement has led to a more thorough disenchantment with his progressive roots. In 2020, during the height of the pandemic, he had become acutely ill with Covid, but two different hospitals sent him home. Only when a doctor-client put in a good word for him did he get admitted to an ICU, where he received monoclonal antibodies—an effective though underutilized treatment—which he credits with saving his life.

In the months that followed, he became skeptical of what he saw as the single-minded focus on Covid vaccines and what he considered to be the suppression of treatments like the one he received, as well as more scientifically dubious drugs like ivermectin and hydroxychloroquine. "All you saw in the US media was vaccine, vaccine, vaccine," he said. "Any other mentions of these alternative treatments were blacklisted." He now believes not only that the Covid vaccines are bioweapons, but also that the Democratic party has lost its way—he saw it even before Covid in Democrats' soft stance on domestic surveillance under Obama, and now he sees it in foreign policy, too. In a pivot I frankly did not see coming, he said, "I do not recognize this administration or this party when it comes to the war in Ukraine," especially since he claims that Russia had good reason to invade the country

MORENS_SUBPOENA_005370
MORENS_NIH_013420
REL0000478945

because of its problem with Nazis (ostensibly a reference to Russian President Vladimir Putin's shaky-at-best justification for his invasion).

It's possible, though, that something unrelated to politics deepened his disenchantment with progressives: In 2015, his PR firm closed abruptly after several female former employees accused him of sexual assault and harassment; he spoke to me on the condition that I note that the US Attorney declined to file any criminal charges, and a woman who had accused him of rape publicly retracted her allegations and apologized as part of a settlement in 2019.

Both Kirsch and FitzGibbon complained that progressive groups with whom they both were previously allied would no longer return their calls—about Covid or anything else. Aggrieved, they were determined to press on in what they saw as a countercultural but righteous crusade—a sentiment echoed by many of the speakers. Their alienation and what they consider to be oppression only further energizes them and their cause. In a heartfelt speech in the ballroom, Sujata Gibson, a New York-based lawyer and activist who recently won a lawsuit that led to New York overturning its vaccine mandate for healthcare workers, compared current medical freedom activism to the Indian struggle for independence, Nelson Mandela's campaign against apartheid in South Africa, and the American civil rights movement. "Part of what we have to do as lawyers when we're in these tyrannical moments in history—and this one is quite extreme—is we have to hold the line in the courts," she said. "I've been lucky enough to see time after time how David and Goliath battles can be won."

OPINION

Who will defend embattled scientists?

MORENS_SUBPOENA_000308
MORENS_NIH_003668
REL0000478947

The latest round of attacks on prominent US scientists from public figures and elected officials may require the formation of a new type of organization to ensure our safety and productivity.

By Peter Hotez Updated January 27, 2022, 4:35 p.m.

People who are anti-vaccination take part in an event "for the preservation of personal sovereignty and to STOP medical coercion, discrimination" on Jan. 23 in Washington, [b6] WONG/GETTY

Even before the COVID-19 pandemic, being a public defender of vaccines was not rewarding. After I wrote the book "Vaccines Did Not Cause Rachel's Autism: My Journey as a Vaccine Scientist, Pediatrician, and Autism Dad," about my daughter, as a means to debunk false assertions alleging vaccine-autism links and educate the public about the origins and causes of autism, I became a target of antivaccine groups. Their threats (which continue) through e-mails, social

media, personal confrontations, and anonymous phone calls, assert that I maintain secret ties to big pharma (even though I develop vaccines for neglected diseases linked to poverty), or that I have financial motivations (I don't). In some cases, the threats were overtly antisemitic and included horrific images from the Holocaust.

During the pandemic, the anti-science attacks have gotten worse. Adding to my distress is that many scientific professional organizations do not speak out to defend scientists or offer us assistance.

I have been outspoken about the dangers of refusing a COVID-19 vaccination, and have pointed out how more than 150,000 unvaccinated Americans have needlessly lost their lives since last summer as a result. I cite data from the Kaiser Family Foundation, NPR, Charles Gaba (an independent health analyst), and other sources revealing an unambiguous and stark partisan divide: overwhelmingly Republican or conservative stronghold areas exhibit the lowest acceptance of COVID-19 vaccinations, and consequently the highest number of cases and deaths due to COVID-19.

Those who defy vaccines are paying with their lives. They are victims of media outlets and even members of Congress who openly espouse antivaccine views. Last summer, Republican Representative Marjorie Taylor Greene of Georgia called vaccinators "medical brown shirts," referring to Nazi paramilitary groups, while other congressional members attending the July Conservative Political Action Conference claimed vaccines were political instruments of control.

Some elected officials have since taken this a step further by seeking to discredit individual biomedical scientists. I was ridiculed by Governor Ron DeSantis of Florida on a Fox News broadcast, and, earlier this month, I was targeted by Greene and Steve Bannon on Real America's Voice a week after our research team announced emergency use authorization in India of a recombinant protein COVID vaccine for global health. Such statements are often followed by threatening e-mails and other notes accusing me of "crimes against humanity" or warning that I will soon be hunted by "armed patriots." During the Jewish high holidays, while I was in Houston to give a speech at a reform synagogue, I was stalked and heckled.

Other scientists have fared worse, including Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, who has been the subject of intimidation on multiple occasions by both Senate and House members, including a vituperative exchange earlier this month with Republican Senator Rand Paul of Kentucky. Several nongovernmental scientists have been targeted as well.

Dog whistles from highly visible elected officials are unnerving, especially when followed by a barrage of hate e-mail and online threats. For biomedical scientists laboring to shape new approaches or therapeutics to combat COVID-19 there is really no roadmap for how to respond or seek protections. In my case, since this also includes antisemitic attacks, I have been able to get help and advice from the Anti-Defamation League and other Jewish organizations, but often there is nowhere obvious to seek help.

Fifty years ago, American scientists founded the Committee of Concerned Scientists to defend their colleagues abroad — many from authoritarian states such as Turkey or China where they experienced human rights violations. However, political scientists such as Harvard's Steven Levitsky have since sounded the alarm for increasing authoritarianism in the United States. How can society address a far-right US authoritarian movement seeking to undermine scientists?

We need an organization that is prepared to defend biomedical scientists. Thus far, the major professional and academic societies, including the National Academies, find themselves in the difficult position of balancing their historical neutrality in American politics with the need to preserve the integrity and productivity of American science. The reality is that political neutrality is often impossible when defending scientists — it favors the oppressor (to paraphrase Elie Wiesel). Ideally, an organization defending scientists would provide legal advice or practical instructions for managing media and social media communications. It could advise on how to engage law enforcement when public attacks incite serious threats from adherents. It might resemble the renowned Southern Poverty Law Center, established to promote social justice and combat racism, but be focused on helping US scientists, or a biomedical equivalent to the more recently created Climate Science Legal Defense Fund.

When I obtained my MD and PhD in the 1980s, I never dreamed it would become necessary to defend the importance of science and scientists in a nation built on great research universities. We must face this new reality and find new paths, to hold to account those who seek to destroy basic tenets of knowledge and the safety of those who generate and promote it.

Dr. Peter Hotez is a professor of pediatrics and molecular virology at Baylor College of Medicine and codirector of the Texas Children's Center for Vaccine Development, which developed a low-cost COVID-19 vaccine for global health.

Cheers,

Peter

Yes I saw it David - pretty offensive stuff, but it does contain 3 factually correct statements:

1) I'm bald
2) I wear hiking pants and shirts to the office unless when talking with VIPs, when I don a jacket (not tweed though – that's ridiculous).
3) I've worked extremely hard to raise funds for our non-profit over the years, and if some of that's been successful, I'm happy to be guilty as charged.

From what I've read, all the rest is pure garbage.

Sorry you spent time talking with her David. I also addressed a long list of detailed questions from her, some of which she had to print and I think that helped throw a bit of water on some of her BS lines of attack.

Cheers,

Peter

Peter and all, i am sure you have all seen this by now. I hate this piece, which is twisted and full of innuendo and false equivalency. I am sorry i ever spoke to her (twice) and let her snow me with her assurances of setting the story straight re the good work of EcoHealth. To his credit i think Tony declined to speak with her. I feel like she betrayed what i told her on background.

Anyone who portrays Jesse Bloom as a visionary is incompetent in my book. Very sorry to see this piece of bat guano.

Hi Rich,

Totally agree with the need to get rid of the slogan for attacks on science that GOF has become. The question is how. That would be something a new advocacy organization that engages the scientific societies to fight back against the attacks on science and scientists could pick up and pursue.

More immediate is the issue of EHA and what Bertagnolli will experience in the hearings. Ordinarily what Harold suggests would be fine, however in the current circumstances Building 1 remains hostile to EHA and too reticent with the republican congressmen. I don't trust them to prep her in a manner that we would consider both rational and reasonable. Maybe the other way to get her attention is to get something in Science (? via and editorial from you and Harold, or prod Holden Thorpe to take a proactive stance) providing the background including the suspensions, terminations, reversals, reimpositions etc in a way that has stopped the important work EHA does for all this time. Jocelyn Kaiser has a nice news report in Science; what is needed now is an editorial that Bertagnolli will see and hopefully ask lots of questions to the legal office at NIH and HHS.

Peter, is there anybody in that office who has been willing to both listen and to hear the message? I don't know how to get more information to that person, that office, without stepping over red lines for influencing (rather than informing) decision making. What is needed is some sort of amicus brief. Is there any precedent for something like that outside the courts?

I'm just verbally mulling over where this issue is and what can be legitimately be done proactively in defense.

Subject: Re: The new NIH Director nomination

EXTERNAL SENDER

Rich, yes, I know Monica and we have talked several times about the NCI and NIH jobs. But I don't expect to be involved in her preparation for the hearing on her nomination as NIH Director. That is usually organized by the legislative offices in the NIH Office of the Director and by the legislative team at DHHS. I am sure that she will get briefed about the EHA grant and it is likely that NIAID will be asked to provide background material.

The document you sent has a lot of detailed information that she might want to read but it would best be delivered to her via NIAID; in addition, the source of the document (presumably EHA itself) should be apparent. EHA might simply provide that to NIAID's current leadership and I expect that they've done that already.

Best,

HV

PS Can't we find a better, more restricted way to label experiments that enhance pathogenicity or transmissibility of infectious agents than "gain of function"? Even DURC (dual use research of concern) is better than that. I've been doing GoF research for decades, enhancing cell growth by enhancing the function of proto-oncogenes!

To: Harold E. Varmus [b6]
Subject: [EXTERNAL] The new NIH Director nomination

Harold:

You probably know Monica Bertagnolli and I am wondering if you will be contacting her prior to the Senate Hearing?

I ask because in light of the recent events related to EcoHealth Alliance she is likely to be questioned about their funding and the relationship to the COVID lab-leak hypothesis. I had let you know that their grant had been re-instated (2 1/2 years after we asked for it!), but I don't see that will stop some awkward questions for her.

If you do get the chance to chat you might mention some of the possible responses to questions that are covered in the attached.

If you will not be speaking with her, perhaps you could suggest someone else I might contact about this matter.

Hope all is well with you.

Amen! Great work, guys!

I also have been talking to Eddie Holmes. He will NOT get involved in any activist things (for hsi own safety and his family's) but is willing to have a zoom chat with me alone, and discuss things he knows about the situation in China, science and people, that has not all been ijn the press. Peter, you may already know some or all of this, we'll see. But for me to learn whatever he has to say can help us. I p[roposed that the zoom call would be with the several of us, but he said no, just me. But I can relate the converstaion to you all. david

*****CAUTION:*** This email is not from a BCM Source. Only click links or open attachments you know are safe.**

My wife spotted this in the awful rag the Daily Mail. It's now in all the Murdoch right wing press (this is from Fox News - https://www.foxnews.com/politics/fauci- resisted-trump-cancel-virus-research-grant-wuhan-lab). Apparently a new tell-all book about Trump's management of the pandemic gives details of how the EcoHealth CoV grant was terminated. This is written from the right wing perspective – their spin is that "Fauci had the audacity to think it shouldn't have been terminated!". But actually, it reveals some interesting new information:

- NIH and HHS thought it likely illegal to terminate a grant "for convenience". My lawyers also believe that, as does just about everyone I've asked
- Trump pressured HHS who pressured Tony and Francis. They hesitated to terminate, the well-known HIV/AIDS activist Peter Staley tried to persuade them both not to allow this to happen – political interference in science
- Fauci and Collins thought it not worth resigning over a $3.7 million grant. Peter Staley agreed ultimately. Fauci reluctantly agreed to terminate it, as he said, "because the white house told us to". Personally, I understand this decision, even though it's been devastating to me and EcoHealth. It would not have been good to have lost Tony's leadership in the middle of the pandemic with Trump's reckless leadership.

FYI – I forwarded a copy of this to the GAO in case they want to use it in their work.

Fauci resisted Trump directive to cancel virus research grant linked to Wuhan lab: Book

The White House demanded the grant be canceled after reports the coronavirus leaked from the lab

By **Thomas Barrabi | Fox News**

Exclusive: Anthony Fauci resisted a White House directive in April of last year to cancel a research grant for a nonprofit linked to the Wuhan Institute of Virology but "reluctantly agreed" after he learned that then-President Donald Trump had explicitly ordered its

MORENS_SUBPOENA_020615
MORENS_NIH_041323
REL0000478953

cancellation, according to an exclusive excerpt from a book detailing the Trump administration's response to the COVID-19 pandemic.

Fauci's debate with other top officials on how to handle the request was detailed in "Nightmare Scenario: Inside the Trump Administration's Response to the Pandemic That Changed History," an upcoming book from Washington Post reporters Yasmeen Abutaleb and Damian Paletta.

The White House pushed the National Institutes of Health to cut funding for a study examining how coronaviruses jump from infected bats to humans following reports linking the research to the Wuhan facility at the center of the "lab leak theory," which posits the pandemic originated from a lab accident. The study's sponsor, the nonprofit EcoHealth Alliance, was told not to spend the remaining $369,819 balance of its 2020 grant.

<image001.gif>

In their book, Abutaleb and Paletta provide a behind-the-scenes account of how Fauci and his colleagues at the National Institutes of Health responded to the White House's directive:

"With questions swirling about the origins of COVID-19—experts had determined that the virus was not man-made but could not rule out that it might have slipped out of a lab—the NIH had gone to the principal study investigator on April 19 and asked that payments be halted to the subcontractor in Wuhan until it had more answers.

A few days later, the relatively small grant had garnered new attention…On the afternoon of April 24, NIH director Francis Collins and Fauci received notice that Trump wanted to formally announce in a 5:00 p.m. press conference that the grant had been terminated."

Collins and Fauci told the White House and [the Department of Health and Human Services] that they were not sure the NIH actually had the authority to terminate a peer-reviewed grant in the middle of a budget cycle. The HHS general counsel told them to do it anyway and made clear it was a direct order from the president, implying that their jobs were on the line if they didn't comply. Fauci and Collins reluctantly agreed to cancel the grant."

According to the book, Fauci relayed the incident to his longtime friend Peter Staley, the

MORENS_SUBPOENA_020616
MORENS_NIH_041324
REL0000478953

prominent HIV/AIDS activist, who purportedly pushed him to resist the administration's directive.

"What do you mean?" Staley asked. "You can't cancel a grant like this."
"What do you want me to do?" Fauci said.
"Can't you and Collins threaten to resign over this?" Staley suggested.
"You want us both to resign over a $3.7 million grant?" Fauci snapped back.
Staley instantly backed down. 'You're right, you're right,' he said. 'That's not what you resign over.'"
(Collins and Fauci heard from many members of the scientific community that they should have resigned. The HHS general counsel later found that the agency probably had not had the authority to terminate the grant. NIH had to reinstate the grant but stopped all of its funding.)

It was the second time in a matter of days that it looked as though Fauci was being bullied by political forces at the White House, and Staley thought it was a worrisome trend.
"You combine this with what happened with your Oval Office remdesivir announcement—and I know this doesn't matter to the country. We're not talking about Trump and politics and Fox and the whole country. "We're talking about the fact that you are now our leader in AIDS, in public health advocacy," he told Fauci, his voice rising with emotion.

"In the scientific community, you are our leader. And in the course of forty-eight hours, you have broken two major tenets of how the scientific community does things. We have these rules for a reason, which you've been a major defender of your whole life."

Fauci did not return a request for comment on the book's claims by the time of this article's publication.

EcoHealth Alliance has worked with Wuhan lab researchers in the past but was not actively collaborating with them when the grant was canceled, Politico reported last year.

When testifying at a House Energy & Commerce Hearing in June 2020, Fauci claimed he was unaware of the reason why the grant was canceled.

"Why was it canceled? It was canceled because the NIH was told to cancel it," Fauci said at

MORENS_SUBPOENA_020617
MORENS_NIH_041325
REL0000478953

the time. "I don't know the reason, but we were told to cancel it."

The NIH's decision to fund research at the Wuhan Institute of Virology is an ongoing point of contention between Fauci and several Republican lawmakers. Sen. Rand Paul and others have alleged that Fauci was aware scientists at the Wuhan lab were conducting "gain of function" research on the virus – a charge Fauci has adamantly denied.

"Nightmare Scenario: Inside the Trump Administration's Response to the Pandemic That Changed History" will debut on June 29.

Cheers,

Peter

If there is something brewing with the NL group or if Harold is willing to push her on this it may help to harden the possibility NAS would take a fact based approach and reproach the kangaroo trials under way.

EXTERNAL SENDER

Thanks for sharing this document. I don't know Peter personally, so don't understand how he wants to present himself and EcoHealth to the politicians. As we all have seen, politicians purposefully come across as combative, like to speak in sound bites, and take much liberty with the facts. As a scientist, my personal style is to stick to the facts, insist that others stick to those facts, and admit when and where science cannot answer questions. The way this statement is written, it tends towards giving the politicians a taste of their own medicine, so to speak, by stating in absolute terms topics that are more nuanced. For example:

"Many of the claims levied against EcoHealth Alliance are built on the false assumption that COVID-19 emerged from the Wuhan Institute of Virology because of a lab leak during research supported by the NIH under a subgrant from EcoHealth Alliance: There is not a scintilla of scientific evidence for this narrative. "

I probably would have stated this differently. The failure to find the SARS-COV2 virus in nature has been the primary support for the lab leak hypothesis. So I think stating that "there is not a scintilla of scientific evidence" is overstated, and could bring trouble. The epidemiology of the disease does suggest origin at the market, but without the cooperation of the Chinese, we will not solve this problem. I am sure that many interpret the lack of cooperation by the Chinese as "proof" that they engineered the disease, even if by mistake.

The rest of the statement follows in similar vein, by showing anger and frustration. (And believe me, I can completely relate to why Peter is so frustrated!) But emotion tends to detract from the impression that this is a fact-based rebuttal. I guess I would have just made the same points more dispassionately. e.g. Debarment is not an appropriate action in this case based on government regulations. The timing of the request for data and notebooks was too late, and by that time political tensions virtually guaranteed that they would not be forthcoming as distrust was evident on both sides (Chinese and US). etc.

Please note that these comments are just based on my personal experience with Congress. Peter can take or leave.

One strategy I used to use with Congress was to meet privately with the Members prior to my testimony. For those likely to be in opposition to my case, I would explain in

MORENS_NIH_047117
REL0000478954

great detail to them and in terms they can understand why they should back off or change their minds. For those likely to be sympathetic to my case, I would feed them questions to ask. I remember one case when I was testifying for the USGS budget, and the proposal had been to zero out the Earthquake Research Grants to universities, a program in place for many decades. I had one Member ask me whether these grants had any impact in the past. That gave me the opening to tell the story of a young Stanford grad student from France whose research funding had run out, and he was going to have to return to France. The USGS stepped in, supported the student, and he used the funds to conduct a strong ground motion mapping of the Bay Area to predict what areas were most vulnerable to earthquake shaking and sediment liquification. Three years later, the Loma Prieta earthquake occurred, and basically validated all of the microzonation shaking that the map had predicted. The student was able to stay in the US, finish his degree, obtain US citizenship, and at the time of my testimony was President of Caltech. All of the money for the earthquake research grants was restored by Congress as a result of that testimony, and no funds were taken out elsewhere.

Peter needs an opportunity to talk about all of the good that the EcoHealth Alliance has done, and needs to create an opening to tell that story.

Hope this is helpful. Have a great Memorial Day!

Marcia

This is yet another petty and vindictive effort. While it seems to me it's being applied selectively does it have any traction beyond the annoyance feature to EHA to respond legally to the suit?

And I saw that Collins and Fauci are joining 25 interfaith clergy who will be vaccinated in a live stream from National Cathedral tonight. It's being promoted as part of the Biden administration effort to influence the hesitant to be immunized. This suggests Collins is not likely to be terminated any time soon, if he proves valuable to motivate that segment of the population he appeals to, and any further efforts should focus on the failure of transparency and the need to open up the investigation findings to the public. I am going to ask Harold for his advice on what strategy to take now. It will be important to have all of the Lauer letters in the public domain. How can that be accomplished without tracking back to an identifiable source?

On the other side, there is an interview Peter just did with NPR that is calm, cool, and focused on more relevant information – which I expect will be in the WHO report – regarding the shutdown of wild animal farming. I saw an NPR report on that from June 2020, so this is not new but maybe a new part of the origins from nature argument.

I somehow missed the NIAID briefing this morning – I didn't recognize what it was on my calendar, adjacent to one of the Mass Consortium sessions at 8 this morning. How did it go? Was Tony participating? What if anything came up about your work with WIV? David, I don't suppose that somehow I can have the link to view it that NIAID provided to you – I know it is restricted to internal staff, so there might be a red flag raised if I were to try to access it. Peter, can you share any slide deck you used with me? I won't disseminate those or pass on the link if I have it.

A U.S. nonprofit with close ties to the Wuhan Institute of Virology violated federal law by failing to disclose that taxpayer funds

MORENS_SUBPOENA_012845
MORENS_NIH_024316
REL0000478958

supported its work, according to a complaint a taxpayer watchdog group filed Monday.

EcoHealth Alliance (EHA) diverted $600,000 in taxpayer funds to the WIV in the form of National Institutes of Health subgrants between 2014 and 2019 as part of a research project studying coronaviruses from Chinese bats. But press releases from EHA describing the project failed to disclose that the project was backed by federal dollars, an omission that, according to the White Coat Waste Project, is a violation of a federal law known as the Stevens Amendment.

"Virtually all of EHA's press releases reporting its taxpayer-funded experiments over the last three years violate the Stevens Amendment," the White Coat Waste Project wrote in its complaint filed Monday with the National Institutes of Health Office of Management Assessment. "The releases fail to acknowledge federal funding, and/or fail to report the amount of taxpayer money spent, and/or fail to report the percentage of the project paid for with taxpayer funds."

The Stevens Amendment requires that any group that receives funding from the departments of Labor, Health and Human Services and Education disclose the percentage of costs financed with federal funds and the federal dollar amount in any statements, press releases, bid solicitations and other documents describing a project supported by those agencies, according to the Government Accountability Office.

Approximately 92% of EHA's revenue in 2018 was from government contracts, the group disclosed in its 2018 financial statements. The bulk of EHA's funding comes from the Department of Defense, however, the group has received over $14.7 million from the Department of Health and Human Services since 2002.

The White Coat Waste project flagged in its complaint three EHA press releases that touted its work on bat-based coronaviruses in China that did not disclose the percentage or dollar amount of project costs financed with federal dollars. EHA's work with the WIV studying bat-based coronaviruses was funded with a $3.4 million NIH grant, according to The Wall Street Journal.

While some press releases on EHA's website do disclose that NIH funded its work, the Daily Caller News Foundation did not locate any that indicated the dollar amount or percentage of costs funded by federal funds.

The White Coat Waste Project's complaint called on the NIH, an agency within the HHS, "permanently disqualify EHA from receiving taxpayer funding" in light of its alleged transparency violations.

"Taxpayers have a right to know — and federal law requires that we're told — exactly how much of our money EcoHealth has shipped to the notorious CCP-run Wuhan animal lab for reckless coronavirus experiments that may have caused the pandemic," White Coat Waste Project spokesman Justin Goodman told the DCNF. "EcoHealth's rampant violations of federal transparency law are yet another example of the group and its President Peter Daszak obscuring their close ties to — and financial support for — the Wuhan Animal Lab."

Sen. Joni Ernst told the DCNF that she will demand an investigation into the federal government's failure to enforce the Stevens Amendment in light of the revelations in the White Coat Waste Project's letter.

"The federal government is failing to comply with the law and disclose how many American taxpayer dollars go to research labs around the world, like the Wuhan Institute of Virology—a reported and potential origin of the novel coronavirus," the Iowa Republican said. "The American people deserve answers."

"I'm demanding an investigation to compel HHS to comply with the law," Ernst continued. "This isn't Communist China; the law isn't optional."

EHA's alleged failure to comply with the Stevens Amendment is emblematic of widespread non-enforcement of the law. The Government Accountability Office reported in March 2019 that most subagencies under the departments of Labor, Health and Human Services and Education do not monitor grantees for compliance with the Stevens Amendment.

Ernst issued a letter to HHS Principal Deputy Inspector General Christi Grimm on Thursday urging a thorough review of the department's enforcement and compliance of the Stevens Amendment.

The WIV's past work conducting gain-of-function research on bat-based coronaviruses, its proximity to the first known cases of COVID-19 and China's lack of transparency surrounding the lab has led to widespread speculation that the virus could have entered the human population due to an accidental leak from the institution.

Gain-of-function is a type of research in which scientists intentionally make pathogens more deadly in a lab setting with the intention of getting ahead of any future outbreaks. Critics of the procedure say it's not worth the risk as it introduces the possibility that a non-natural pathogen could enter into the human population.

The NIH banned funding of gain-of-function research in 2014 due to safety concerns, but the ban was lifted in 2017.

U.S. diplomats wrote two cables to Washington D.C. in 2018 warning of safety issues at WIV. The cables specifically noted that researchers at the lab had discovered new bat-based coronaviruses that could easily infect human, Politico reported. Their warnings went ignored.

WHO team members Marion Koopmans (L), Peter Daszak (3rd R) and Peter Ben Embarek (2nd R) pose for a picture as Koopmans and Daszak leave their hotel after the World Health Organization (WHO) team wrapped up its investigation into the origins of the COVID-19 coronavirus in Wuhan. (HECTOR RETAMAL/AFP via Getty Images)

Daszak, the EHA president, was the only American member of the World Health Organization's 2021 team that investigated the origins of COVID-19 in China. Daszak said Wednesday that the WHO team did not ask to review a database of at least 16,000 virus samples that the WIV deleted in September 2019 because he personally vouched for the lab, saying the data did not contain relevant information on the pandemic's origins.

Daszak's involvement in the WHO probe has been described as a major conflict of interest due to his financial and professional ties with the WIV. Critics have also noted that Daszak appeared to have made up his mind on the lab leak theory at the onset of the pandemic, having organized a statement in The Lancet medical journal in February 2020 condemning "conspiracy theories" suggesting that COVID-19 does not have a natural origin.

A spokesperson for Daszak later admitted to The Wall Street Journal that Daszak's letter was intended to protect Chinese scientists from online criticism. **(RELATED: The Man At The Center Of The World's Biggest Story Has A Conflict Of Interest. Why Won't The Media Report It?)**

The WHO team announced during a joint press conference with Chinese officials in February that their investigation concluded that it's "highly unlikely" that COVID-19 could have accidentally leaked from a Chinese lab and that the theory was not worth further investigation.

WHO Director-General Tedros Ghebreyesus walked back the announcement just days later, saying that all theories on the origins of the pandemic, including the lab leak hypothesis, "remain open and require further study."

The WHO scrapped earlier plans to release an interim report on its investigation in China amid growing scientific concerns over the legitimacy of its investigation. The team said on March 4 that it plans to release a full report on its findings "in coming weeks."

EHA did not immediately return a request for comment.

There is no choice to be made. Either will be a disaster to the other. Both must be opposed. Rich and I are drafting a letter to our representatives asking them to intervene with their colleagues on the subcommittee, and explaining the existential crisis this represents. We have no direct route to the actual subcommittee members. We need to activate the societies as well. Peter, your recent presentation at NAS and the response from Marcia McNutt suggests she might be willing to step forward in a manner than Victor has not.

All:

This is just Wenstrup and the Rs spiking the ball after a hearing in which they refused to let Peter answer the questions posed to him. All of the alleged "evidence" of EHA's supposed transgressions is based on misrepresentation and selective citation of the documentary evidence and false assumptions about the science involved (e.g., since when does a Republican Congresswoman with an MBA and no scientific training get to decide what the definition of gain-of-function research should be?). The only people showing contempt for the American people on Wednesday were the members of Congress and staff who used this hearing as a vehicle to propagate a malicious political narrative that falsely and unfairly blamed Peter Daszak and EHA for research that never happened and outcomes that are chimerical figments of their imagination.

As ever,
Jeff

Amen to that Jerry. The problem is that NIH Acting Dentist Director Tabak said we failed to comply with reporting requirements and both him and Former Director and Awful Guitarist/singer Collins said that this will have (administrative) consequences for EHA.

That's called 'throwing them under the bus'. As you know it's based on them discovering that our Yr 5 report didn't get uploaded properly - something that NIH O/D "hitman" Lauer gleefully sent over to the legal team in a redacted email that's been FoIA'd with the title "gift".

What an obnoxious, anti-science shit-show they've engaged in.

Thanks for sharing David. FactCheck.org should also directly state EHA did nothing wrong or inappropriate in its research collaboration, and in fact had sounded the warning about CoVs years ago and should be commended for its prescience as well as its science.

Navarro Falsely Links Fauci to Pandemic Origin

By Jessica McDonald

Posted on May 19, 2022

SciCheck Digest

The U.S. indirectly funded some bat coronavirus research at a lab in Wuhan, China. But those experiments could not have led to the coronavirus that causes COVID-19, because the viruses used were very different. Yet former White House trade adviser Peter Navarro repeated a false claim that Dr. Anthony Fauci "killed a lot of people" by funding the lab.

Full Story

It's not known how SARS-CoV-2, the coronavirus that causes COVID-19, originated. But many scientists suspect the virus "spilled over" into humans from an animal. There is no evidence the virus was created in a lab, let alone as part of any U.S.-funded research.

For over a year, politicians and others have misleadingly cited certain grants awarded to a group collaborating with a lab in Wuhan to incorrectly suggest that National Institute of Allergy and Infectious Diseases Director Dr. Anthony Fauci is responsible for the COVID-19 pandemic.

While there is a debate about whether some of the research should have been funded or performed, the experiments did not produce SARS-CoV-2, as the National Institutes of Health and others have explained.

The latest iteration of these claims comes from Peter Navarro, former President Donald Trump's trade adviser, who in a May 16 interview with the conservative outlet Newsmax blamed Fauci for the pandemic and called for his imprisonment.

Navarro began by responding to a clip of Fauci telling CNN on May 15 that he would not serve under Trump if the former president were elected in 2024.

"Tony, you're fired, dude. There's no way you're ever getting back into the Trump White House," Navarro said, adding that as soon as Republicans take back the House, Fauci would sit in Congress and "confess to creating the virus that's killed almost a million Americans now."

"We're going to fit you for an orange jumpsuit, Tony, you can count on that," he continued. "So don't be smug on CNN, dude, okay. You're fired. And if that's the only thing that happens to you, Tony, you'll be lucky because you killed a lot of people by funding this Wuhan lab.

MORENS_SUBPOENA_009528
MORENS_NIH_020033
REL0000478972

You got in bed with the Chinese Communist Party, you lied to the American people."

Fauci, who has been head of NIAID since 1984 and is one of the most distinguished living scientists, has served under seven presidents, including three Democrats and four Republicans. At age 81, Fauci has said he is thinking of retirement, but has no immediate plans to depart and would not do so until the country is firmly out of danger from COVID-19's pandemic phase.

Later, Navarro, who has previously misled the public about hydroxychloroquine as a COVID-19 treatment and shared inaccurate information about COVID-19 vaccines, baselessly stated as fact that the pandemic began at the Wuhan Institute of Virology.

"This is where the virus started," he said, pointing to an image of the facility. "This was funded by Tony Fauci. Gain-of-function research is what he went behind the back of Donald Trump and the White House to get going here in 2017 with the Chinese communists. And now we have a pandemic that's killed almost a million people. I don't know how this guy is still in public office, he really ought to have a jumpsuit."

Newsmax shared its interview with Navarro on Facebook, where it received more than 30,000 views in two days.

Fauci Has No Connection to Pandemic Virus

Navarro's statements are reminiscent of those from other Republicans, including Florida Rep. Matt Gaetz and Sen. Rand Paul of Kentucky, who have at times also falsely insinuated that NIH-funded research at the Wuhan Institute of Virology could have led to the creation of SARS-CoV-2.

As we have explained before, NIAID did fund some experiments at WIV as part of a multiyear $3.7 million grant that began in 2014 to the U.S.-based nonprofit EcoHealth Alliance. The research was aimed at understanding the risk of the future emergence of coronaviruses from bats, and a small portion of the money — $600,000 — went to an EcoHealth collaborator at the Wuhan Institute of Virology.

But those experiments, which mixed and matched certain elements of bat coronaviruses, couldn't have produced SARS-CoV-2 because the viruses used were very different.

"Analysis of published genomic data and other documents from the grantee demonstrate that the naturally occurring bat coronaviruses studied under the NIH grant are genetically far distant from SARS-CoV-2 and could not possibly have caused the COVID-19 pandemic," NIH Director Dr. Francis Collins said in an Oct. 20, 2021, statement, referring to an analysis posted to the NIAID's website. "Any claims to the contrary are demonstrably false."

As we've written, the NIH analysis shows that the WIV viruses share only about 80% of their genomes with SARS-CoV-2, which is a tremendous

MORENS_SUBPOENA_009529
MORENS_NIH_020034
REL0000478972

difference. Even much more similar viruses — those 96% identical — still differ from SARS-CoV-2 by more than 1,000 nucleotides, and could not have plausibly been the ancestral virus, David Robertson, the head of viral genomics and bioinformatics at the University of Glasgow, told us for a previous story.

There is simply no basis to claim that Fauci, via this NIAID grant, has anything to do with the origin of the coronavirus.

Moreover, there is no evidence that SARS-CoV-2 came from WIV or any lab, and many experts say the virus almost certainly was not bioengineered. Indeed, despite continued speculation, largely because of the proximity of certain research institutions to the city of Wuhan, where the first COVID-19 cases were identified, there is no credible evidence of a lab leak.

In contrast, while there is still no proof, multiple lines of evidence, including geolocation and genetic analyses, suggest the pandemic began with a natural spillover at the Huanan market, which sold a variety of live animals for human consumption.

Much of the debate about the WIV experiments has focused on whether they were so-called gain-of-function experiments and whether NIH should have funded them. Paul has an ongoing feud with Fauci over this issue, and each man has accused the other of lying.

Fauci has said the experiments do not count as gain-of-function, which the agency defines in a specific way and refers to research involving "enhanced pathogens of pandemic potential," or ePPPs. Paul has insisted they do.

In February, the NIH said it had ordered a review of its ePPP policies, which have been controversial.

Regardless of whether certain potentially risky research should be funded or not, it's inaccurate for Navarro to claim Fauci had a role in starting the pandemic.

Editor's note: SciCheck's COVID-19/Vaccination Project is made possible by a grant from the Robert Wood Johnson Foundation. The foundation has no control over FactCheck.org's editorial decisions, and the views expressed in our articles do not necessarily reflect the views of the foundation. The goal of the project is to increase exposure to accurate information about COVID-19 and vaccines, while decreasing the impact of misinformation.

Bring on the Witchfinder-General! This shows how little we've improved in the public understanding of science since Medieval times..

It also demonstrates what a disastrous thing it was for David Relman and others to sign that letter to Science. It's fine to claim that as scientists we need to be honest about our doubt, but to give credence to the lab leak theory and place it on equal status to the wildlife farms is a heinous act as a scientist and a citizen.

Cheers,

Peter

POLITICO-Harvard poll: Most Americans believe Covid leaked from lab

Opinion on the lab leak scenario, once seen as a fringe theory, has shifted dramatically.

By ALICE MIRANDA OLLSTEIN
07/09/2021 06:00 AM EDT

Most Americans now believe that the coronavirus leaked from a laboratory in China, according to a new POLITICO-Harvard poll that found a dramatic shift in public perception of Covid-19's origins over the last year.

U.S. adults were almost twice as likely to say the virus was the result of a lab leak in China than human contact with an infected animal, which many scientists believe is the most likely scenario. The poll's findings show what was once a fringe belief held mainly among some on the political right has become accepted by most Republicans, as well as most Democrats, amid heightened scrutiny of the lab leak theory.

In March 2020, a Pew Research Center poll found 29 percent of Americans believed the virus was made in a Chinese lab and released either accidentally or intentionally. The new survey shows 52 percent believe the virus came out of a lab, including 59 percent of Republicans and 52 percent of Democrats, while 28 percent said it was from an infected animal.

The absence of a large partisan gap on the issue is particularly striking, said Bob Blendon, a professor of health

policy and political analysis at the Harvard T.H. Chan School of Public Health who designed the poll.
"Usually, our polls find a big split between Republicans and Democrats, so this is unique," he said. "More conservative media have been carrying the 'lab leak' issue, and it's been a Trump talking point from the beginning, so we expected people who lean Democratic would say either 'It's not true' or 'I don't know.' But the belief is bipartisan."
Blendon said Democrats likely became more receptive to the idea after President Joe Biden's recent order that intelligence agencies investigate the virus' origin and comments from Anthony Fauci, the White House chief medical officer, that it's worth digging into. Fauci and other scientists have cautioned the answer may never be known definitively.
"That the president thought there was enough evidence to ask intelligence agencies to put together a report sends a signal to Democrats that there might be something there," Blendon said.
Democratic lawmakers have also faced pressure to look more closely at the lab leak scenario, though they worry Republicans will stoke uncertainty about the virus origin for political gain. Several congressional committees have launched inquiries, and the House Science Committee plans to hold its first hearing on the issue next week.
The POLITICO-Harvard poll, which will be released next week, also found there's a high level of public interest in investigating Covid-19's origin, with almost two-thirds of Democrats and Republicans calling the issue "extremely" or "very" important. The finding also surprised Blendon, who said the public isn't typically invested in such a scientific inquiry.
The broad attention on the issue underscores the stakes for the Biden administration's upcoming report on the virus origin, due in August. Even if the report concludes the virus came from nature, it could be hard to move public opinion, lawmakers and researchers like Blendon have noted.
The poll surveyed 1,009 adults from June 22-27. The margin of error was plus or minus 3.8 percentage points.

Yes – Eddie and I have had some remembrances of our separate interactions with Hooper. There are a lot of parallels.

The current batch of Lab Leakers are giving Hooper a run for the money in the crazy Department.

I have nothing at all against people writing books [like Hooper or Sir Jeremy for that matter], but it's not a coincidence that several of the most annoying Lab Leakers are attempting to selling books.

mber Nick was fired from the New York Times
and has a history of controversial stuff including truly appalling neo-eugenics crap.
Sadly, he has even influenced Don McNeil, another great journalist also fired from the NYT. I have always admired Don, a protege of sorts of the NyT's Larry Altman, but even he fell under the crazy spell

I greatly admire highly intellectual journalists as a whole, but as a group they seem to have a tenfency to go off the deep end

Is there something about this era? Did aliens put crazy-drugs in our drinking water???

Anyone remember Edward Hooper and The River, a best seller of 20+ years ago in which the author impugned, harassed, and nearly drove to the grave one of virology's heros, the late Hilary Koprowski. All from a cockamamie book length best selling slander that Hilary started the AiDS epidemic with 1950s polio vaccine trials

I knew Hilary well, the tragedy of slander by smart and smarmy journalists is real

You cannot make this shit up!!!!!

Something is very, very wrong about the interface between science and science journalism. Jason, we need folks like you to take note and follow breadcrumbs out of this forest. d

Add to that a preprint we'll be posting next week that suggests 50,000 – 400,000 people are actually infected by bat SARSr-CoVs in SE Asia each year, and a comment from the international members of the WHO team that'll be in Nature this week or next.

As long as these articles keep up their 'drip, drip' with actual new data and analyses, all the lab leak hypothesis has is re-hashing of the same innuendo-filled vitriol.

Cheers,

Peter

Thanks Peter,

Totally agree that It's quite sad to see the attacks on scientists and science from Wade. It's the very basis for the "lab leak" hypothesis, so no surprise.

Wade is old enough to know this, but anyone that thinks that Jeremy Farrar and Tony Fauci are part of the "problem" has literally [in the case of Tony] not been paying attention for 50 years.

Looking forward to Wade and his ilk going ballistic as two new papers favoring natural origin appear shortly in *Cell* and *Science*.

Bob G.

Nicholas Wade's at it again – another miserable innuendo-filled attack on science and the process by which scientists email, talk and come to decisions. Nothing new of course, just trash journalism published in a pseudo-scientific journal. Pretty shameless smear on some of us – no facts of course, no sue-able accusations, just snipey comments and excerpts from Social Media. It's as if we can't now be scientists and actually colleagues who break bread and share a glass any more.

https://thebulletin.org/2021/08/how- covid-19s-origins-were-obscured-by-the-east-and-the-west/

The irony is in the ending – he claims the lab leak is an albatross hanging around China's neck that they won't be able to shake off until they open up the lab videos, books, freezers etc. The truth is his and others continued attacks are what put the albatross there in the first place. Does anyone really believe that if China gave access to all the above and no further evidence was found, that these folks would simply say "OK, it wasn't a lab leak after all"!!!

Cheers,

How COVID-19's origins were obscured, by the East and the West

By Nicholas Wade | August 17, 2021

Error! Filename not specified. A bus carrying a team of experts from the World Health Organization departs an airport in Wuhan on Jan. 14, 2021, after arriving in the Chinese city to investigate the origins of the coronavirus pandemic. That investigation is widely seen as having been obstructed by Chinese authorities. (Photo by Kyodo News via Getty Images)

Some 20 months after the Covid-19 pandemic first broke out, its origins remain obscure. A vigorous campaign of concealment by the Chinese authorities is the principal reason. But China received considerable help, strange to say, from senior medical research officials in the United Kingdom and United States who mishandled and effectively derailed the initial inquiry into the virus's origins.

The mishandling began at a pivotal teleconference held on February 1, 2020. The organizer was Jeremy Farrar, director of the Wellcome Trust, a large medical research charity in London. News of the conference emerged with the release this June of emails from the office of Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases (NIAID). Farrar supplied further information in his book *Spike*, published on July 22.

The conference was held to discuss the unanimous view of a group of virologists that the SARS2 virus had been manipulated in a lab. Yet within a few days of the meeting, the virologists abruptly reversed their conclusion. The meeting's participants were later involved in two letters to scientific journals that stated the virus must have emerged naturally and that condemned any suggestion of manipulation as a conspiracy theory. These two letters, to *The Lancet* and *Nature Medicine*, shaped the views of the mainstream media for more than a year.

Error! Filename not specified. Letters published by *The Lancet* and *Nature Medicine* in early 2020.

Even today, no one can say for sure whether the SARS2 virus emerged naturally or escaped from a lab. Much less could anyone have been sure back then. If the conferees had stuck to known facts, they would have left the question open to the two hypotheses, and the full exploration of the virus's origins might not have been sidetracked for over a year.

More significant, the Chinese government would have found it much harder, if not impossible, to manipulate the World Health Organization (WHO) into setting terms of reference that favored China's obstructive goals and kept WHO inspectors who visited China this February from accessing records vital to understanding the origin of the pandemic. China now insists those terms of reference cannot be changed, blocking further investigation into the origin of the SARS2 virus. "The two groups that produced the infamous letters in *The Lancet* and *Nature Medicine* paved the way for the Chinese government and

MORENS_SUBPOENA_021714
MORENS_NIH_042592
REL0000478981

helped enormously to facilitate all of that," says Milton Leitenberg, an arms control expert at the University of Maryland. The reversal of the virologists' conclusion about SARS2's artificial origin is thus a matter of some significance.

At 10:32 p.m. on the evening before the February 1 conference, Fauci had received an electrifying memo from Kristian G. Andersen, a virologist at the Scripps Research institute in California. Andersen reported that the virus seemed to be man-made. "The unusual features of the virus make up a really small part of the genome," he wrote, referring presumably to a genetic component known as a furin cleavage site, which greatly enhances the virus's infectivity, "so one has to look really closely at all the sequences to see that some of the features (potentially) look engineered."

Error! Filename not specified. A key email from Kristian Andersen to Anthony Fauci.

Andersen went on to note that "after discussions earlier today, Eddie, Bob, Mike and myself all find the genome inconsistent with expectations from evolutionary theory"— meaning that, in their unanimous view, the virus didn't come from nature. "Those opinions could still change," Andersen added. Eddie is Edward C. Holmes of the University of Sydney. Bob is Robert F. Garry of Tulane University. Mike is Michael Farzan at Scripps Research.

The message sent Fauci into a whirlwind of activity. "You will have tasks today that must be done," he emailed his deputy director, Hugh Auchincloss, two hours later at 12:29 am on February 1. One of these urgent tasks evidently concerned NIAID funds that had been passed, via the EcoHealth Alliance of New York, to Zhengli Shi, China's leading bat virus expert, at the Wuhan Institute of Virology. Fauci was doubtless anxious to check whether his agency's funding of Shi's work had complied with US law, which banned funding gain-of-function research from 2014 to 2017 and required it be reported to a government panel thereafter. "Gain of function" refers to research in which a pathogen's ability to cause disease is enhanced. Auchincloss replied a few hours later that efforts were underway to ascertain "if we have any distant ties to this work abroad."

Meanwhile Farrar, who had independently heard of the Andersen team's conclusion from Holmes, says in *Spike* that he arranged a teleconference set for 7 p.m. London time, convenient for both Washington and Australia, where Holmes was based.

The participants included Fauci and possibly his nominal boss, Francis Collins, the director of the National Institutes of Health. (Farrar says in *Spike* that Collins was present, but Collins's name is not on the list of invitees in the Fauci emails.) Officials on the UK side were Farrar and Patrick Vallance, the chief scientific adviser to the UK government. The others were mostly virologists, including Andersen, Holmes, and Andrew Rambaut of the University of Edinburgh.

Far from being selected at random, the conferees were associated through a complicated web of relationships, a sort of virologists' old boy network that included senior medical officials in China. Farrar was well acquainted with George Fu Gao, the head of China's counterpart of the US Centers for Disease Control and Prevention. He has described Gao as an "old friend," who in fact had called a month earlier, on December 31, 2019, to tell Farrar about the initial cases in Wuhan of what turned out to be Covid-19. Farrar says in his book *Spike* that on the weekend of the teleconference, he called another highly placed Chinese official, Chen Zhu, China's minister of health from 2007 to 2013, to tell

him of "rumours that the novel coronavirus could be the result of a lab accident." As for Holmes, he has published many papers both with Farrar and with Gao and has been a guest professor at Gao's CDC from 2014 until 2020.

Because of these varied connections, it seems likely that Chinese authorities knew about the conference almost from the moment it occurred and, if so, would have had the opportunity to influence deliberations that followed it.

At the conference there was a notable imbalance of power between the virologists and the officials. Fauci and Farrar together control a large portion of the funds available for virological research in the Western world. A virologist keen to continue his career would be very attentive to their wishes. Two of the conference participants had multimillion-dollar grant proposals under final review with NIAID at the time of the call.

Almost all references to what was discussed at the teleconference have been redacted from the Fauci emails under exceptions to the Freedom of Information Act. The conference would doubtless have included explanation from Andersen and Holmes as to why they had concluded the previous evening that the virus had been altered through laboratory manipulation. "Kristen and Eddie have shared this and will talk through it on the call," Farrar writes in one of the Fauci emails.

RELATED:

The known knowns, known unknowns, and unknown unknowns of COVID-19

Error! Filename not specified. A Jeremy Farrar email about the teleconference.

Whatever was said at the meeting, it was followed by a remarkable and almost immediate about-face. By at most three days later, Andersen had executed a 180 degree turn in his views about the virus. In an email of February 4, 2020 to Peter Daszak, president of the EcoHealth Alliance, which had directed NIAID funds to Shi, Andersen wrote, "The main crackpot theories going around at the moment relate to this virus being somehow engineered with intent and that is demonstrably not the case." The email was obtained by U.S. Right to Know, an investigatory group.

Participants have not explained what was said at the meeting or found in the days immediately following it to induce the change of mind. Media offices at the Wellcome Trust and NIAID declined to comment on this article. Andersen, Holmes and Rambaut did not reply to emails seeking an account of the reversal.

Farrar, not Fauci, seems to have been the leader in the teleconference's deliberations. "This is not my area of expertise so I have backed off and am leaving it all to Jeremy," Fauci wrote on February 13 to a CDC official. US officials were not to take the lead in this pivotal inquiry.

Error! Filename not specified. Fauci's "leaving it all to Jeremy" email.

Farrar had a direct hand in the two letters that went out to the *Lancet* and *Nature Medicine*. He was a signatory of the *Lancet* letter, a draft of which Daszak, the organizer of the letter, began circulating just five days after the conference. The letter sought to squelch all discussion of the possibility that the virus had escaped from a lab by deriding it as a conspiracy theory. When Daszak wrote an article in the *Guardian* elaborating on the same theme, Farrar promoted it with a tweet, saying "as always worth reading @PeterDaszak."

Farrar also recruited the five authors who drew up the *Nature Medicine* letter, his spokesman told the writer Ian Birrell. (The spokesman referred to the *Lancet*

letter but evidently meant the *Nature Medicine* letter, which has five authors.)
The *Nature Medicine* letter, accepted on March 6 and published on March 17, 2020, presented a detailed and influential case that the virus had emerged naturally from animals. Its authors were Andersen, Rambaut, W. Ian Lipkin, Holmes and Garry.
In his book *Spike*, Farrar portrays the events between the February 1 conference and publication of the two medical journal letters as a judicious process in which he held an agnostic view and played no role other than asking questions. "On a spectrum if 0 is nature and 100 is release—I am honestly at 50!" Farrar says he emailed to Fauci and Collins a day after the conference. But if that were honestly so, he fails to explain his switch from 50 to 0 when signing the *Lancet* letter a few days later.
According to *Spike*, it wasn't until March, "after the addition of important new information, endless analyses, intense discussions and many sleepless nights" that Andersen and his four fellow virologists "were ready to pronounce on the origins of the novel coronavirus." Why then was Andersen, the virologists' leader, ready to pronounce just 3 days after the conference that lab release was a conspiracy theory? Farrar's account does not match with the available facts. Nor does Andersen's. In a June interview with the *New York Times,* he painted a picture that includes a change of mind on the possible engineering of the virus "in a matter of days, while we worked around the clock," and then that quick reversal being buttressed by drawn-out research.
"This is a textbook example of the scientific method, where a preliminary hypothesis is rejected in favor of a competing hypothesis as more data become available and analyses are completed," he said in a statement released by Scripps Research after his Jan 31 email to Fauci had become public. "I cautioned in that same email that we would need to look at the question much more closely and that our opinions could change within a few days based on new data and analyses—which they did," Anderson said in the *New York Times* interview. In that same interview, he also said that "more extensive analyses, significant additional data and thorough investigations to compare genomic diversity more broadly across coronaviruses led to the peer-reviewed study published in *Nature Medicine*."
These later data and analyses would not have been available three days after the conference, the date of Andersen's volte-face email to Daszak. And they would not have been available to Farrar as he signed the *Lancet* letter, which was published just 17 days after the teleconference.
More puzzling is Andersen's statement that in his preliminary studies "the genome of RaTG13, a SARS-related coronavirus found in bats, wasn't yet available." In fact its full sequence had been deposited by Shi in a data bank on January 24, 2020, a week before Andersen's report to Fauci, and Farrar says in *Spike* that he had seen the sequence by the time of the conference. RaTG13 is the closest known relative of SARS2, and the fact that it lacks the furin cleavage site found in SARS2 would have been a major reason for the Andersen group to suppose that this genetic element had been inserted into SARS2 in a lab.
Given his role in leading the February 1 teleconference, in presiding over the virologists' 180 degree change of views, and in arranging or influencing the *Lancet* and *Nature Medicine* letters, Farrar was evidently the driving force of the campaign to persuade the public that the SARS2 virus could not possibly have leaked from a lab. This was an unfortunate position for any scientist to take,

given that he was assuring the public of something he could not be sure was true.

Farrar now says in *Spike* that, although natural emergence is more likely, "nobody is yet in a position to rule out an alternative." But his campaign sought very vigorously to do exactly that. "We stand together to strongly condemn conspiracy theories suggesting that COVID-19 does not have a natural origin," Farrar and his cosignatories wrote in the *Lancet* on February 18, 2020. This lapse in scientific judgment reflects also on the other senior participants in the conference who saw what was happening but apparently took no steps to insist that scientific truth should take precedence over unjustifiable professions of certainty.

Caltech's David Baltimore discusses the debate over origins of SARS-CoV-2

The decision to quash any notion of lab escape seems to have brought relief all round. At least until the tide of opinion began to change a year later, Fauci and Collins didn't have to endure unpleasant questions about why they had been funding hazardous research in minimally safe conditions at the Wuhan Institute of Virology.

"I just wanted to say a personal thank you on behalf of our staff and collaborators, for publicly standing up and stating that the scientific evidence supports a natural origin for COVID-19 from a bat-to-human spillover, not a lab release from the Wuhan Institute of Virology," Daszak emailed Fauci after a White House press briefing on April 17.

In August 2020 the NIAID announced it would award $82 million over five years to 10 participants in its new network for detecting infectious diseases. Among the lucky winners: Daszak, Andersen, and his associate Robert Garry.

The perturbing lab leak theory raised by Andersen and his colleagues on January 31, 2020 had been safely laid to rest. Farrar and his colleagues had succeeded in the one goal also pursued by the autocrats in Beijing, that of suppressing discussion of whether the SARS2 virus might have escaped from the Wuhan lab.

Beijing's way of squelching inquiry about the virus was, unintentionally, somewhat more obvious than the methods used in London. Chinese authorities tried so hard to stamp out information about the virus's origin that they left a rather clumsy trail of footprints pointing to where they didn't want people to go. One of the more informative suppressions of data was the closure of China's main database on bat and other viruses. Zhengli Shi, China's leading expert on bat coronaviruses, told the BBC that it was taken off line because of numerous hacking attempts. It's conceivable that in January 2020, after the pandemic broke out, people without authorized access might have tried to hack into the database. But in fact the database went off line on September 12, 2019. Who would have wanted to hack into a bat virus database back then? More likely, that is the date at which Chinese authorities realized they had a virus escape problem.

In February of last year, President Xi referred to the need to ensure biosafety and biosecurity, and the Chinese Communist Party followed by tightening up their biosafety rules in October 2020, accelerating a long planned revision. "To me, the fact that the CCP enacted a major series of laboratory biosafety regulations this past year is an indication that China's political leadership

believes that a lab accident is likely to have caused the pandemic," says a biosurveillance expert who has monitored China's disease outbreak reporting for the past two decades.

Major clues as to what happened are evident in Shi's various pronouncements about the virus. The omissions and untruths in these statements are specific enough to outline the very body of facts the censors have sought to conceal.

Error! Filename not specified. Wuhan Institute of Virology researcher Shi Zhengli spoke about SARS during a Yixi event (comparable to a TED talk) on June 23, 2018. (Yixi video)

In looking at Shi's questionable statements, it's only fair to keep in mind that they may have been compelled. Her train of deceptions began immediately after the genetic sequence of the SARS2 virus was published on January 10, 2020, by Yong-zhen Zhang of Fudan University, against the wishes of Chinese authorities who subsequently closed his lab for a time. Where did this strange new virus come from? Shi wanted or was told to establish SARS2's pedigree as a bat virus, with an ancestry analogous to that of SARS1, the bat virus that caused an epidemic in 2002. In an important paper published on February 3, 2020, Shi reported that the genome of SARS2 is 96 percent similar to that of a bat virus, RaTG13, "which was previously detected in [the bat species] *Rhinolophus affinis* from Yunnan province."

Shi neglected to mention a salient difference between the two viruses, namely that SARS2 possessed a furin cleavage site and RaTG13 did not. Alina Chan, of the Broad Institute in Cambridge, has likened the omission to describing a unicorn by reporting all its horse-like features, but neglecting to mention the horn. Evidently the Chinese authorities were highly sensitive to the furin cleavage site's presence.

Shi also failed to say when and where she had discovered the RaTG13 virus, surely important data for the closest known relative of SARS2. In fact, she had found RaTG13 in 2013, in an abandoned mine in Tongguan—the same place where six miners had fallen sick the year before. At that time, she analyzed just one of its genes and reported the virus under another name, BtCoV/4991. Daszak, the holder of her NIAID grant, told the London Times, perhaps on misinformation from Shi, that the virus was then thrown in a freezer and forgotten about until 2020. This was untrue—the virus was of much greater interest. Shi had analyzed its full genome, probably by 2018, but did not publish it. It was only when she needed a bat virus pedigree for SARS2 that Shi released information about the virus, which she now renamed RaTG13. The fact that BtCoV/4991 and RaTG13 were one and the same was discovered by Monali Rahalkar and Rahul Bahulikar, two internet-sleuthing researchers in Pune, India.

It's not acceptable practice among scientists to report something already published under a different name as if were new. Shi's February paper had the goal of portraying SARS2 as just another bat virus while concealing the true provenance of its closest known relative—a cave known to harbor lethal viruses. When RaTG13's connection to the Tongguan mine was pointed out, Shi still tried to conceal the lethality of the mine's bat viruses, saying the miners had died of a fungus infection. This untruth was corrected when a master's thesis by a Chinese doctor, Li Xu, was unearthed by the internet sleuth who calls himself TheSeeker268. The thesis reported that the miners had died of a SARS-related virus with symptoms identical to those of Covid-19 and with CT scans similar to

those of Covid patients. The only evident difference between that virus's effects and those of SARS2 is that the miners' virus was not readily transmissible from one person to another.

The specificity of what Shi's statements concealed—the furin cleavage site, RaTG13's identity with BatCoV/4991, the latter's origin in the mine where six miners were infected, the death of the three miners from infection by a virus with symptoms very similar to those of SARS2—all point to the involvement of these elements in a scenario the Chinese authorities are determined to cloak. That scenario may have been the storage or generation of the SARS2 virus in Shi's lab from one of the many viruses recovered from the Tongguan cave.

The Chinese government's persistent stonewalling and Shi's pattern of evasions do not amount to proof that the SARS2 virus escaped from her lab. But they seem less like the actions of innocent people and more like attempts to cover up a fatal accident, one that has caused the deaths of maybe 10 million people and counting.

Perhaps proof will one day emerge that the virus emerged naturally. If not, the likelihood that SARS2 escaped from a researcher's laboratory is an albatross that will hang round China's neck in perpetuity. China's only hope of release from this terrible encumbrance lies in opening its laboratory doors and either establishing its innocence or admitting its fateful error.

Cheers,

Peter

Jason, not sure whose office politics is worse, but there is many a day I'd rather be in Australia, even if I had to drink that awful beer Fosters. (To quote Grouco Marx as he help up a glass of questionable beer: "last time I saw something like this, they had to shoot the horse")…. But I do have fond memories of Australia, and two of my closest freiends, both ex-students of mine, are out in Perth, the only large city there (if oy can call it that) I have never been, although it's high on my bucket list if this damn pandemic ever ends. He's an American public health physician and she's an Australian-Tongan PhD virologist, both wondeful smart people.

Thanks, David.
I just got off a video conf call with the current editor in NY (the one asking all the latest questions). He's very nice and

I feel like he gets its. He thinks it's a fascinating story. Problem we have in journalism is that there are some people who aren't interested in actual journalism and telling stories; they want to climb to the top and manage people. I rejected the latter route 10 years ago, but am so grateful that I still get to meet so many remarkable people, visit cool places and see all aspects of humanity.
A difficulty working for a NY-based organization is that it's assumed that all the best people are in NYC, so being in Melbourne (where I need to be to be close to my kids in Adelaide), is that folks consider Australia a backwater and, by association, I mustn't be all that important/valuable. But my new role as "global biosecurity czar" is helping somewhat. Ahhhhh... Office politics!

Jason, all I can say is that it must be harder to be a journalist than a scientist.... I had no idea someone at your level would get pushed back.

Usually i get from one to 4 reviewer responses to a ms. and three of those are out to lunch. Occasionally i get a reviewer who really understands the work: half of those are helpful, the other half are trashers.

Maybe it's like being in the government where i am: there is endless push back, but the push-backers are brainless idiots who don't know what they are talking about.

Do you ever get to a point where the editors leave you alone on the science? Or do they all think they are science geniuses? d

External Sender. Be aware of links, attachments and requests.

Hi guys, in case you have nothing better to read over the weekend, this is some of the dialog I am having with editors in the U.S. Essentially, my response to questions from editor #6.
I thought I could claim victory when it looked like the story could be published this morning, but the editor of Businessweek objected and thinks he can make it better with another revision and an ETA of Tuesday. Sigh.

> When you look back at what's happened here, it seems that in trying to deflect blame for the pandemic, which became increasingly vicious as the cataclysmic nature of the Covid-19 pandemic unfolded around March-April 2020, China tried to conceal a very obvious, very plausible source of the pandemic: it's flourishing wildlife trade (worth about $90 billion in 2016).
> It was an obvious cause of the pandemic

MORENS_SUBPOENA_021723
MORENS_NIH_042601
REL0000478981

because an almost identical scenario triggered an international outbreak caused by a very similar coronavirus (SARS) in 2003-04. But in attempting to cover up the wildlife trade, and making like there were never any wild animals being sold in Wuhan's wet markets, things began to backfire on China; questions were raised about the nearby lab studying these coronaviruses. The more geopolitical, heated and vicious the arguments and accusations became, the less cooperative China became. In response, the more intent/adamant some groups have become in their belief that China is covering up a lab-leak. It's become a vicious circle. If China isn't coming clean on the wild animals, what else is it trying to hide?? China's defensiveness means we may never get the cooperation needed to find the answers. If China had been honest and transparent about the wild animals in the wet markets, it might not be in this mess now.

Anyway, here are my response to your queries in green.

By the way, I wonder if the current headline:
Delayed Paper Gives Credence to Wuhan Market Covid Origin Story
doesn't convey much more than what we had 2 months earlier when we reported Xiao's findings: China Markets Sold Mink, Civets, Stoking Natural Origins Theory
Perhaps Obscured China Paper Scuppered Chance to Trace Covid Origins
would hits "China", "Covid" and "Origins" in a way that won't alienate people who already believe it was a lab-leak

<><><><>

According to the report, minks, civets, raccoon dogs and other mammals known to harbor coronaviruses were sold in plain sight for years in shops across the city, including the now infamous Huanan wet market, to which many of the earliest Covid cases were traced. The evidence collected over 30 months by **Xiao Xiao** a I'D NAME HIM HERE [[i don't know that naming a researcher no one has ever heard of adds much]]researcher working at a lab affiliated with China's Ministry of Education was hastily drafted into a manuscript and

submitted to a scientific journal [Joel, we cannot name the first journal they delivered it to because the authors decline to give us the name, saying it may affect their future chances of being published] in February 2020, just weeks before the outbreak was declared a pandemic.

<><><><>

While the study received wide attention when it was eventually released by a different publisher [Publisher (Springer Nature) and publication (Scientific Reports) are different. Might add confusion DO YOU WANT TO ADD NAME HERE?], its long and torturous journey to publication gave **Chinese officials an opportunity to weave alternative narratives in which the virus may have come from abroad, even from a U.S. Army biological research facility**. [the stuff in bold is not contested and we go on to show how that happened, documenting with links when available]I TWEAKED WORDING HERE BUT THIS STILL ISN'T QUITE RIGHT. IF THE REPORT HAD BEEN PUBLISHED EARLIER CHINESE OFFICIALS COULD STILL HAVE DONE WHAT THEY DID—THEY COULD HAVE JUST SAID THE REPORT WAS SHODDY, OR WHATEVER, AND THEY ALSO COULD HAVE JUST IGNORED IT. I disagree. The evidence that Xiao et al provide was meticulously documented and supported by photographs that would have been difficult/impossible for China to dismiss (as older published photos and media reports had been). What's more, Newman understands that Xiao collected blood-sucking ticks from the wild animals he studiously cataloged. His frozen tick samples could be tested for blood/antibodies/virus, which could be extremely helpful in identifying infected species PRIOR to December 2019. The WHO team knew nothing of this, so couldn't have asked China for this research or any results, had they actually done the research. The delay in the publication of Xiao's paper delayed the evidence that there were live animals sold in the Huanan market. The WHO researchers couldn't have asked about tests on wildlife that ostensibly were never there. Likewise, Chinese authorities couldn't have done the tests on animals that didn't exist. The problem is that in January and February 2020,

it was widely assumed the animals HAD been there and that the necessary tests and tracing of animals (the sampling of animals on farms they were raised on, testing of farm workers, animal hunters, transporters and traders **had all been done** by researchers in China -- the very things that ultimately led to the discovery of the origins of SARS and of MERS viruses. **None of these things were done** (or at least, there is nothing publicly available to show that they were done) **because the animals "weren't there"**. Now that we all know they were there, China as lost considerable face. The issue has become so political than there is much less/?no willingness to cooperate and conduct the additional research that the WHO-led team recommended. Ideally, Xiao's ticks should be studied, but it's doubtful that will now happen (I wouldn't be surprised if he's been ordered to incinerate them!) Hope this is clear.

<><><><><>

An international team of experts convened by the WHO traveled to Wuhan earlier this year to seek answers—a trip that might have yielded different results if the scientists had known about the work of Xiao Xiao, a virologist whose roles straddled epidemiology and animal research at the government-funded Key Laboratory of Southwest China Wildlife Resources Conservation and at Hubei University of Traditional Chinese Medicine.‘MIGHT HAVE YIELDED DIFFERENT RESULTS’ SEEMS HIGHLY SPECULATIVE. WHAT RESULTS DID IT YIELD? I’D CUT THIS GRAF
As mentioned above, the WHO-convened team of researchers was told by market authorities, vendors and regular market visitors that there were no live animals sold in the Huanan market. That undermined completely the premise that the Huanan market was the kind of place where live animals from different species are stacked in cages, with urine and fecal material drips from one cage to the one below it, where there are splatters of blood and guts from animals, and lots of potential for the spread of diseases from one species to another (including Homo sapiens). Instead, the market (and one other one known to have been selling live wild animals in 2019) was

presented as selling only frozen wild animals and aquatic species and things unlikely to be the source of SARS-CoV-2. The WHO researchers were told there were frozen ferret badgers and other wildlife found in freezers. Some of the carcasses actually came from Yunnan, the province where the closest coronavirus related to SARS-CoV-2 was found in bats -- thus establishing a potential route from Yunnan to Wuhan in wildlife. That was actually important. When the researchers showed their Chinese counterparts photos of caged raccoon dogs taken in the Huanan market by Prof. Edward Holmes five or six years earlier, they were told by Chinese scientists that the photos may have been faked, and that the market had ceased selling such live animals anyway. The WHO researchers saw no evidence (empty cages, animal pelts, etc) to dispute what the Chinese scientists told them, although they did smell "animals" -- but were told they were smelling rotten meat, sewage etc. Three people associated with the WHO-led mission told me that they didn't believe the information they were given by anyone associated with the market. But since there was no evidence to the contrary, they were unable to push the Chinese scientists further on this. T**he fact that the mission concluded that frozen, not live wild animals were sold in the market undermined the thesis that Covid resulted from an animal spillover**. And the absence of strong evidence pointing to a spill over from wild animals to humans made the lab-leak theory look, in relative terms, more plausible.

<><><><><><>

Six months and two revisions later, the journal's publishers rejected the paper. "They did not think it would have widespread appeal," says Newman, who declined to name the publication [do you want us to say why he won't name it? I don't think it's necessary. There's no upside for scientists to make a publisher look bad (most journals are published by a handful of publishers)] "It caused us, especially our Chinese co-authors, concern that these data would not be taken seriously."

<><><><><><>

The manuscript underwent a third revision to include data on China's pangolin trade networks (an earlier study, later contested, had implicated pangolins in the virus's spread to humans)WHO ASKED THAT THIS INFO BE INCLUDED? (I did, because we're trying to explain here why WHO missed the significance of Xiao's evidence. The WHO was slammed by other papers being submitted PLUS Xiao's paper had a weird title. That title seemed relevant to the authors back in January-February 2020, when pangolins were considered a possible SARS-CoV-2-spreading culprit. But in October 2020, pangolins were off the hook, so the title would have seem irrelevant/unimportant at first glance at WHO). It was then sent to the online journal *Scientific Reports*.

<><><><><><>

The China-based researchers had reason to be cautious. In February 2020, the China Center for Disease Control (CCDC lets not use "CCDC". It's not commonly used like the U.S. "CDC" is, and it's going to force readers to go back and figure out what the "CCDC" is) prohibited scientists working on Covid-relate

<><><><><><><>

~~CCDC~~ Disease detectives arriving from Beijing (think this makes it clear that these are China's disease "feds" arriving) on the first day of 2020 ordered environmental samples to be collected from drains and other surfaces at the market. Some 585 specimens were tested, of which 33 turned out to be positive for SARS-CoV-2. "All current evidence points to wild animals sold illegally," China CDC Director George Gao and colleagues wrote in the agency's weekly bulletin in late January. All but two of the positive specimens came from a cavernous and poorly-ventilated section of the market's western wing, where many shops sold animals.

<><><><><><><><>

~~The information void kindled a raging political debate that's already caused a trade war between China and Australia, as nations~~ demand to know ~~how Covid emerged.~~

Australia in April 2020 called for a global inquiryinto the origins of the pandemic, including China's handling of the initial outbreak. Days later, then-U.S. Secretary of State Mike Pompeo used part of his Earth Day message to call on China to close its wet markets to "reduce risks to human health inside and outside of China."

Based on a discussion today with someone with knowledge of the WHO-led mission to Wuhan in Jan-Feb 2021, a significant catalyst for China's defensiveness is the emergence of **claims for reparations** that extended from the finger-pointing at China's wet markets. These surfaced in April 2020, and have continued as recently as June 2021 (when Trump pushed for it again at a rally in the Midwest)

SO IS THIS THE POINT AT WHICH CHINA, WHICH SEEMINGLY ACCEPTED THE WET MARKET HYPOTHESIS, BEGAN TRYING TO CREATE A DIFFERENT NARRATIVE? (I think it was incremental. I believe China was embarrassed that its citizens were still buying wild animals in wet markets to eat -- a well-known hazard for zoonotic disease transmission that China tried unsuccessfully to outlaw almost 20 years ago. But that embarrassment/humiliation morphed into rigid denial and obfuscation when governments began openly blaming the Chinese Communist Party and agitating for China to pay reparations for the pandemic. See these clips:

In response, Geng Shuang, a spokesman for China's Foreign Ministry, denied "wildlife wet markets" existed in the country. Government researchersCAN WE BE MORE SPECIFIC? Twenty-two researchers from mostly nationally-funded laboratories (I think it's the Chinese equivalent of the NIH in the U.S.) and institutes attached to the Chinese Academy of Sciences) now dismiss the market hypothesis completely. "SARS-CoV-2 could not

have possibly evolved in an animal market in a big city and even less likely in a laboratory," they wrote in a paper released last month ahead of publicationWHERE/WHENWILL IT BE PUBLISHED? It was released as a "pre-print" on a Chinese academic repository ahead of publication that appears to be managed/owned by the Chinese Academy of Sciences. Papers are usually released in pre-print form before they have been accepted for publication or peer-reviewed as a way of expediting public access to the information. In this case, there is no information to suggest if, where or when the paper will be published.

<><><><><><><><><>

A more recent paperBY WHOM? (China CDC's Gao and eight other scientists mostly from the Chinese of Academy of Sciences' institutes) contends that the virus may have been imported from multiple locations worldwide, including parts of Europe where mink are raised in areas inhabited also by horseshoe bats known to harbor coronaviruses. "The official narrative changed not because the evidence changed," says Robert Garry, a professor of microbiology and immunology at Tulane University's School of Medicine in New Orleans "A spillover from a wet market was what caused SARS, and, embarrassingly for China, those wet markets were never shut down." Garry is the co-author of one of the earliest papers on the origins of Covid but wasn't involved in the research on Wuhan's markets.

<><><><><><><><><>

I DON'T REALLY UNDERSTAND WHAT POINT THIS GRAF IS TRYING TO MAKE. This is intended to demonstrate the kind of gaslighting that has occurred. Some of the WHO-led researchers are veterinarians and zoologists -- they know what animals smell like, and could smell their lingering presence a year later, but were told essentially that it was impossible that they were smelling animals because **there "were no live animals there"**.) The researchers noted a mixed smell of animals and disinfectant in some areas of the market, but they were told by the market's manager that

they were probably smelling the lingering stench of rotten meat and sewage, according to a joint WHO-China report. [should we add “according to Laing Wannian etc here? Liang Wannian was the leader of the Chinese research team collaborating jointly with the WHO-led research team. The source for the above description are in the annexes to the official joint WHO-China report released at the end of March 2021.]

<><><><><><><>

Earlier the same day, the international research team visited Wuhan’s larger Baishazhou market, where Xiao had regularly surveyed two sellers of live wild animals. Yet the group was told only frozen food, ingredients, and kitchenware were on offer there. Liang Wannian, an epidemiologist who led the Chinese experts collaborating with the WHO-convened team, says his group had no knowledge of Xiao’s data either. [if the above information on what the delegation saw all comes from this same source, maybe we should include his name higher up (The source for the description of what the origins researchers saw on Jan. 31, 2021, comes from the official 120-page joint WHO-China report and its 193-page annexes, not from Liang. Since we are essentially accusing China of concealing the information that Xiao documented, we asked Liang at a press conference in late July 2021 when the Chinese team first knew about Xiao's findings -- that the Huanan market and three others in Wuhan were selling live animals permissive to SARS-CoV-2 infection -- and what research China has done subsequently as a follow-up on this information? Liang gave a very long-winded response in Chinese in which he said essentially "we didn't have that information in January-February 2021 when the research team was in Wuhan". I think it's important we keep this to demonstrate that we have tried to ascertain what China knew/has done and have given the Chinese researchers the opportunity to respond. In addition, I have emailed China CDC Director George Gao at least twice and not received any response.]

<><><><><><><><>

Among the earliest clusters of infections recorded in Wuhan, one involved three Covid cases among staff working at a stall in Huanan. One of the employees, a 32-year-old who fell ill on Dec. 19, traded goods back and forth between the Huanan and Baishazhou markets.
WHERE DOES THIS FACT COME FROM? NOT THE REPORT, RIGHT? WHEN DID IT FIRST BECOME KNOWN?
This information was from the joint WHO-China report released in March 2021, however, the WHO-led researchers went to the Baishazhou market more as a demonstration by the China team of what a perfectly functioning large food market looks like. The WHO-led team was oblivious to Xiao's research that showed there were at least two stalls in Baishazhou that had been selling live wild animals for human consuption. So this detail and its significance was lost on the WHO researchers at the time.)

<><><><><><>

A confirmed case linking two markets that sold wild animals is “very intriguing,”says Stephen Goldstein, a research associate in evolutionary virology at the University of Utah in Salt Lake City. But tracing any contact the employee might have had with infected wildlife is impossible now that the animals are long gone.WOULD TIMELY PUBLICATION OF THE REPORT HAVE CHANGED THIS?
It's unlikely that Xiao et al's paper would have been *published* soon after It was drafted in February 2020, but it could have been *released* as a pre-print ahead of publication and peer-review that same month. That would have **confirmed** what almost everyone had suspected: that there **was** a flourishing wildlife trade in Wuhan that provides a plausible pathway by which coronavirus-infected wildlife from Yunnan and beyond could have introduced the virus to the city, sparking the Covid outbreak. It's also possible that swift recognition of these potential wild-animal vectors could have allowed scientists to test them for the virus and for antibodies against the virus while they were still alive (perhaps not the ones from Huanan, but wildlife in the three other Wuhan markets). Because of the statements the Chinese authorities had been making in

January and February that strongly supported the animal spill over theory, it was assumed that this research was being done. Of course, the pandemic was raging then, so it would have been challenging. But, because of the denial by Chinese researchers that wild animals were being sold in Wuhan wet markets before the pandemic, there was never that level of follow up. At least, if there was, it was never made public.)

<><><><><><><>

"It seems to me, at a minimum, that local or regional authorities kept that informationWHAT INFORMATION? (that Wuhan had a flourishing live wild animal business going on in its wet markets before the pandemic) quiet deliberately," Goldstein says. "It's incredible to me that people theorize about one type of cover-up, but an obvious cover-up is staring them right in the face."

This is from NIH - Francis Collins - a statement now on the website explaining that EcoHealth didn't cause the COVID pandemic.

Little bit late, but I'll take any positive support from anywhere at this point...

https://www.nih.gov/about- nih/who-we-are/nih-director/statements/statement- misinformation-about-sars-cov-2-origins

Of course, that now means reporters are asking us questions to see if there's any secret information as to why this is suddenly going up online – you just can't make this stuff up. See emails below…

Cheers,

Peter

Subject: STATEMENT ON MISINFORMATION ABOUT SARS-COV-2 ORIGINS

EXTERNAL SENDER: Use caution with links and attachments.

U.S. Department of Health and Human Services NATIONAL INSTITUTES OF HEALTH NIH News NIH Office of the Director (OD) <https://www.nih.gov/institutes- nih/nih-office-director>
For Immediate Release: October 20, 2021

CONTACT: NIH Office of Communications, 301-496-5787, <e-mail:nmb@od.nih.gov>

STATEMENT ON MISINFORMATION ABOUT SARS-COV-2 ORIGINS

To date, the origin of the SARS-CoV-2 virus that caused the COVID-19 pandemic has not been identified, despite intensive efforts to do so. This is not unusual -- confirming with 100% certainty the origin of a virus is a long and complicated process. It took 14 years for scientists to find a single bat population that contained all the necessary genetic components of SARS-CoV, the virus that caused the 2003 SARS epidemic. We still do not know the origins of the 2014 Ebola outbreak.

Unfortunately, in the absence of a definitive answer, misinformation and disinformation are filling the void, which does more harm than good. NIH wants to set the record straight on NIH-supported research to understand naturally occurring bat coronaviruses at the Wuhan Institute of Virology, funded through a subaward from NIH grantee EcoHealth Alliance. Analysis < https://www.niaid.nih.gov/diseases- conditions/coronavirus-bat-research> of published genomic data and other documents from the grantee demonstrate that the naturally occurring bat coronaviruses studied under the NIH grant are genetically far distant from SARS-CoV-2 and could not possibly have caused the COVID-19 pandemic. Any claims to the contrary are demonstrably false.

The scientific evidence to date indicates that the virus is likely the result of viral evolution in nature, potentially jumping directly to humans or through an unidentified intermediary animal host. Historically, many viruses have emerged from animals to cause epidemics and pandemics, including influenza, Ebola, Zika, West Nile fever, SARS, and more. Importantly, after an intensive

MORENS_SUBPOENA_013976
MORENS_NIH_026510
REL0000478989

investigation, agencies in the U.S Intelligence Community agreed that the virus was not developed as a biological weapon and most agencies assessed that SARS-CoV-2 most likely was not genetically engineered.

Public health and scientific organizations, including NIH, are intensely interested in getting a definitive answer to inform efforts to prevent future events. This effort would benefit from less speculation and more scientific cooperation, especially from China, without which the SARS-CoV-2 origins will be impossible to identify.

Francis S. Collins, M.D., Ph.D.
Director, National Institutes of Health

About the National Institutes of Health (NIH): NIH, the nation's medical research agency, includes 27 Institutes and Centers and is a component of the U.S. Department of Health and Human Services. NIH is the primary federal agency conducting and supporting basic, clinical, and translational medical research, and is investigating the causes, treatments, and cures for both common and rare diseases. Appreciate you doing this Jerry. I hope NAM members will be able to distinguish between a genuine case of malfeasance that rises to the level that the US Congress should become involved, and a manufactured piece of disingenuous pseudo-legal BS designed to create a Stalinesque show trial out of scientists who were working to prevent the exact same pandemic that we're all suffering now.

OK, after that 70 word sentence, I'm definitely off for a beer.

See you on our 8am "Former Lancet" Task Force call tomorrow Jerry!

BTW – as if adding insult to inury, on page 3 of the letter from the Republican Ne'er-do-wells, they cite Jeff Sachs' annoyance at my behavior as part of their rationale for the NAM to flush me down the plughole – great!

Cheers,

Peter

I am going to use the list serve I created in 2020 when 140 or so NAM members signed an appeal from Rick Klausner, Ken Olden and myself for the Academies to support the call for a transparent evaluation of the action taken to defund EHA and reverse the decision if there was no justification. It fell on mostly deaf ears.

But the more members who do speak up directly to Victor the more he will understand that what I said in my email to him today, that most members are pissed off about these attacks, is true and maybe will embolden him.

MORENS_SUBPOENA_015043

I think you HAVE TO push back against the NAM. If you don't fight an injustice, you enable it.

Are there not internal NAM mechanisms to prevent leadership from throwing you under the bus without due process? Surely members can prevent Victor from doing this, or has NAM become so politicized that it will knuckle under to a bunch of Congressional demagogues with no major backing?

These several Congress folks are not the Congress, just a small hit team not supported by by the majority, even within the Republican party. d

I smelled a rat when the NAM secretary asked me today to 'volunteer' to recuse myself, having told me it was a policy.

Below is the email I got from her and my responses to it. I spent a long time on the web trying to find a specific NAM policy or bylaw that prevents a member taking part in a NAM activity while accused of inappropriate behavior. I found none. Here are the only rules on conduct, which we all voted on 3 years ago:

https://nam.edu/national- academy-of-medicine-code-of-conduct/

Nothing about the process, or not being allowed to take part in NAM activities while disingenuous accusations are being 'investigated' or 'reviewed'.

Next week I'm supposed to take part in a small meeting with Eric Lander (OSTP Director), Victor Dzau, and other leaders to discuss the American Pandemic Preparedness Plan. If this isn't cleared up by then (which I doubt it will be), either I don't show and Victor will have to let everyone know I've been 'suspended' (a public humiliation), or I show up and get accused of not adhering to these rules that aren't visible.

I can't believe that this lab leak origins crap has led me to have private arguments and public fights with the DG of WHO; public spats with Jeff Sachs; legal arguments with NIH; public harassment from Congress; and now what looks like a protracted battle with the National Academy of Medicine. What a life!

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

Dear Elena,

So I don't make any infractions of the rules, please could you point me to the section of the NAM Bylaws, or Policies and Procedures that govern the process being undertaken now in response to these allegations, including on what I can and cannot do while the review is being undertaken. I looked long and hard on the website and can't find the specifics.

This is particularly important because I'm scheduled to take part in meetings very soon as part of my NAM commitments.

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

Thank you for the call today Elena. I've cc'd our Chief-of-Staff, Dr. Aleksei Chmura, who also joined us. I appreciate your explanation and will do my best to adhere to the policies of the NAM as we go through this process.

My only hope is that the review can be as rapid as possible. Our organization has been the focus of a horrific series of political attacks from the hard right wing as part of their political goals regarding Dr. Fauci, NIH and ultimately the Biden administration. These tie up resources and staff answering pages upon pages of false accusations, all carefully worded to give the impression of a thoughtful and sincere inquiry.

Again, I want to reassure you that none of the accusations from Republicans on the House E&C Committee have the slightest bearing in fact. We have acted honorably and with the highest scientific integrity throughout the pandemic, and simply want to be allowed to continue our work without constant, politically-motivated harassment.

I'm not sure it's a wise thing to independently contact two journalists at the same publication about a scientific issue of importance that needs coverage for the general public. What is both start to put something together without knowing what the other is doing? If I were them I might be a bit upset by it.

I'm willing to contact Specter. I first go to know him just after I left NIH when he was doing a piece on the interference in NIH autonomy over its science, grants, and administrative independence by the George W Bush administration. As I recall he produced a very good investigative article about it.

Maybe we should pick one and provide the background information Peter is putting together. The trouble with The New Yorker or the Atlantic is that it will take weeks for them to get something published and what is necessary now is to have the news journalists point out the written record to the contrary for claims like those the committee is making. Hiltzik is good at that. He has the attention of Ruiz's PR guy who is distressed Michael did not soften the criticism in his piece today. I think that has just made Michael more determined to tell it like it is and reveal the perfidy of Ruiz, his colleagues, HHS, and ultimately up to the White House.

By the way, I have found Michael Specter at The New Yorker to be a direct, scientifically driven, hard driving writer. I have dealt with him in the past and could try to interest him in following up. What say?

On May 17, 2024, at 5:13 PM, Keusch, Gerald (b) (6) rote:

That just builds on the dystopic presentation of what Tabak said, referring to the definition with or without "of concern." He was careful to give them what they needed to distort the truth while not exactly lying.

On the other hand his testimony about the requirement for EHA to produce WIV lab notebooks is an outright lie. I have pointed this out to Jocelyn Kaiser and to Michael Hiltzig. Maybe one of them will write about it.

Jerry

On May 17, 2024, at 3:19 PM, Keusch, Gerald (b) (6) wrote:

Regarding Tabak's comments on GoF, this is what the text below shows.

Rep. Lesko: "Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?"

Dr. Tabak: "It depends on your definition of gain-of-function research. If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

So it is not what he said but how the SSCP spun it. That's a weakness that should be exploited in the press. It is deliberately spinning information into disinformation and that is both lying and dangerous. We need to point it out, find other examples where it is easy to refute what they are saying about Peter, EHA, and David, and make sure others will amplify that and delegitimize the committee. I'm going to point out that one to Hiltzik and Kaiser.

Jerry

Press Release Published: May 17, 2024

Hearing Wrap Up: NIH Refutes EcoHealth's Testimony, Tabak Reveals Federal Grant Procedures in Need of Serious Reform

WASHINGTON — The Select Subcommittee on the Coronavirus Pandemic held a hearing titled "Overseeing the Overseers: A Hearing with NIH Deputy Director Lawrence Tabak" to examine the National Institutes of Health's (NIH) process for funding and overseeing

MORENS_NIH_045234
REL0000478998

scientific research as well as investigate NIH's relationship with EcoHealth Alliance, Inc. (EcoHealth). Members pressed former Acting NIH Director and current Principal Deputy Director, Dr. Lawrence Tabak, to explain numerous inconsistencies between the public and private testimonies of NIH employees and EcoHealth President, Dr. Peter Daszak. Dr. Tabak offered substantial evidence that Dr. Daszak purposefully misled both the NIH and the Select Subcommittee about EcoHealth's efforts to

MORENS_NIH_045235
REL0000478998

comply with grant procedures. In a shocking admission that directly contradicts Dr. Fauci's previous statements, Dr. Tabak testified that the NIH was funding gain-of-function research in Wuhan, China through a grant to EcoHealth. Members highlighted the dangers of continuing to fund gain-of-function research in foreign laboratories where NIH cannot ensure proper biosafety measures are implemented. Both Dr. Tabak and Select Subcommittee Members agreed that, in "hindsight," the NIH

MORENS_NIH_045236
REL0000478998

could have done more to protect the American taxpayer from EcoHealth.

Key Hearing Takeaways

- NIH Deputy Director and former Acting NIH Director, Dr. Lawrence Tabak, acknowledged that NIH funded gain-of-function research in Wuhan, China.
- Dr. Lawrence Tabak repeatedly refuted EcoHealth Alliance President Dr. Peter Daszak's public and private testimonies. It is now clear that Dr. Daszak misled both the Select Subcommittee and the NIH on numerous occasions.
- Serious shortcomings and failures in the NIH's grant awarding and grant oversight procedures enabled EcoHealth to facilitate gain-of-function research in Wuhan, China. These NIH deficiencies were exploited by Dr. Daszak and his team in an effort to avoid oversight and maintain funding.
- The U.S. Department of Health and Human Services' (HHS) decision to immediately suspend funding and commence debarment proceedings against EcoHealth is backed by substantial evidence and necessary to protect America's national security. The Select Subcommittee also recommends that HHS immediately begin debarment proceedings against Dr. Peter Daszak personally.
- The NIH often lacks the necessary subject matter and scientific expertise to ensure U.S. taxpayer funds are spent and overseen safely. Dr. Tabak testified to these gaps in NIH's system today, and former NIH Director Dr. Francis Collins recounted similar problems during his transcribed interview found here.
- The Select Subcommittee's investigation into EcoHealth's impropriety is far from over. Chairman Wenstrup appreciates Dr. Tabak's honesty today and intends to use his testimony to hold EcoHealth accountable for its facilitation of gain-of-function research and its blatant contempt for the American taxpayer.

Member Highlights

Select Subcommittee on the Coronavirus Pandemic Chairman Brad Wenstrup (R-Ohio), D.P.M, pressed Dr. Tabak to address Dr. Daszak's testimony

MORENS_NIH_045237
REL0000478998

that EcoHealth was "locked out" of the NIH's grant reporting system. NIH conducted an internal forensic audit which proves EcoHealth was, in fact, not "locked out" from submitting its required NIH grant research update report on time. Notably, EcoHealth finally submitted its report nearly two years after the required deadline. According to the facts gathered by NIH, Dr. Daszak's sworn testimony appears to be false. <image001.png

MORENS_NIH_045238
REL0000478998

>

Chairman Wenstrup: “

EcoHealth, like every other NIAID grantee, was required to submit a five-year progress report, as you know. This report was submitted nearly two years late. Dr. Daszak testified that EcoHealth had tried to submit the report on time but was locked out of the NIH system. Dr. Lauer testified that a forensic audit was conducted, and no such system error was detected. Is NIH now willing to share the findings of this forensic audit with the Select

MORENS_NIH_045239
REL0000478998

Subcommittee?
"
Dr. Tabak: "*We certainly will work together with you to obtain things that you require, sir*."
Chairman Wenstrup: "*Does the audit indicate that EcoHealth could have submitted their report on time?*"
Dr. Tabak: "*That's what our audit indicates, yes.*"
Chairman Wenstrup: "*When EcoHealth eventually submitted its year-five report, Dr. Daszak testified it took 11 days to unlock the NIH system. Is this true?*"
Dr. Tabak: "*We have no evidence of that.*"
…

MORENS_NIH_045240
REL0000478998

Dr. Tabak: "*All I can say to you is that our system did not lock them out and there was no impediment for them to provide that report on time.*"

Committee on Oversight and Accountability Chairman James Comer (R-Ky.) questioned Dr. Tabak about the employment status of alleged federal records violator and top advisor to Dr. Anthony Fauci — Dr. David Morens — who was placed on administrative leave after the Select Subcommittee uncovered incriminating information. Dr. Morens used his personal email(s) to

MORENS_NIH_045241
REL0000478998

hide conversations about the origins of COVID-19 and undermine the operations of the NIH. <image002.png >

Chairman Comer: "*What is Dr. Morens's current employment status?*"
Dr. Tabak: "*He is an employee of NIH.*"
Chairman Comer: "*Well, I think you see where my lines of questioning were leading. We have some serious concerns. We have fought in this Select Subcommittee, the Oversight committee, on obtaining information. And here you have an admission of deleting information,*

MORENS_NIH_045242
REL0000478998

going to great lengths to not be transparent, in an apparent cover-up of something that I think we would agree, in a bipartisan manner, is one of the most serious issues that our country has ever faced, the COVID 19 pandemic."

Rep. Debbie Lesko (R-Ariz.) elicited an admission from Dr. Tabak that the NIH funded gain-of-function research at the WIV through a grant to EcoHealth. This directly contradicts Dr. Fauci's U.S. Senate testimony in 2021 in which he claimed

MORENS_NIH_045243
REL0000478998

the NIH "has not ever and does not now fund gain-of-function research in the Wuhan Institute of Virology." This type of research is known to be dangerous and even former NIH Director Francis Collins and Dr. Fauci were willing to admit that there are risks associated with this experimentation.
<image003.png >

Rep. Lesko: "*Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?* "

Dr. Tabak:

MORENS_NIH_045244
REL0000478998

"It depends on your definition of gain-of-function research. If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

Rep. Rich McCormick (R-Ga.), M.D., proved that EcoHealth violated the terms of its NIH grant when it failed to produce "laboratory notebooks" with information about the WIV's

MORENS_NIH_045245
REL0000478998

gain-of-function research. On May 1, Dr. Daszak falsely testified that he was not required to produce these notebooks as a condition of his grant.
<image004.png>

Rep. McCormick: "*When the National Institutes of Health requested the notebooks from EcoHealth, was EcoHealth required to produce them under its grant terms?*"
Dr. Tabak: "*Yes, they were.*"
Rep. McCormick: "*When NIH requested notebooks from EcoHealth should EcoHealth*

MORENS_NIH_045246
REL0000478998

have been able to access them or already have access to them?"

Dr. Tabak: "*That's correct.*"

Rep. McCormick: "*Did EcoHealth ever produce the requested notebooks?*"

Dr. Tabak: "*They have not.*"

Rep. McCormick: "*Dr. Daszak testified two weeks ago that he was not required to produce the lab notebooks. Would NIH disagree with that testimony?*"

Dr. Tabak: "*Yes, we disagree with that testimony*."

Rep. McCormick: "*The testimony here today clarifies*

MORENS_NIH_045247
REL0000478998

the inconsistency between Dr. Daszak's testimony and the testimony of numerous NIH officials and NIAID officials, also, including yourself. Dr. Daszak continues to thwart congressional oversight through semantics and outright dishonesty, quite frankly. He has routinely failed to produce pertinent documents and made countless misleading statements to the Select Subcommittee right here."

Rep. Mariannette Miller-Meeks (R-Iowa), M.D., uncovered serious shortcomings in NIH's

MORENS_NIH_045248
REL0000478998

grant awarding and grant oversight procedures. Dr. Tabak testified that he would never again support a grant to EcoHealth Alliance to fund gain-of-function research in Wuhan and believes the NIH relied too heavily on Dr. Daszak attestations.

.

<image005.png>

MORENS_NIH_045249
REL0000478998

Wuhan University of Public Health. Do you believe this grant was an effective use of taxpayer dollars, and would you support issuing the same grant today?"

Dr. Tabak: "*Well, with the benefit of what we know today, no, of course not.*"

Rep. Miller-Meeks: "*There is great concern with Dr. Daszak interaction with NIH and NIAID pertaining to the one log growth term of the award. The NIH relied on Dr. Daszak to monitor and report virus growth after being a month late on his*

MORENS_NIH_045250
REL0000478998

annual reporting requirements, which were outlined in the grant. Dr. Tabak, looking back, did the NIH rely too much on Dr. Daszak's self-reporting information?
"

Dr. Tabak: "*Again, with the benefit of hindsight, we did because we never received the information.*
"

Rep. Miller-Meeks: "*Well, as an ophthalmologist, hindsight is always 20/20.*"

Rep. Nicole Malliotakis (R-N.Y.) revealed NIH's honest viewpoint regarding its funding of EcoHealth's risky

MORENS_NIH_045251
REL0000478998

research at the WIV. Dr. Tabak testified that NIH believed it was not funding any dangerous research prior to or during the COVID-19 pandemic.

Rep. Malliotakis: "*We also know that at least 20 more EcoHealth research projects received funding since March of 2020, and they are conducting research Nipah, zoonotic viruses, bat coronaviruses, MERS. They are doing a lot of this research, mostly actually in third world countries. Subpar safety conditions.*

How do you ensure that our federal dollars are not going to do risky experiments in countries where there are subpar safety regulations? And do you believe that should be a criteria that is put forth to ensure that the money doesn't?"
Dr. Tabak: "*Well, again, once we established special conditions for award on EcoHealth Alliance, we have monitored them very carefully with regard to expenditure and with regard to their various administrative processes. There was never a concern*

MORENS_NIH_045253
REL0000478998

with the danger, if you will, of the experiments that NIH approved for EcoHealth Alliance to with under subaward with WIV."

Cheers,

Peter

Well, I am beginning to wonder. It turns out it costs me cash each year, I have a bunch of work to do on committees, and the minute I get publicly vilified, they add fuel to the fire by failing to defend me. What a shambles. Worst of all, like the WHO origins group, and Jeff Sachs' Covid commission – once they start to haul you over the coals, it drives further rounds of publicity and threatens my job, and my family's security.

I didn't even get a secret handshake!

EXTERNAL SENDER

Sad..... One would think the NAM had more integrity than that. Guilty 'til proven innocent. Looking at all this from the outside, it doesn't exactly make your NAM club look like a stellar organization. Sorry to say. Time to go watch the fine movie made of Arthur Miller's play The Crucible, which was about the McCarthy era but presciently also about this one. d

Thank you for the call today Elena. I've cc'd our Chief-of-Staff, Dr. Aleksei Chmura, who also joined us. I appreciate your explanation and will do my best to adhere to the policies of the NAM as we go through this process.

My only hope is that the review can be as rapid as possible. Our organization has been the focus of a horrific series of political attacks from the hard right wing as part of their political goals regarding Dr. Fauci, NIH and ultimately the Biden administration. These tie up resources and staff answering pages upon pages of false accusations, all carefully worded to give the impression of a thoughtful and sincere inquiry.

Again, I want to reassure you that none of the accusations from Republicans on the House E&C Committee have the slightest bearing in fact. We have acted honorably and with the highest scientific integrity throughout the pandemic, and simply want to be allowed to continue our work without constant, politically-motivated harassment.

Subject: RE: Early appearance of two distinct genomic lineages of SARS-CoV-2 in different Wuhan wildlife markets suggests SARS-CoV-2 has a natural origin - SARS-CoV-2 coronavirus - Virological

Just off the phone with Arthur Allen from Kaiser Family Foundation News, thanks to an introduction from David. I spent 45 minutes talking to him about this GOF stuff, and why that was a pejorative term being used to drum up support to ban certain kinds of research into evolutionary biology of viruses and viral pathogenesis, with the ban being far more dangerous than any possible leak of a created super pathogen. Peter, I characterized you as a hero. Don't disappoint me or undermine my credibility (said tongue in cheek to be absolutely clear). In response to a question I said you were the member of the WHO team who would most want to find out if there was a leak of virus from the laboratory because your integrity as a scientist would want

to know how this virus became a human pandemic so that we can try to better prevent it in the first place, and if not find it as quickly as possible in order to stop it from spreading. So while on the list of priorities the emergence from bats through some mammal to spillover to humans was at the very top, and lab origin was at the very bottom, you would not be the one to eliminate the latter from the list. That said, I do think that after characterizing it as highly unlikely, it was a mistake for the WHO report to say it should not be explored any further. I suspect that was more an offering to the Chinese to keep the door open to the next step in the investigation than anything else. After all, it would not be at all possible if the Chinese didn't actually agree to allow it to happen.

I also saw the Garry paper this morning and not only brought it to Allen's attention (he said he had just become aware of it 30 minutes before we spoke) but I also characterized it as the first piece of actual field derived evidence to evaluate, and really very powerful evidence that the evolution of the precursor virus to CoV-2 happened in nature and not in a lab. I think he will look at it carefully and use it.

We also talked politics and the consequences of continuing expression of concerns about GOF research, with my take that if certain lines of research were cut off instead of managed/regulated/overseen the lost benefits for humankind would so overwhelm the miniscule chance of unintended harm like an asymptomatic infected person leaving a lab and initiating a global pandemic resulting in (according to Chris Murray et al) more than 900,000 deaths in the US to date, and over 7 million global deaths and counting as the deadly outbreak in India continues to wreak havoc, and without doubt spread to other countries, travel bans or not. I made the analogy to recombinant DNA, and more recently to CRIPR where the benefits overwhelm the chance of inadvertent harm. And I said the small number of scientists who are on this bandwagon can really harm the future of science to explore, understand, and use knowledge about microbial evolution and pathogenesis to develop treatment, vaccines, and diagnostics, playing into the hands of the crazies, the conspiracy community, and scientifically illiterate so called communities of conscience or those who have no concern for the common good.

I asked him to do a good job in his write up. He promised, and I will hold him to it if I can figure out how to accomplish that.

Jerry

I agree. I have only skimmed it too, so will have to really read it carefully. Also it will be helpful for independent phylogeneticists to take a look. David

EXTERNAL SENDER

2023 is going to be a rough year with both the House Oversight and Judiciary Committees conducting scientist witch hunts.

My new 2023 book with Johns Hopkins Univ Press out early next year I hope

"The Deadly Rise of Antiscience: How Health Freedom Propaganda Endangers the World"

How House GOP Freedom Caucus and Senate GOP in Alliance with Fox News and contrarian pseudo intellectuals to give it academic cover, formed an alliance to convince Americans across Texas and US Southern States to shun covid vaccinations during the delta variant wave. This led to the unnecessary and needless deaths of 200,000 Americans. Also discusses how antiscience extends to phony Covid origins

EXTERNAL SENDER

Just returned from 3 weeks in Western Thailand near the Myanmar border organizing fieldwork in bat caves. It was hard work, made even harder by the ongoing level of harassment in the US. During that short trip we had to deal with the following attacks:

- A new lawsuit (our 3rd) claiming our work caused COVID and led to the death of a rock musician in a Midwest state in the USA
- A book from a former EHA employee that is so factually-incorrect, even the title is demonstrably wrong. The author, who sadly has some mental health issues (self-acknowledged and publicly stated) has been lauded by the usual Right wing hacks and did the rounds on Fox last week. He's getting his 15 mins of fame, but I'm a bit worried that a former Iraq/Afghanistan veteran with a grudge is drumming up hate against me and our organization.
- A series of harassing articles about me and EcoHealth in the Daily Mail, NY Post, Fox News, all based on a single tweet of some of our staff in Tyvek suits in a bat cave in Thailand, doing their job as scientists, and as laid out in our NIH grant.
- Quotes from Senator Joni Ernst & Roger Marshall bragging about how I'm not going to be able to do my work next year because I'll be spending so much time in front of Congress: 'Instead of playing in a bat cave, next year Daszak will find himself in front of Congress answering questions about his batty studies and what was really going on inside the Wuhan Institute,' added the Iowa Republican. https://www.dailymail.co.uk/news/article- 11530565/GOP- senators-slam-Peter-Daszak-playing-bat-cave-[b6]
- Finally the letter from the Republicans on the House Oversight Committee demanding the usual trove of documents and emails, and on-the-record interviews with me and 5 of our staff. Amusingly that includes

MORENS_SUBPOENA_014304
MORENS_NIH_026998

> our collaborator in Australia Hume Field, who's a member of the Independent (former Lancet) Taskforce, and not a paid employee of EcoHealth. I'm not sure what jurisdiction Congress has over Australians who live in outback Queensland, but I can imagine his fruity answer if they asked him to testify…

I now know some very remote camps in the Myanmar-Thailand border region that are beginning to look like nice places to spend the next few months rather than sitting through the constant garbage these folks are generating……

I am going to use the list serve I created in 2020 when 140 or so NAM members signed an appeal from Rick Klausner, Ken Olden and myself for the Academies to support the call for a transparent evaluation of the action taken to defund EHA and reverse the decision if there was no justification. It fell on mostly deaf ears.

But the more members who do speak up directly to Victor the more he will understand that what I said in my email to him today, that most members are pissed off about these attacks, is true and maybe will embolden him.

Its just necessary to keep fighting. Peter, you did well to restrain yourself while questioning the basis for the request from NAM.

I think you HAVE TO push back against the NAM. If you don't fight an injustice, you enable it.

Are there not internal NAM mechanisms to prevent leadership from throwing you under the bus without due process? Surely members can prevent Victor from doing this, or has NAM become so politicized that it will knuckle under to a bunch of Congressional demagogues with no major backing?

These several Congress folks are not the Congress, just a small hit team not supported by by the majority, even within the Republican party. d

I can't believe that this lab leak origins crap has led me to have private arguments and public fights with the DG of WHO; public spats with Jeff Sachs; legal arguments with NIH; public harassment from Congress; and now what looks like a protracted battle with the National Academy of Medicine. What a life!

Cheers,

Peter

Dear Elena,

So I don't make any infractions of the rules, please could you point me to the section of the NAM Bylaws, or Policies and Procedures that govern the process being undertaken now in response to these allegations, including on what I can and cannot do while the review is being undertaken. I looked long and hard on the website and can't find the specifics.

This is particularly important because I'm scheduled to take part in meetings very soon as part of my NAM commitments.

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

Thank you for the call today Elena. I've cc'd our Chief-of-Staff, Dr. Aleksei Chmura, who also joined us. I appreciate your explanation and will do my best to adhere to the policies of the NAM as we go through this process.

My only hope is that the review can be as rapid as possible. Our organization has been the focus of a horrific series of political attacks from the hard right wing as part of their political goals regarding Dr. Fauci, NIH and ultimately the Biden administration. These tie up resources and staff answering pages upon pages of false accusations, all carefully worded to give the impression of a thoughtful and sincere inquiry.

Again, I want to reassure you that none of the accusations from Republicans on the House E&C Committee have the slightest bearing in fact. We have acted honorably and with the highest scientific integrity throughout the pandemic, and simply want to be allowed to continue our work without constant, politically-motivated harassment.

sincerely,

Peter

Dr. Daszak,

Thank you for speaking with me this afternoon.

In accordance with the NAM's policy related to conduct, I am writing to inform you that we have received written allegations of misconduct. As we undertake our review process, you are not eligible to participate in any NAM and/or NASEM activities for the duration of the review.

Best,
Elena Fuentes-Afflick

China, Fauci and the Origins of Covid

Did the virus come from a Chinese lab funded by the celebrated doctor's U.S. government institute?

By James Freeman
May 7, 2021 4:39 pm ET

MORENS_SUBPOENA_014981
MORENS_NIH_030634
REL0000479022

In February of 2021, a security guard moves journalists away from the Wuhan Institute of Virology in China's Hubei province.

Before Covid-19 ravaged the world, Dr. Anthony Fauci's National Institutes of Allergy and Infectious Diseases funded coronavirus research that included work at China's Wuhan Institute of Virology. The idea was to study the ability of such viruses to attack humans, but could a Fauci-funded experiment actually be the source of the deadly global infection? In an exhaustive account of the viral possibilities published this week by the Bulletin of the Atomic Scientists, Nicholas Wade argues that the Chinese lab is the most likely source of the world-wide agony.

Left-leaning journalists who don't like where this story is going may struggle to dismiss the author given his establishment credentials. The Bulletin of the Atomic Scientists describes him this way:

> Nicholas Wade is a science writer, editor, and author who has worked on the staff of *Nature*, *Science*, and, for many years, the *New York Times*.

The former Timesman writes:

> The virus that caused the pandemic is known officially as SARS-CoV-2, but can be called SARS2 for short. As many people know, there are two main theories about its origin. One is that it jumped naturally from wildlife to people. The other is that the virus was under study in a lab, from which it escaped... it seems to me that proponents of lab escape can explain all the available facts about SARS2 considerably more easily than can those who favor natural emergence.

Mr. Wade describes a key Chinese researcher whose work received support from Dr. Fauci's institute via a U.S. group called EcoHealth Alliance:

> Researchers at the Wuhan Institute of Virology, led by China's leading expert on bat viruses, Shi Zheng-li or "Bat Lady," mounted frequent expeditions to the bat-infested caves of Yunnan in southern China and collected around a hundred different bat coronaviruses...
>
> It cannot yet be stated that Shi did or did not generate SARS2 in her lab because her records have been sealed, but it seems she was certainly on the right track to have done so. "It is clear that the Wuhan Institute of Virology was systematically constructing novel chimeric coronaviruses and was assessing their ability to infect human cells and human-ACE2-expressing mice," says Richard H. Ebright, a molecular biologist at Rutgers University and leading expert on biosafety.

Mr. Wade then details at length why he believes a lab-created virus in this case is much more likely than a natural one. His case in the following paragraphs contains much jargon but his argument is clear: The scourge was particularly suited to attack humans and yet there's little if any evidence showing a natural evolution from a virus that attacks bats to a virus that attacks people:

> It's documented that researchers at the Wuhan Institute of Virology were doing gain-of-function experiments designed to make coronaviruses infect human cells and humanized mice. This is exactly the kind of experiment from which a SARS2-like virus could have emerged. The researchers were not vaccinated against the viruses under study, and they were working in the minimal safety conditions of a BSL2 laboratory. So escape of a virus would not be at all surprising.

MORENS_SUBPOENA_014982
MORENS_NIH_030635
REL0000479022

> In all of China, the pandemic broke out on the doorstep of the Wuhan institute. The virus was already well adapted to humans, as expected for a virus grown in humanized mice. It possessed an unusual enhancement, a furin cleavage site, which is not possessed by any other known SARS-related beta-coronavirus, and this site included a double arginine codon also unknown among beta-coronaviruses. What more evidence could you want, aside from the presently unobtainable lab records documenting SARS2's creation?
>
> Proponents of natural emergence have a rather harder story to tell... No one has found the bat population that was the source of SARS2, if indeed it ever infected bats. No intermediate host has presented itself, despite an intensive search by Chinese authorities that included the testing of 80,000 animals. There is no evidence of the virus making multiple independent jumps from its intermediate host to people, as both the SARS1 and MERS viruses did. There is no evidence from hospital surveillance records of the epidemic gathering strength in the population as the virus evolved. There is no explanation of why a natural epidemic should break out in Wuhan and nowhere else. There is no good explanation of how the virus acquired its furin cleavage site, which no other SARS-related beta-coronavirus possesses, nor why the site is composed of human-preferred codons. The natural emergence theory battles a bristling array of implausibilities.

There seems to be some debate about whether the Wuhan coronavirus work really did involve "gain-of-function" research—genetically engineering viruses to attack people under the premise that such research assists in learning how to counter future threats. In February the website PolitiFact reported, "All parties involved in the grant to the Wuhan Institute of Virology have denied that it involved gain-of-function research." PolitiFact attributed a quotation to the National Institutes of Health, the parent agency of Dr. Fauci's organization:

> The NIH told us: "The research supported under the grant to EcoHealth Alliance Inc. characterized the function of newly discovered bat spike proteins and naturally occurring pathogens and did not involve the enhancement of the pathogenicity or transmissibility of the viruses studied."

But PolitiFact also stated:

> MIT biologist Kevin Esvelt reviewed a paper that appears to have been published with financial assistance from the grant. According to Esvelt, certain techniques that the researchers used seemed to meet the definition of gain-of-function research.

This column contacted the National Institute of Allergy and Infectious Diseases this afternoon on this issue and a spokesperson says, "We'll get back to you." This column will be updated if NIAID comments. Rep. Mike Gallagher (R., Wis.) wrote to Dr. Fauci on Wednesday in search of some answers:

> The State Department has detailed several concerning revelations, including that the U.S. government has reason to believe several researchers at the Wuhan Institute of Virology (WIV) became sick in autumn 2019 with symptoms consistent with COVID-19, before the first public cases emerged in that community...
>
> How much U.S. government funding has gone to the WIV over time, and how much of that supported gain-of-function research? Did U.S. government funding go to the WIV even during the 2014-2017 U.S. moratorium on funding gain-of-function research?

On Thursday the ranking member on the House Energy and Commerce Committee, Rep. Cathy McMorris Rodgers (R., Wash.), and two Republican colleagues on the committee wrote to Secretary of State Antony Blinken to "request that the U.S. Department of State release unclassified documents and declassify other documents for public release, as appropriate, related to the assertion in the Department's January 15, 2021 Fact Sheet that the Wuhan Institute of Virology (WIV) in Wuhan, China collaborated with the Chinese military in conducting classified research, including laboratory animal experiments."

Did any of the results of those experiments leave the lab and make their way around the world?

Subject: RE: Daily Caller: EXCLUSIVE: Sen. Rand Paul, Rep. Chip Roy To Introduce Legislation To Eliminate Fauci's NIAID

The problem apparently is influenced by several things: a) some scientifically strong outside candidates have either refused to consider or dropped out given the politics, among other issues, b) the lead inside candidate is apparently a disruptive personality, c) the administration has a lot of other things to deal with that apparently override (I can't use that other word) in importance this appointment.

But this is madness and so obviously politically driven. Had there been a strong NIH leader in place in April 2020 NIH would not have caved in and cancelled Peter's grant. That's when the slope became slippery.

Rich, you may be on this already but it seems to me this is a critical time for the Nobel laureates to speak up, and echo Tony's characterization of Rant Paul as knowing nothing about public health, and my favorite phrase that he is an ophthalmologist who cannot see the difference between evidence-based decisions and ideologically driven "don't bother me with information, my decision stands".

EXCLUSIVE: Sen. Rand Paul, Rep. Chip Roy To Introduce Legislation To Eliminate Fauci's NIAID

Photo by Chip Somodevilla/Getty Images
● Henry Rodgers Chief National Correspondent
March 23, 2023 9:44 AM ET
Republican Kentucky Sen. Rand Paul and Texas Rep. Chip Roy will introduce legislation Thursday that would eliminate the National Institute of Allergy and Infectious Diseases (NIAID).
The Daily Caller first obtained a copy of the bill, which is titled the NIH Reform Act. The bill would specifically replace the NIAID with three separate national research institutes that would be led by directors subject to Senate confirmation and limited to no more than two 5-year terms.
The three new institutes would be the National Institute of Allergic Diseases, the National Institute of Infectious Diseases, and the National Institute of Immunologic Diseases. The directors of each new institute would be appointed by the president, subject to Senate confirmation, and limited to no more than two 5-year terms.
"We've learned a lot over the past few years, but one lesson in particular is that no one person should be deemed 'dictator-in-chief.' No one person should have unilateral authority to make decisions for millions of Americans," Paul told the Daily Caller before introducing the legislation. **(RELATED: Rand Paul Introduces Legislation To Repeal Federal Mask Mandate For Public Transportation)**
"To ensure that ineffective, unscientific lockdowns and mandates are never foisted on the American people ever again, I've introduced this bill to eliminate Dr. Anthony Fauci's previous position as Director of the National Institute of Allergy and Infectious Diseases and divide the role into three separate new institutes. This will create accountability and oversight into a taxpayer funded position that has largely abused its power and has been responsible for many failures and misinformation during the COVID-19 pandemic," he added.
READ THE LEGISLATION HERE:

(DAILY CALLER OBTAINED) — ... by Henry Rodgers

"From the earliest days of the pandemic, unaccountable public health bureaucracies proved themselves far more adept at ruining lives than saving them. Never again should a single individual, like Dr. Anthony Fauci, wield unchecked power and influence over the lives of the American people. Breaking up Dr. Fauci's taxpayer funded bully pulpit into three separate agencies — and requiring Senate confirmation for all their future directors — is one of many actions necessary to allow the American people to hold public health agencies accountable," Roy, who introduced an identical House version of the bill, said in a statement. **(RELATED: EXCLUSIVE: Sen. Rand Paul Demands NIH Preserve All Documents, Communications In Fauci's Possession)**
The legislation is currently cosponsored by Utah Sen. Mike Lee, Tennessee Sen. Marsha Blackburn, Indiana Sen. Mike Braun and Missouri Sen. Josh Hawley.

It's truly appalling what so many Republican politicians, whether they totally agree or are just looking for a political edge in their election, can do knowing full well what they are unleashing. While most of the threats are just that, threats that are never considered to be actionable, there is plenty of reason to be concerned if there is one particularly evil Maggot out there.

I don't know why but today I'm feeling more upbeat about the outcome than the polls and history suggest likely. Tomorrow I vote and then I turn off my devices until Wednesday, as fortunately one of my best friends is performing in the Harvard Institute for Learning in Retirement Shakepeare players presentation of Midsummer's Night Dream, followed by Chinese food at a really good place in Cambridge. The latter two, set for tomorrow evening, seem more than coincidental to me and are the source of some optimism.

Rich: Your summary of my summary is right on point – that was exactly the vibe of Sachs's comments during the webinar. He let Ebright and Kopp spell out the crazier aspects of the lab leakers' viewpoint. Chan was more balanced than I expected her to be (although her summary clearly had a thumb on the scale).
Best regards,
Jeff

Jeff:

Great summary, but nothing really new as all the presenters had well-known views. My only comment is that Sachs recently seems to be a little less adamant that it was a lab leak and just now relies on innuendo.

Subject: Jeff Sachs moderated a Lancet Commission webinar on COVID-19 origins this morning
Importance: High

EXTERNAL SENDER

All: I listened in this morning on the webinar on COVID-19 origins that Jeff Sachs moderated under the auspices of the Sustainable Development Solutions Network (SDSN). I wasn't able to stay until the end of the Q&A, but I did hear the three main presentations. Sachs said that he plans to post the recording of the session (on SDSN?). This was the first of three planned webinars – the second (on global health financing) will take place on November 22, the third (on health system strengthening) on December 8.

Sachs served as moderator. His introduction was fairly mundane. His basic premise was that there are two "absolutely viable" hypotheses for the origin of COVID-19 – either zoonotic or due to a lab leak. (Note that the language he uses – "absolutely viable" –

obscures the fact that the evidence differs significantly for each of the two hypotheses. But this was a bias that ran through all of the presentations.) He then argued that we need to follow both lines of inquiry equally, to have a proper understanding of both possibilities. He alluded to the bimodal distribution of most discussion of these questions – with "mainstream media" coming down on natural origins, and "alternate media" arguing for laboratory origins (including in this Senator Burr's Senate Minority Report). He then turned to two "leading scientists" and a "leading reporter" for further perspectives.

The speakers were Alina Chan (Broad Institute), Richard Ebright (Rutgers University) and Emily Kopp (US Right to Know) – no great surprises there.

Alina Chan's main argument was that there is not enough evidence to decide which hypothesis is true, and that all the evidence is circumstantial. She did say that there is no argument over the fact that the pandemic originated in spillover from bats – just a difference of opinion on how and where this happened.

She presented a set of factors that would explain the chain of causation for each of the two hypotheses:

Natural origins
- Earliest cases handled live animals?
- Were there infected animals in markets or farms?
- Were there animal variants of the virus?
- Was there antibody evidence of infected animals or traders (not presenting with pneumonia)?
- Was there a strong wildlife conduit between known bat reservoirs and the outbreak site?

She then claimed that none of these have been established for SARS-CoV-2, and thus we can't say that natural origins hypothesis is true.

Lab leak
- WIV was the HQ for virus hunting program targeting both animals and humans
- WIV found and developed SARS-CoV-2-like viruses by 2013
- WIV did advanced work with virus isolates and "seamless clones"
- Live virus work was done in BSL2 and BSL3 environments, which could not contain airborne viruses
- WIV and collaborators were planning to insert furin cleavage sites in different viruses (she referred to a "pipeline" of risky research and

made a big deal of the rejected DARPA proposal, for which the research was never done)

Her conclusion: evidence is not definitive for either hypothesis, but these aspects of research at the WIV were "very concerning" and thus we need to investigate both conclusions.

Richard Ebright was then asked what should be done about improving the oversight of research in this area from the perspective of biosafety, biosecurity, and biorisk management. He concurred with Sachs and Chan that the available data do not enable a choice between the two hypotheses of COVID-19 origin. But regardless of where one stood on this question, the research by EcoHealth Alliance, WIV, and their collaborators – according to Ebright – used inadequate biosafety protocols and lacked transparency. Again, according to him, this points to, but does not prove, a research spillover as the origin of COVID-19.

I've attached a screen shot of the slide he shared that lays out his bill of complaint. As you can see, he's fixated on the work that WIV and EHA did from 2016-2019, arguing that, while this doesn't prove laboratory origins, it "exceeds the standard of probable cause" and provides "ample basis to initiate investigation and ample basis to improve oversight." (Like Chan, he also made much of EHA's rejected DARPA proposal, trying to use it as a "smoking gun" for malign intent by EHA and WIV, despite the fact that this research was never done!)

He spent most of his time, however, outlining a basis for and recommendations for improved research regulation and oversight in biosafety, biosecurity, and bio risk management.

Sachs and Ebright had an exchange about the recent news of the creation of a variant of COVID-19 that appeared to be more virulent than Omicron, without the "knowledge or approval of NIH." This was evidence for both of them of the need for enhanced oversight.

Emily Kopp, an investigative journalist with US Right to Know, then made a breathless presentation about her attempts to bring the truth about COVID-19 origins to light through FOIAs and dogged persistence. The gravamen of her complaint is that much of the relevant research has been underwritten by NIH, DOD, and USAID with taxpayer funds, and conducted in the US (at EHA, University of North Carolina, University of Texas, and UC Davis), yet she and her colleagues have had to file dozens of FOIA requests and lawsuits to

get access to what they consider to be relevant information.

She reviewed five categories of evidence:

1. EHA progress reports to the NIH: She noted that the Intercept is going after 31 EHA NIH proposals and over 1000 other documents not yet released. They also plan to go after EHA Board members and collaborators at the U of Maryland and UC Davis.

2. USAID databases from PREDICT.

3. NIH bioinformatics databases for sequence data from WIV: She was quite exercised about the "apathy" of NIH at not going through archived sequences to provide the information that USRTK wants.

4. The Baric Lab at UNC: She said as yet there are few clues to planned work on genetic engineering techniques here.

5. Department of Defense: Again, she railed about the lack of transparency about the rejected EHA DARPA proposal, which she claimed DARPA tried to conceal. She also mentioned data from PREEMPT.

She then claimed that the public can't trust the credibility and integrity of the NIH on these matters, since they tried to obscure the existence of relevant data – and event tried to obscure the involvement of other scientists in the discussion of COVID-19 origins in the conversations that led to the *Nature Medicine* correspondence in 2020 (I lost her here – the discussion became very "inside baseball"). She concluded with a plea that the public deserves more clarity about the pandemic's early days.

Sachs then threw her a softball about the *Nature Medicine* correspondence, inviting her to tell the listeners how it appeared that NIH was trying to obscure who came up with the zoonotic origins theory (and then didn't credit those authors on the publication). She then said that the virologists who were on this correspondence have continued "to be aggressive about natural origins and to marginalize other theories" – asking (rhetorically) if they have shown integrity.

Sachs then said that all of this information had to be pried out of the NIH and the USG, rather than being offered transparently. He showed how the NIAID had redacted most of the 300-page COVID strategic plan of April 2020, and also made a point of saying that Robert Redfield had wanted to attend today's webinar but couldn't,

noting that he believes a lab leak is more likely – and that he was shut down by NIH when he tried to call for further investigation. Sachs then teased that there may be new revelations that the WIV and US scientists were implicated in evidence that COVID-19 emerged in China before December 2019. (This latter evidence-free speculation seems to refer to Mike Pompeo's evidence-free contention that the USG had evidence of this – but that evidence has never materialized.)

Sachs then reiterated his contention that both hypotheses need further investigation – and that the relevant information may be in the US, not China. We need an independent, rigorous, transparent scientific investigation. (Despite this language, I think you can sense from my summary of the webinar that Sachs is actually shading the argument toward his belief that COVID-19 had a laboratory origin.)

I wasn't able to stay on for the Q&A, but we should be able to review the rest of the session when Sachs posts the recording.

Hope this is helpful.

As ever,
Jeff

Re. the timeline – that's shown in the system records, and in emails to Erik Stemmy. WIV has confirmed to us that this was the same experiment, so it was absolutely, prove-ably reported to NIH on time in our year 4 report. Erik did nothing wrong – it probably did not rise to the level that any secondary review was necessary – as we explain in the main letter to Michael lauer. The highlighted section is a clear 'out' for NIH re. why they should have interpreted the results as non-problematic or not:

From our upcoming letter to Michael Lauer
Secondly, the direction in our revised NoA was that we should report experiments in which *"the MERS-like or SARS-like chimeras generated under this grant show evidence of enhanced virus growth greater than 1 log over the parental backbone strain"*. In virological terms, "virus growth" normally refers to viral titer measuring the concentration of infectious viruses by plaque assay. The experiment we reported to NIH, performed one time using x mice per group, actually shows genome copies per gram *not* viral titer. We have been advised by (I would say 'highly experienced,' not senior) senior virologists that data on genome copies per gram usually do not accurately equate to viral titer, since genomic material from inactivated, incompletely formed, or dead virus are also measured. Viral titers were not conducted in this experiment. We also note that the genome copy data for SHC014 are only enhanced relative to the WIV1 backbone at the earliest part of the experiment, and considerable variability within the groups. with often (I'm not quite large error bars. Importantly, by Day 6-8, there was no discernably significant difference among the genome copy per gram data, suggesting that these differences, if in fact real and reproducible, were

MORENS_NIH_046889
REL0000479037

transient and viral genome copy data were statistically equal among viral types by the end of this short experiment. Given the small number of mice, it is also uncertain if the survival and weight loss data were statistically relevant. We believed NIH read the data the same way because we received no feedback at all or any request to provide further clarification or that a secondary review should be undertaken. In any event, as already noted above, this experiment was not repeated. [Delete the following] All this suggests that the rationale NIH appears to have used at the time for *not* highlighting this work as requiring further clarification or secondary review, was appropriate, and may explain the lack of request for further information from NIH to us.

Re. the system shutting us out –(I'm not exactly clear what this means. I would revise this portion. Ignorance of process by a first time renewal grant is no excuse. You have to submit a final report even if your grant isn't renewed. I think you should apologize first and then provide a rationale. Part of that was the fact that you had scored in the 2nd or 3rd percentile and the work was going forward so you presumed the next report was at the end of year 1 of the renewal grant. You can mention you asked NIH Grants management about it, didn't hear back, and were focused on gearing up for the new set of specific aims. it was my first renewal and we were unclear of what to do, but we asked an NIH Grants management specialist (Tseday Girma) on 7/30/19 what the deadline was on submitting the year 5 report, and if we could now go ahead. We received no response from that person. Erik was cc'd on this but surely it's up to the Grants Management Specialist to get back to us. The next correspondence I received about our grant was then the notice to remove WIV and then a few days later, to terminate.

Cheers,

Peter

Amen to keeping the science going Jerry.

I have no problem at all with any of you talking about these actions with colleagues and others. Please continue talking about this issue with people at NIH in particular Jerry. I strongly believe that most people at NIH, and especially NIAID, realize that this is a case of Office of the Director senior staff trying to worm their way out of a problem that they caused themselves when they went too far back in April 2020 and terminated a grant that would likely have delivered good science.

By the way, our team is right now working on analyzing over 100 completely novel full genomes of SARS-related CoVs that WIV have sequenced from our original samples in the terminated grant. We're doing this work funded by other mechanisms, including the generous gift you negotiated Rich. The results are already fascinating and will likely be important. For example, out of >100 novel full genomes, every single one of them is a recombinant. That includes what seem to be genes from close relatives of the original progenitor of SARS-CoV mixing with genes from close relatives of SARS-CoV-2. We're working on a pretty deep analysis of what drives recombination hotspots – it has to be good because the computer took 3 months to do the original recombination analysis!

That's the sort of science we could be cranking out at full steam if we didn't have to spend days out of each week responding to these attacks, dealing with death threats and lawsuits etc.

Cheers,

Peter

Before I give up the ghost I am going to get that guy fired in disgrace.

We have a site visit for the lab coming up on Tuesday, and I'm considering asking the program officers what they know about the attacks on EHA and what the think of Lauer. They would have to deal with him since he runs the extramural research office in the Directors office. Unless you think I shouldn't say anything.

Just keep on producing good science, because that in the end is the name of the game. And its great to be running the SE Asia EID network – Ron and I are looking forward to participating in the network meeting in September.

Jerry

Here's the latest from NIH – as usual we received a Friday afternoon pdf letter from Michael Lauer that's full of legalistic language (attached). And as also 'usual', Lauer only sent this the same day he informed Republicans on an oversight committee, and either him or the Republicans then instantly made it public. There's already an article in the Washington Examiner about it (below)

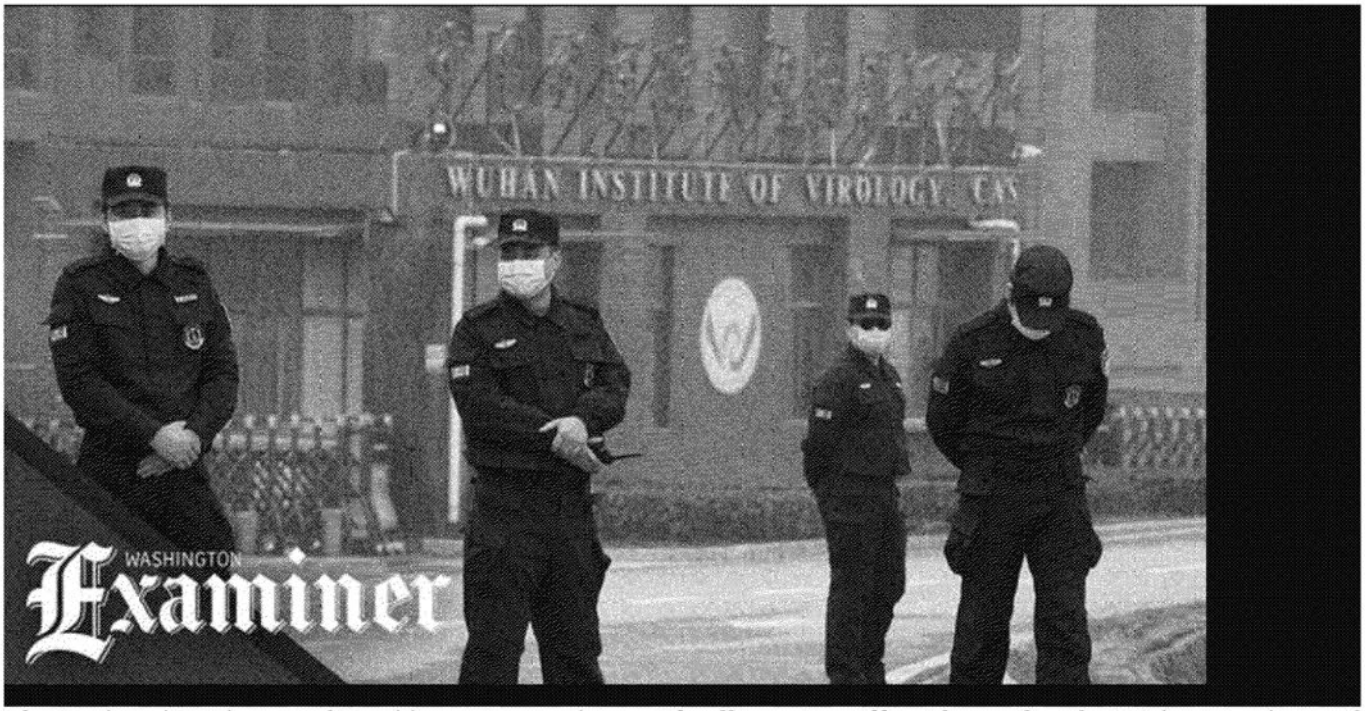
They're basically terminating our subcontract to WIV because we were unable to get the lab notebooks they demanded (no surprise there, given the politics). They're also offering us the chance to renegotiate the grant. Sounds great, but by now of course the chances of any institution in China wanting to work with an organization targeted in this way are pretty slim. There's also the buried proviso that we have to arrange for 6-monthly inspections of our subcontractee's labs.

If we don't want to renegotiate, we have to bilaterally terminate.

After 2 and a half years of pressure from NIH, we're now back to where we were in April of 2020, when NIH informed us to suspend all work with WIV, but that we could carry on with the grant. This was then followed a few days later with full termination, then suspension with conditions, then more conditions, now this. Pretty depressing, awful, and utterly unnecessary.

Not sure what we'll do, but my gut feeling is we should continue and try to find a way forwards with other groups in China. It'll be a hard path, considering WIV are the premier bat virus group in China and our preferred partners, and the politics has made all of this completely toxic. But it's the honorable path, as a scientist, and I think we should at least try.

Here's the Washington Examiner article: https://www.washingtonexaminer.com/policy/healthcare/nih- ends-subaward-wuhan-lab-stonewalling



WUHAN LAB

NIH ends subaward to Wuhan lab after continued stonewalling

by Jerry Dunleavy, Justice Department Reporter |
August 19, 2022 08:21 PM

Ad ends in 9s

MORENS_SUBPOENA_010615
MORENS_NIH_021150
REL0000479038

The National Institutes of Health announced it was finally cutting off a subaward to the Wuhan Institute of Virology after it continued to refuse to hand over key information about the coronavirus research it conducted with U.S. tax dollars.

NIH Deputy Director Michael Lauer made the revelation in a letter Friday to House Oversight Committee Republicans, in which he said the Wuhan lab had refused to turn over lab notebooks and electronic files connected to its research funded through an NIH subaward given to it by the U.S.-based EcoHealth Alliance.

But Lauer indicated the NIH may continue funding EcoHealth's controversial bat coronavirus research despite the group's documented noncompliance issues, its close links to the Wuhan virology institute, and its history of funneling hundreds of thousands of U.S. tax dollars to the Chinese lab.

"NIH … identified one non-compliance under the ... award that cannot be remedied with specific award conditions," Lauer said Friday. "NIH has requested on two occasions that EHA [EcoHealth Alliance] provide NIH the laboratory notebooks and original electronic files from the research conducted at the WIV [Wuhan Institute of Virology]. To date, WIV has not provided these records."

Lauer added: "Today, NIH informed EHA that since WIV is unable to fulfill its duties for the subaward grant under R01AI110964, the WIV subaward is terminated for failure to meet award terms and conditions requiring provision of records to NIH upon request."

FBI INVESTIGATED NIH AWARD TO ECOHEALTH AND WUHAN LAB

The Office of the Director of National Intelligence released an assessment in 2021 stating that one U.S. intelligence agency assessed with "moderate confidence" that COVID-19 most likely emerged from the Chinese government lab in Wuhan, while four U.S. spy agencies and the National Intelligence Council believe with "low confidence" COVID-19 most likely has a natural origin.

The NIH's Lauer also said Friday that the National Institute of Allergy and Infectious Diseases, which has been led by Dr. Anthony Fauci for decades, "will begin to engage with EHA to renegotiate the specific aims and objectives of the R01 grant without the involvement of WIV … in light of the cooperation from EHA and the substantial subsequent improvements in administrative processes that EHA demonstrated."

Rep. James Comer (R-KY), the ranking member on House Oversight, hammered the NIH over this.

"Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum," Comer said Friday. "It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract. EcoHealth conducted gain of function research on bat coronaviruses in Wuhan, knew about the Chinese Communist Party's coverup, and failed to inform the U.S. government."

Comer added: "EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence

MORENS_SUBPOENA_010616
MORENS_NIH_021151
REL0000479038

may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money."

The NIH had awarded EcoHealth with a grant dubbed "R01AI110964" years ago, and EcoHealth then doled out three research subawards, including one to the Wuhan lab.

"The research approved under this grant sought to understand how bat coronaviruses evolve naturally in the environment to become more transmissible to the human population," the NIH said Friday in defending the award. "This type of research is a critical part of pandemic preparedness."

The grant to EcoHealth was suspended by the NIH in June 2020 due to "grant administrative non-compliance concerns." EcoHealth was reprimanded by the NIH in October when the agency found that the organization delayed revealing that a U.S.-funded experiment conducted with the Wuhan lab determined that mice with implanted human cells became sicker with an engineered version of bat coronavirus. The NIH found more EcoHealth violations in January.

Republicans say the findings showed EcoHealth was funding risky gain-of-function research in China. EcoHealth leader Peter Daszak was a longtime collaborator with the Wuhan lab who steered hundreds of thousands of dollars in NIH funding to the Chinese lab and was also a key World Health Organization-China joint study team member in early 2021.

Daszak dismissed the lab leak hypothesis in March 2021 when he admitted he took Wuhan lab workers at their word. Meeting minutes from discussions between lab scientists in Wuhan and the WHO-China COVID-19 origins joint study team reveal lab leak concerns were referred to as "myths" and "conspiracy theories."

An advisory group assembled by the WHO said in June that the lab leak hypothesis needed further study.

The NIH said Friday that the prior problems it had identified with EcoHealth's handling of its coronavirus grant included "inadequate oversight in monitoring the activities of its subawardees, failure to report subawards to the General Services Administration's Federal Subaward Reporting System, and errors in indirect rate charges."

But Lauer nevertheless said EcoHealth might again soon start receiving U.S. tax funding for its bat coronavirus experiments — just without the Wuhan lab's continued involvement.

The NIH had been run until recently by Dr. Francis Collins, while Fauci still leads NIAID.

Scientists consulting with the U.S. government early in the pandemic believed COVID-19 originating from a lab in Wuhan was possible or even likely, but emails show Fauci and Collins worked behind the scenes to shut the hypothesis down.

Cheers,

Peter

Peter, can i share the proofs with Tony, confidentially of course? If not i will at least give him a heads up if that's ok

Also, correct me if i am wrong, but the 66k number is significantly higher than your previous estimate, right?

Some good news..

Just letting you all know that our paper in *Nature Communications* will go live tomorrow at 11am: Sánchez *et al.* "*A strategy to assess spillover risk of bat SARS-related coronaviruses in Southeast Asia*". We used distribution data from bats known to host SARSr-CoVs, human population data, and serological testing results to estimate that a median of ~66,000 people are infected by bat-origin SARSr-CoVs in South and Southeast Asia each year. Obviously, this suggests spillovers are a daily occurrence in the region and would make any possibility of a lab leak pale into insignificance, given that 1) only a few dozen people work in labs or in the field on these viruses, 2) they all wear PPE as opposed to villagers hunting bats etc.

Note that the analysis doesn't take into account people working in the wildlife trade because data are so patchy, but we do know that 14 million people worked in the wildlife trade in China alone before the outbreak, so that means human infections are probably even more common.

I've attached the proofs here, and a press release, as well as an editorial I've published in our journal *EcoHealth* published by Springer. We also know that a story will appear in orrow about this. tomorrow about this.

Cheers,

Peter

Bizarre indeed, but this is how they do it – tangential links from you to your former postdoc to Zhengli to me, followed by accusations that you're linked to research which they (wrongly) claim is GoF, all used to try to undermine your appropriate pushback against all these other attacks.

It's exactly what the Union of Concerned Scientists called the 'disinformation playbook' that was used by big tobacco and anti-climate change activists (successfully I might add). https://www.ucsusa.org/resources/disinformation- playbook

*****CAUTION:*** This email is not from a BCM Source. Only click links or open attachments you know are safe.**

I'll also report that the paper you cofunded with EcoHealth Alliance dealt with rWIV1-SHC014S, a chimeric virus shown to be very dangerous to mice with human airway cells, which biosafety experts consider to be gain of function, and which is already under GOP congressional investigators' microscope. Were you aware of this? Should you have disclosed this to your followers on Twitter and The Lancet Commission?

Please clarify if this is incorrect.

Thank you,
Emily

David:

I found 76 emails from you – like Jerry, they spanned the past year, from 8.23.22 to today. I've attached a listing of the subjects and dates. Since you'll most likely have copies of these emails on your computer, I haven't sent the complete text of the emails to avoid duplication. If you no longer have some of them, just highlight these on the list and send it back – then I'll forward those emails to you.

As ever,
Jeff

Hi David,

I have 49 emails from you in dating from August 23, 2022 to today, exactly one year to the day, and another set of 5 from September 17, 2022 to June 29, 2023. I have gone through them and none of them have the message that I recall seeing multiple times that you cannot discuss government business, have to drop out of the group emails we use to discuss the world and science, but want to hear about new information about the science of emerging infectious diseases.

I'm going to look through my sent email box this evening to see if anything I sent to you and still have a copy of is relevant.

I regularly delete stuff just to keep the file size down and mostly newer exchanges.

Jerry

Subject: Re: Follow-up Action: NARA Allegations of Unauthorized Records Destruction

PS, there is some urgency to my responding, with all the info i can dig up. Sorry to ask a favor but this is an important "ask".

I have told nih that i have NOT done what nih defines as "government business" on my gmail, but rather on several occasions, in emails, gmails, and phone calls, to you and others, have requested that personal emails to me or cc'd to me should be sent to my gmail, and even later, sent to my proton mail.

In my understanding, personal emails that are not business of the US govt, include things like discussing death threats to scientists, investigations of non nih scientists for alleged wrongdoing, discussions about defending scientific integrity, etc

As govt scientists we DO NOT lose first amendment rights, but cannot take public positions on matters of government policy unless we identify ourselves as citizens, ie, not as government employees. Hence we have all been trained to keep personal stuff or emails that reflect opinions which are not USG policies, off of NIH email, and by default onto private mails like gmail

That is what i believe i have done, with the extra caveat that since i was being continually foia'd i also wanted to prevent the personal and private opinions and concerns of my friends, ie, all of you, from showing up in the newspapers, and reduce the chance that your harrassments would be magnified

I hope you will recall and even find emails that are supportive of the fact that i said to all of you that i could not discuss govt business on emails, but please keep me in the loop for my info, and that you

should not expect me to respond although i wanted to know what was happening

Stuff like that.

Some of you know that as of yesterday, and thanks to Rich and (b) (6) (b) (6) guess, i now have legal representation. NIH will apparently be happy to throw me under the bus to appease the House Subcommittee, but even at my age i feel i am still highly productive scientifically and have much more to do, including development of covid and influenza vaccines with our molecular pathogenesis lab and with our nih vaccine research center

Thanks for your support, david

David,

In follow up to your email below, do you have any email correspondence in your possession that supports the following statement from your July 21, 2023, email below?

> *I have never done nih business on my gmail account. The misunderstanding of the subcommittee comes, I believe, from one facetious joking email I sent to a group of scientists-friends trying to support our colleagues (Daszak, Holmes, Rasmussen, and a few others, and by default Tony) who were being stalked and threatened with death by organized groups of people who believed scientists created the pandemic. The goal of these networking emails was to support these scientists, who are my friends and who were living in literal terror. However, since this wasn't really government business, and contained a lot of dark humor, and I knew that my emails had been and would be foia'd, potentially allowing their private worries to become public, I kept repeatedly trying to get them to stop sending stuff to my govt email.*

If so, please forward that entire string of emails to your NIH account as soon as possible and confirm that you have done so.

Thanks,

Jill

Thanks, Jill, this is helpful.

Just to clarify, I have never done nih business on my gmail account. The misunderstanding of the subcommittee comes, I believe, from one facetious joking email I sent to a group of scientists-friends trying to support our colleagues (Daszak, Holmes, Rasmussen, and a few others, and by default Tony) who were being stalked and threatened with death by organized groups of people who believed scientists created the pandemic. The goal of these networking emails was to support these scientists, who are my friends and who were living in literal terror. However, since this wasn't really government business, and contained a lot of dark humor, and I knew that my emails had been and would be foia'd, potentially allowing their private worries to become public, I kept repeatedly trying to get them to stop sending stuff to my govt email.

I noticed that on my list of 24 people, at least 9 are people with whom I have published scientific papers, 4 of those on COVID issues, so there will be a lot of emails about that, 100% on email.

Regarding the list you sent, I have already made a similar list from a combination of memory and all of the names on the 10 papers ID'd by the subcommittee. Probably 95+ percent of all of my correspondence with them will be in email, not gmail, and what's in gmail will be them sending my stuff and me not replying.

I didn't know about the 7 year thing but I recall that a couple years ago or so David Awwad told me that all my emails lived on the servers forever.

OK, focusing on my gmail now. The only other thing is my govt phone but I doubt there is anything on that. That should be easy to check…

TY,

David

Subject: Re: Notification and Action: NARA Allegations of Unauthorized Records Destruction

Jill, Mason is setting up my work station now, so i am over in B31 because we dont get a wifi signal over there

i did about an hours worth of hard copy searching earlier including printing out all ten of the documents requested. Some of them i recognize and at least one i probably sent sn emsil about, that was the Jerry Keusch paper, which i though was great and recall congratulating him on it

I also looked at the list of authors on those ten papers and compiled a sublist of all of those i might have corresponded with in the past, so that i can sesrch for emails to or from. The list is quite long but i don't expect to find much except for Peter Daszak and Jerry Keusch, two old friends who i have been regularly in touch with for years

Regarding a list of things i might have deleted, for both my email and gmail there isn't any one thing i remember

deleting, just my daily or frequent getting rid of emails. That would include some but not all of my emsils to and from all the folks named above. Most of my deletions are from inbox and sent mail, once i have read them to make sure i got the info. Emails that i have transferred to a folder , eg, regarding a manuscript, should still be there

Policy dictates that emails are retained by CIO/CIT for seven years from the date of deletion; therefore CIT can recover all items deleted from an NIH account.

One further thing that is a bit puzzling. The subcommittee has not asked anything about the published manuscript on the origin of covid 19 that i led, and which was available in spring 2020 and published in July. That was one of the most forceful and reasoned of the early papers that said the virus could only have come from a bat. At least 2-3 of the 9 co authors on that paper are on the list of authors of other papers the subcommittee requests. Should i send the emails with these authors which were about our paper even though they were not requested? Sounds like a semantic question, but the info base for all of us was pretty much the same, and all of the pspers published around that time came to pretty much the same conclusion. I am thinking to err on the side of over rather than under identifying emails and stuff

I agree that over identifying is better – I would include anything COVID related..

Finally, i am still a little unclear, should i be focusing how on finding gmails and sending to email, or the infinitely larger amount of stuff already in email that will take alot of time to identify? d

When you say "stuff already in email", do you mean in your government email? You should be focusing on correspondence in gmails or any other personal email accounts or any other text messaging or social media that were used to conduct and/or communicate NIH business and forwarding that to your NIH account.

If you forward emails from your gmail to your NIH account, NIH will be able to access them.

For pdfs and word documents, you can email to your government account with an subject line that denotes the contents and how it relates to the request.

As a reminder, you have also been requested to provide a detailed list (to me via email) of any communications that were deleted – see original memo for what to include in that list.

OK, i will ask IT how to do that

MORENS_SUBPOENA_016459
MORENS_NIH_034591
REL0000479040

You may come into the office to go through your files, but please notify me in advance of what days you plan to come in. I know you need to come in to deal with your computer – please let me know what day you plan to do this.

I had hoped to come in yesterday or today, but IT told me on both days that until further notice they cannot help me. And since my computer system in my office is apparently completely dead, I dont want to come in unless i can get something done

All of my hard copy files regarding all things covid are in my office in building 33. By chance, a month or so ago i spent a full day semi-organizing those and they are in maybe 5-6 3 inch binders plus maybe several up to 2 foot high stacks, only loosely organized Most of those are either pdfs of published scientific papers or printouts from Greg's news feeds, but there could be a handful of emails too. So i should be able to go through all of that in 1/2 a day, and am very doubtful there is anything in there of importance

Electronic versions of files are preferred as much as possible. The memo requests that you forward emails from your gmail to your government email, so no need to print those. Likewise, electronic files that you have can be emailed to your government account. For files that only exist in paper version, the preference would be to scan those and email to your government email.

Jill, a couple of clarifications here. Do you mean that anything i find in my gmail i just forward to my email and then what? NIH sends it all, or goes over it, or I do?

To be on the safe side should i for example forward to my email everything referring to or from/to the authors of the documents noted, which would save time in having to read endless pages of stuff that probably isnt relevant, or look only for specific things requested. For example, there maybe emails on which i was copied along with an author on one of those documents, but i didn't do anything about it. In otherwords should i cast a very wide net?

By other electronic files do you mean things like pdfs or word docs?

Regarding things that only exist in paper versions i dont expect to find any or at least very few, but scanning those should be easy, and then email to my nih nih email, right?

TY, david

Subject: Re: Notification and Action: NARA Allegations of Unauthorized Records Destruction

Jill, i have received this memorandum but as i am at home without a printer, is there a workaround way to sign it?

With respect to the NARA requests, the only way to fully respond is to go through documents which are at work, which isn't possible if i cannot go in to work

As I have said, to the best of my knowledge, i have never in my 25 years

at nih generated or worked on a record that would go to NARA, so it would be helpful to get a better idea of what i should be looking for and how can i be sure that the documents i have are or are not nara documents

A couple years ago David Awwad told me that all of our emails whether in our computer files or deleted can be retrieved by IT so is this something they can do? I have no way of retrieving the estimated million or more emails i must have deleted over the years

I have many hardcopy files that i can check but it will take time

Regarding all the 10 listed papers I have no memory of any of them with the possible exception of one called "proximal origins". I got that paper off pub med last week but didn't recognize that i had ever seen it before. If i did, it will be in my hard copy files since i have not pitched any of them. david

From 15mins on he talks about how I lied, our group lied, and how we're a small group with the "inside track" to NIH etc.

It's delusional and pretty offensive, frankly.

I didn't watch much of it, I have to write a grant application – unlike Jeff Sachs, I don't make my money from talking to the press and trashing other people…

Subject: A barrage of attacks against EHA in last week
Importance: High

I don't know if you're seeing any of the bad press we've been getting in the last few days, but it's been a rollercoaster week for us here.

MORENS_SUBPOENA_001756
MORENS_NIH_008133
REL0000479042

On the one hand, NIH has finally reversed the suspension of our China R01! We're currently renegotiating the terms, albeit without the capacity to collaborate with the WIV. We also got the notice of award on a new R01 to work in Vietnam, Laos and Myanmar to conduct human sampling in communities and clinics, and sampling of bats to identify the risk factors and degree of bat-CoV spillover in the region. Both are great news for us, but as soon as NIH put this on their public website, the harassment started.

We've now had articles in the Daily Mail, US Right to Know, The Intercept, https://theintercept.com/2022/10/04/ecohealth- alliance-lab-leak-nih-grant/?utm_source=twitter &utm_medium=social &utm_campaign=theintercept

.. and just now in the Financial Times criticizing the govt for funding us. https://www.ft.com/content/5504ad3a- eef2-49eb-b8dc-2a417d6f711c

One particularly hurtful quote in the FT is from Andrew Weber, who we previously had as a speaker at one of EcoHealth's Cosmos Club events in DC:
"Andrew Weber, who was assistant secretary of defence in the Obama administration and is now a senior fellow at the Council on Strategic Risks, called the work **'reckless, risky research with virtually no benefit to humanity'**". I get it that he has a political agenda, but surely anyone with half a brain can see that there's a benefit to finding out what viruses are spilling over from wildlife into people, particularly when they belong to the same viral clade as the one that caused SARS and COVID, and are infecting 60,000 people a year in SE Asia. What small minded person would allow politics to cloud their logic so blatantly.

We've also got Sen. Joni Ernst filing a bill to defund EcoHealth of all federal funding, and letters back and forth from the usual suspects (Republican members of Congress and Senators) attacking us with wild accusations of coverups and nefarious behavior.

Add to that a GAO request for a pile of documents (because Republicans asked them), and our first subpoena for documents. These last two mean weeks of work digging through emails, files and records, all for naught…

..and finally a disingenuous letter to NIH and CDC that cites a pile of BS about EcoHealth as an excuse to get CDC and NIH to review biosafety of field programs that work with wildlife – part of a growing anti-science luddism that threatens to close down our work and many others: https://republicans-energycommerce.house.gov/news/ec- republicans-press-nih-and-cdc-over-safety-gaps-with-virus-hunting-to-prevent-next-pandemic/

Looks like we're in for a rough road ahead…

One silver lining – the Honorable Dr. Fauci defending NIH's decision to fund our new R01 in a podcast: https://video.twimg.com/ext_tw_video/1577400180067995659/pu/vid/1284x720/KIyqU6NOK7zjvYio.mp4?tag=12

EXTERNAL SENDER

Just got word this afternoon from PNAS that it will appear as early as next Monday, October 10, and that the embargo ends that afternoon, although it may actually appear in any issue next week. Seems a bit strange to me, but the key is its no longer embargoed and will be in the journal next week.

That's an interesting suggestion Peter to compile a packet of key papers. The two questions are which papers, and what do we do with the packet?
As far as Jeff Sachs is concerned nothing surprises me any more. To his credit, he didn't accuse aliens working for the US Space Force of doing – maybe that's the next interview.

Jerry

By Michael Sims
Oct. 1, 2022

"Nobody," Donald Trump claimed in a March 2020 address, "had any idea." He was talking about the Covid virus — which had, seemingly overnight, sparked a global pandemic. In his compelling and terrifying new book, "Breathless: The Scientific Race to Defeat a Deadly Virus," the veteran science journalist David Quammen demonstrates just how much was known — and expected — by infectious disease scientists long before patrons of the Huanan Seafood Wholesale Market fell ill in December 2019 with a pneumonia-like virus.

"Soothsayer" isn't on Quammen's extensive résumé, but he was among those who had long predicted this kind of catastrophe. In 2012 he provided a field guide to the future, "Spillover," whose subtitle — "Animal Infections and the Next Human Pandemic" — explains exactly what the scientific community had long been expecting.

"This is a book about the science of SARS-CoV-2," he specifies in his new book. "The medical crisis of Covid-19, the heroism of health care workers and other people performing essential services, the unjustly distributed human suffering, and the egregious political malfeasance that made it all worse — those are topics for other books." Instead, he focuses his informed attention on the unsung heroes who dare to wrestle with viruses, those strange entities he calls "the dark angels of evolution." Human beings are part of a sprawling family of interconnected species who can share illness because they all grew up together. It is our common ancestry and related bodily ecology that makes spillover possible between, say, bats and Earth's (currently) dominant mammal.

Covid is, after all, as natural as a wolf cub or David Attenborough, and its thriller-level rate of evolution is part of its danger. "A virus is a parasite, yes," writes Quammen, "a genetic parasite, to be more precise, using the resources of other organisms to replicate its own genome." He demonstrates the sheer *weirdness* of viruses when he explains how difficult it is to even define them.

Quammen follows the story of Covid from scientists' first awareness of the outbreak in Wuhan through reports of Omicron in late 2021. Alongside the human story, spillover between humans and other animals is a persistent theme. Early in 2020, a dog in Hong Kong tested positive. There were positive cats in Minnesota, two positive hippos in Antwerp, a positive tiger in Knoxville. An outbreak spread through mink farms in the Netherlands. Last year, of the many white-tailed deer sampled in Pennsylvania, 44 percent tested positive. The persistent danger of spillover between species informs arguments over the virtues and

MORENS_SUBPOENA_001761
MORENS_NIH_008138
REL0000479042

the flaws of both approaches to pandemics: "prediction and prevention versus surveillance and response."

"Breathless" is so good that I was slow to realize that it lacks the vivid you-are-there details of "Spillover." That's because he *wasn't* there. In "Breathless," there are no scenes of an intrepid author helping trap macaques at a Sufi shrine or examining a white-footed mouse for Lyme-infested larval ticks. Among its other virtues, "Spillover" was something of a nightmare travel book, but "Breathless" is a different species of tour de force. Quammen's research methods have mutated. "I avoided airports for more than two years after Covid-19 exploded," he says up front, "and I got through the year 2020 on one tank of gas." Yet these barriers didn't prevent him from writing a luminous, passionate account of the defining crisis of our time — and the unprecedented international response to it. While many people were begging for mercy from the motley of gods that they also credit with designing this Eden for viruses, epidemiologists and vaccine scientists all over the world raced to save the lives of people they would never meet.

Citing Faulkner's multiple narrators, Quammen says, "The discernment of truth — let's make that 'truth,' because it's such an imperious and suspect word — comes from listening to many voices." He read a library's worth of books and Zoomed with some 95 sources — epidemiologists, geneticists and public health officials who were closely involved in research and decision-making. He smoothly weaves not only their facts, but their way of speaking, into his story. "Spoken words are data, in nonfiction," he says, "and I share scientists' respect for the sanctity of data." He provides a mini-biography of each interviewee. Backstage outtakes humanize the participants, as when Quammen asks Anthony Fauci whether Brad Pitt or Kate McKinnon did a better job of satirizing him. These glimpses undergird his assertion that science is "a rational process leading toward ever-clearer understanding of the material world, but it's also an activity performed by humans."

Quammen marries an old-fashioned love of colorful language to his passion for detail — an odd coupling that results not just in a lucid book about an important topic, but also in a book that's a pleasure to read. "What nature of bug seethed in this dollop of liquid human distress?" he asks of a private genome-sequencing company in Guangzhou. Sometimes his Chandleresque metaphors distract. (When the rate of infection among the deer spikes, it's "like popcorn in a hot pan.") Usually, however, his imagery vividly reinforces a point. He explains that a laboratory sample from bat feces "is not a virus, just as the text of 'Hamlet, Prince of Denmark' is not a performed play" — that the sample is, instead, "the script of a virus." Quammen can't resist snarking that Trump, "as you may have heard, is not a scientific sophisticate," but he doesn't waste much time shooting at such an easy target. He describes Elon Musk as an "entrepreneur and spaceman," and Alex Azar, the secretary of health and human services, as "pliable." The "Intelligence Community" is "a bodacious aggregation of intelligences" that includes Space Delta 7 — "within the United States Space Force, whatever that is." Didier Raoult, the French physician who promoted hydroxychloroquine, Quammen terms a "prideful contrarian." Hydroxychloroquine did indeed have a history of prescription for malaria, and, he deduces, presumably, "Trump listened to people who listened to people who listened to Didier Raoult."

While staying on mission, Quammen allows himself room for context. The importance of the February 2020 announcement that scientists had found in pangolins a close match to the virus infecting humans makes more sense — both scientific and narrative — because Quammen begins with a brief survey course on these armored-looking, anteater-like creatures. He smoothly interweaves their evolution, the ecological sin of animal trafficking, the imaginary pharmacological virtues of pangolin scales (which are actually mostly keratin) and the contemporary "vogue in urban China for *ye wei*, or 'wild tastes.'"

"This virus is going to be with us forever," Quammen warns, with a wealth of data and precedent to support him. We haven't eradicated polio or measles. "And those viruses have nowhere to hide except within humans." This one could be cleared from every living human, and still exist in other animals. "Covid-19 won't be our last pandemic of the 21st century. It probably won't be our worst." In our international world, as one scientist tells Quammen, "A disease anywhere is a disease everywhere."

Michael Sims's books include "Adam's Navel" and a companion volume to the National Geographic Channel series "In the Womb: Animals."

EXTERNAL SENDER

Jerry, The way it works with Tony, at least at my level, is you can't suggest he do anything. If you do, he won't do it on principle. The trick is to make him think of doing something himself, and then he will ask you to help him do it

My strategy tomorrow is to tell him that alarming things are at work, to the point that many scientists (our grantees and others) have become increasingly worried and are looking for the way forward. In that context i will share with him verbally Peter's information, and offer to get to him any of the materials he wants to see, or connect him directly with Peter, who he very much respects

I have not heard that he has engaged Harold, or the National Academies, or the professional societies, although i might not know if he did. He is very much a loner about things like this. He prides himself on being like teflon, but I am worried that he may not be as invulnerable as he may think

Our Chief of Staff, Greg Folkers (who has Masters degrees in both journalism and PH), is among the only folks here, partly excepting Cliff Lane, in whom Tony confides when the subject is difficult or personal, only rarely to me.... and Greg told me today that he thinks Tony is getting worried that the brown stuff is about to hit the fan, and that he may have become a major target

There is very little i can do to help because i am a mere scientist, not a NL, or member of the NAM, or head of a prestigious society (the only kinds of people Tony will usually engage with, as he is very proud).

So if he doesn't become more proactive, what remains is for scientists and science orgs at the very highest level to come together forcefully to push back against the craziness

Who would be willing to approach him directly and "talk turkey"? Harold? Rich? You? Victor? A couple of you?

Jerry, i am traveling without much news access, but this is really depressing. My concern has grown to alarm and i am afraid to think what comes next

We seem to have arrived at that Orwellian point where all investigations of important matters have to exclude participation of the subject experts, since being a subject expert is disqualifying on the grounds that all expertise is inherently biasing.

Before George Orwell, we had Lewis Carroll telling us this. We are in grave danger of going down-the-rabbit-hole-with-Alice.....

On Apr 21, 2021, at 14:36, Keusch, Gerald T [b6] wrote:

The COVID Commission Planning Group includes people like Mike Osterholm. I don't put him into the category of Lipsitch, but am I missing something here? He was one of the people on the Biden COVID task force I talked to in December-January about the shattered integrity at the level of NIH/OD. He didn't say much to me, and I didn't take that as a signal that he was on the darker side of the divide.

I saw the results of a focus group of Trump supporters reported on today: https://www.washingtonpost.com/health/2021/04/20/vaccine- hesitant-republicans/ A bit of text in this report is about Tony.

"Every participant said they preferred hearing from politicians over the medical expert, who has been pilloried by conservative media for months over his coronavirus warnings. The data have shown that unfortunately Dr. Fauci has been politicized, and we need different messengers, because even the right messages coming from the wrong

messengers aren't always helpful," Castrucci said, noting his foundation's polling [de Beaumont Foundation] found Americans trust their personal doctors more than the government's top infectious-disease doctor".

This is the fundamental problem we have, as the politicians will only use this as an echo chamber to amplify their support from their public supporters and constituents. It does point back to the scientific societies which have weighed in previously, but no more impact than we have had as individuals. It doesn't stop this approach, its just that we need some deus ex machina to help us. Is that going to be Eric Lander? What's happening with his approval? I haven't heard much of late.

Jerry

Thanks for the email David - comments below. Also please see the attached word doc with links to some of the political actions that I'm concerned about. Tell Tony that this is very early days, with most of these coming from the Right, and many that can be headed off at the pass by positive outreach to Democrats, which I believe people will be doing.

I've also put in a link to the new " Covid Commission Planning Group (Covid CPG)" that has no official role from USG, but boldly states as its core mission "to prepare the way for a National Covid Commission". Members include David Relman & Marc Lipsitch and I have heard from many on the conspiracy theory chatter networks online that this will focus partly on advocating for reduction in biosafety labs, viral work in wildlife, and gain-of-function.

Please feel free to share any docs that I've sent to you, with Tony. Hopefully you can do that in a way that avoids FoIA, and if not possible, just show him stuff on screen share on Zoom.

Please also see comments below...

Cheers,

Peter

Subject: Zoom meeting with Tony tomorrow

Peter, i am on leave in Florida for my granddaughters graduation from Florida State

Tomorrow at 130 i will be having a zoom call with Tony to tip him off on some of the info you sent in your recent email

I want to be sure about what info or docs you would or would not want me to share
[Peter Daszak:] Any and all

Other than what i see on tv, the jousting with Rand Paul and Jim Jordan, for example, i do not know how much of this Tony is aware of. To my knowledge he doesn't share it with anyone up here

I think issues he will be most concerned about are not your grant, although i add i am sure he would do anything he could to restore the funds and get the hellhounds of your back, but rather 1) the possibility that people like Rep Rodgers and her committee are about to turn up the heat and put Tony, personally, in their crosshairs, and 2) the possibility the NIH funded scientists or other esteemed scientists, are in cahoots with politicians wanting to attack him or niaid
[Peter Daszak:] agreed

As background, we all went through the original version of this crap about 10 years ago with the original GOF attacks surrounding H5N1. As Tony's scientific advisor, i spent much of the year, along with Jeff T, helping brief him and get him up to speed, which he did. At the time, David Relman, who had been one of Tony's favorites, was leading the charge, and we all wondered why a young guy with so much promise would choose demagoguery over science. Lipsitch was only a minor player at that time, but relished his attack role and seem to become more alarmist as time went on. Now these guys are in the NAM. How did that happen???? Ebright has always been a crackpot, in the mold of Peter Duseberg, remember him?, and no one took him seriously except some of the press who didn't know any better
[Peter Daszak:] I had the unfortunate issue of voting on Marc Lipsitch's

MORENS_SUBPOENA_013989
MORENS_NIH_026528
REL0000479043

membership of NAM. He's an accomplished scientist. He's also very opinionated, arrogant and pushy on whatever issue he believes in. I voted on his science acumen.

I was unclear from your email on a couple points you might clarify. Obviously the Rodgers letter asking you to produce all those dox not only overlaps with the Lauer letter to you, but could not have been written without the help of a virologist.
[Peter Daszak:] I have it on good authority (Ebright's Twitter account) that he was involved. They are also getting pressured from Jamie Metzl who's working with the internet conspiracy networks actively to promote their "Research"

Actually, given that there are a few points in the letter that someone knowledgable about coronavirus virology would have corrected, my suspicion is that the letter was put together with the help of a legitimate scientist who needs to do more homework on coronaviruses.
[Peter Daszak:] you're right..! Metzl isn't a virologist, neither's Ebright. The internet 'researchers' are led by a banker and some junior scientists, many from human genetics, mol boil world.

Do you agree, and do you think that person was Ebright? Do you think Relman, Lipsitch, Imperiale, or other current or former grantees might have been involved?

I am not sure we ever funded Ebright, but we did fund the others. I would like to think that Relman et all are only mouthing off to the press, but do you think there is more to it than that, eg, that any of them are working with the politicians?
[Peter Daszak:] David Relman is talking with reporters a lot about this, including casting aspersions on my motives for speaking out about this virus emerging via wildlife-to-human spillover (he's quoted as saying my motives are to protect the research I've been doing and reputations of our collaborators). Ebright is very actively (and obnoxiously) critical on social media calling me a 'Grifter' on a weekly basis and promoting unsubstantiated arguments for a lab leak. I had to look up what 'grifter' meant at first...

Your earlier comments about this proposed investigative committee, and the possible role of these folks in it, are alarming. Can you be more specific about where this stands and what is being done to forward it and to squelch it?
[Peter Daszak:] Nothing's being done to squelch it, and neither should it be - there will be other committees that also pop up. My concern is their bold claim that they're laying the groundwork for a 9/11 type commission (and have a 9/11 commission person involved). It may be that just by saying that a lot, and having well known people involved, they end up forming one. They're clearly politically connected and are advocating for this politically. Jerry and I also proposed this in our paper published in Health Affairs, but we assumed this would be led by NAM or some other well-respected institution.

When i speak with Tony i do not want to step into the politics of all this, as that's not my job and he wouldn't want me to. If he needs further info it might be best to connect you two, in an off the record manner. Would that be OK? We are getting FOIA'd non stop, so it's most important that Tony not have anything on the record that could come back to bite
[Peter Daszak:] Totally agree. Tell him I'm happy to speak with him at any time and will do so in a way that's not FoIA-ble. One thing I could do is

MORENS_SUBPOENA_013990
MORENS_NIH_026529
REL0000479043

either on a zoom call or by sending you a document, is lay out responses to the Mendendez questions so that the arguments are known and well-supported. For example, everyone's saying that this is a 'gain-of-function' issue, but actually that's not the case - we worked on bat viruses, not human pathogens. The expts produced loss of function, not gain of function, all appropriate conditions and approvals were demonstrably checked and correctly answered.

Finally, i didn't read all of the Menendez bill-in-committee, which is longer than Les misérables, but what's the gist? Do you think that in their zeal to take a hard stance against the PRC, these Democrats are purposely, or accidentally, getting sucked into the evil-WIV scenario? Is there real danger here?
[Peter Daszak:] The Menendez bill is the only one that stands a chance so far of becoming law because it's bipartisan. The WIV, gain-of-function stuff is thrown in as a very small part of it. The draft wording only calls for a report from NIH after 180 days on these issues, and they are easily addressed. However, if it does pass and the anti-China mood hardens in the US, it may end up with calls to testify and the Republicans may use that to undermine NIH, and in particular Tony, given the rabid GoF myth they've been building.

Anything you think might be helpful, I'd appreciate

TY, david

Spot on – that reporter is Emily Kopp who works for US Right to Know. They're straight out of the McCarthy Era –They FoIA emails, then write to you to ask questions, then whatever you say, they write the same story about how you lied, covered up and generally were 'likely' up to no good.

All I can say is that it's my honor to (likely) be in the same soon-to-be-published BS story from this group along with your esteemed self…

Here are some of their stories on our work. Each one is chock-full of lies, innuendo, mistakes, deliberate omissions etc.…

https://usrtk.org/biohazards- blog/another-missing-database-ecohealth-project-in-southeast-asia-is-under-construction/ (

https://rollcall.com/2021/10/22/nih- grantee-in-wuhan-faces-questions-deadline-for-more-information-on-research/

https://usrtk.org/biohazards- blog/virus-hunter-siphoned-funds-for-global-virome-project/

We've responded to them when they send email questions, sometimes, but I'm not sure if it's worth it – they usually just publish the same narrative. It also gives some legitimacy to their attacks by making you sound defensive when you argue back against these pretty offensive innuendo filled accusations. It also makes their articles look like normal journalism – which it is not!

Cheers,

Peter

Dr. Hotez,

I received an anonymous tip regarding an apparent conflict of interest relevant to your criticism of the GOP investigation into the possibility that a lab accident sparked the pandemic.

The tipster pointed out that your grant to develop a SARS vaccine was in part motivated by the possibility that a lab accident or bioterrorist attack could result in a SARS outbreak.

Questions:

1. Could you please clarify why you believe the lab origin theory of SARS-CoV-2 is ridiculous pseudoscience, even though you did research under the presumption that a SARS-like virus escaping from a laboratory was possible? Taxpayers devoted $1.6 million in funding toward that project - was it under pseudoscientific pretenses?

2. Could you clarify your involvement in this research project underwritten by both your grant and EcoHealth Alliance's controversial "understanding the risk of bat coronavirus emergence" grant? Do you have a personal or professional relationship with Shi Zhengli? What about Peter Daszak? Have you ever funded or co-funded research at the Wuhan Institute of Virology?

Thank you,

--

It was an awful experience – Republicans repeatedly calling for us to be debarred, Democrats saying 'while ecohealth didn't cause covid, their behavior with Federal grant compliance raises serious questions as to whether they should receive federal funding in the future'.

I did a good job from what I'm hearing overall, on defending our work, and the issues they're coming after us on are of no real consequence (a late NIH report, margin notes in a draft proposal etc.), but used to paint a picture of a deceptive organization. I've spoken with Jeff about why the Dems are seemingly ready to throw us under a bus, and he believes it's partly because the SSCP has come up with nothing and this would be a 'scalp' for them to wave around. Secondly, the politics for the Dems are all about winning in November, so they're happy to defend NIH and point the finger at EcoHealth, even though many of the issues they highlighted were due to NIH bureaucratic sluggishness, rather than any genuine issue with EHA.

We're going to pick apart the democrat and Republican reports finding-by-finding, draft rebuttal statements and probably

set up a press conference next week. The next phase will now be fighting to try to make sure we aren't debarred.

Cheers,

Peter

His testimony is full of similar comments. I think he's basically covering his ass, protecting himself from the harassment I've gone through.

It's ugly, and a shame he joined in throwing us under the bus with some of his comments.

Brave, honest, noble people are hard to come by, and often vilified themselves when they stand up against bullying, but all of you already know that!

I pushed back hard today against him saying that the biosafety standards in China were below the US – they weren't and they aren't – it's written into the mandatory rules in China and the BMBL - I tried to read chapter and verse, and I hope it helped in some way…

Cheers,

Peter

Ralph Baric, Whose Virology Techniques Were Used in Wuhan, Testified That Lab Leak Was Possible

The UNC coronavirologist who has collaborated on gain-of-function research with the Wuhan Institute of Virology's Shi Zhengli, told congressional investigators that he has long worried about biosafety protocols inside China. Though he thinks it's far more likely COVID-19 originated in nature, he said of a possible laboratory escape, "You can't rule that out."

By Katherine Eban

May 1, 2024

Ralph Baric, researcher and lab leader at North Carolina's Gillings School of Global Public Health, sits for a photograph in Chapel Hill, North Carolina, U.S., on Friday, Feb. 14, 2020.ILLUSTRATION BY PAMELA WANG. Photo by Christopher Janaro/Bloomberg/Getty Images.

In 2015, **Ralph S. Baric,** arguably the world's most accomplished coronavirologist, published groundbreaking research with **Shi Zhengli,** the leading coronavirus researcher at the Wuhan Institute of Virology.

They had mixed components of different coronaviruses and created an artificial virus, or chimera, that could infect human cells. The research helped crystallize the threat posed by bat coronaviruses

MORENS_NIH_044864
REL0000479054

lurking in nature. But the experiments were dangerous too. In 2014, while their research was underway, the Obama administration enacted a pause on so-called gain-of-function research that could increase the virulence or transmissibility of certain viruses. Baric and Shi even flagged the dangers of the research themselves, writing, "Scientific review panels may deem similar studies…too risky to pursue."

The experiments were done in Baric's well-secured laboratory in Chapel Hill, North Carolina. Afterward, however, Shi's team at the WIV continued to utilize Baric's cutting-edge research techniques. Their work was funded in part with a US research grant.

Baric testified that he had specifically warned Shi Zhengli that the WIV's critical coronavirus research was being conducted in labs with insufficient biosafety protections.

Amid competing theories about the origins of SARS-CoV-2, the virus that causes COVID-19—including whether it could have originated in a Wuhan laboratory—Baric has become a figure of intense interest. After all, he had pioneered techniques the WIV was using, including one that allows researchers to invisibly splice components of viruses together without leaving a trace.

For the last three years, as the COVID-19 origins debate has grown increasingly toxic, a small army of global sleuths and Freedom of Information petitioners have taken aim at Baric's emails and research documents, hoping to uncover information about the true genetic-engineering capabilities of the WIV scientists, the ongoing research they were pursuing, and the viral genome sequences they had in their possession prior to the pandemic.

Through it all, Baric has kept mostly silent—until now. On January 22, he gave a six-hour interview to investigators from two Republican-led House committees: the Oversight and Accountability's Select Subcommittee on the Coronavirus Pandemic, and Energy and Commerce's Subcommittee on Oversight and Investigations. Though the committees have not yet made his testimony public, *Vanity Fair* has exclusively reviewed his statements. While not formally under oath, Baric was required by federal law to answer truthfully. (Through a University of North Carolina-Chapel Hill spokesperson, Baric declined to comment for this article.)

While there is little in the 212-page transcript that is likely to markedly shift the debate on how COVID-19 originated, the picture that emerges is of an American scientist who is deeply wary of his Chinese counterparts and has no way of knowing if or how they may have made use of the groundbreaking research techniques he developed.

Perhaps most notably, Baric testified that he had specifically warned Shi Zhengli that the WIV's critical coronavirus research was being conducted in labs with insufficient biosafety protections. When he urged her to move the work to a more secure biosafety level 3 (BSL-3) lab, he testified that she did not heed his recommendation. Because the WIV continued to perform coronavirus research at what he considers an inappropriately low biosafety level, Baric said of a laboratory accident, "You can't rule that out…. You just can't."

"Clearly, the market was a conduit for expansion," Baric testified. "Is that where it started? I don't think so."

In an email turned over to the Select Subcommittee as part of its investigation, Baric told **Peter Daszak,** president of the scientific nonprofit EcoHealth Alliance, that it was "a load of BS" to suggest that the WIV conducted coronavirus research in labs with sufficient biosafety protocols.

Baric told congressional investigators that he believes it's far more likely that SARS-CoV-2 spilled over naturally from animals to humans, given the sheer abundance of viruses in nature. But he also said in his testimony that he disagrees with the most widely promulgated spillover argument: that the virus leapt from infected animals to people at the Huanan Seafood Wholesale Market, where it first burst into public view in December 2019. The argument does not hold up, he said, because genomic evidence suggests that COVID-19 was already circulating in the human population by mid-to-late October. "Clearly, the market was a conduit for expansion," he testified. "Is that where it started? I don't think so."

Baric also weighed in on a controversy that has pitted Dr. **Anthony Fauci** against Senator **Rand Paul** (R-KY), who has leveraged his credentials as an eye doctor to position himself as a crusader against America's scientific and medical establishments. In contentious Senate hearings, Fauci has

repeatedly denied Paul's claims that the National Institute of Allergy and Infectious Diseases, which Fauci led at the time, had funded gain-of-function research at the WIV. However, Baric told investigators that the experiment in dispute, in which technicians created a chimeric virus that made lab mice sicker, was "absolutely" gain-of-function research: "You can't argue with that." He also said he felt that the experiment's results should have triggered regulatory review.

The federal grant money for the experiment in question, which was conducted at the WIV sometime between 2018 and 2019, was funneled through EcoHealth Alliance. It was Daszak, EcoHealth's president, who organized an open letter in the *Lancet* medical journal early in the pandemic that helped paint the lab-leak hypothesis as a baseless conspiracy theory. Today, the Select Subcommittee is expected to release a report that calls for NIH to recommend that EcoHealth Alliance, and Daszak personally, be debarred from receiving federal funds. As part of its investigation into COVID-19's origins, the Select Subcommittee is holding a series of hearings. Daszak is scheduled to testify publicly today, and Fauci is set to do so on June 3.

America's intelligence agencies remain divided over whether SARS-CoV-2 came from a natural spillover or a lab accident. US Health and Human Services Secretary **Xavier Becerra** recently said the question may "never" be answered "unless China opens up some more."

The single biggest issue to jump from the pages of Baric's testimony is his persistent concern over unsafe research practices at the WIV. Some of Shi's research papers, he said, "actually stated that they were doing the culturing work under BSL-2." BSL-3 labs typically require negative pressure air flow, HEPA air filtration systems, and full Tyvek suits for lab workers—all to protect against leaks. BSL-2 laboratories do not require specialized air filtration or full gowns.

Throughout his interview, Baric took pains to emphasize to congressional investigators that he had not simply turned over his research techniques to his colleagues at the WIV. Referring to his 2015 research with Shi, he said, "Although we published the approaches for how to build molecular clones of coronaviruses, we never had anyone from Dr. Shi's lab or any of the Wuhan Institute of Virology come to our lab and train. We never taught them."

His trust was violated on at least one occasion, he said. In order to test the ability of different viruses to infect humans, Baric had engineered mice with lungs that contained a human gene. He said he shared these mice with the WIV under a contractual agreement that they only be used there. Then, during the pandemic, he said he discovered that his mice were being offered for sale by a commercial company. The profiteering, he told investigators, was "infuriating."

As Baric recounted to congressional investigators, Shi's earlier work was "very vague about safety conditions. They said they followed Chinese regulations." But in two subsequent papers, said Baric, "They actually stated that they were doing the culturing work under BSL-2.... And then they continued that even into September of 2020, which I thought was irresponsible." (Neither Shi Zhengli nor a spokesperson for the Wuhan Institute of Virology responded to requests for comment.)

Baric told the committee that, from his earliest days working with zoonotic coronaviruses, he always understood there was a real if "rare" chance that one could prove infectious to humans. "And if that's your hypothesis, then you do it under BSL-3," he said. "So I kind of set the standard in the United States."

But the WIV, he said, operated under a looser set of biosafety protocols. "Their regulations state pretty clearly that they don't consider culturing bat viruses at BSL-2 as a biosafety concern," he said. "I also had that verbally confirmed by Zhengli Shi at a meeting in Harbin, when I was telling her she should move it all to BSL-3 and the reasons why." (Less than a year into the pandemic, the Chinese government passed legislation that tightened the nation's laboratory safety practices.)

The dispute over biosafety arose again in 2018, as Baric and Shi worked with Daszak on a grant proposal to collect SARS-like bat coronaviruses and insert a genetic component called a furin cleavage site that would enable them to more easily infect human cells. The proposal has since drawn attention because, when SARS-CoV-2 subsequently emerged in Wuhan, it possessed a furin cleavage site, making it unique among SARS-related coronaviruses. The 2018 proposal was submitted by Daszak to the Pentagon research and development agency DARPA.

Last December, a Freedom of Information research group called U.S. Right to Know released

margin comments from an early draft of the grant proposal. In one, Peter Daszak tagged his collaborators and said, "Ralph. Zhengli. If we win this contract, I do not propose that all of this work will necessarily be conducted by Ralph, but I do want to stress the US side of this proposal so that DARPA are comfortable with our team. Once we get the funds, we can then allocate who does what exact work, and I believe that a lot of these assays can be done in Wuhan as well."

The early draft stipulated that the research would be done at a BSL-2 level, making it "highly cost-effective." Baric objected to this in a margin comment of his own: "IN the US, these recombinant SARS CoV are studied under BSL3, not BSL2, especially important for those that are able to bind and replicate in primary human cells. In china, might be growin these virus under bsl2. US researchers will likely freak out." In the finished proposal, BSL-2 was changed to BSL-3.

Baric told congressional investigators that he wrote the margin comment to Daszak "to make sure he pays attention." He added, "First, I'm informing him, just in case he doesn't know, that a lot of the virus discovery work and culturing work that the Chinese do with zoonotic coronaviruses is done at BSL-2…. I'm letting him know there's a difference."

After a congressional investigator observed, "It appears there may have been a willingness, not necessarily by you, to do some of this work in the BSL-2 in China," Baric responded, "There was no willingness on my part to do any of this work…. Let me make that clear." He subsequently clarified, "My role was to study a couple of the viruses that the Wuhan Institute of Virology found that they were willing to share with me."

DARPA rejected the grant, but questions have persisted over whether WIV scientists carried out the proposed research anyway. Baric told congressional investigators that he doesn't know whether the WIV continued the research or got other funding for it. He added that he does not believe SARS-CoV-2 was engineered and discounted a 2022 paper making that argument as "biostatistical BS." **Alex Washburne,** one of the paper's authors, told *Vanity Fair,* "Baric doesn't provide any scientific evidence or reasoning that would lead us to revisit our results or change our theory."

In May 2021, Baric signed an open letter in the journal *Science* affirming that the lab and natural origin hypotheses are both viable and calling for further investigation. A fellow scientist, Columbia University virologist **Ian Lipkin,** questioned him about why he signed the letter. In response, Baric told the subcommittee, "I sent him a couple of papers that the Chinese had published where they were doing virus discovery work under BSL-2 conditions, which is one of the main reasons why I felt that the potential laboratory escape hypothesis shouldn't be, in essence, put under the rug."

"You believe this was appropriate containment if you want but don't expect me to believe it," Baric wrote Daszak. "Moreover, don't insult my intelligence by trying to feed me this load of BS."

Baric's signing of that letter also precipitated a testy email exchange with Daszak over the WIV's safety standards, obtained by *Vanity Fair.* Daszak enumerated to Baric the various ways in which China's lab safety standards did not lag far behind US standards. He added, "We checked with Zhengli, who let us know that she used 'BSL-2 with negative pressure and appropriate PPE.'"

This brought a withering response from Baric. "Bsl2 with negative pressure, give me a break." He pointed out that even Shi's most recent papers never defined the safety precautions used. "Yes china has the right to set their own policy. You believe this was appropriate containment if you want but don't expect me to believe it. Moreover, don't insult my intelligence by trying to feed me this load of BS."

Reached for comment, Daszak told *Vanity Fair* that the WIV performed its animal infection experiments "at BSL-3, as per work at Dr. Baric's lab in the USA." He also stated that the research rejected by DARPA was "never done," and said that the proposal called for only work that "did not involve any infectious materials" to be done in a BSL-2 facility at the WIV. Regarding the Subcommittee's call for the NIH to recommend debarring him and EcoHealth Alliance from receiving federal funds, he said he hadn't yet seen the report and couldn't comment on it. However, he stated that EcoHealth Alliance has "cooperated fully and expeditiously with the NIH on additional oversight measures since 2020" and shared a letter from last October in which the NIH deemed the nonprofit compliant with oversight requirements.

MORENS_NIH_044867
REL0000479054

Another signatory to the May 2021 letter was Dr. **Michael Worobey,** who has since become a leading proponent of the theory that the virus spilled over from infected animals at the Huanan Seafood Wholesale Market.

In 2022, Worobey and a team of international scientists published an influential research paper that used a geospatial analysis of early infections in Wuhan to make a case for the market spillover theory. Using data collected by Chinese scientists, Worobey's team later also published evidence in a preprint that virus-susceptible mammals, such as raccoon dogs, were present at the market.

When prominent virologists state that the preponderance of evidence points to a natural origin, they are often referring to Worobey's research. Baric, for his part, told congressional investigators that Worobey's geospatial study has a "major problem" with its timeline. He told the subcommittee, "The only thing we have really solid data [for] is that the market was the site of amplification in late December, January. That's still two months from the origin date, based on a molecular clock, which means it was circulating somewhere before it got there. And the question is, where was it?"

Baric said the earliest cases are "almost impossible" to document because many were asymptomatic. "It's a fundamental problem with the papers that are reported to prove—they write it too strong, I think, but they're very passionate about their data. And to be fair to them, it is the best data that's out there." He went on to critique the papers' claim of two independent jumps from different infected animals at the market based on the presence of two different lineages of the virus. "It's a stretch," he said, adding that his view is shared by "a lot of virologists that look at that data and go, mmm."

Calling the evidence for a market origin "powerful," Worobey told *Vanity Fair* that he thinks the first jump from animals to humans happened in November. Baric, he said, "possesses essentially no expertise in the subjects of the papers he is commenting on…. It is irresponsible for him to share these views with anyone without also making it clear that he is in no better position than the average educated person to judge this work."

In his testimony, Baric was equivocal on the question of whether WIV scientists could have possessed SARS-CoV-2, or a very close progenitor, prior to the pandemic. There "was evidence that they were building chimeras" and "doing some discovery work about the functions of spike genes of zoonotic strains that they discovered later on, but I don't know if they did any of the engineering or anything."

Without further disclosure from China, the answer may be unknowable. As Baric told congressional investigators, "If you had access to the laboratory notebooks, if you had access to the safety records of the Wuhan Institute of Virology, if you had access to the sequence databases, the level of assurance that you would have would be greater. No question."

"Which we didn't really have?" a congressional investigator asked.

"Which we don't really have," Baric responded. "That's very true."

---

Dear colleagues,

I just wanted to share a paper that will be coming out this week that maps the high-risk 'hotspots' for where the next SARSr-CoV might emerge. We've spent the last few months analyzing all available information from our many studies in China and Southeast Asia and those published by other groups. Our results show that both China and many highly-populated parts of Southeast Asia are at high risk for future spillover of SARS- and COVID-like viruses. We also used data on seroprevalence of bat SARSr-CoVs and other bat viruses to estimate the number of people in the region who are likely infected – 400,000 each year on average – most of whom probably don't realize they've got a new bat virus, some of whom might have symptoms but dismiss it as a bad cold or flu.

I've attached the paper, supplementary material and a 'narrative' that we used internally. The main points, in my opinion are:

- This is a definitive analysis of where on the planet the next SARS- or COVID-like virus is most likely to emerge next. It uses data on all known bat hosts of SARS-related CoVs to build a map of where the viruses could possibly be located. It then assesses where people are living and the overlap between the two. We find that the hotspots for spillover of these viruses extends from South China all the way across Southeast Asia – a densely populated region with an active wildlife trade and many other ways of people being exposed.

- The hotspots maps can be used for 3 purposes: 1) to conduct better surveillance in people to catch a new outbreak before it spreads; 2) to work with communities to reduce high-risk behavior like visiting bat caves, hunting and eating wildlife; 3) to hunt for the source of COVID-19 – these are the places where the initial spillover of SARS-CoV-2 likely happened

- We then looked at data from our studies of communities in rural China prior to the COVID outbreak. We'd found evidence that small numbers of people had antibodies to bat SARS-related CoVs, meaning they'd been previously infected, perhaps even without knowing. At some sites almost 3% of people tested positive for bat-CoVs. We used data from this and other studies of bat viruses to estimate how long antibodies persist in people, and then to calculate how many people would be infected annually. Our work suggests that an average of 400,000 people in South China and Southeast Asia are likely infected each year by SARS-related bat coronaviruses. This active high-risk interface is a top priority for surveillance and disease prevention

- Relevance to COVID origins work: Our findings support other scientific work that suggests the spillover of these viruses occurs regularly, and that spillover from bats to people, perhaps through an intermediate host in a wildlife farm or market, is the most likely pathway for emergence of COVID-19.

- Because there's so little information mapping the extensive wildlife farms and trade networks in the region, we expect the risk of infection is even higher – 14 million people worked in the wildlife trade in China in 2016, and at the beginning of the COVID outbreak, this was a very active risk for spillover because many of the animals in these farms and markets could carry coronaviruses.

- While we don't often see bats, they are abundant and diverse in this region and many species are able to host coronaviruses. People are likely exposed by contamination of food or surfaces by bat excrement or urine, by hunting butchering and eating wildlife including bats (common in some regions), by living near bat caves or sheltering in them, or by other high risk activities like digging for bat guano as a fertilizer without appropriate PPE

- EcoHealth Alliance conducted this work as part of its NIH-NIAID funded Center for Research in Emerging Infectious Diseases Contract – 1U01AI151797 "EID-SEARCH", and will use this research to better target surveillance in

communities and clinics to identify and prevent spillovers and outbreaks, and to build capacity in the region to protect communities there, and all of us from emerging viral threats.

Hope you enjoy the read. I'll send you a link to the preprint server once it comes online (takes them a few days to put it up so don't know when that will be).

Cheers,

Peter

Its an insane diatribe. I first wondered what in the world was going on at McMaster but then I found on the web that he had an unpaid part-time position there – seems like they got what they paid for. I also found a link to a letter from Jim Clyburn to him in April last year asking him to testify before the House Select Committee

(https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcoronavirus.house.gov%2Fsites%2Fdemocrats.04-08.Clyburn%2520to%2520Alexander%2520re%2520COVID%2520Response%2520.pdf&data=05%7C01%7Cdmorens%40niaid.nih.gov%7Cf28037c58d304641f6c908db8a1154df%7C14b77578977342d585&sdata=kvI1D0t1VHFNHZYJjZ6QpYlZuwt8RnxFkniilZEWxwY%3D &reserved=0).
I gather he never showed up.

Who is he networked with? The incoming far out Republican right?

Jerry

Press Release

New Staff Report Dismantles Republican Allegations That Dr. Fauci Funded Research Causing COVID-19, Lied about Gain-of-Function Research, and Orchestrated a Campaign to Suppress the Lab Leak Theory

Washington, D.C. (June 3, 2024)—Today, Rep. Raul Ruiz, M.D., Ranking Member of the Select Subcommittee on the Coronavirus Pandemic, released a **new staff report** ahead of the Select Subcommittee's hearing with Dr. Anthony Fauci, former Director of the National Institute of Allergy and Infectious Diseases (NIAID). Today's staff report is based on a transcribed interview with Dr. Fauci, as well as more than a dozen transcribed interviews with other current and former federal officials and scientists.

"Under the guise of investigating the pandemic's origins, House Republicans have abdicated their responsibility to objectively examine how COVID-19 came to be—and instead weaponized concerns about a lab-related origin to fuel sentiment against our nation's scientists and public health officials for partisan gain. After fifteen months, the Select Subcommittee still does not possess a shred of evidence to substantiate these extreme allegations that Republicans have levied against Dr. Fauci for nearly four years," said Ranking Member Ruiz.

Select Subcommittee Republicans have accused Dr. Fauci of funding research through the EcoHealth Alliance grant that caused the COVID-19 pandemic; lying about gain-of-function research in Wuhan, China; and orchestrating a campaign to suppress the lab leak theory. But those allegations are not supported by any evidence collected by the Select Subcommittee.

Internal documents and testimony provided to the Select Subcommittee over the past fifteen months suggest that:

- Dr. Fauci was not aware of NIAID's grant to EcoHealth Alliance or the grant's subaward to the Wuhan Institute of Virology (WIV) until after the COVID-19 outbreak, and there is no evidence that the viruses studied under that grant caused the COVID-19 pandemic.
- Dr. Fauci's prior Senate testimony explicitly referred to the regulatory definition of the term "gain-of-function," rather than to an informal usage of the term, and his testimony was accurate.

- Dr. Fauci did not orchestrate the "Proximal Origin" paper, he did not bribe its authors, and he did not direct NIAID staff to manipulate public media coverage regarding the origins of the COVID-19 pandemic.

Instead of objectively examining the pathways by which the novel coronavirus could have emerged, Select Subcommittee Republicans have spent the 118th Congress probing federally funded research in an effort to substantiate their extreme allegations baselessly linking Dr. Fauci to the pandemic's origins.

Findings from today's staff report highlight the damage that Republicans' unsubstantiated claims have had on public health officials, their families, and our nation's trust in public health.

Click **here** to read the full report.

CC: David Morens [b6]>; Aleksei Chmura [b6]>; Jeff Sturchio [b6]
Attachments: image001.jpg

I don't know if you're seeing any of the bad press we've been getting in the last few days, but it's been a rollercoaster week for us here.

On the one hand, NIH has finally reversed the suspension of our China R01! We're currently renegotiating the terms, albeit without the capacity to collaborate with the WIV. We also got the notice of award on a new R01 to work in Vietnam, Laos and Myanmar to conduct human sampling in communities and clinics, and sampling of bats to identify the risk factors and degree of bat-CoV spillover in the region. Both are great news for us, but as soon as NIH put this on their public website, the harassment started.

We've now had articles in the Daily Mail, US Right to Know, The Intercept, https://theintercept.com/2022/10/04/ecohealth- alliance-lab-leak-nih-grant/?utm_source=twitter &utm_medium=social &utm_campaign=theintercept

.. and just now in the Financial Times criticizing the govt for funding us. https://www.ft.com/content/5504ad3a- eef2-49eb-b8dc-2a417d6f711c

One particularly hurtful quote in the FT is from Andrew Weber, who we previously had as a speaker at one of EcoHealth's Cosmos Club events in DC:
"Andrew Weber, who was assistant secretary of defence in the Obama administration and is now a senior fellow at the Council on Strategic Risks, called the work **'reckless, risky research with virtually no benefit to humanity'**". I get it that he has a political agenda, but surely anyone with half a brain can see that there's a benefit to finding out what viruses are spilling over from wildlife into people, particularly when they belong to the same viral clade as the one that caused SARS and COVID, and are infecting 60,000 people a year in SE Asia. What small minded person would allow politics to cloud their logic so blatantly.

We've also got Sen. Joni Ernst filing a bill to defund EcoHealth of all federal funding, and letters back and forth from the usual suspects (Republican members of Congress and Senators) attacking us with wild accusations of coverups and nefarious behavior.

Add to that a GAO request for a pile of documents (because Republicans asked them), and our first subpoena for documents. These last two mean weeks of work digging through emails, files and records, all for naught…

..and finally a disingenuous letter to NIH and CDC that cites a pile of BS about EcoHealth as an excuse to get CDC and NIH to review biosafety of field programs that work with wildlife – part of a growing anti-science luddism that threatens to close down our work and many others: https://republicans- energycommerce.house.gov/news/ec- republicans-press-nih-and-cdc-over-safety-gaps-with-virus-hunting-to-prevent-next-pandemic/

Looks like we're in for a rough road ahead…

One silver lining – the Honorable Dr. Fauci defending NIH's decision to fund our new R01 in a podcast: https://video.twimg.com/ext_tw_video/1577400180067995659/pu/vid/1284x720/KIyqU6NOK7zjvYio.mp4?tag=12

EXTERNAL SENDER

Just got word this afternoon from PNAS that it will appear as early as next Monday, October 10, and that the embargo ends that afternoon, although it may actually appear in any issue next week. Seems a bit strange to me, but the key is its no longer embargoed and will be in the journal next week.

That's an interesting suggestion Peter to compile a packet of key papers. The two questions are which papers, and what do we do with the packet?
As far as Jeff Sachs is concerned nothing surprises me any more. To his credit, he didn't accuse aliens working for the US Space

Force of doing – maybe that's the next interview.

In "Breathless," David Quammen explores the predictable lead-up to the global Covid pandemic, and the frantic, belated attempts to stop it.

New Jersey first responder Robert Sabia being decontaminated after answering a call in March, b6 W. Lee/The New York Times

By Michael Sims
Oct. 1, 2022

"Nobody," Donald Trump claimed in a March 2020 address, "had any idea." He was talking about the Covid virus — which had, seemingly overnight, sparked a global pandemic. In his compelling and terrifying new book, "Breathless: The Scientific Race to Defeat a Deadly Virus," the veteran science journalist David Quammen demonstrates just how much was known — and expected — by infectious disease scientists long before patrons of the Huanan Seafood Wholesale Market fell ill in December 2019 with a pneumonia-like virus.

"Soothsayer" isn't on Quammen's extensive résumé, but he was among those who had long predicted this kind of catastrophe. In 2012 he provided a field guide to the future, "Spillover," whose subtitle — "Animal Infections and the Next Human Pandemic" — explains exactly what the scientific community had long been expecting.

"This is a book about the science of SARS-CoV-2," he specifies in his new book. "The medical crisis of Covid-19, the heroism of health care workers and other people performing essential services, the unjustly distributed human suffering, and the egregious political malfeasance that made it all worse — those are topics for other books." Instead, he focuses his informed attention on the unsung heroes who dare to wrestle with viruses, those strange entities he calls "the dark angels of evolution." Human beings are part of a sprawling family of interconnected species who can share illness because they all grew up together. It is our common ancestry and related bodily ecology that makes spillover possible between, say, bats and Earth's (currently) dominant mammal.

Covid is, after all, as natural as a wolf cub or David Attenborough, and its thriller-level rate of evolution is part of its danger. "A virus is a parasite, yes," writes Quammen, "a genetic parasite, to be more precise, using the resources of other organisms to replicate its own genome." He demonstrates the sheer *weirdness* of viruses when he explains how difficult it is to even define them.

Quammen follows the story of Covid from scientists' first awareness of the outbreak in Wuhan through reports of Omicron in late 2021. Alongside the human story, spillover between humans and other animals is a persistent theme. Early in 2020, a dog in Hong Kong tested positive. There were positive cats in Minnesota, two positive hippos in Antwerp, a positive tiger in Knoxville. An outbreak spread through mink

MORENS_SUBPOENA_001682
MORENS_NIH_008023
REL0000479073

farms in the Netherlands. Last year, of the many white-tailed deer sampled in Pennsylvania, 44 percent tested positive. The persistent danger of spillover between species informs arguments over the virtues and the flaws of both approaches to pandemics: "prediction and prevention versus surveillance and response."

"Breathless" is so good that I was slow to realize that it lacks the vivid you-are-there details of "Spillover." That's because he *wasn't* there. In "Breathless," there are no scenes of an intrepid author helping trap macaques at a Sufi shrine or examining a white-footed mouse for Lyme-infested larval ticks. Among its other virtues, "Spillover" was something of a nightmare travel book, but "Breathless" is a different species of tour de force. Quammen's research methods have mutated. "I avoided airports for more than two years after Covid-19 exploded," he says up front, "and I got through the year 2020 on one tank of gas." Yet these barriers didn't prevent him from writing a luminous, passionate account of the defining crisis of our time — and the unprecedented international response to it. While many people were begging for mercy from the motley of gods that they also credit with designing this Eden for viruses, epidemiologists and vaccine scientists all over the world raced to save the lives of people they would never meet.

Citing Faulkner's multiple narrators, Quammen says, "The discernment of truth — let's make that 'truth,' because it's such an imperious and suspect word — comes from listening to many voices." He read a library's worth of books and Zoomed with some 95 sources — epidemiologists, geneticists and public health officials who were closely involved in research and decision-making. He smoothly weaves not only their facts, but their way of speaking, into his story. "Spoken words are data, in nonfiction," he says, "and I share scientists' respect for the sanctity of data." He provides a mini-biography of each interviewee. Backstage outtakes humanize the participants, as when Quammen asks Anthony Fauci whether Brad Pitt or Kate McKinnon did a better job of satirizing him. These glimpses undergird his assertion that science is "a rational process leading toward ever-clearer understanding of the material world, but it's also an activity performed by humans."

Quammen marries an old-fashioned love of colorful language to his passion for detail — an odd coupling that results not just in a lucid book about an important topic, but also in a book that's a pleasure to read. "What nature of bug seethed in this dollop of liquid human distress?" he asks of a private genome-sequencing company in Guangzhou. Sometimes his Chandleresque metaphors distract. (When the rate of infection among the deer spikes, it's "like popcorn in a hot pan.") Usually, however, his imagery vividly reinforces a point. He explains that a laboratory sample from bat feces "is not a virus, just as the text of 'Hamlet, Prince of Denmark' is not a performed play" — that the sample is, instead, "the script of a virus." Quammen can't resist snarking that Trump, "as you may have heard, is not a scientific sophisticate," but he doesn't waste much time shooting at such an easy target. He describes Elon Musk as an "entrepreneur and spaceman," and Alex Azar, the secretary of health and human services, as "pliable." The "Intelligence Community" is "a bodacious aggregation of intelligences" that includes Space Delta 7 — "within the United States Space Force, whatever that is." Didier Raoult, the French physician who promoted hydroxychloroquine, Quammen terms a "prideful contrarian." Hydroxychloroquine did indeed have a history of prescription for malaria, and, he deduces, presumably, "Trump listened to people who listened to people who listened to Didier Raoult."

While staying on mission, Quammen allows himself room for context. The importance of the February 2020 announcement that scientists had found in pangolins a close match to the virus infecting humans makes more sense — both scientific and narrative — because Quammen begins with a brief survey course on these armored-looking, anteater-like creatures. He smoothly interweaves their evolution, the ecological sin of animal trafficking, the imaginary pharmacological virtues of pangolin scales (which are actually mostly keratin) and the contemporary "vogue in urban China for *ye wei*, or 'wild tastes.'"

"This virus is going to be with us forever," Quammen warns, with a wealth of data and precedent to support him. We haven't eradicated polio or measles. "And those viruses have nowhere to hide except within humans." This one could be cleared from every living human, and still exist in other animals. "Covid-19 won't be our last pandemic of the 21st century. It probably won't be our worst." In our international world, as one scientist tells Quammen, "A disease anywhere is a disease everywhere."

Michael Sims's books include "Adam's Navel" and a companion volume to the National Geographic Channel series "In the Womb: Animals."

Does little to solidify his public health legacy!

He says "It's not unusual for respiratory pathogens that are being worked on in a laboratory to infect the laboratory worker. ... That's not implying any intentionality. It's my opinion, right? But I am a virologist. I have spent my life in virology,"

Problem is – they didn't have this bloody respiratory pathgoen in the lab prior to them being sent a sample on Dec 29th/30th.. Ridiculous comment. None of the bat covs they had in culture (3 beta covs) were anything related to SARS2. Pure 'bollocks' as we would say back home…

Cheers,

Peter

Ex-CDC head claims without evidence Covid-19 began in a China lab

By Julia Hollingsworth, Meg Wagner and Melissa Macaya, CNN
Updated 9:08 AM ET, Fri March 26, 2021

What you need to know

- **JUST IN:** Former CDC head Dr. Robert Redfield says he believes the origin of the Covid-19 pandemic is a lab in China — a controversial theory without evidence.
- The current CDC director is concerned about a new surge in Covid-19 cases, as the US surpassed 30 million infections since the start of the pandemic.
- AstraZeneca updated its data on how well its Covid-19 vaccine works, saying the vaccine showed 76% efficacy against symptomatic disease.

33 min ago

WHO's comments on Covid-19's origins contradicts Redfield's claims it began in a China lab

From CNN's Jamie Gumbrecht

In a clip released this morning on CNN, Dr. Robert Redfield, the former director of the US Centers for Disease Control and Prevention, told CNN's Dr. Sanjay Gupta he believes the origin of the Covid-19 pandemic is a lab in China — a controversial theory without evidence.

MORENS_SUBPOENA_014991
MORENS_NIH_030644
REL0000479074

A World Health Organization team exploring origins of the coronavirus in Wuhan, China, is expected to release a report of its findings soon, but has already said a lab-related incident is “extremely unlikely.”
The most likely causes of transmission of the Covid-19 virus to humans, the WHO team said, are introduction through an intermediary host species or transmission through the trade of frozen products. The team has also investigated direct transmission from an animal reservoir to human.
In early February, World Health Organization expert Peter Ben Embarek said that the team investigating the origins of the coronavirus in Wuhan have identified two scenarios that most likely caused the transmission of Covid-19 to the human population.
"Our initial findings suggest that the introduction through an intermediary host species is the most likely pathway and one way that will require more studies and more specific targeted research," Embarek said during a news conference.
He added that the possibility of transmission through the trade of frozen products was also likely.
Embarek also noted two other hypotheses the team had probed while investigating the origin of the virus.
One hypothesis was a "direct zoonotic spillover," meaning, direct transmission from an animal reservoir to a human.
"The hypothesis of a direct spillover from an original animal source into the human population is also a possible pathway and is also generating recommendation for future studies," he said.
The fourth hypothesis was the possibility of a laboratory-related incident, but that this was the least likely of the four to be the cause of the virus' introduction to humans.
"Findings suggest that the laboratory hypothesis is extremely unlikely to explain the introduction of the virus to the human population," Embarek said.
Meanwhile, Chinese officials and state media have promoted an unsubstantiated, so-called “multiple-origin” theory, suggesting the pandemic may have started in various locations around the world, even a US military lab.

Dr. Sanjay Gupta: "We still don't know" how the Covid-19 pandemic started

Dr. Sanjay Gupta on March 26. CNN
Moments ago, CNN's Dr. Sanjay Gupta reported that the former head of the US Centers for Disease Control and Prevention, Dr. Robert Redfield, told him that he believes the coronavirus pandemic came from a lab in China.
It is a controversial, politically charged theory — one the World Health Organization calls "extremely unlikely." There has been no clear evidence to support this "lab leak" theory.
"We still don't know — a year later — exactly how this pandemic started," Gupta said.
Gupta said there's a "back and forth" happening right now when it comes to the pandemic's origins, with different officials around the world claiming different theories.
"Chinese officials have started increasingly pointing to a multiple-origin theory, saying that this pandemic may have started in multiple places, even around the world, including US military labs. That's unsubstantiated," Gupta said.

Exclusive: Former CDC director makes controversial claim that Covid-19 began in a China lab

From CNN's Jamie Gumbrecht
Dr. Robert Redfield, then director of the US Centers for Disease Control and Prevention, attends a hearing in Washington, DC, in September 2020. Andrew Harnik/Pool/Getty Images
Dr. Robert Redfield, the former director of the US Centers for Disease Control and Prevention, told CNN's Dr. Sanjay Gupta he believes the origin of the Covid-19 pandemic is a lab in China — a controversial theory without evidence.
“If I was to guess, this virus started transmitting somewhere in September, October in Wuhan,” Redfield told Gupta in a clip that aired Friday on CNN New Day. “That's my own feelings. And only opinion. I’m allowed to have opinions now.”
Redfield, a virologist who led the CDC under former President Donald Trump, said he thinks the virus originated inside a lab in China and “escaped,” not necessarily intentionally.
There is no clear evidence to support the “lab leak” theory, although it has played an ongoing role in conspiracies and speculation, including statements from Trump. The World Health Organization has called it "extremely unlikely."
"Now, I am of the point of view that I still think the most likely aetiology of this pathogen in Wuhan was from a laboratory, escaped. The other people don't believe that. That's fine. Science will eventually figure it out. It's not unusual for respiratory pathogens that are being worked on in a laboratory to infect the laboratory worker," Redfield told Gupta.
Redfield’s comments appear in the documentary “COVID WAR: The Pandemic Doctors Speak Out,” which airs Sunday at 9 p.m. ET on CNN.

6 US states still have not shared when they plan to vaccinate everyone

16 and older

From CNN's Ashley Ahn, Jacqueline Howard, and Virginia Langmaid

Most US states have announced plans to open up coronavirus vaccination to everyone eligible under US Food and Drug Administration emergency use authorization.

Just six states still have not told CNN when they plan to start vaccinating everyone 16 and older: Alabama, Arkansas, New Jersey, New York, Pennsylvania and Wyoming.

Another six states — Alaska, Mississippi, West Virginia, Utah, Georgia and Arizona — have already expanded coronavirus vaccine eligibility to anyone 16 and older, and a CNN analysis finds that at least 28 more plan to open up to people 16 and older by the end of April.

Here's a timeline of when states have said they will open vaccination eligibility to the general public:

- March 29: Oklahoma, Texas, Ohio, North Dakota, Louisiana
- March 30: Minnesota
- March 31: Indiana
- April 1: Montana, Connecticut
- April 2: New Hampshire
- April 5: Michigan, Tennessee, Idaho, Iowa, Florida, Nevada
- April 7: North Carolina
- April 9: Missouri
- April 12: Illinois, Kentucky
- April 15: California
- April 19: Maine, Vermont, Massachusetts, Rhode Island
- April 27: Maryland
- April, no set date: New Mexico, Virginia, Colorado
- May 1: Wisconsin, Oregon, South Dakota, Washington
- May 3: South Carolina
- May or later: Nebraska, Kansas, Hawaii, Delaware

EU leaders squabble over vaccine supplies, as tension grows over AstraZeneca shortfalls

From CNN's Frederik Pleitgen, Livvy Doherty and Rob Picheta

European Council President Charles Michel, top of screen, speaks with European Union leaders during a virtual summit in Brussels, Belgium, on March 25. Yves Herman/Pool/AP

European Union leaders met Thursday at a virtual summit designed to push AstraZeneca to speed up its deliveries of tens of millions of Covid-19 vaccines bound for the bloc, hoping to present a united front as it continues to wrangle with the drug giant over the shortfall.

But the virtual summit exposed tense divisions within the EU itself; several countries expressed concerns that doses are being distributed unfairly around the region, and part of the meeting was hijacked by Austrian Chancellor Sebastian Kurz, who demanded a greater share of shots for his country.

"We have worked hard to ensure that the gap within the #EU in terms of vaccination coverage for the population does not widen any further," Kurz tweeted after the meeting, adding that he expects "a fairer delivery of vaccines in the EU" in the coming months.

What the EU agreed: The EU has been engaged in a tense back-and-forth with AstraZeneca over vaccine supplies to the bloc after the firm said it would not be able to meet its full delivery targets.

That shortfall has led to internal squabbles over which countries are prioritised when sought-after vaccine deliveries arrive. EU leaders agreed Thursday to tighten rules to allow for an export ban on vaccines but has so far stopped short on actually imposing

a ban.
European Commission President Ursula von der Leyen said the bloc will create "transparency" by introducing a principle of proportionality and reciprocity on vaccine supply chains.
In a swipe targeted at Britain, she added that she had "no knowledge so far of UK exports," essentially accusing it of implementing a de facto export ban. Von der Leyen said she was "waiting for that transparency."
The UK's vaccine rollout has far outpaced Europe's, but the country, which recently left the EU, relies on exports from the bloc for some of its doses.
"The bottom line is: we invite others to match our openness," von der Leyen said.
The background: Rising coronavirus infection rates across much of Europe have created an increasingly dire backdrop to the quarrelling. France imposed tougher restrictions on social gatherings on Thursday as it battles a third wave of Covid-19, while sharp rises in case loads have been reported this week in Germany, Poland and the Netherlands.
Von der Leyen said she still expects to achieve the goal of vaccinating 70% of the EU's adult population by this summer.
"But of course we all know we could have been much faster if all pharmaceutical companies had fulfilled their contracts," she added.

France clears vets and dentists to give vaccines to "speed up campaign"

From CNN's Pierre Bairin in Paris
A pharmacist prepares a dose of the Oxford/AstraZeneca Covid-19 vaccine in Nantes, France, on March 25. Loic Venance/AFP/Getty Images
France will allow veterinarians and dentists to give Covid-19 vaccines in order to "speed up the campaign," the French national health authority (HAS) said in a press release Friday.
"The arrival of additional doses of vaccines will make it possible to carry out vaccinations on a larger scale as of April and require the mobilization of more professionals in order to rapidly vaccinate all those concerned," the agency said.
These new categories of health workers vaccinating comes in addition to doctors, nurses, pharmacists and medical students, including those who have retired. Most will be receiving a training specific to the Covid vaccines.
France is in the midst of a third wave of coronavirus infections, and its stalling vaccination campaign has done little to stem the tide.
On Thursday, Prime Minister Jean Castex described the situation in Paris as "extremely worrying," and the country has banned outdoor gatherings of more than six people in an effort to reduce transmission.
4 hr 5 min ago

India sees third day of record-high Covid cases since last year

From CNN's Esha Mitra in New Delhi
A health worker preserves a swab sample for a Covid-19 test at Government Kanwatiya hospital, on March 22, in Jaipur, India. Himanshu Vyas/Hindustan Times/Getty Images
India has reported its highest jump in new Covid-19 cases since last year for a third consecutive day.
On Friday, the country reported 59,118 new Covid-19 cases, its highest rise since October 18, according to a CNN tally of figures from the Indian Ministry of Health.
The country has been reporting more than 35,000 new cases daily for over a week in a recent surge in infections after they fell in January and February this year.
Randeep Guleria, director at the All India Institute of Medical Sciences, told CNN on Wednesday "it is the beginning of a second wave."
India has reported more than 11.8 million total cases of coronavirus including over 160,000 virus-related deaths, according to the Ministry of Health. The country has distributed more than 55 million doses of Covid-19 vaccines.

At least 10 dead in fire at Mumbai Covid-19 hospital

From CNN's Esha Mitra in New Delhi
Smoke rises from a fire that broke out at Dreams Mall Sunrise Hospital in Mumbai, India on March 26. Divyakant Solanki/EPA-EFE/Shutterstock
At least 10 people were killed in a fire Friday at a Covid-19 hospital in a Mumbai mall, senior police official Prashant Kadam said.
"At around 12:30 a.m. at night, a fire broke out on the first floor at Dream Mall, next to it there was Sunrise Covid care center where about 76 Covid patients were admitted," Kadam told reporters early Friday.
Mumbai Mayor Kishori Pednekar said Friday patients had been evacuated to another facility and the cause of the fire was being investigated.
Sunrise Hospital has described itself as the first hospital in Asia to be located in a mall.

New cases: Mumbai reported 5,504 new Covid-19 cases on Thursday, bringing the total to 380,115 in the city. According to the Indian Ministry of Health, Maharashtra state, of which Mumbai is the capital, contributed more than 50% of the new cases reported in the country on Thursday.
Mumbai is the district with the third-highest active cases across the country, the Ministry of Health said Wednesday.

Peter:

Thanks for sharing this. It is very discouraging to see these kinds of attacks continuing and very disturbing that Dave Relman is involved.

I am attaching an email I received on Wednesday from Francis in response to a letter I had sent to him (at the bottom of the thread). While at least he responded to this one it was merely a deflection.

As for another investigation, hopefully you will be able to convince them that it would be a huge waste of time and money. Unless the Chinese undergo a complete about turn, they are not going to be cooperative in any additional way over and above their response to the WHO investigation.

If you see any additional way in which I might help please do let me know.

Importance: High

EXTERNAL SENDER

This letter from Republican leaders of Committee on Energy & Commerce was filed yesterday. I don't know what normally happens with this, but I'm assuming NIH will respond and I won't have to do anything. Note that Dr. Relman is cited and center, and I believe he's agitating to head up an inquiry from the NASEM. I've thought this for a long time after he approached me a couple of times a year ago to inquire about my work in China.

This letter is part of a barrage of daily attacks at this point. Today, the US Right to Know filed a FoIA at Erasmus Univ Netherlands where Marion Koopmans (also on the WHO mission) works, for emails to me and the WHO people, adding to multiple broadsheet articles over the past week from WSJ and less sophisticated right wing papers. I don't know if they can FoIA a foreign Univ, but I've now got to spend hours of my time with their lawyers and ours to find out.

On the good side, I was asked to brief staffers at the House Committee on Science, Space, and Technology, which I'm assuming will be a positive experience, and I'm reaching out to the State Dept and NSC to offer briefings on WHO findings ahead of the report. Additionally, 60 minutes is doing a piece on the report and interviewed me, but I suspect they're going to dwell on the lab release hypothesis.

Meanwhile, I'm drafting a response to the 10 conditions from Collins & Lauer and will have a draft within a few days for your comments if that's ok. Given Biden's theatrical show at the China summit today, I don't hold up much hope that this sort of aggression is going to dissipate quickly…

Cheers,

Peter

David:

I have a lot of emails from you, but none that I would classify as discussing government business. It may also be worth noting that I cannot be Foied since I work for a private company.

If you wanted to check these emails yourself I could find a secure way to get them to you, But I don't think it is really necessary.

I could also just delete them if that would be preferable.

Please let me know.

EXTERNAL SENDER

PS, there is some urgency to my responding, with all the info i can dig up. Sorry to ask a favor but this is an important "ask".

I have told nih that i have NOT done what nih defines as "government business" on my gmail, but rather on several occasions, in emails, gmails, and phone calls, to you and others, have requested that personal emails to me or cc'd to me should be sent to my gmail, and even later, sent to my proton mail.

In my understanding, personal emails that are not business of the US govt, include things like discussing death threats to scientists, investigations of non nih scientists for alleged wrongdoing, discussions about defending scientific integrity, etc

As govt scientists we DO NOT lose first amendment rights, but cannot take public positions on matters of government policy unless we identify ourselves as citizens, ie, not as government employees. Hence we have all been trained to keep personal stuff or emails that reflect opinions which are not USG policies, off of NIH email, and by default onto private mails like gmail

That is what i believe i have done, with the extra caveat that since i was being continually foia'd i also wanted to prevent the personal and private opinions and concerns of my friends, ie, all of you, from showing up in the newspapers, and reduce the

chance that your harrassments would be magnified

I hope you will recall and even find emails that are supportive of the fact that i said to all of you that i could not discuss govt business on emails, but please keep me in the loop for my info, and that you should not expect me to respond although i wanted to know what was happening

Stuff like that.

Some of you know that as of yesterday, and thanks to Rich and his (b) (6) guess, i now have legal representation. NIH will apparently be happy to throw me under the bus to appease the House Subcommittee, but even at my age i feel i am still highly productive scientifically and have much more to do, including development of covid and influenza vaccines with our molecular pathogenesis lab and with our nih vaccine research center

Thanks for your support, david

Subject: RE: Notification and Action: NARA Allegations of Unauthorized Records Destruction

Thanks, Jill, this is helpful.

Just to clarify, I have never done nih business on my gmail account. The misunderstanding of the subcommittee comes, I believe, from one facetious joking email I sent to a group of scientists-friends trying to support our colleagues (Daszak, Holmes, Rasmussen, and a few others, and by default Tony) who were being stalked and threatened with death by organized groups of people who believed scientists created the pandemic. The goal of these networking emails was to support these scientists, who are my friends and who were living in literal terror. However, since this wasn't really government business, and contained a lot of dark humor, and I knew that my emails had been and would be foia'd, potentially allowing their private worries to become public, I kept repeatedly trying to get them to stop sending stuff to my govt email.

I noticed that on my list of 24 people, at least 9 are people with whom I have published scientific papers, 4 of those on COVID issues, so there will be a lot of emails about that, 100% on email.

Regarding the list you sent, I have already made a similar list from a combination of memory and all of the names on the 10 papers ID'd by the subcommittee. Probably 95+ percent of all of my correspondence with them will be in email, not gmail, and what's in gmail will be them sending my stuff and me not replying.

I didn't know about the 7 year thing but I recall that a couple years ago or so David Awwad told me that all my emails lived on the servers forever.

OK, focusing on my gmail now. The only other thing is my govt phone but I doubt there is anything on that. That should be easy to check…

TY,

David

Subject: Re: Notification and Action: NARA Allegations of Unauthorized Records Destruction

Jill, Mason is setting up my work station now, so i am over in B31 because we dont get a wifi signal over there

i did about an hours worth of hard copy searching earlier including printing out all ten of the documents requested. Some of them i recognize and at least one i probably sent sn emsil about, that was the Jerry Keusch paper, which i though was great and recall congratulating him on it

I also looked at the list of authors on those ten papers and compiled a sublist of all of those i might have corresponded with in the past, so that i can sesrch for emails to or from. The list is quite long but i don't expect to find much except for Peter Daszak and Jerry Keusch, two old friends who i have been regularly in touch with for years

Regarding a list of things i might have deleted, for both my email and gmail there isn't any one thing i remember
deleting, just my daily or frequent getting rid of emails. That would include some but not all of my emsils to and from all the folks named above. Most of my deletions are from inbox and sent mail, once i have read them to make sure i got the info. Emails that i have transferred to a folder , eg, regarding a manuscript, should still be there

Policy dictates that emails are retained by CIO/CIT for seven years from the date of deletion; therefore CIT can recover all items deleted from an NIH account.

One further thing that is a bit puzzling. The subcommittee has not asked anything about the published manuscript on the origin of covid 19 that i led, and which was available in spring 2020 and published in July. That was one of the most forceful and reasoned of the early papers that said the virus could only have come from a bat. At least 2-3 of the 9 co authors on that paper are on the list of authors of other papers the subcommittee requests. Should i send the emails with these authors which were about our paper even though they were not requested? Sounds like a semantic question, but the info base for all of us was pretty much the same, and all of the pspers published around that time came to pretty much the same conclusion. I am thinking to err on the side of over rather than under identifying emails and stuff

I agree that over identifying is better – I would include anything COVID related..

Finally, i am still a little unclear, should i be focusing how on finding gmails and sending to email, or the infinitely larger amount of stuff already in email that will take alot of time to identify? d

When you say "stuff already in email", do you mean in your government email? You should be focusing on correspondence in gmails or any other personal email accounts or any other text messaging or social media that were used to conduct and/or communicate NIH business and forwarding that to your NIH account.

David,

If you forward emails from your gmail to your NIH account, NIH will be able to access them.

For pdfs and word documents, you can email to your government account with an subject line that denotes the contents and how it relates to the request.

As a reminder, you have also been requested to provide a detailed list (to me via email) of any communications that were deleted – see original memo for what to include in that list.

OK, i will ask IT how to do that

> You may come into the office to go through your files, but please notify me in advance of what days you plan to come in. I know you need to come in to deal with your computer –

MORENS_SUBPOENA_007417
MORENS_NIH_016624
REL0000479082

please let me know what day you plan to do this.

I had hoped to come in yesterday or today, but IT told me on both days that until further notice they cannot help me. And since my computer system in my office is apparently completely dead, I dont want to come in unless i can get something done

All of my hard copy files regarding all things covid are in my office in building 33. By chance, a month or so ago i spent a full day semi-organizing those and they are in maybe 5-6 3 inch binders plus maybe several up to 2 foot high stacks, only loosely organized Most of those are either pdfs of published scientific papers or printouts from Greg's news feeds, but there could be a handful of emails too. So i should be able to go through all of that in 1/2 a day, and am very doubtful there is anything in there of importance

> Electronic versions of files are preferred as much as possible. The memo requests that you forward emails from your gmail to your government email, so no need to print those. Likewise, electronic files that you have can be emailed to your government account. For files that only exist in paper version, the preference would be to scan those and email to your government email.

Jill, a couple of clarifications here. Do you mean that anything i find in my gmail i just forward to my email and then what? NIH sends it all, or goes over it, or I do?

To be on the safe side should i for example forward to my email everything referring to or from/to the authors of the documents noted, which would save time in having to read endless pages of stuff that probably isnt relevant, or look only for specific things requested. For example, there maybe emails on which i was copied along with an author on one of those documents, but i didn't do anything about it. In otherwords should i cast a very wide net?

By other electronic files do you mean things like pdfs or word docs?

Regarding things that only exist in paper versions i dont expect to find any or at least very few, but scanning those should be easy, and then email to my nih nih email, right?

TY, david

MORENS_SUBPOENA_007418
MORENS_NIH_016625
REL0000479082

what i should be looking for and how can i be sure that the documents i have are or are not nara documents

A couple years ago David Awwad told me that all of our emails whether in our computer files or deleted can be retrieved by IT so is this something they can do? I have no way of retrieving the estimated million or more emails i must have deleted over the years

I have many hardcopy files that i can check but it will take time

Regarding all the 10 listed papers I have no memory of any of them with the possible exception of one called "proximal origins". I got that paper off pub med last week but didn't recognize that i had ever seen it before. If i did, it will be in my hard copy files since i have not pitched any of them. david

Subject: For urgent review: Question raised by EcoHealth Alliance Grant proposal

Good afternoon,
We received some follow-up questions from The Intercept regarding the GoF research documents they received (full inquiry below). DMID suggested the following language in order to respond to the reporter's questions. Her deadline is 5:00 PM today; would you be able to comment on these draft responses?

- Does this fit the NIH's definition of Gain of Function research?

    - The award to EcoHealth Alliance was reviewed by NIAID in the context of both the Gain-of-Function Research Funding Pause and the subsequent HHS P3CO Framework. In 2016, NIAID determined that the work was not subject to the Gain-of-Function (GoF) research pause because the proposed chimeras contained only S glycoproteins from distantly related bat coronaviruses, and also because contemporaneous data published at the time demonstrated that similar chimeric viruses exhibited reduced pathogenicity compared to wild type viruses. NIAID subsequently reviewed the work in the context of the P3CO Framework and determined it was not subject to P3CO because 1) P3CO requires a pathogen be highly transmissible and highly pathogenic in humans. Such chimeric work done in backbones of animal CoVs or mouse adapted CoVs (e.g. in WIV1 or SARS-CoVMA15) are performed in viral backbones unable to readily infect human cells; and 2) insertion of spike proteins from more

MORENS_SUBPOENA_022205
MORENS_NIH_043106
REL0000479083

distantly related animal CoVs would not be anticipated to increase pathogenicity or transmissibility in humans.

- Was anyone at NIH was aware of the work described above (and in the update presumably sent to you in late 2018 or early 2019)?
    - NIAID reviewed the work for compliance with both the GoF Research Funding Pause and the P3CO Framework as described above. Progress reports are reviewed and approved annually by NIAID staff.
- And if NIH was aware of the work, why was it allowed to continue?
    - This work was allowed to continue because it was not reasonably anticipated to increase pathogenicity or transmissibility either in mammals (Gain-of-Function Research Funding Pause) or in humans via the respiratory route (P3CO). These types of studies are important to understand whether newly discovered viruses have the potential to infect and cause disease in humans.
- She also wants to know: "was this process described above — the immediate stopping of working and notification of the NIAID Program Officer Grants Management Specialist, and appropriate institutional biosafety committee — set in motion on the case I wrote about earlier (ie the case of the novel coronaviruses replicating at 100s of times the rate compared to the original virus?"
    - It is not accurate to say that the chimeras replicated "at 100s of times the rate compared to the original virus." The figure you referenced clearly demonstrates that viral titers are equivalent by the end of the experimental time-course.
- Lastly, for awareness, she also sent one final follow-up which I have not had a chance to run past DMID yet: "And actually I found this similar statement, which was made in the 2017 NOA, which would pertain to the time period the research was being done: 'Per the letter dated July 7, 2016 to Mr. Aleksei Chmura at EcoHealth Alliance, should any of the MERS-like or SARS-like chimeras generated under this grant show evidence of enhanced virus growth greater than 1 log over the parental backbone strain you must stop all experiments with these viruses and provide the NIAID Program Officer and Grants Management Specialist, and Wuhan Institute of Virology Institutional Biosafety Committee with the relevant data and information related to these unanticipated outcomes.' So my question is the same, but refers to the above warning: Were all experiments with these viruses stopped and did WIV provide the NIAID Program Officer and Grants Management Specialist, and Wuhan Institute of Virology Institutional Biosafety Committee with the relevant data and information related to these unanticipated outcome?"

Subject: Question raised by EcoHealth Alliance Grant proposal

Hi NIH Press-

I am writing about EcoHealth Alliance grant proposals you recently released to us (see p 684 in the that you released to us over the weekend). In particular in this story, I am noting that, in an annual report on work conducted between June of 2017 and the end of May 2018 under a NIH grant to the EcoHealth Alliance called "Understanding the Risk of Bat Coronavirus Emergence ,"scientists describe creating new coronaviruses based on an original bat coronavirus called "WIV1," and injecting the new "chimeric" viruses, as they are called, into mice that were engineered to respond to them similarly to humans.
Once inside the lungs of the altered mice, the novel viruses reproduced at a hundreds of times the rate than the original virus that was used to create them, according to a table shown on the next page (685) in the documents. (I am sending a screenshot FYI.)
My questions to you:
Does this fit the NIH's definition of Gain of Function research?
Was anyone at NIH was aware of the work described above (and in the update presumably sent to you in late 2018 or early 2019)?
And if NIH was aware of the work, why was it allowed to continue?
Please get me your responses by 2 pm today.

Thank you,
Sharon

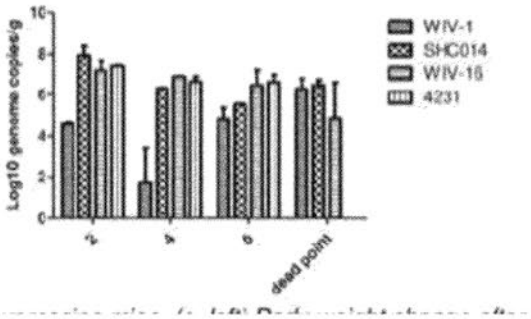

Figure 34. BtCoV/KGD/2014-422 RBD analysis (a) and DPP4-binding assay (b)

In Vivo Infection of Human ACE2 (hACE2) Expressing Mice with SARSr-CoV S Protein variants

Using the reverse genetic methods we previously developed, infectious clones with the WIV1 backbone and the spike protein of SHC014, WIV16 and Rs4231, respectively, were constructed and recombinant viruses were successfully rescued. In Year 4, we performed preliminary *in vivo* infection of SARSr-CoVs on transgenic mice that express hACE2. Mice were infected with 10^5 pfu of full-length recombinant virus of WIV1 (rWIV1) and the three chimeric viruses with different spikes. Pathogenesis of the 4 SARSr-CoVs was then determined in a 2-week course. Mice challenged with rWIV1-SHC014S have experienced about 20% body weight loss by the 6th day post infection, while rWIV1 and rWIV-4231S produced less body weight loss. In the mice infected with rWIV1-WIV16S, no body weight loss was observed (**Fig. 35a**). 2 and 4 days post infection, the viral load in lung tissues of mice challenged with rWIV1-SHC014S, rWIV1-WIV16S and rWIV1-Rs4231S reached more than 10^6 genome copies/g and were significantly higher than that in rWIV1-infected mice (**Fig. 35b**). These results demonstrate varying pathogenicity of SARSr-CoVs with different spike proteins in humanized mice.

It's not phylogenetics.

One thing is ascertainment bias which could be huge.

Second thing is to distinguish the long-term ecology of these viruses from the short-term emergence of the virus. These Laos viruses are the former. Clearly these viruses are commonplace in SE Asia. And I don't just think that bats and pangolins will be the only animals with SC2-like viruses. Virus ecology does not work like that. But this is not the same as determining the events that happened in Wuhan. To me, China still looks like the most likely source.

Third, I'm pretty certain that groups in China are sitting on more SC2-like viruses. If you sample bats you find them. It is striking to me that CCDC have published so little on this yet have supposedly sampled so many animals. That doesn't add up. Never discount the politics.

This also effectively excludes that virus-receptor relationship was generated through lab passage, that the pangolin sequences were faked, and that this outbreak had anything to do with the Mojiang mine as a virus from a different country is now closer. That mine will go down in history as the reddest of herrings.

That said, I am a little worried about confirmation bias for the origin being bats from Yunnan/Laos/Cambodia. The more they find there, the more they sequence. But no doubt these Laotian samples are of huge significance. As are the Hubei civets.

nPeter, as i am perennially swamped with work that has nothing to do with COVID issues of importance, i am always catching up on reading the important stuff

Just now i poured a martini and-read word for word your "A strategy…" paper with first author Sánchez. Also Kevin and Lin-fa were coauthors. Wow!!!

This is dynamite and also beautifully written. I mean, Hemingway, Conrad, Nin, couldn't have written it better. Beautiful job and so important.

I think you need to promote this work, and emphasize that the conclusions are far reaching and a sort of call to arms.

Let us all keep pushing,
and keep our eyes on the
prize of getting to the bottom of it all

Dear All,

I'm so sorry to darken your doorsteps again with news of more awful attacks from the Republicans. This time it's the House Energy and Commerce Republicans – the same ones who asked for me to be kicked out of the NAM (still not heard from the NAM by the way).

They've now sent a letter to NIH (Tabak) accusing EHA of fraud because we're allegedly double-dipping on funding (USAID and NIH), and not declaring private funding, specifically the anonymous donation that you helped organize Rich. Of course, this was after the NIH terminated our funding, so is utterly irrelevant, but they give the impression that we used the attacks to raise funds. Well, we've lot substantial funding since then, so that's also not true.

Here is the news story on Fox:
https://www.foxnews.com/politics/covid- origins-republicans-pressure-nih-risky-research

The letter to Tabak is attached. It specifically names you Rich, and insinuates that we were busy making money out of this miserable situation.

Here are the facts:

- The research work we conducted in China on coronaviruses was funded by NIH, with support for One Health capacity building and emerging viral risk analysis supported later by USAID.
- NIH and USAID undertook an assessment of any potential overlap in funding, and decided that there was none.
- We reported to each agency about the work we did and acknowledged funding on all scientific papers from this work.
- No non-federal funding was used to support this coronavirus research in China prior to the abrupt termination of our NIH funding on April 24th 2020, after which we had to use used non-federal funding to pay for staff time to publish this information and make it available to the world.
- We remain committed to doing everything we can to continue getting the work we conducted in China prior to COVID-19 out into the public domain, for the benefit of citizens in the USA and globally.

This week alone we were notified about 2 separate FoIAs to USAID for our emails and proposals. We've got daily requests from reporters who are trying to generate negative press. We've got a former disgruntled employee accusing us of being a CIA front on right-wing podcasts, and a barrage of online threats and harassment, many of them from well-known right-leaning social commentators with hundreds of thousands of followers (including Glenn Beck – 2 video podcasts on EHA and Eric Weinstein).

Meanwhile, I'm being quietly sidelined by all the societies, agencies and academies that used to ask me to give talks, join committees etc. The NAM hasn't even let me know whether they're going to 'investigate' me or not, so I'm in limbo there too.

I've had 2 years of this and at this point, I'm really worried about my future in science, our organization's future, my own job, my family and my health.

Cheers,

Peter

From:	Peter Daszak [b6]
To:	Morens, David (NIH/NIAID) [E] [b6]
Attachments:	Appendix 12) Table detailing evidence for origin of COVID via the wildlife trade vs. a laboratory leak. From Keusch et al. PNAS (submitted).pdf

Here's the lowdown – the report is essentially exactly the same as the previous version – it has no new data provided to the WHO team from China, but it does review published information that's come to light since. For example it has a table on the known bat-CoVs related to SARS-CoV-2 that have been published since.

It does not take into account papers under peer review that are available as preprints, so therefore misses a bunch of new information from reputable researchers that is under review in high quality journals and will be published, e.g. papers by Worobey and Pekar that strongly implicate the Huanan Seafood Market as the origin, not the lab. I've attached a supplementary figure from our just submitted PNAS paper (for your eyes only) that's from the Lancet Taskforce that Jeff Sachs disbanded, but has been meeting weekly since then and has now got its report in review at PNAS. As you can see, there are a series of papers supporting the wildlife trade origin since the original WHO report, all either published in peer-reviewed journals, or under review. On the lab leak side, there are mainly op eds, opinion pieces in peer-reviewed journals, or uploaded web commentary – almost all by relatively unknown people, and most already strongly disputed publicly by well-known authors.

Another failing is that, unlike the first team, the SAGO group does not 'rank' the likely pathways of origin. They clearly didn't want to get the same level of attack that we did, because as you can see from their conclusions, they still find the wildlife trade origin the most likely explanation for COVID's emergence.

One key difference between the first report and this one is that the SAGO report, despite finding no evidence for a lab leak, recommends a series of investigations into the labs in China (and also other countries) that are pretty invasive and would clearly not be supported by China. Our original report has been misquoted repeatedly as saying that we shouldn't investigate the lab. What we actually said was that we found the lab leak pathway 'extremely unlikely' (not impossible) and that if any evidence comes to light, phase 2 work should investigate it. The lab leak recommendations were publicly dismissed by 3 members of SAGO because there is not enough evidence to support those recommendations. The three are:
1) the China representative, which will be dismissed as political;
2) the Russian Rep, who is Vladimir Dedkov and was a member of the original WHO-China study. He's a good scientists and though it's being discussed as a political statement, I believe he's simply voting his conscience;
3) Carlos Morel, from Brazil Fiocruz, former head of WHO TDR and a very well-respected public health scientist. I've spoken with him at length re. this and he believes that including the lab leak recommendations was pure politics and not based on science. He's now said this publicly.

On the political issue, it's important to remember that the WHO DG initially set up the group in Summer 2020 because of the criticisms of China and openness early on, and of WHO in accepting China's word on lack of human-to-human transmission. Then, as Trump started to withdraw from the WHO, I believe he became less concerned about the US version of events and let the group convene and organize. While we were doing our work in Wuhan, Biden's admin took over and we noticed a change in the way Tedros communicated with us. He tried to push for the lab leak to be included (you can quote me as someone close to the team if you like) for what we believe were political reasons to ingratiate himself with Biden's State Dept and their more anti-China policies. Biden's team was publicly supportive of Tedros then, at a time he was running to renew his Directorship. He criticized our report publicly re. the lab conclusions, dismissed the team and formed the SAGO with mainly new members, having removed those that pushed back (me, Marion and a few others). If you look at the US media's response to the new report, it's exactly what Tedros would have wanted – "WHO does U-turn on lab origins of COVID":

https://www.nbcnews.com/news/world/covid- 19-urges-investigation-chinese-wuhan-lab-leak-theory-rcna32910

https://www.livemint.com/news/world/origin- of-covid-19-who-takes-u-turn-says-chinese-lab-leak-theory-needs-study-11654818780688.html

MORENS_NIH_015590
REL0000479099

https://www.science.org/content/article/open- minded-underwhelming-mixed-reactions-greet-latest-covid-19-origin-report

Ironically, a careful read of our original report shows that they haven't really done a U-turn – just stated that the labs should now be investigated, even as they know full well they won't be… if that's not politics, then what is..

Hope all this helps…

Cheers,

Peter

This is excellent! I'm sorry to be slow in responding, but "officially" I have been on vacation and unable to read all emails coming my way without alerting my wife to my "non-vacation" behaviour. I am not en route home and have had the chance to read through this response.

What is so annoying here is that politicians have the easy option of targeting would-be scapegoats to uphold a political agenda and ignore science.

I hope the NAM will finally decide to follow the science and tell the politicians to go to hell.

EXTERNAL SENDER

Dear all,

Thank you very much for your support dealing with this awful situation. Below is my email to NAM with an attached letter responding to the allegations, and a dropbox file with 28 appendices supporting each of the points I make (feel free to click on the link and sift through if you've got a spare few hours!).

Having been lucky enough to get a scholarship to one of those schools in the UK where we had to stand when the teachers (who we had to call "masters") came in the room, this brings back some powerful memories of the way institutions can be manipulated to make the lives of the people they're supposed to serve totally bloody miserable.

I only hope the committee is able to see beyond the political narratives, and their desire to save the NAM from attack, and do the right thing by one of their members. If not, I'll get ready with my appeal, and continue this tedious journey…

Cheers,

Peter

Dear Dr. Fuentes-Afflick,

MORENS_SUBPOENA_006701
MORENS_NIH_015593
REL0000479099

I want to thank you and the NAM for granting me the extra time to respond to the allegations from the three Republican members of the Congress. I am attaching the original letter to the NAM (attachment A), the focused allegations (attachment B), your letter to me informing me of the intent to open an investigation ("Letter to Member…."), and my response to your letter refuting these allegations ("Dr. Daszak, response to NAM letter of April 11th 2022").

As you can see, I have provided a detailed refutation of each of the allegations, along with documentary evidence to support each point. This consists of 28 appendices (many are quite short consisting of specific email chains or short documents). However, because of their overall size, I have placed them in a secure dropbox folder that is available for you to download and circulate among the committee by clicking on the following link:

https://www.dropbox.com/sh/io8q3iq64g0tkum/AACvnf8IlwXX86sfDXUOPIMaa?dl=0

As you stated below, I appreciate that this process is confidential, and I would ask that you take particular care to ensure that my letter and the appendices are carefully shared so as not to be circulated more widely than necessary – some of these appendices contain information that has never been released publicly before.

I will await the decision of the committee, the NAM Council and Dr. Dzau in due course, but in the meantime, please do not hesitate to reach out to me of my Chief-of-Staff, Dr. Aleksei Chmura (cc'd) for any further information or clarification

Sincerely,

Peter Daszak

From: Fuentes-Afflick, Elena b6
Sent: Saturday, April 30, 2022 2:06 PM
To: Peter Daszak b6; Dzau, Victor J. b6; Kim, Se b6
Subject: confidential

Dr. Daszak,

Thank you for your note of April 22nd. I was traveling and apologize for my delayed response. I have reviewed your letter in detail and will respond to each point.

First, when the NAM receives any allegation of misconduct against a member, we have to follow an independent process that is outlined in the policy document you received. We have undertaken an initial evaluation by an assessment panel which eliminated many of the allegations but recommended a subset

MORENS_SUBPOENA_006702
MORENS_NIH_015594
REL0000479099

of the allegations to be further investigated by the conduct review committee. The list of allegations was shared with you.

I accept your request for a deadline extension to June 12th. You may enlist the assistance of others and I encourage you to request that they honor the confidentiality of the process.

Point 1: To date, the NAM has not conducted its own investigation of the allegations. We have identified a subset of materials for further investigation which were referenced in the April 11, 2022 letter.

Point 2: I apologize for not providing information about the conflicts evaluation. We conducted a thorough evaluation of the conflicts of the assessment panel and conduct review committee members and none were identified.

Point 3: We identified selected references from the list provided in the original letter with the allegations and added one reference that is publicly available on the NIAID's website. These materials and any response you provide are the only materials that the Conduct Review Committee will consider.

Point 4: I should have asked if you have the results of an external investigation related to the allegations under consideration. If you have any such results, please share them.

Point 5: You are correct that our policy does not include a provision to meet with the conduct review committee and I cannot offer you this option. I invite you to submit additional materials if you believe they are relevant.

I want to assure you, personally, that the confidentiality requirement and following our process are my top priorities. I have discussed this with all individuals involved and have not shared information with anyone other than the assessment panel and conduct review committee members. My communication with the representatives of those who wrote the original letter was to confirm receipt of the materials and explain that we would be following our conduct review process.

I would be happy to connect with you, by phone or Zoom, to discuss.

Best,
Elena Fuentes-Afflick, MD, MPH

Subject: Reporter inquiries re. the confidential NAM process of dealing with alleged code of conduct violations

Dear Victor, Elena and Kim,

I was very concerned to have received three separate press inquiries today regarding a story in *Fox News* (https://www.foxnews.com/politics/house- republicans-ecohealth-alliance-concealed-data). I am not planning to respond to these questions.

As you can see in the *Fox News* article, yet another partisan political letter has been made public with unsubstantiated and clearly politically motivated allegations against our organization and myself. In the article, an aide to Representative McMorris Rodgers states that "*After receiving our letter, NAM notified us they had opened an internal review of Daszak's behavior, per our request…We believe this letter about EcoHealth's potential false statements and fraud is relevant to the ongoing investigation the NAM is conducting into Peter Daszak, so we have sent NAM a copy of this letter as well.*"

In your letters to me, and by phone, you reassured me repeatedly that the process of deciding whether to investigate these allegations was confidential on the NAM side, and you urged me to also treat correspondence with NAM on this issue as confidential, which I have. However, it appears that this is not the case, in that NAM has informed the Republican staff of intent to review my 'behavior' and that this has now been made public, as I indicated could happen in my letter to you last week, April 22, 2022.

It seems rather evident that the letters you have received are part of an ongoing and systematic political campaign to destroy EcoHealth Alliance's reputation and my own, with the ultimate target of undermining the NIH, Dr. Fauci, and the Biden White House. They are hyper-partisan and disingenuous in their goals, in that the letters and the fact they are simultaneously made public on *Fox News* and *Twitter*, are clearly designed to push a false narrative. EcoHealth Alliance has repeatedly and publicly refuted such allegations in our responses to NIH that have since been made public (e.g. https://www.wsj.com/articles/coronavirus- study-of-bats-in-china-met-nih-grant-requirements-ecohealth-say b6 and in carefully given interviews with the press (e.g. https://www.science.org/content/article/we- ve-done-nothing-wrong-ecohealth-leader-fights-charges-his-research-helped-spark-covid-19 and https://theintercept.com/2022/03/11/covid- nih-ecohealth-peter-daszak-interview/).

Given the developments today, I urge you to reconsider your decision to investigate these allegations, which have nothing to do with my adherence to the rules of conduct of NAM members, and to respond to the Republican accusers to state that they do not rise to the level whereby an investigation is warranted. I believe this is justified by the one-sided political nature of the attacks, the lack of prima facie evidence for the allegations, and the fact that your communications have already been made public in defiance of the confidentiality of the matter that NAM and EcoHealth Alliance have maintained. I'm very concerned that this public witch hunt will be damaging not just for myself and our organization, which has consistently produced cutting edge research on emerging diseases that has been fundamental to a series of NAM publications, but that it will also be damaging to NAM and the Academies in general. If you do not stand up to these politicized attacks at this point, they will surely continue and drag in other members of the Academies who have been publicly criticized and accused by the same politicians for the last two years, and who are being continually attacked by various fringe groups espousing conjectural hypotheses about the origins of SARS-CoV-2, in spite of the increasing scientific evidence supporting the spillover from bats through an intermediary host to humans.

This active political interference with stewardship of science, the integrity of science, and the pursuit of knowledge by scientists, goes well beyond EcoHealth Alliance and threatens the integrity of the entire U.S. scientific enterprise. It is no different except in volume than the incontrovertible political interference by Donald Trump in the scientific enterprise at NIH in April 2020, which prompted you to issue a public statement about the separation of politics from science in response. Your words and those of Marcia McNutt ring even more true at this point: "*Any efforts to discredit the best science and scientists threaten the health and welfare of us all*" (https://www.nationalacademies.org/news/2020/09/nas- and-nam-presidents-alarmed-by-political-interference-in-science-amid-pandemic). EcoHealth Alliance, myself, the NIH, Tony Fauci, NAM and

MORENS_SUBPOENA_006704
MORENS_NIH_015596
REL0000479099

you are in the cross-hairs now because NIH failed to protect science and scientists from Trump's overtly political, and sadly successful, effort to close down research that was politically inconvenient. I worry that this is just the beginning of the goal of this anti-science agenda, and for that reason it demands brave, bold, and decisive action.

Yours sincerely,

Peter

I will let them know and copy your Op Ed (and mention that you're a former NIH Center Director).

I'm compiling a very detailed timeline, including notes from a phone call where a NIAID Sr. staffmember who'd spoken with Lauer commented:
"I got a red flag got waived [by Lauer], this grant is not in compliance with NIH grant rules. If you are not in compliance with one grant, you should not be getting any other grants. This was a red flag for me, .. if they submit a new grant tomorrow, what happens. Mike Lauer said they can have it reviewed, accepted, and it will not be accepted until original grant is in compliance. Obviously, I did not bring up the other EHA grants. It was made pretty clear to me that if you have a future grant, it would be put on hold until you are back in compliance."

I took this as a threat, implied by Lauer. One he failed to put in writing because no doubt it's on shaky legal grounds. I will hand over all notes on these calls to GAO.

Cheers,

Peter

Thanks – please ask him to email me and cc Robert Kessler. Right now is not a great time for EHA to be speaking out, but we can always give him facts and have that in background.

Also, by the way, I heard back from GAO. They're focusing on the details of why the NIH grant to EHA was terminated, and the follow up actions, trying to understand if NIH was the subject of political interference. I'll be sending them all the relevant docs and doing an interview v. soon.

Cheers,

Peter

Peter,

It just hit me that i have some recommended reading for you. The story of a great scientist who went through something eerily similar to what you are going through - attacked by the wackos with death threats requiring police protection, accused of bioterrorism and starting a potential pandemic, and thrown under the bus by the US government, AND losing his research work. This was exactly 120 years ago and the scientist was Joe Kinyoun, the founder of the NIH

You can read the whole story in a monograph i wrote 10 years ago, available on the nih website. It's quite long, but just read the several ending chapters beginning with the San Fran plague epidemic of 1900 until the end, maybe a 25 minute read.

I think you may he shocked at the similarities. Come to think of it, it would make a great then and now manuscript ….

The reason it hit me just now is that PBS is doing a show on it and they are filming at my house on Thu. In preparation, i just read the whole monograph to refresh my memory, and it was like i was reading YOUR story. Wow.

It should be easy to find on the nih website if you search on kinyoun and morens. If not I can send the pdf

On May 11, 2021, at 13:31, Peter Daszak <b6> wrote:

Just to let you know that the saga continues…

First, I got an email from a GAO group "examining issues related to scientific integrity and independence at HHS agencies, including NIH, at the request of Senators Warren, Peters, and Murray, and Rep. Tonko" requesting an interview re. the terminated grant. I'll be setting up an interview with them and hope this might lead somewhere. It might be part of the new Scientific Integrity Taskforce that Biden's setting up via OSTP – I'll find out (https://www.cnn.com/2021/05/10/politics/biden- task-force-science/index.html) – their first meeting is Friday

Second, Sen. Marshall (R) published a resolution calling for Covid-19 Select Investigative Committee, including "secret research and gain-of-function zoonic (sic) research at WIV" and "funding distributed by WIV by NIAID, NIH and organizations of higher education" https://www.washingtonpost.com/context/marshall- resolution-calling-for-covid-19-select-investigative-committee/b44a9780- 7653-4004-8887-ed24ace6dce8/ I doubt it will go anywhere – it's grandstanding.

Third – just saw excellent testimony before a senate committee where Dr. Fauci duked it out with Sen. Rand Paul re. 'gain-of-function': Dr. Fauci stated that "The NIH has not ever, & does not now, fund 'gain of function research' in the Wuhan Institute." He was then asked about our terminated grant and said: "Let me explain to you why that was done, the SARS COV-1 originated in bats in China. It would have been irresponsible of us if we did not investigate the bat viruses & the serology to see who might have been infected." https://thehill.com/policy/healthcare/552857- rand-paul-clashes-with-fauci-over-coronavirus-

MORENS_SUBPOENA_014170
MORENS_NIH_026761
REL0000479103

origins. The video is worth watching if you have a spare 10 mins: Full hearing here https://help.senate.gov, the Q&A with Rand Paul begins at 01:11:59. Fauci dodges the question on whether he 'supports funding of WIV', and just repeats that NIH did not fund GoF work there. It's categorically correct. He also points out that the expt. that Rand Paul talks about (a supervirus – actually SARS with a bat spike that is less able to infect human cells than sars!) was conducted in North Carolina, not Wuhan.

Cheers,

Peter

say the flu or MMR vaccines?

Hotez: Yeah, because remember, MMR came out of autism; that was the [original] assertion that the MMR vaccine causes autism. That was [*The Lancet*] paper from 1998. But then around 2014, 2015 (I like to think because I was helping to take some of the wind out of the sails around autism), you started to see the anti-vaccine movement pivot around this concept of health and medical freedom, that you can't tell us what to do about our kids. And that was the first link to the Republican Tea Party here in Texas. In fact, they started getting PAC [political action committee] money… It really took off in Texas and Oklahoma and that's what you see came off the rails with COVID-19.

It has been documented now by Charles Gaba, a health analyst whose work has been mentioned in the *New York Times*, National Public Radio, Pew Research Center and Peterson Academic Center, that the lowest vaccination rates were where health freedom propaganda was the strongest, and among those who are in red states like Texas, the redder the county, the lower the vaccination rate, the higher the numbers of deaths. It's a really tight correlation, so much so that David Leonhardt in the *New York Times* has called it red COVID. My forthcoming book, *The Deadly Rise of Antiscience: A Scientist's Warning* and it's full on linked to far-right politics and it's been embraced by the House Freedom Caucus.

After vaccines became widely available, the statements from the 2021 CPAC conference of conservatives in Dallas was first along the lines of: "they're going to vaccinate you, and then they're going to take away your guns and your bibles." It's ridiculous. A quarter of the country accepted it—mostly in Texas and the Southern states, and then [Georgia US Rep.] Marjorie Taylor Greene called people like me "medical brownshirts," using Nazi paramilitary analogy. Then, those in the Senate GOP, such as Senator Johnson from Wisconsin, held anti-vaccine roundtables, amplified by Fox News. Every night, during the last half of 2021, nighttime anchors Tucker Carlson and Laura Ingraham filled their airwaves with very strong anti-vaccine rhetoric, discrediting the effectiveness and safety of vaccines. And then contrarians from the far right think tanks piled on.

As I said, if it were just a theoretical construct, I wouldn't get so exercised, but 40,000 Texans died during the delta wave in the last half of 2021 and early Omicron BA1 wave in 2022 because they refused the COVID vaccine and were victims of this targeted aggression towards them. The number that I put out in the new book is 200,000 Americans across the country. The Kaiser Family Foundation and the health analyst Charles Gaba come up with similar numbers. On that basis, anti-vaccine activism, anti-science aggression, if you look at it as a societal killing force, is killing more Americans than gun violence, terrorism, nuclear proliferation, or cyber-attacks.

Goudarzi: And the interesting thing is that COVID-19 vaccines have been tremendously successful.

Hotez: Alison Galvani at Yale has just done a modeling exercise with the Commonwealth Fund, indicating that COVID vaccines have saved 3.1 million Americans.

Goudarzi: Yet the messaging against these vaccines seems to be just as successful and as you mentioned hundreds of thousands of deaths could have been prevented here in the United States. So, it begs the question, why are we having such an anti-science moment?

Hotez: It's because it's fully ensconced in the political landscape of the country that became part of the far right, and people refused the vaccine out of allegiance. Part of showing your allegiance to the far right is not getting vaccinated. Then, you saw the Proud Boys march in anti-vaccine rallies, and an early arrest in the January 6 insurrection included a prominent anti-vaccine activist.

The question that I get is: "Hey doc, what should we do about this?" And I say I don't know, because this goes outside the health sector. This is a political problem right now. How do you uncouple the anti-science from the politics? It's been really, really challenging, and the Biden

administration has not been willing to take this on. Vivek Murthy, who is a very good Surgeon General, issued an advisory in July of 2021 about social media and said we have to work with Meta and Facebook and Twitter to prevent this stuff from going viral. That's fine, but it doesn't get to those who are generating the content. This is where we're starting to see breakdowns, in my view, among our scientific and professional societies, and even the National Academies, because this idea that we have to remain politically neutral is so strong that no one will talk about it the way I'm talking about it with you. You have to be politically neutral; it's silly.

To paraphrase Desmond Tutu and Elie Wiesel, neutrality favors the aggressor.

Goudarzi: What do you think the end goal is for those generating the content and spearheading these movements? There are certain people who truly believe that vaccines could cause x, whatever x is, but there are others like Gov. DeSantis who himself was vaccinated yet promotes anti-vaccination sentiments.

Hotez: Early on when vaccines first came out, he was actually pro-vaccines. So, what caused the change? When it was pre-health freedom, it was fairly straightforward: It was people monetizing the internet, selling nutritional supplements and books on phony autism cures. When I wrote the book, trying to look at other examples of this, I found what's going on now in Stalin's Russia in the 1930s 1940s. This is part of the signature of an authoritarian regime: to target the science and scientists. When you read Hannah Arendt's *The Origins of Totalitarianism*, you see this is part of the playbook. Even though it's self-defeating, it still fosters allegiance and belonging. I think what happened is with the anti-vaccine groups for whom the wind was let out of their sails around autism, they needed a new thing. They found money and power and relevance by tying themselves to the far right, and the far right created a whole new cadre of people that they wouldn't have otherwise.

Goudarzi: Just add adding to that: Do you think vaccine disinformation is propagated or reinforced purposely by other governments to cause division within the United States, similar to the 2016 election?

Hotez: No question about that, and I think Russia is probably the most egregious [perpetrator], and this has been documented. David Broniatowski, a computer scientist at the George Washington University, has written about this and the Russian bots' roles. In some cases, they're using both anti-vaccine and pro-vaccine rhetoric. They are specifically using this as a wedge issue to divide the country and destabilize our democracy. And it's not only the Russians—the Chinese, North Koreans and Iranians are doing this. But I think Russia is probably the biggest state actor.

What I've recommended to the Biden administration is they create an inter-governmental agency, because the United States Department of Health and Human Services (HHS) doesn't know what to do at this point. Because of the foreign actors involved, you have to bring in Homeland Security, the Commerce Department, the Justice Department and the State Department as well. There are people smart enough who know about these big dangerous societal forces, and we need their advice on what levers we can pull and push. But they haven't wanted to take it on.

Similarly, at the level of the UN agencies, the World Health Organization doesn't know what to do at this point. So, you're starting to see that same US-style anti-vaccine activity moving to Canada, the United Kingdom and Western Europe—and I wrote about this in a paper in *Nature Reviews Immunology*. You're even seeing it now in low- and middle- income countries, including those in Africa. So, it's going to destabilize the global vaccine ecosystem, even around childhood vaccination.

Goudarzi: Scientific debate around new treatment or preventive measure used to happen more or less behind closed doors. But given the nature of a real time pandemic, some of those debates are taking place on social media, and sometimes that leads to the lay audience

misunderstanding certain aspects of the discussion and spreading misinformation. How valuable, and how harmful, do you think it is to have scientific debates between researchers on social media?

Hotez: It's often not between researchers. For instance, one of the most common things when they target me on social media is they say I should be in a public debate with the lead anti-vaccine activist. And I say, "No, that's not how science is done. I've written a scientific paper and if somebody has an issue with that, they can either refute it in a scientific journal, or publish their own finding." Of course, they can't get it published because there's no science behind it. So, what they want to do instead is they want a public debate.

And I say, "Look, you can debate 18th-century enlightenment philosophy, but science is not typically something that's debated in that kind of forum; we have a mechanism for doing that through scientific publication and peer review." And they don't want to play that way. They just want to put out their propaganda because that's all they have behind it. An example is ivermectin or hydroxychloroquine, which the scientific community has clearly shown has no effect on COVID-19. Hydroxychloroquine is even harmful. But the problem is the anti-vaccine force has dominated the internet, and they say, "Hey, scientists don't want to debate us, what are they hiding?"

And that's, again, how they weaponize communication.

Goudarzi: I was actually thinking of earlier during the pandemic. Because there was so little time, some researchers were putting their papers up on open access preprint servers, which didn't require a peer review, and then others were weighing in on social media platforms. At times, you would see non-scientists take one aspect of that discussion and spread something that wasn't necessarily true.

Hotez: I think with the whole preprint server mechanism, ultimately the benefits outweighed the downside. I can't tell you how many times I had to depend on data from bioRxiv, medRxiv in order to make sense of what was going on. If I had to wait a few weeks for it to air in *New England Journal of Medicine* or *Nature* and *Science*—and by the way, they did a pretty good job too; they were able to turn that around in record time—[it would have been too late.] If you're looking for any silver lining in this pandemic, it's the journal editors, the whole preprint server mechanism, and the willingness of the scientific community to share information. And I think for most of the public understood that they were seeing this play out in real time and that there wasn't always going to be consistency. The problem was those who were who were weaponizing it for their own personal or political gain.

Goudarzi: But you still think the advantages outweighed the disadvantages?

Hotez: I think so. It's hard to imagine how I could've really talked about everything going on knowledgeably on CNN, NBC, or wherever without having access to the information. The preprints were so important.

Goudarzi: Some researchers have either left Twitter or are thinking of leaving. What will this do to scientific discourse? Would it make sense to stay on the platform to counter misinformation and disinformation and increase public awareness, or should researchers seek a more balanced platform?

Hotez: I don't have the answer. I struggle with this every day. I mean, the aggression against me and the threats would continue even if I wasn't on Twitter, because more often than not, it's not against anything that I tweeted. Ninety percent of the time, it's people who see me as a threat to undermine their politics or their business line and are just making up things about me and would still continue even if I wasn't on Twitter. So that's the reason I stay on it, because at least I'm getting out important and timely information. But it is really painful and awful to see what's going on there.

Goudarzi: Is the amount of aggression you face tied to the changing ownership of Twitter and political shifts?

MORENS_SUBPOENA_019499
MORENS_NIH_039085
REL0000478480

Hotez: The politics around the anti-science, anti-vaccine and phony baloney about COVID origins had started with the pandemic in 2020. But now with all the contrarians back at once it reminds me of the old *Batman* series when they brought back Catwoman, Joker, Penguin, and Riddler all at once to do away with Batman. That seems to be going on, so it's been their superstars who are super energized by being invited back to Twitter, and they are using the platform very aggressively.

Goudarzi: What are some of the lessons we've learned about disinformation and misinformation over the last few years regarding social media that we should consider moving forward?

Hotez: I would say social media is a major weapon of choice for spreading disinformation. But remember, we have to get to those who are generating content. Social media is an important vehicle, but it's not the only one. I think we probably should stop calling it misinformation, disinformation or infodemic. We should call it for what it is, which is anti-science aggression, because it is a killing force. What we realized is that the science aggression is taking lives in the United States on an unprecedented scale.

For that reason, it needs to be addressed, and that's the part the scientific community has not come to terms with. When I call myself a scientist, it's not just co-heading a team of scientists making a COVID vaccine for the world that has reached a 100 million people. That's a very noble activity, but from my perspective, even that's still insufficient. Now being a scientist means, to some extent, being willing to combat the anti-science. It's nothing that any of us signed up for. I never dreamed when I got my MD-PhD in New York in the 1980s that this was something I'd be doing, but this is what's in front of us.

And I don't really feel that the scientific community—the professional societies, scientific bodies, even the academy—fully understand the impact. Hopefully it'll be clear when my book comes out, but it may become even clearer when we see the House GOP hearings. I predict the oversight committee and the judiciary committee or select subcommittees will become an anti-science witch hunt and will target prominent American scientists. And then we'll get a better picture.

Cheers,

Peter

I forgot about that Rich. But I'm assuming it wasn't you that came upwith somewhat colonial name!!???

In all seriousness, while it's good for virologists to pushback against calls to block scientific research, I don't think a campaign to support gain of function work that's designed to see what would happen if you make a lethal pathogen more transmissible is anything any of us particularly want to get behind right now!

Article in NPR this morning (https://www.npr.org/sections/health-shots/2023/01/27/1151867224/virologists- science-oversight-risky-experiments) – and below, based on a Commentary (attached) in mBio and various ASM journals signed by >150 virologists that fights back against the anti-science, defends virus research and gives a table of positive results from gain of function work.

I'll reach out to Felicia Goodrum (lead author) today to see if they will talk about helping with some sort of coalition. Michael Imperiale was quoted so if any of you know him or Felicia or others who are leading this (e.g. Arturo Casadevall), it would be good to reach out to let them know the urgency.

Some of these people were involved in the coalition (Scientists for Science - http://www.scientistsforscience.org/) to push back against earlier efforts to cancel Gain of function work by the "Cambridge Working Group" (a pretentious name, of course)…

BTW – saw your name on the Scientists for Science website Jerry!

Virologists defend their science as officials eye more oversight of risky experiments

NELL GREENFIELDBOYCE

MORENS_SUBPOENA_019505
MORENS_NIH_039091
REL0000478480

This image shows purified particles of mpox virus, formerly called monkeypox. Viruses like these can be genetically altered in the lab in ways that might make them more dangerous.

NIAID

Over 150 virologists have signed on to a commentary that says all the evidence to date indicates that the coronavirus pandemic started naturally, and it wasn't the result of some kind of lab accident

MORENS_SUBPOENA_019506
MORENS_NIH_039092
REL0000478480

or malicious attack.
They worry that continued speculation about a lab in China is fueling calls for more regulation of experiments with pathogens, and that this will stifle the basic research needed to prepare for future pandemics.

The virologists issued their statement just ahead of a key meeting Friday held by outside advisors to the federal government. That group is set to wrap up a recent review of the existing oversight system for experiments that are controversial because they could create new potential threats.
The advisors' draft recommendations call for expanding a special decision-making process that currently weighs the risks and benefits of experiments that might make "potential pandemic pathogens" more dangerous.
"The government really has a strong interest on behalf of all of us, in the public, in knowing when researchers want to make a virus more lethal or more transmissible, and understanding how that would be done and why that would be done, and whether the benefits are worth it," says Tom Inglesby, director of the Center for Health Security at the Johns Hopkins Bloomberg School of Public Health.
Sponsor Message
He thinks if the draft recommendations were adopted by the government, "it would be a very big step forward."

The origins of the pandemic

All of this comes as the lab in China, known as the Wuhan Institute of Virology, is again in the headlines. An internal government watchdog released a report this week criticizing the National Institutes of Health, saying it failed to adequately monitor grant awards given to a nonprofit that had collaborated with scientists at the Wuhan lab.
Felicia Goodrum, a virologist at the University of Arizona, says that open-minded experts have investigated the origins of the pandemic. The available evidence, she says, supports the notion that the virus emerged from nature just like other viruses such as HIV and Ebola did — by jumping from animals into people who had contact with them.
"The evidence that we have to date suggests that SARS-CoV-2 entered the human population by that route," says Goodrum. "There is no evidence to the contrary or in support of a lab leak, nothing credible."

Basic research on viruses, she says, is what led to the swift development of vaccines and drugs to fight the pandemic.

And yet virologists have watched in dismay as misinformation and conspiracy theories have placed the blame on science.

Sponsor Message
"There's this complete disconnect between reality and what happened," says Michael Imperiale, a virologist at the University of Michigan.
He says that while debates have gone on for years about the wisdom of doing experiments that might make bad viruses even worse, this moment feels different.

"The pandemic," he says, "has really kind of heightened the urgency with which we need to address these issues, just because of all the controversy that's been out there regarding, you know, was this a lab leak or not?"

A bird flu study raises alarm

Unlike, say, nuclear physics research, biology has traditionally had a culture of openness. After the anthrax attacks in 2001, however, biologists began to grapple with the possibility that their published work might serve as recipes for evildoers who wanted to make bioweapons.

And in 2011, there was an outcry after government-funded researchers altered a bird flu virus that can be deadly in people. Their lab work made this virus more contagious in the lab animals that are stand-ins for people.

MORENS_SUBPOENA_019507
MORENS_NIH_039093
REL0000478480

Critics said they'd created a super flu. Proponents said that viruses sometimes have to be manipulated in the lab to see what they might be capable of; in nature, after all, mutations occur all the time and that is how pandemic strains emerge.

That episode marked the start of a long, heated debate, plus research moratoriums and ultimately the development of new regulations. In 2017, a review system was put into place to weigh the risks and benefits of studies that might make a potential pandemic pathogen even worse. So far just three proposed lines of research, with influenza viruses, have been deemed risky enough to meritthat kind of extra scrutiny.

"We are really talking about a small amount of research proposals," says Lyric Jorgenson, the acting associate director for science policy and the acting director of the Office of Science Policy at the NIH.

Sponsor Message

She says just before the pandemic started, officials asked advisors on the National Science Advisory Board for Biosecurity to consider whether the government needed to be more transparent to the public about how it was making decisions about this kind of research. Before that work was done, the pandemic hit and everything was put on hold. Last year, officials asked the group to broaden its work and to evaluate the regulations more comprehensively.

If the draft changes developed by this advisory group are eventually adopted by the government, an extra layer of oversight would apply to any study "reasonably anticipated" to enhance the transmission or virulence of any pathogen in a way that could make it a public health threat. That means more experiments on more viruses would get a closer look.

"What this new recommendation is saying, is that even if you start with a virus that had no potential to cause an epidemic or pandemic, if you are doing research that will change that virus in a way where it could now cause an uncontrollable disease, or a widely spreading disease, that has to be reviewed by this new framework," says Inglesby.

What's more, the advisory group has noted that "increased transparency in the review process is needed to engender public trust in the review and oversight processes."

What's "Reasonably Anticipated"

The American Society for Microbiology has responded positively to the draft recommendations, saying "we urge swift implementation of the recommended changes by the federal agencies engaged in this work."

But some virologists think the devil will be in the details if these recommendations turn into policy.

"They keep using this phrase 'reasonably anticipated,"' says Imperiale. "How is that going to be interpreted? Is there going to be clear guidance as to what is meant by that?"

Sponsor Message

Researchers often don't know what will happen when they start an experiment, says Goodrum, especially when the science is cutting-edge.

"That's where the big scientific advancements come from. And so to tie our hands behind our back, to say we can only do the science that we can anticipate, then we're really restricting innovative science," she says.

Ron Fouchier, the virologist at Erasmus University Medical Center in the Netherlands, whose lab did the bird flu experiments over a decade ago, said in an email that he'd hoped the experience of going through a pandemic would simulate more research, not "unnecessarily delay or restrict it." He said it looked like many infectious disease researchers in the United States "will face substantial delays in their crucial research efforts, if they can continue that research at all."

The U.S. is unusual in that it has a lot of public discussion of these issues and a system to try to manage the risks, says Inglesby.

He thinks that oversight can be made stronger without getting in the way of science.

MORENS_SUBPOENA_019508
MORENS_NIH_039094
REL0000478480

"I am avidly, absolutely pro-science and pro-research, and in particular pro-infectious disease research," says Inglesby.

But he says there's a very small part of that research "where there is the potential for very high risk if things go wrong, either by accident or on purpose. And so we have to get the balance right, between the risks that could unfold and the potential benefits."

For what it's worth I sent a brief note to the two leads for the White House COVID response team, Ashish Jha and Nahid Bhadelia, to say why they needed to agitate at the higher levels to get on to appointing a new NIH Director, preferably from the outside, and ideally a candidate like Harold Varmus who could command respect from both sides of the congressional divide.

I also suggested they consider the point that it would be better if there was a new NIH Director before they appointed somebody to NIAID, and that was OK because Hugh Auchincloss was eminently able to be a respected interim Director, both within the NIH and the outside scientific community. And, that the next NIAID Director should come from outside of the institution.

MORENS_SUBPOENA_019509

Subject: Re: Tweet by MinerFlux on Twitter

Guys, although the director search seems to be proceeding with total secrecy, I learned yesterday that our worst fear has come true: a highly undesirable internal candidate has applied. This person is a middle to upper level physician scientist who is widely disliked as a self-serving narcissist, back stabber, and manipulator. Tthis opinion comes not from me, but from colleagues with much more knowledge of him/her than me. Of course, being an A-hole doesn't necessarily predict a bad leader, but there is widespread worry.

I won't name the candidate but Peter S would know because her/his research at NIAID is in the area of clinical management of rare hereditary pediatric diseases such as Job disease and CGD. Peter H, you could easily ID this person, but i do not want to do so, in part because i have limited personal experience with him/her and am merely relating opinions of colleagues i trust

This individual is in a key management position in which she/he has earned a reputation of cresting an ant-meritocracy: screwing the best scientists while supporting those who suck up. Again this is hearsay, but from people who work under him/her.

If these negative assessments are true, it is still unclear what the implications, if any, would be for EHA, but i would worry that she/he would throw good scientists under the bus to appease politicians downtown

In any case, the best scenario is an open search with many good candidates. I am not sure whether we have that.

Also, my opinion, and that of many others, is that we need someone from the outside, in part because NIAID management and leadership has become inbred, nepotistic, and uninterested in hiring top scientists to fill positions. Moreover, we totally lack vision or any idea about where the science will and should go, and no mechanism to plan for being at/staying on the cutting edge

When i came here in the 1990s, from academia, where i was a 40-something year old full tenured professor in both med and public health school departments, i was told thst because i only had about 160 publications i had no chance of getting automatic tenure or even being put on a tenure track position

MORENS_SUBPOENA_019513
MORENS_NIH_039099
REL0000478480

That was then.

Of our two most recent hires placed into tenured positions, one had only 10 publications and the other came straight out of a post doc with few publications as well.

Both were in their early 30s and, as far as i can tell, are unlikely to ever do much

At the same tim a top sc from the outside, my good friend the (b) (6) from (b) (6) - Peter H, you may know him- and we was the 100% top choice of the search committee. However leadership below Tony refused to hire him with the excuse that he was overqualified and would make the other scientists look bad

No, i am not joking. This is where we are

I have in my had a small list of about 5-10 qualified folks for NIAID director, and have spoken or written to 4 about it, one being you, Peter H, but all four have expressed no interest. Peter D, you are clearly on that list too, but obvious to all of us is the fact that HHS would never let that happen, sadly, so i never mentioned it. In a better world, you would be at the top of that list in my view

The application deadline of 1/17 has passed, so we may be stuck with a non-ideal list, although no one knows including, i believe, our acting director Hugh, who is not a candidate, or so he told me

Disgusting. Reported to Twitter safety. They've been surprisingly good over the last few months. When there's a clear violation they've tended to lock the account.

Cheers,

Peter

Cc: Roberts, Rich <(b) (6)

Rich reached out to Jeff Sachs to set up a call with him and he sent the response below, which Rich suggested I could share with you all.

I think, unfortunately, you're right Peter that he holds a grudge against me re. the way I pushed back against his efforts to remove me from the Taskforce, which is a shame, and he seems to have re-hashed his memory of what happened in a way that's unfortunate.

However, he also lays out below his rationale for his Op Ed, and again, it's riddled with errors or misconceptions that I've addressed with brief bullets in the body of his email below. It also shows that he's clearly bought into the lab leak theory hook, line and sinker. It's very worrying to see that, but this is the problem with beguiling conspiratorial narratives like these. To counter them, you have to explain complex science, and the convoluted way science is funded and

conducted. The simplest, most exciting story often wins out.

Given the animosity in his email, the fact that Jeff's so well-known, and that his op ed calls for a "fair and balanced" investigation into COVID origins, I don't think EcoHealth 'wins' if I'm involved in a rebuttal to the PNAS paper. Others I've spoken with also suggest it would just amplify the attack. However, I would strongly encourage any of you to think about writing some sort of response either in PNAS or another form, and I'd be happy to provide facts and supporting documents for the many, many errors in his piece.

Please read his email below and my responses, I expect the lines of attack he puts forward will be used elsewhere by others, as many of them have already, and all can be easily refuted:

Cheers,

Peter

EcoHealth Alliance develops science-based solutions to prevent pandemics and promote conservation

From: Jeffrey Sachs <(b) (6)
Sent: Saturday, May 21, 2022 9:37 PM
To: Roberts, Rich <(b) (6)
Cc: Sonia E Sachs <(b) (6) >
Subject: Re: Your criticisms of the call for an independent investigation?

EXTERNAL SENDER

Dear Rich,

Thanks so much for your detailed comments.

Kindly let me share a few thoughts with you.

First, I got to know Daszak, as I invited him to chair a task force of the Lancet Covid-19 Commission. I observed close at hand that he was dishonest and untrustworthy. I had to dismiss him and disband the group that he set up. Many people associated with him also behaved very improperly, hiding their conflicts of interest and in other ways. I know that you defended him and I am absolutely sure that you did so out of the highest motives. Yet I've seen a side of Daszak that is disreputable.

Response: The conflicts of interest are that I worked with the WIV. This was absolutely known to Jeff from the start – it's why he reached out to me in April 2020 after Trump terminated our NIH funding, literally because "we funded the lab in Wuhan". A few weeks into my work with the Lancet Commission that Jeff headed up, he received a letter from a Congressman complaining about my alleged conflicts. Jeff responded to him to explain that my experience working with Wuhan is a benefit to the commission. Both are attached above.

Second, the EHA grant proposals are deeply disturbing. The DARPA-DEFUSE grant proposal raises the highest questions (especially pp. 10-11)

https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.dropbox.com%2Fs%2F7ds489l7l28us4t%proposal%2520.pdf%3Fdl%3D0&data=05%7C01%7Cdmorens%40niaid.nih.gov%7C02bf1391c68442ed507208db8ba0aaea%7C14b77578977342d585&sdata=QO%2FeF502R6fwDTgFrSgxc2fd9pTTPZ70%2BriNv3Zhasg%3D &reserved=0

Response: This is a rejected proposal from 2018 – the grant was never funded, the work was never done. The hypotheses and experiments proposed on pp 10-11 are based on well-known properties of other virus' proteolytic cleavage sites, and the (correct) idea that SARSr-CoVs might have them.

Why did we have to wait for more than a year to know about this grant proposal – and then only through FOIA? NIH has behaved very badly and continues to do so.

Response: The reason it wasn't made public is because no scientist in their right mind would publicly release an unfunded grant proposal – they represent your best ideas and hard work, and by releasing them, you hand over those ideas to competitors who are vying for the same sources of funding. However, it was in the possession of the US Federal agencies – it was in the files at DoD! Should the intelligence agencies have wanted to see it, they could have done so easily. Jeff's also wrong in that it was not released by FoIA because USG agencies also refuse to release unfunded proposals – they're privileged and confidential. If scientists submit proposals knowing that they might be FoIA'd, they would not submit their best ideas for fear of being scooped by rivals. The DARPA proposal was leaked by someone. Finally Jeff says NIH behaved badly, but this was a DoD proposal.

Why did NIH redact 290 pages here?

https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.dropbox.com%2Fs%2Fhripmsjk3ovi5fm%foia-request-55058-february-production.pdf%3Fdl%3D0&data=05%7C01%7Cdmorens%40niaid.nih.gov%7C02bf1391c68442ed507208db8ba0aaea%7C14b77578977342d585&sdata=7wySMqAgO%2BWtozQpM8og3cn643PZUhm7gLCJAaFxm4E%3D &reserved=0

Response: Simple. The 290 pages were an attachment to an email that happened to be a draft version of NIAID's COVID-19 Strategic Plan. This was published and widely disseminated later on, but it makes total sense for NIAID to redact a version that's unfinished, so that the public don't get fed other erroneous theories based on some typos or errors in the uncorrected version.

Third, NIH knew full well since February 1, 2020 if not earlier that a lab-leak was not only plausible, but for many leading scientists was odds-on. Yet that was deliberately covered up in the Proximal Origins paper in Nature Medicine, a paper advanced with Francis Collins' early intervention and editing. (The Proximal Origins paper is a remarkably crude whitewashing of the question – claiming that SARS-CoV-2 was "irrefutably" not from a known SARS-CoV backbone -- citing a 2014 (!!!) paper (see footnote 20, which gives away the game).

Response: It's just simply not true (and never has been) that many leading scientists view the lab leak theory as 'odds-on'. Neither was the theory deliberately covered up – it was debated and put to bed, that's why people changed their opinions from FoIA'd emails wherein they noticed the FCS and suggested it could indicate a lab origin, to the final paper wherein they had spent time debating the veracity of this with colleagues – that's how science should work. Ref. 20 is about how FCS arises in nature in avian flu, following prolonged passage of a mild strain. This plausibly could have happened when a bat-CoV circulated repeatedly in an amplifier host or in people prior to emerging with a full FCS. SARS-CoV circulated for months before emergence in China, so it's more plausible than months of lab passage for a virus that was never in the lab (we had all the sequences of all known bat-CoVs).

Fourth, even Baric has joined the call for an investigation. He has been the relentless champion of the genetic re-engineering of SARS-CoV viruses, and he trained Shi Zhengli. He has claimed that GoF is vital for drug and vaccine development. Yet GoF in a BSL2 laboratory (as in Wuhan) is a mighty risky proposition.

Response: The work in WIV that EHA collaborated on was definitively not gain-of-function. It was reviewed by NIH before we did it and they're the organization of note to do this. Their decision and the rationale has been made public and fits exactly with the published P3CO rules. This has been stated over and over again, but I guess Jeff just somehow disagrees with the authority to decide whether an expt is GoF or not!. In any case, none of the viruses at WIV were anywhere close to SARS-CoV-2, as published by us in Latinne et al. Nature Comms. 2020. Finally, the BSL argument is clearly false. The animal experiments that Jeff is alluding to here were conducted at BSL-3. The in vitro work at BSL-2 is the standard in China, just as it is in the USA for Cedar virus with a Hendra spike protein – something that's BSL4 in Australia. If we work with a lab in China, we cannot impose US law on them. NIH approved that work.

Fifth, I am not much persuaded that the presence of an FCS in some coronaviruses means all that much when: (a) no FCS is known in a sarbecoronavirus; (b) UNC-WIV planned to insert an FCS into a library of so-far undocumented SARS-CoVs; and (3) no single animal in China,

MORENS_SUBPOENA_009563
MORENS_NIH_020073
REL0000478484

in >80,000 tested, has carried SARS-CoV-2.

Response: this has been widely debunked. A) The site where FCS is found in the SARS-CoV-2 spike has mutations in many of the closely related bat-CoVs that show it is 'evolvable' and could easily mutate into a full FCS. B) UNC planned to insert FCS in 2018, but the grant wasn't funded, the work wasn't done. C) the sample of 80,000 animals includes before and after the pandemic, zoo animals, animals known refractive to SARSr-CoVs (e.g. salamanders). No group of a single species known to harbor SARSr-CoVs from this sample is of a size large enough to give statistical power to rule out infection.

In short, I believe that we need an independent investigation because:

(1) The virus could have emerged in a BSL2 based on the research promised in the DARPA-DEFUSE grant proposal

Response: yes it could have, but not based on a grant that wasn't funded

(2) NIH knows this very well, but has never admitted it or supported a public review

Response: I don't know how anyone can second guess what NIH knows. However, they have publicly stated that they support continued efforts to identify the origin

(3) We should therefore have a long-overdue transparent stock-taking of what the US organizations (NIH, EHA, UNC, DOD, IC, others) actually know

Response: I think I've told everyone all I 'actually know' about 100 times over. What Jeff Sachs is actually proposing is an invasive witch hunt whereby my private emails and files are published for the right wing press to spend another 2 years canceling out our organization.

(4) The Intelligence Community is itself divided on the issue, which some agencies leaning towards a lab leak. Why do some IC agencies lean towards a lab release?

Response: Not true. Prior to Biden's 90 day intel review, only a few intel agencies expressed an opinion: 2 agencies concluded 'natural' origins were more likely and 1 concluded lab leak more likely. After the review 4 agencies considered 'natural' origins more likely and 1 concluded lab leak more likely. Confidence in conclusion was low

MORENS_SUBPOENA_009564
MORENS_NIH_020074
REL0000478484

throughout, but there was a distinct shift suggesting intelligence supports natural over lab leak.

All best wishes and with very warm regards,

Jeff

The GAO was asked by the Biden administration to look into political interference in science by the white house under Trump. They interviewed me repeatedly last year and this year about the termination of our R01 grant.

MORENS_SUBPOENA_003547
MORENS_NIH_010446
REL0000478491

https://www.gao.gov/products/gao- 22-104613

This is the first report from them on the topic. It's massively disappointing, of course, because it just comes up with broad recommendations on what agencies should do to protect themselves against political interference. However, if you read the email below, this is the first of two reports, and the second one should hopefully go into more detail about the NIH actions on EcoHealth's grant.

Cheers,

Peter

Dear Peter,

Thank you for participating in our report on scientific integrity at HHS. Our completed report can be accessed here. Please feel free to share it with your network and colleagues. We plan to issue an additional report that will examine the key characteristics that can insulate agencies from political interference, and how, if at all, the selected HHS agencies have experienced potential political interference while carrying out their missions.

Thank you again for your time and providing information on this important topic.

Sincerely,

Rob Marek

> It's been a while since we all connected, and after a hectic build up to the holidays (I was on 3, multi-week trips to Southeast Asia between Sept and Dec), I wanted to get back in touch with you and let you know what's happening. As you know, we received a letter from Reps. Comer and Jordan mid-December demanding documents and on-the-record interviews as part of their 'investigations' they're planning into COVID origins. The White House received similar letters demanding docs and interviews with the HHS Secretary, multiple people from NIH (incl. David Morens) and others. They pushed back because the Republicans weren't even in power, and we've now heard from the staffers that they're getting ready to send new letters over to us all. None of us are sure how actively or rapidly they'll get to their COVID investigation, or if this will involve public hearings. They've got a lot of other issues, and a priority to target Hunter Biden's laptop, as well as new issues like the debt ceiling and classified documents. However, we do expect that they will get to it eventually, and that the Republicans in the House will be aggressively targeting EcoHealth Alliance (and probably other organizations) with efforts to defund us.
>
> This all adds to a growing anti-science movement that Peter Hotez has been highlighting in articles and online recently around COVID origins, the mask mandates, vaccine mandates and other anti-vaxx and 'anti-expert' type attacks. The Republicans will want to turn up the heat to keep all of this in the press so it helps them in

their attacks on Biden, Fauci etc. It's pure politics, but has a real threat of damage to us, and to the research we all value. At the very least, we expect to see substantial efforts to legislate against so-called gain-of-function work, and as of yet, zero pushback from the scientific community writ large – the societies, academies, universities. The media are jumping in. Everyone wants to write an article about COVID origin and given the aggression on social media, these are being amplified rapidly and getting into the public eye. Just in the last couple of days:
>
>
>
> · A long-winded whiny article from The Intercept about FoIA'd emails that basically show how scientists discussed the lab hypothesis early on, but David Relman (at the end of the article) claims shows they were rushing to judgement:

> The problem I see is that the Republicans are getting what they want – keeping the lab leak hypothesis and anti-science sentiments in the mainstream press and setting the stage for the McCarthy-style witch hunts that Peter Hotez has been talking about. We are actively reaching out to Democrats in Senate and Congress to try to build up their energy to defend against this, but we are just one small organization, and I'm worried about how successful we can be. I've been talking with Jeff Sturchio about renewing our efforts to try and build a coalition to counter this, involving the societies, activist groups like Research! America, university coalitions like the Consortium of Universities for Global Health (CUGH), ASTMH, APHA, NL Campaigns, The pandemic Action coalition, etc.

Former Harvard University Professor Sentenced for Lying About His Affiliation with Wuhan University of Technology; China's Thousand Talents Program; and Filing False Tax Returns

Wednesday, April 26, 2023
For Immediate Release

MORENS_SUBPOENA_008383
MORENS_NIH_018320
REL0000478500

U.S. Attorney's Office, District of Massachusetts
BOSTON – The former Chair of Harvard University's Chemistry and Chemical Biology Department was sentenced today in federal court in Boston for lying to federal authorities about his affiliation with People's Republic of China's Thousand Talents Program and the Wuhan University of Technology (WUT) in Wuhan, China, as well as failing to report income he received from WUT.

Dr. Charles Lieber, 64, was sentenced by U.S. Senior District Court Judge Rya W. Zobel to time served (two days) in prison; two years of supervised release with six months of home confinement; a fine of $50,000; and $33,600 in restitution to the IRS. The government recommended a sentence of 90 days in prison and a $150,000 fine.
In December 2021, Lieber was convicted by a federal jury of two counts of making false statements to federal authorities, two counts of making and subscribing a false income tax return, and two counts of failing to file reports of foreign bank and financial accounts (FBAR) with the Internal Revenue Service (IRS).
Lieber served as the Principal Investigator of the Lieber Research Group at Harvard University, which between 2008 and 2019 conducted more than $15 million in research sponsored by various U.S. Government agencies, including the U.S. Department of Defense ("DOD") and the National Institutes of Health ("NIH"). Unbeknownst to his employer, Harvard University, Lieber became a "Strategic Scientist" at WUT and, later, a contractual participant in China's Thousand Talents Plan from at least 2012 through 2015. China's Thousand Talents Plan was one of the most prominent Chinese talent recruitment plans designed to attract, recruit and cultivate high-level scientific talent in furtherance of China's scientific development, economic prosperity and national security.

In April 2018, during an interview with federal agents from DOD (one of the agencies that sponsored a portion of Lieber's research), among other things, Lieber falsely stated that he had never been asked to participate in the Thousand Talents Plan. Later, in January 2019, Lieber caused Harvard to falsely tell the NIH (another sponsor of Lieber's research) that Lieber was not, and had never been, a participant in the Thousand Talents Plan. Lieber knew these statements were false because he had signed a Thousand Talents contract with WUT in 2012, performed many of the duties and responsibilities required of him under that contract, and been paid a substantial salary by WUT in exchange for his work. Specifically, the terms of Lieber's three-year Thousand Talents contract with WUT entitled Lieber to a salary of up to $50,000 per month, living expenses of up to $150,000 and approximately n $1.5 million to conduct joint research at WUT.

In tax years 2013 and 2014, Lieber earned income from WUT in the form of salary and other payments made to him pursuant to his Thousand Talents contract, which he did not disclose to the IRS on his federal income tax returns. Together with WUT officials, Lieber also opened a bank account at a Chinese bank during a trip to Wuhan in 2012. Thereafter, between at least 2012 and 2015, WUT periodically deposited portions of Lieber's salary into that account. U.S. taxpayers are required to report the existence of any foreign bank account that holds more than $10,000 at any time during a given year by the filing an FBAR with the IRS. According to Lieber, the balance of his Chinese bank account was approximately $200,000 in 2014 and 2015. Nonetheless, Lieber purposely failed to file FBARs for those years.
United States Attorney Rachael S. Rollins; Matthew Olsen, Assistant Attorney General for National Security; Joseph R. Bonavolonta, Special Agent in Charge of the Federal Bureau of Investigation, Boston Division; Patrick J. Hegarty, Special Agent in Charge of the Defense Criminal Investigative Service, Northeast Field Office; Joleen D. Simpson, Special Agent in Charge of the Internal Revenue Service-Criminal Investigation Division for the Boston Field Office; Michael Wiest, Special Agent in Charge of the Naval Criminal Investigative Service (NCIS), Northeast Field Office; and Philip M. Coyne, Special Agent in Charge of the U.S. Department of Health and Human Services, Office of Inspector General made the announcement today. Assistant U.S. Attorney Jason A. Casey of Rollins' National Security Unit and Assistant U.S. Attorney James R. Drabick of Rollins' Securities, Financial & Cyber Fraud Unit prosecuted the case.

Not pleasant reading but thanks for sharing this link. It's a stream-of-consciousness diatribe that makes you think this guy is simply mentally ill, but actually he's a well-known right wing 'influencer', appearing on Steve Bannon's podcast, member of the Brownstone Institute and regular on other outlets. In the end, just probably a sad lonely person looking for outside validation. Still, pretty disturbing to read…

Peter, i must say, and i mean this with respect and aloha, i do agree with Rich and Harold that this may be a time for you to lay low yourself, and let others go to bst for you

I know that must be hard when u are being pilloried, but my sense is that we are at a time when you need to be the victim being saved by noble champions

Will noble champions step up? This is a place where Harold, Rich, Jerry, Victor and others must step in. You can't do this yourself, the assholes are too powerful

Let's all of us work behind the scenes to reverse this injustice. I don't know how, but my boxing gloves are on and laced up. David

Great to read this chain. I also spoke with Rich Roberts and will be sending a 2 pager with all the NIH/EHA letters and responses in a timeline, and links to all the political action going on.

I agree with your assessments (both of you) – this is a threat to science, and it's not going away – it's now become more centralized with Biden maintaining a tough-on-China stance, and there are loud people on the left (e.g. Jamie Metzl) and within science (Relman, Lipsitch, Ebright) who are feeding political action and the call for commissions. Note that only yesterday there were two actions of note – the bill on China interference was pass in Senate Committee (Foreign Affairs), with Michael Lauer testifying, and the bill from the nutter Right re. declassifying intelligence on Wuhan.

We need to continue this multi-pronged effort to defend science, even though, as Tony suggested, Harold also, and my Board Chair, I will continue to try to avoid any publicity on this issue at all…

Cheers,

Peter

Great news, and i think you are probably exactly tight about Tony. Just a bit ago, I got a call from Rich saying he hadjust talked to Harold, who went into abit of a tirade about Francis, I omit the colorful language here, and said he, Harold, would call Tony next week

Rich also said he would be advising Peter to stay away from the press, as that may be fanning the flames with the nutters. D

I'm purposely not including Rich on this note because I don't want to be seen as pressuring him further. I think he will follow up, he has as good a connection to Harold as I do, and if necessary I will follow up. Harold has consistently stayed in the background when I have asked him about doing certain things or writing certain commentaries etc. but he has not been reluctant to speak rather frankly about Francis and the Lauer affair when he believed it was necessary or he was directly approached by the reporters at Science, for example. I did try to get Jon Cohen and Meredith Wadman moving on a new article but as you know they both declined at this point because it was not news. I think that was a cop out decision, and depending on what Rich has to day I might just copy Harold on that and see if he is willing to contact them because they will most likely have a different response to him than to me.
> We just have to stay on this, not panic, and not waiver from the ultimate goal. Timing is always critical. So is the messenger. Lander may be the right person, and Harold has indicated to me that he has been in contact with Eric on this issue.

Hi Jerry and colleagues, just spent 40 minutes on Zoom with Tony and one of two possibilities: either we are all unnecessarily alarmed, or else he is not taking the threats seriously

He said repeatedly, in a low key jocular way, that no one could mess with him or niaid since we haven't done anything wrong, apparently not counting as "messing with us" the fact that we had an important research project terminated in an unprecedented manner for political reasons.

He also repeated alot of macho comments about how there is always a guy with an AR-15 right outside his door (true, and sometimes two other armed secret service guys) and everywhere he goes outside the office he has at least two bodyguards, also true...9

I hope he is right that the wackos won't gain any further traction, but i am not so sure. For one thing, there was huge collateral damage a few years back with the H5N1 gain of function mess. It is true that neither Tony nor other NIH staff got into any trouble, but thousands of professional hours were wasted over several years time and, far more importantly, the research moratorium, which went in for years, caused labs across the country to close, or move into other areas, caused lab people on grants to lose their jobs, and grad students to lose their dissertation work and postdocs to lose their projects. It was a mess that ought not to be forgotten

If i had to bet, i would guess that beneath Tony's macho I-am-not-worried reaction he really is concerned. And whatever the case he should be very concerned about what happened to Peter, to our research portfolio in an extremely important area, and to scientific independence

He did not know about either the Miller Commission or the letter from Rep Rogers which i emailed to him on gmail later

I also commented that Lauer's letters to you Peter, and the Rogers letter to you, had alot of overlap and seemed to reflect input of at least one scientist, whether or not one of our grantees. In other words, i feel that regarding those letters someone or someones are working in cahoots with the politicians who wish to do harm to NIH He didn't seem particularly troubled by that.

In the end he said thanks for filling me in and asked me to call him on his private cell phone (which is what i normally do anyway) if i hear anything that might be important

So, i am not sure where things stand. I absolutely DO feel that it would be a good thing if one of you luminaries were to approach him and try to make sure he understood what is going on out there, and perhaps discuss what the larger community of scientists can do to lock arms in unity and push back.

Thanks, Jerry, i will let you know how it goes, although he may not indicate to me his next steps. The way it works with us is that he tries to never ask me things directly, like ask for my advice on what to do, but rather does alot of homework ahead of time, figures out what i am likely to say, then HE tells ME what he thinks so that i can confirm it. Yes, we all have our peculiarities, but as long as the machine runs smoothly its ok

I DO know that he has great respect for Harold, and i think also admires Harold's charge-ahead no-BS style, which is the opposite of Tony's extreme caution. So i have little doubt that he would welcome that kind of help. D

David,
Thanks for the note, and I recognize what you say is what I know about Tony. He is a remarkable person, but like all of us he isn't perfect. I think your strategy to lay out the issues and let him run with it to decide what can be effectively addressed and with what strategy.

Rich's suggestion to talk to Harold is on track, and it would be great Rich if you were to do that. I know that they have a very close and positive history of working together, that Harold is very strategic in his thinking, he prefers to work in the background (something I have confirmed multiple times this past year as I have asked for his advice on things I could take on), and that he will be really frank in talking to Rich. Harold has very recently told me that he has worked closely with Rich on a number of issues related to the concerns we all have.

Let us know how the chat goes tomorrow. I think you have the right perspective heading in to it, and lots of good information at your fingertips.

Hi:

If I am to do something I would talk to Harold first. I'll see what he has to say as a possible path forward.

EXTERNAL SENDER

Jerry, The way it works with Tony, at least at my level, is you can't suggest he do anything. If you do, he won't do it on principle. The trick is to make him think of doing something himself, and then he will ask you to help him do it

My strategy tomorrow is to tell him that alarming things are at work, to the point that many scientists (our grantees and others) have become increasingly worried and are looking for the way forward. In that context i will share with him verbally Peter's information, and offer to get to him any of the materials he wants to see, or connect him directly with Peter, who he very much respects

I have not heard that he has engaged Harold, or the National Academies, or the professional societies, although i might not know if he did. He is very much a loner about things like this. He prides himself on being like teflon, but I am worried that he may not be as invulnerable as he may think

Our Chief of Staff, Greg Folkers (who has Masters degrees in both journalism and PH), is among the only folks here, partly excepting Cliff Lane, in whom Tony confides when the subject is difficult or personal, only rarely to me.... and Greg told me today that he thinks Tony is getting worried that the brown stuff is about to hit the fan, and that he may have become a major target

There is very little i can do to help because i am a mere scientist, not a NL, or member of the NAM, or head of a prestigious society (the only kinds of people Tony will usually engage with, as he is very proud).

So if he doesn't become more proactive, what remains is for scientists and science orgs at the very highest level to come together forcefully to push back against the craziness

Who would be willing to approach him directly and "talk turkey"? Harold? Rich? You? Victor? A couple of you?

Jerry, i am traveling without much news access, but this is really depressing. My concern has grown to alarm and i am afraid to think what comes next

We seem to have arrived at that Orwellian point where all investigations of important matters have to exclude participation of the subject experts, since being a subject expert is disqualifying on the grounds that all expertise is inherently biasing.

Before George Orwell, we had Lewis Carroll telling us this. We are in grave danger of going down-the-rabbit-hole-with-Alice.....

I saw the results of a focus group of Trump supporters reported on today: https://www.washingtonpost.com/health/2021/04/20/vaccine-hesitant-republicans/ A bit of text in this report is about Tony.

"Every participant said they preferred hearing from politicians over the medical expert, who has been pilloried by conservative media for months over his coronavirus warnings. The data have shown that unfortunately Dr. Fauci has been politicized, and we need different messengers, because even the right messages coming from the wrong messengers aren't always helpful," Castrucci said, noting his foundation's polling [de Beaumont Foundation] found Americans trust their personal doctors more than the government's top infectious-disease doctor".

This is the fundamental problem we have, as the politicians will only use this as an echo chamber to amplify their support from their public supporters and constituents. It does point back to the scientific societies which have weighed in previously, but no more impact than we have had as individuals. It doesn't stop this approach, its just that we need some deus ex machina to help us. Is that going to be Eric Lander? What's happening with his approval? I haven't heard much of late.

RE: Zoom meeting with Tony tomorrow
Importance: High

Thanks for the email David - comments below. Also please see the attached
word doc with links to some of the political actions that I'm concerned about. Tell Tony that this is very early days, with most of these coming from the Right, and many that can be headed off at the pass by positive outreach to Democrats, which I believe people will be doing.

I've also put in a link to the new " Covid Commission Planning Group

(Covid
CPG)" that has no official role from USG, but boldly states as its core mission "to prepare the way for a National Covid Commission". Members
include David Relman & Marc Lipsitch and I have heard from many on the
conspiracy theory chatter networks online that this will focus partly on advocating for reduction in biosafety labs, viral work in wildlife, and gain-of-function.

Please feel free to share any docs that I've sent to you, with Tony. Hopefully you can do that in a way that avoids FoIA, and if not possible,
just show him stuff on screenshare on Zoom.

Please also see comments below...

Cheers,

Peter

Subject: Zoom meeting with Tony tomorrow

Peter, i am on leave in Florida for my granddaughters graduation from Florida State

Tomorrow at 130 i will be having a zoom call with Tony to tip him off

on
some of the info you sent in your recent email

I want to be sure about what info or docs you would or would not want me to
share
[Peter Daszak:] Any and all

Other than what i see on tv, the jousting with Rand Paul and Jim Jordan, for
example, i do not know how much of this Tony is aware of. To my knowledge
he doesn't share it with anyone up here

I think issues he will be most concerned about are not your grant, although
i add i am sure he would do anything he could to restore the funds and get
the hellhounds of your back, but rather 1) the possibility that people like Rep Rodgers and her committee are about to turn up the heat and put Tony,
personally, in their crosshairs, and 2) the possibility the NIH funded scientists or other esteemed scientists, are in cahoots with politicians wanting to attack him or niaid
[Peter Daszak:] agreed

As background, we all went through the original version of this crap about
10 years ago with the original GOF attacks surrounding H5N1. As Tony's
scientific advisor, i spent much of the year, along with Jeff T, helping brief him and get him up to speed, which he did. At the time, David Relman,
who had been one of Tony's favorites, was leading the charge, and we all
wondered why a young guy with so much promise would choose demagoguery over
science. Lipsitch was only a minor player at that time, but relished his attack role and seem to become more alarmist as time went on. Now these
guys are in the NAM. How did that happen???? Ebright has always been a
crackpot, in the mold of Peter Duseberg, remember him?, and no one took him
seriously except some of the press who didn't know any better
[Peter Daszak:] I had the unfortunate issue of voting on Marc Lipsitch's membership of NAM. He's an accomplished scientist. He's also very opinionated, arrogant and pushy on whatever issue he believes in. I voted on
his science acumen.

I was unclear from your email on a couple points you might clarify. Obviously the Rodgers letter asking you to produce all those dox not only
overlaps with the Lauer letter to you, but could not have been written without the help of a virologist.
[Peter Daszak:] I have it on good authority (Ebright's Twitter account) that
he was involved. They are also getting pressured from Jamie Metzl who

's
working with the internet conspiracy networks actively to promote their
"Research"

Actually, given that there are a few points in the letter that someone knowledgable about coronavirus virology would have corrected, my suspicion
is that the letter was put together with the help of a legitimate scientist who needs to do more homework on coronaviruses.
[Peter Daszak:] you're right..! Metzl isn't a virologist, neither's Ebright. The internet 'researchers' are led by a banker and some junior scientists, many from human genetics, mol boil world.

Do you agree, and do you think that person was Ebright? Do you think Relman, Lipsitch, Imperiale, or other current or former grantees might have
been involved?

I am not sure we ever funded Ebright, but we did fund the others. I would
like to think that Relman et all are only mouthing off to the press, but do you think there is more to it than that, eg, that any of them are working with the politicians?
[Peter Daszak:] David Relman is talking with reporters a lot about this, including casting aspersions on my motives for speaking out about this virus
emerging via wildlife-to-human spillover (he's quoted as saying my motives
are to protect the research I've been doing and reputations of our collaborators). Ebright is very actively (and obnoxiously) critical on social media calling me a 'Grifter' on a weekly basis and promoting unsubstantiated arguments for a lab leak. I had to look up what 'grifter' meant at first...

Your earlier comments about this proposed investigative committee, and the
possible role of these folks in it, are alarming. Can you be more specific about where this stands and what is being done to forward it and to squelch
it?
[Peter Daszak:] Nothing's being done to squelch it, and neither should it be - there will be other committees that also pop up. My concern is their bold claim that they're laying the groundwork for a 9/11 type commission
(and have a 9/11 commission person involved). It may be that just by saying
that a lot, and having well known people involved, they end up forming one.
They're clearly politically connected and are advocating for this politically. Jerry and I also proposed this in our paper published in Health
Affairs, but we assumed this would be led by NAM or some other well-respected institution.

When i speak with Tony i do not want to step into the politics of all this, as that's not my job and he wouldn't want me to. If he needs further info it might be best to connect you two, in an off the record manner. Would that be OK? We are getting FOIA'd non stop, so it's most important that

MORENS_SUBPOENA_019638
MORENS_NIH_039236
REL0000478517

Tony not have anything on the record that could come back to bite
[Peter Daszak:] Totally agree. Tell him I'm happy to speak with him at any
time and will do so in a way that's not FoIA-ble. One thing I could do is either on a zoom call or by sending you a document, is lay out responses to
the Mendendez questions so that the arguments are known and well-supported.
For example, everyone's saying that this is a 'gain-of-function' issue, but actually that's not the case - we worked on bat viruses, not human pathogens. The expts produced loss of function, not gain of function, all
appropriate conditions and approvals were demonstrably checked and correctly
answered.

Finally, i didn't read all of the Menendez bill-in-committee, which is longer than Les misérables, but what's the gist? Do you think that in their
zeal to take a hard stance against the PRC, these Democrats are purposely,
or accidentally, getting sucked into the evil-WIV scenario? Is there real danger here?
[Peter Daszak:] The Menendez bill is the only one that stands a chance so
far of becoming law because it's bipartisan. The WIV, gain-of-function stuff
is thrown in as a very small part of it. The draft wording only calls for a report from NIH after 180 days on these issues, and they are easily addressed. However, if it does pass and the anti-China mood hardens in the
US, it may end up with calls to testify and the Republicans may use that to
undermine NIH, and in particular Tony, given the rabid GoF myth they've been
building.

Anything you think might be helpful, I'd appreciate

TY, david

I should add that the former Lancet Taskforce (Jerry and I are on it) have a "perspectives" paper to submit Monday for PNAS that reviews all the theories on origins and proposes One Health strategies to deal with future pandemic threats, so we don't need to go too far into the arguments for a natural origin – it will be dealt with in detail in that paper.

Cheers,

Peter

Sounds good, let me know if and how you would like me to contribute, i could write a section that makes the case for natural origins as the most plausible scenario?

response to the PNAS paper - initial thoughts as draft bullets

Importance: High

FYI, Rich will be speaking with Jeff and I sent him some bullets on general reasons why the call for an investigation into US scientists is flawed, inappropriate and based on easily debunked narratives and simple mistakes.

I think we could draft a polite and decent rebuttal based on these. The general thrust I think should be "Why investigating US scientists is the wrong way to identify COVID-19 origins, and prevent future pandemics". This would take the moral high ground in the same way that Peter Hotez has been doing with anti-vaxx sentiment, by talking about how damaging these narratives are on science, and scientists, and how they ultimately undermine public health.

Here is the summary I sent to Rich. I'll continue to read the paper and identify factual inaccuracies we can correct, but maybe one of you (e.g. Peter) could build on this for a rebuttal draft? I have beaucoup references for each point I make, including peer-reviewed science that demolishes the FCS hypothesis, media articles where we refute some of the claims about our openness and data sharing, and reports that link to articles and emails that have been made public via FoIA.

Bullets for a draft rebuttal:
I think we could start on a conciliatory note that most reasonable scientists who believe the lab leak is 'extremely unlikely' (words of the WHO report I was involved with) also believe it is possible. Therefore, calls for further investigations into the origin (including a potential lab leak) are warranted and valid, and come from a basis of scientific inquiry that is beneficial. If a lab leak did happen, we should know, and it would benefit our defenses against future pandemics. However, we should then rapidly pivot to the main issue: that the call for an independent investigation in to US scientists and organizations that the article lays out, and many of the specific statements in it are based on flawed narratives, misunderstandings of the balance of the evidence, mistakes in interpreting the facts behind the work, and simple errors in understanding how science is conducted. Here are some key issues we could raise:

- Understanding COVID origins will require cooperation with China, not investigation of US scientists. A brief look at the history of recent emerging diseases shows that it usually takes many years to identify the reservoir hosts, the amplifier hosts, and the pathway to emergence (e.g. SARS – our paper showing bats carry SARSr-CoVs that can bind to human cells was published 12 years after the outbreak). To do this requires access to sample collection, testing and analysis within the country of origin, and cooperation with the government. Thus, investigating either a natural or a lab origin of COVID will absolutely require working with China.
- Why 'investigating US scientists' is already a witch hunt. The opinion piece calls for bipartisan independent commission that doesn't engage in a 'witch hunt'. However, we are already engaged in a witch hunt. The issue was politicized under Trump, and has led to dozens of letters from Republican members of Congress and the Senate to US scientists demanding documents and testimony, or making accusations about them to the agencies, to the DoJ, White House, and which are inevitably made public without the opportunity for US scientists to respond. Each of the allegations I have seen from Republicans against EHA are easily refuted with documentary evidence, but the volume of them, and their inflammatory nature means that responding to each is either logistically impossible, or simply amplifies these attacks. There have been NO bipartisan requests that I have seen.
- All *relevant* data have already been shared publicly or with the relevant govt. agencies. The article states that "*EHA, UNC, NIH, USAID, and other research partners have failed to disclose their activities to the US scientific community and the US public, instead declaring that they were not involved in any experiments that could have resulted in the emergence of SARS-CoV-2.*" This is simply not true. Each

MORENS_SUBPOENA_005165
MORENS_NIH_013095
REL0000478523

collaborating org has published dozens of papers on this work, in US (not Chinese) journals, uploading data to US (not Chinese) databases like Genbank. All of EHA's papers are available on our website for any member of the public to review, and have been for years. Our staff have given literally hundreds of public lectures on this work. Even after these attacks began, we continued to publish data from our China work, e.g. the 700+ CoV sequences we published and uploaded into Genbank in 2020). Lead scientists from each collaborating organization have shared all unpublished data of relevance (i.e. related to SARSr-CoVs) with the relevant federal agencies including NIH, USAID, DoD, and the intelligence and law enforcement agencies. Sharing of these data has been voluntary, extensive and honorable. This information has not been made public, because it undermines the agencies' ability to conduct their work.

- Demanding release of private emails, files from US scientists does not help build trust in science. Demands on US scientists to release private emails, unpublished data, drafts of reports and other documents that are normally not made public does nothing to elucidate the origins of COVID. Neither does it help build trust in science at a time when our country is so divided along party lines, and where this issue has been so politicized. With social media algorithms demonstrably amplifying negative narratives, the release of private emails and drafts of later-published reports or papers, are easily used to drive and amplify these negative narratives. We have seen this played out already – with every FoIA release of emails, they are cherry-picked for partial-sentence quotes that are then misquoted, misconstrued, and published as part of (usually) right wing hit-pieces that drive the narrative of an elite group of scientists trying to make money by manipulating viruses or vaccines. They are dangerous and lead to people avoiding vaccines. In the case of EcoHealth, the release of private documents, and the narratives around them have also demonstrably been linked to death threats, white powder letters, break-ins, and hacking attempts that we have been suffering repeatedly for the past 2.5 years.
- Inability to prove a negative: We can't prove that China didn't release a virus accidently or by design – that's the nature of scientific hypothesis testing. If US scientists are forced to release emails or files that these do not show any evidence of a lab leak, they will be followed by allegations that other files are being hidden, and therefore more requests for data dumps. For example, if my emails show that China was not working on a SARS-CoV-2 virus with NIH funding, they will be followed by allegations that we used other private funding to do this work (this has already been alleged), and further requests for private emails. Meanwhile, every email, report or unpublished paper I'm forced to turn over is used over and over again by the political forces to attack science – misquoting, using innuendo and assumptions of motives.
- Furin cleavage site hypothesis is already debunked: Theories that the FCS of SARS-CoV-2 indicates lab manipulation have been widely circulated for 2 years and repeatedly debunked by leading virologists. Firstly, there is nothing novel about a wild-type virus having an FCS – they are found in influenza where they enhance virulence, and in other CoVs, including MERS-CoV, and a Rat coronavirus we discovered in China, in wildlife farms, hotels and train stations and published during 2021. There are now peer-reviewed scientific papers demonstrating that bat-CoVs closely related to SARS-CoV-2 have mutations around the site where the FCS in SARS-CoV-2 is found, that are a few mutations away from a true FCS, indicating that this could have easily evolved in nature. These mutations around the polybasic cleavage site are found in many of the viruses closely related to SARS-CoV-2 from SE Asia, and in CoVs from European bats. Other theories about the FCS being incredibly efficient at binding to human cells, or being enhanced easily in a lab, have been refuted in these and other papers.
- Inappropriate legal basis to investigate scientists when no evidence of a lab leak has been proffered: At the moment, it is a fact that there's simply no verifiable evidence whatsoever that a lab leak occurred leading to COVID-19. We have accusations from Secretary Pompeo that people at WIV were sick from COVID in November 2019, but these are allegedly classified. We have stories about the motivations of Chinese scientists in pulling down a database, not citing papers correctly, or removing genomic data from Genbank, but all of these (and all others) can be easily explained by the normal process of doing science, and each of them has occurred many times before with other labs and other circumstances. Many of us, and many other leading scientists have spent countless hours explaining why the theories around lab leaks do not amount to "evidence of a lab leak". Without this it would be massively inappropriate for federal authorities, including the OIG, the FBI or other agencies to launch official investigations into US scientists or US organizations.

That's why they haven't, and that's why the public haven't been informed of any investigations.

In addition to these issues, there are multiple factual inaccuracies in the paper that are extremely important, because some of them are used to provide justification for the lab leak theory. For example, here is an inexhaustive list, just by looking at half of one page of the paper:

- "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the United States and China, *has not been disclosed for independent analysis.*" ***This is not true because details of field and laboratory work have been published repeatedly in scientific papers in the last 15 years, in reports to NIH and USAID, and are laid out in proposals that include pages of details on human subjects, animal use, biosafety and select agent use etc. These are all now public.***
- "Much of the work on SARS-like CoVs performed in Wuhan was part of an active and highly collaborative US–China scientific research program funded by the US Government (NIH, *Defense Threat Reduction Agency [DTRA]*, and US Agency for International Development [USAID]), coordinated by researchers at EcoHealth Alliance (EHA), but involving researchers at several other US institutions." ***False - DoD DTRA do not and have not funded work in China through EHA. This is an easily verified issue, and is a mistake that causes damage because conspiracy theorists globally are on the lookout for linkages to DoD, which leads to damaging narratives such as the Ukraine Biolabs conspiracy theories. The way to check this is that DTRA are NEVER cited on any publication resulting from the work in China.***
- "The precise nature of the experiments that were conducted, *including the full array of viruses collected from the field* and the subsequent sequencing and manipulation of those viruses, *remains unknown*." ***Not true. It is a widely circulated myth that our work involved 'collection of hundreds of viruses from bats'. In fact, there were only 3 isolates of SARSr-CoVs from our work. All of these have been published and some shared with labs in the USA where they were used to test Remdesivir, Molnupiravir, COVID-19 vaccine candidates and monoclonal therapies like ADG20. This work has had a direct benefit to public health and has saved lives of US citizens!***
- "These research proposals make clear that the EHA-WIV-UNC collaboration *was involved in the collection of a large number of so-far undocumented SARS-like viruses* and was engaged in their manipulation within biological safety level (BSL)-2 and BSL-3 laboratory facilities, raising concerns that an airborne virus might have infected a laboratory worker (9)" ***Not true – there were only 3 SARS-related CoVs isolated in China. All the rest are genetic sequences of a short read of the RdRp gene, with a few dozen full genomes. It's documented repeatedly in the scientific papers we published in collaboration with WIV, in mainly US journals, all of which are available publicly on PubMED and on our website. All sequences were uploaded into the US Genbank database and have been freely available for other scientists to peruse and use.***

I don't think PNAS would retract – Sachs is well-known, and this paper will be cited, so it's good for business.

We could ask them to correct, but I think Peter's idea is a good one – a response that's carefully worded, that corrects the errors, and explains why the general approach of investigating scientists based on no evidence would be flawed and damaging to medical progress.

I'm sending some bullets to Rich this morning and will share them with you as a start to addressing some of the errors.

Cheers,

Peter

Peter: I think a response along the lines you suggest would be a good idea. Sachs's piece is so egregious it shouldn't be allowed to stand. Perhaps even better would be a sharp letter to the editor(s) of PNAS explaining why a retraction is necessary. As you and Peter D point out, his argument is based on a number of readily refuted erroneous assertions – it's surprising that PNAS would have published it in the first place.

As ever,
Jeff

Subject: Re: Peter Hotez' tweet and Jamie Metzl's

Potentially we could write a response or a commentary piece in PNAS refuting the nonsense, one that begins with the talking points in my Twitter thread.

There is also suggestion from a Nature article that even SARS 1 exhibited some degree of furin cleavage but that with SARS 2 it accelerated and of course evolved even further with alpha then delta to make it more transmissible.

https://www.nature.com/articles/d41586- 021-02039-y

I could have added that as well. The point is it's not an all or none phenomenon as the Sachs article suggests. He wrote an awful paper that needs to be retracted.

On May 19, 2022, at 4:27 PM, Peter Daszak (b) (6) wrote:

What's really irksome is that this article in PNAS is full of errors and misunderstandings.

I haven't read the whole thing, but just about every paragraph contains an erroneous assumption that could easily be refuted, e.g.:

- "EHA, UNC, NIH, USAID, and other research partners have failed to disclose their activities

MORENS_SUBPOENA_005174
MORENS_NIH_013104
REL0000478523

[redacted] the US scientific community and the US public, instead declaring that they were not involved in any experiments that could have resulted in the emergence of SARS-CoV-2." BS – we published dozens of papers on our work (they're on our website!) and sent reports in to NIH each year. We also gave hundreds of public lectures on this and spoke with the intelligence agencies about it.

> "The exact details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the United States and China, has not been disclosed for independent analysis." BS – that's what happens when you publish peer-reviewed papers. Maybe Sachs has forgotten how that works!
>
> "Much of the work on SARS-like CoVs performed in Wuhan was part of an active and highly collaborative US–China scientific research program funded by the US Government (NIH, Defense Threat Reduction Agency [DTRA], and US Agency for International Development [USAID]), coordinated by researchers at EcoHealth Alliance (EHA), but involving researchers at several other US institutions." Wrong again – DoD DTRA do not and have not funded work in China, let alone the Wuhan lab.
>
> "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown." BS – all 'viruses' collected from the field have been published already.
>
> "These research proposals make clear that the EHA-WIV-UNC collaboration was involved in the collection of a large number of so-far undocumented SARS-like viruses and was engaged in their manipulation within biological safety level (BSL)-2 and BSL-3 laboratory facilities, raising concerns that an airborne virus might have infected a laboratory worker (9)" BS – there were only 3 SARS-related CoVs isolated in China. All the rest are simply genetic sequences of a short read of the RdRp gene, with a few dozen full genomes. It's all in the scientific papers that Sachs hasn't bothered to read.

And so on, and so forth.

Honestly, it would take me about a day to go through this paper and rebut every single error and misconception, but who's got time for that!

By the way – all of these questions have been asked repeatedly on Twitter, by journalists, by the FBI and CIA, and by hundreds of people who've spoken with me over the last 2 years. I've answered them all, now I have to do it all again, and again, and again. Problem I see here is that he just doesn't believe me, so the only option is for my laptop to be downloaded in front of a Great Inquisition, led by an eminent person such as…dare I say…Professor Sachs himself.

Cheers,

Peter

Subject: Jeff Sachs causing trouble via a PNAS article
Importance: High

EXTERNAL SENDER

Looks like Sachs has been taken down yet another rabbit hole by a scientist at Columbia (Harrison) who doesn't work in the field, and is just plain wrong. It's the old Furin cleavage site hypothesis again, without any new data or evidence. Of course, that's their point – the lack of evidence means we're all hiding information and need to be hung, drawn and quartered.

They've published an opinion piece in PNAS (attached) and there's this article in 'The Intercept'. Ebright is quoted, of course!

MORENS_SUBPOENA_005177
MORENS_NIH_013107
REL0000478523

https://theintercept.com/2022/05/19/covid- lab-leak-evidence-jeffrey-sachs/

All this will be put straight into the subpoena letters that we've been told by Democrat staffers to expect to arrive in Jan/Feb 2023 when the Republicans take over the house (their words, not mine).

JEFFREY SACHS PRESENTS EVIDENCE OF POSSIBLE LAB ORIGIN OF COVID-19

An article in the Proceedings of the National Academy of Sciences calls for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of Covid.

Sharon Lerner
May 19 2022, 4:00 p.m.

IN AN ARTICLE published Thursday, economist Jeffrey Sachs called for an independent investigation of information held by U.S.-based institutions that could shed light on the origins of the Covid-19 pandemic. Writing in the Proceedings of the National Academy of Sciences, Sachs and his co-author, Neil Harrison, a Columbia University professor of molecular pharmacology and therapeutics, said that federal agencies and universities possess evidence that has not been adequately reviewed, including virus databases, biological samples, viral sequences, email communications, and laboratory notebooks. Sachs and Harrison also highlighted a tantalizing scientific

MORENS_SUBPOENA_005178
MORENS_NIH_013108
REL0000478523

detail that may be an indication that SARS-CoV-2, the coronavirus that causes Covid-19, originated in a laboratory: a sequence of eight amino acids on a critical part of the virus's spike protein that is identical to an amino acid sequence found in cells that line human airways.

Sachs and Harrison are hardly the first to suggest that SARS-CoV-2 might have been created in a lab. Since its genetic sequence was first published in February 2020, scientists have puzzled over the furin cleavage site, an area on the virus's spike that allows it to be broken apart by a protein on the membrane of human cells and makes the coronavirus particularly dangerous to people. Once split, the virus releases its genetic material into the cell and reproduces. While all viruses work by attaching themselves to cells, breaking apart, and releasing their genetic material, SARS-CoV-2 is the only one of its class, sarbecoviruses, to use this particular mechanism to do so.

As with past discussion of a possible lab origin of SARS-CoV-2, this latest theory has already been met with considerable pushback. Even some scientists who are open to the idea that a lab accident could have sparked the pandemic remain unconvinced by the particular trail of evidence laid out by Sachs and Harrison.

The journal article offers a scientific road map for how this unusual sequence of amino acids could have made its way into the furin cleavage site, or FCS, of the virus. Sachs and Harrison acknowledge that the sequence could have arisen naturally. But they also lay out another possibility: that scientists might have purposefully inserted this particular string of amino acids into a bat coronavirus in the course of their work. They focus particularly on scientists who submitted an unfunded grant proposal to a division of the Defense Department called the Defense Advanced Research Projects Agency, or DARPA, laying out plans to insert a furin cleavage site into a bat coronavirus.

"We do not know whether the insertion of the FCS was the result of natural evolution — perhaps via a recombination event in an intermediate mammal or a human — or was the result of a deliberate introduction of the FCS into a SARS-like virus as part

of a laboratory experiment," Sachs and Harrison write. "We do know that the insertion of such FCS sequences into SARS-like viruses was a specific goal of work proposed by the EHA-WIV-UNC partnership within a 2018 grant proposal ("DEFUSE") that was submitted to the US Defense Advanced Research Projects (DARPA)."

EHA is a reference to EcoHealth Alliance, a nonprofit research group based in New York City that has received more than $118 million in grants and contracts from federal agencies. WIV, or the Wuhan Institute of Virology, is a Chinese research organization that collaborated with EcoHealth Alliance in the past and was listed as a subcontractor on the DARPA grant. UNC is mentioned because Ralph Baric, a molecular biologist at the University of North Carolina, Chapel Hill, was to have conducted part of the work pitched to DARPA. The grant proposal touted Baric's "two-decade track record of reverse engineering [coronavirus] and other virus spike proteins."

The intent of the DARPA proposal was to prevent emerging pathogenic threats, but the work, if conducted, could have created a novel virus capable of infecting humans. "We will introduce appropriate human-specific cleavage sites and evaluate growth potential in [a type of mammalian cell commonly used in microbiology] and [human airway epithelial cell] cultures," the proposal stated.

Several scientists interviewed about the DARPA proposal in September told The Intercept that scientists often begin research before seeking funding and thus that some of the experiments described in the proposal could have already been completed. But when asked about that possibility in an interview, Peter Daszak, the president of EcoHealth Alliance, rejected it: "The DARPA proposal was not funded. Therefore, the work was not done. Simple."

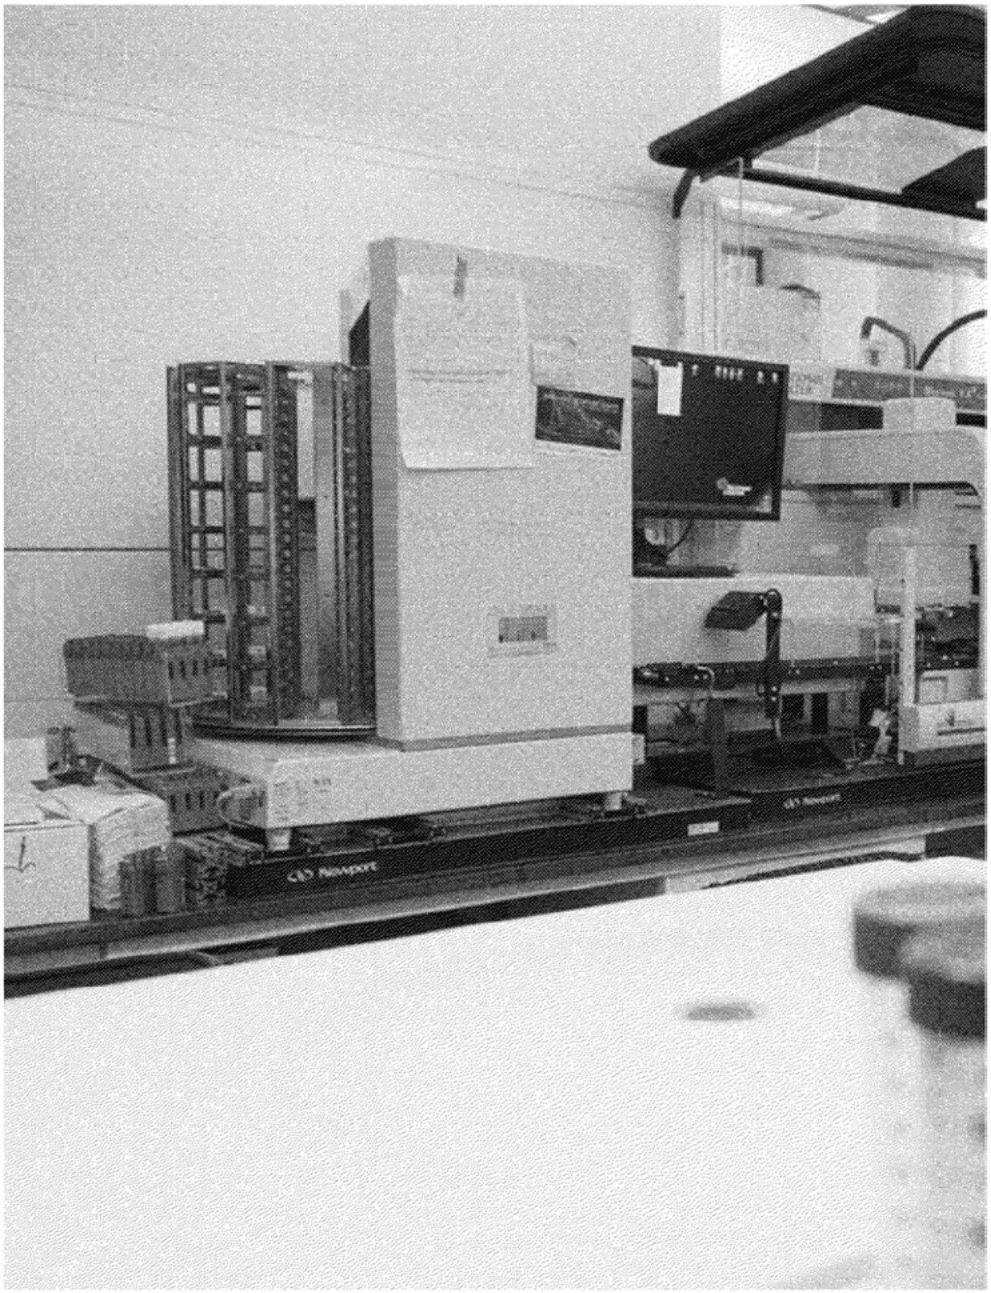
A Rational Choice

As Sachs and Harrison note, the part of a protein on the cell membrane that shares its amino acid sequence with the bat

MORENS_SUBPOENA_005180
MORENS_NIH_013110
REL0000478523

coronavirus is critical for lung function. Known as an epithelial sodium channel-alpha, or ENaC-alpha, it is found in human airway cells, as well as in human kidneys and colons. Intriguingly, like SARS-CoV-2, ENaC-alpha, which facilitates the absorption of fluid in cells, is also activated by the unusual furin cleavage site. Harrison, a physiologist affiliated with Columbia's Department of Molecular Pharmacology and Therapeutics, studies ion channels, the larger category to which ENaC-alpha belongs.

Other scientists have already pointed out the match between the amino acid series in the furin cleavage site of SARS-CoV-2 and the ENaC-alpha found in human airways. In 2020, a team from the biomedical company Nference suggested that the overlap between the virus and the sequence found in human lungs is part of the reason that Covid-19 is so damaging to the respiratory system. Those scientists described the sequence as having evolved naturally.



Read Our Complete Coverage **The Coronavirus Crisis**

Sachs and Harrison, in contrast, suggest that researchers may have inserted the string of amino acids into a bat coronavirus precisely because of its known importance to lung function. "For a research team assessing the pandemic potential of SARS-related coronaviruses, the FCS of human ENaC an FCS known to be efficiently cleaved by host furin present in the target location (epithelial cells) of an important target organ (lung), of the target organism (human) might be a rational, if not obvious, choice of FCS to introduce into a virus in order to alter its infectivity, in line with other work performed previously," they write.

MORENS_SUBPOENA_005181
MORENS_NIH_013111
REL0000478523

Such a choice, they point out, would have been in keeping with another viral research project on which EcoHealth Alliance, the Wuhan Institute of Virology, and UNC's Baric collaborated: a 2014 grant from the National Institute of Allergy and Infectious Diseases that involved increasing the transmissibility and pathogenicity of bat coronaviruses.

Ralph Baric, a researcher at the University of North Carolina's Gillings School of Global Public Health, in Chapel Hill, N.C., on Feb. 14, 2020.

Growing List of Coincidences

The intriguing theory of viral engineering hinges on two observations: that the amino acid sequences match and that experts in both the ENaC-alpha furin cleavage site and the insertion of genetic sequences into bat coronaviruses happen to work at the same academic institution: the University of North Carolina, Chapel Hill.

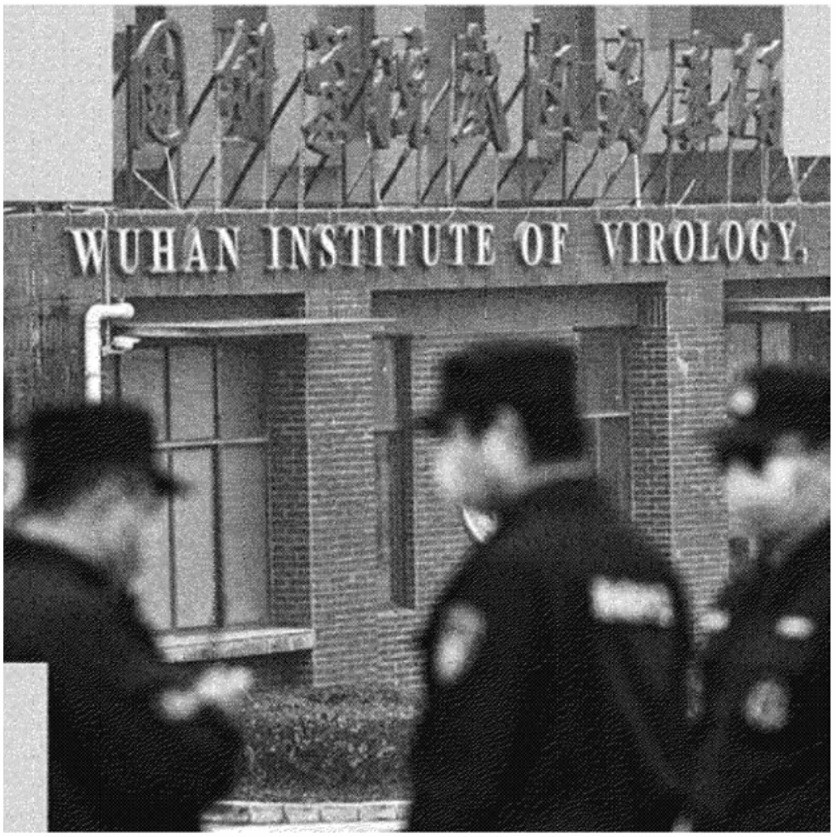
Baric, whose work aims to prevent and create treatments for viral outbreaks, has previously inserted segments of DNA and RNA into viruses and created an infectious clone of SARS using his own patented "No See'm" method of inserting genetic materials without a trace. He has also collaborated on coronavirus research with scientists from a center for lung studies at UNC-Chapel Hill who are knowledgeable about ENaC-alpha. In one 2016 study, the scientists created a new virus using the spike of a bat coronavirus that had been isolated and characterized by the Wuhan Institute of Virology. The experiment found that the new virus "replicated efficiently" in human airway cells that were cultured in a lab.

In another paper, published a year earlier, Baric, along with the Wuhan Institute of Virology's Shi Zhengli and a lung expert UNC-Chapel Hill's lung institute, described creating a hybrid virus using a SARS-like virus from a bat and a "mouse-adapted" coronavirus. The new virus caused mice to get sicker than those exposed to the original virus. The goal of these experiments was to prepare for the possibility that a virus might jump naturally from animals to humans, as SARS had in 2003. But even before the pandemic, the experiment drew criticism from other scientists, who were concerned because the researchers had created a virus that was able to spread in humans.

Sachs and Harrison note that the scientists who co-authored the DARPA grant proposal would have been aware of research on coronavirus furin cleavage sites, including one 2006 experiment in which a furin cleavage site was inserted into a coronavirus.

MORENS_SUBPOENA_005183
MORENS_NIH_013113
REL0000478523

"The research team would also have some familiarity with the FCS sequence and the FCS-dependent activation mechanism of human ENaC, which was extensively characterized at UNC," they write.



"The list of coincidences is getting verrrrrrrrrrry long."

Still, both the overlap in the amino acid sequence and the fact that experts in the furin cleavage site of the ENaC-alpha and insertion of genetic material into bat coronaviruses work at the same university could be coincidental, as Harrison and Sachs acknowledge. Some virologists, though, say that the coincidence strains credulity.

"Could be," Richard Ebright, a molecular biologist at Rutgers University, wrote in an email to The Intercept when asked about the possibility that these things are both chance occurrences. "But the list of coincidences is getting verrrrrrrrrrry long."

Ebright, a vocal proponent of the lab-leak theory whom Harrison and Sachs thank "for helpful commentary on the manuscript," spelled out some of the other Covid coincidences that he considers questionable, including its initial outbreak in a city that, well before 2019, had already been pegged as a biosafety risk. Ebright also noted Wuhan's 1,000-mile distance from the nearest wild bats that carry the type of SARS-related coronaviruses that caused the pandemic. And he pointed to the particular coding of the amino acids in the furin cleavage site of SARS-CoV2.

MORENS_SUBPOENA_005184
MORENS_NIH_013114
REL0000478523

Related

The Lab-Leak Theory Is Looking Stronger by the Day. Here's What We Know.

"The sequence encoding the FCS of the pandemic virus contained two consecutive CGG arginine codons," Ebright explained in his email. (A codon, or a combination of three nucleotides, supplies the genetic code for a single amino acid, though most amino acids can be represented by multiple different codons. Each nucleotide is represented by a letter — for RNA, either A, C, U, or G.) "This codon usage is unusual for a natural bat SARS-related coronaviruses (for which fewer than 1 in 30 arginine codons are CGG) but is optimal for humans (for which most arginine codons are CGG codons)."

Still, Ebright said that at first he didn't see the identical amino acid sequences as particularly suspicious. "I had known for more than a year that there was a perfect match to an eight-amino acid sequence present in human ENaC. What I had not known was that the sequence was known to be a functional furin cleavage site and that it was a sequence extensively studied at UNC," he said. "The crucial point that the ENaC sequence was

MORENS_SUBPOENA_005185
MORENS_NIH_013115
REL0000478523

a known functional site, not just that there happens to be a match to a protein that happens to be in humans. … That suddenly turned it from what I thought to be largely irrelevant to being a logical and obvious choice to proceed."

Ralph Baric and the University of North Carolina did not immediately respond to requests for comment.

The Wuhan Institute of Virology in Wuhan, China, on June 24, 2021.

Name Calling

Other scientists dismiss the idea that the ENaC sequence might have been purposefully inserted into a coronavirus. Scientists who are already convinced that the new coronavirus emerged naturally are unlikely to be persuaded by Sachs and Harrison's article, which appears in the opinion section of the esteemed journal. Over the past year, many scientists involved in the debate over the origins of the pandemic have settled into an increasingly acrimonious, coarse, and unyielding opposition.

Some proponents of the natural origin theory became particularly dismissive of those open to the possibility of a lab leak after the February release of two pre-print studies mapping the early spread of the virus at the Huanan market in Wuhan. Angela Rasmussen, one of a team of virologists who worked on the project, described it on Twitter as "dispositive evidence of a zoonotic origin" that will "drive those with personal interest in the lab leak hypothesis out of their goddam minds." In another tweet, Rasmussen referred to proponents of the lab-leak theory as a "pack of ghouls, who through gullibility, stupidity, & conspiracist thinking have decided this is their thing despite zero expertise."

Although the pre-prints had not been peer-reviewed and may have simply illustrated the spread of the virus rather than its original outbreak, the New York Times ran a front-page story about them that quoted an epidemiologist as saying that the origins debate "has been settled with a very high degree of evidence." The story, which was announced by a push notification from the paper, also noted a lack of direct evidence for a lab leak.

Meanwhile, Kristian Andersen, another co-author of the pre-prints and a virologist at the well-regarded Scripps Research Institute, used the "poop" emoji to criticize a deeply researched article by Katherine Eban about EcoHealth Alliance. On Twitter, Andersen tarred Eban, New York Times columnist Zeynep Tufekci, and others reporting on biosafety issues that could have led to the release of SARS-CoV-2 as "deep in conspiracy theories" and on the other side of "a clear split" from

MORENS_SUBPOENA_005187
MORENS_NIH_013117
REL0000478523

journalists who dismiss the possibility of a lab origin, whom Andersen referred to as "science-based."

Even some scientists who have been vocal about the possibility that the pandemic may have been sparked by research have expressed skepticism about the theory suggested by Harrison and Sachs. "I'm sure that these authors believe in their own hypothesis and arguments, but to me, it's not one that is particularly convincing," said Alina Chan, a scientist who laid out a number of possible routes for how the coronavirus might have emerged through research-related incidents in her recent book "Viral: The Search for the Origin of Covid-19."

"There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

While she is open to the possibility that the furin cleavage site might have been purposefully inserted into the coronavirus, Chan said there was no reason to think that researchers would mine humans for such material. "These scientists literally had access to hundreds of SARS-like viruses and sequences," said Chan, referring to the vast collection of coronaviruses from bats and other animals that researchers amassed at the Wuhan Institute of Virology. "There's no need for them to go hunting inside the human protein catalogue to look for cleavage sites to put into viruses."

Jack Nunberg, a virologist at the University of Montana, was also not immediately persuaded by the theory of engineering suggested by Sachs and Harrison. "It's possible," Nunberg said of the idea that the ENaC segment was inserted into a bat coronavirus as part of research designed to gauge the pandemic potential of a virus. "But I don't find their evidence on ENaC compelling because furin cleavage sites have a lot of common amino acids, and therefore it may just have happened by chance."

Others say that the article adds noteworthy information to the public conversation about the origins of the pandemic. "The

defenders of the natural origin indicate that the virus on which this type of experiment could have been done — the backbone — has never been published and that specialists in the furin cleavage sites would have chosen a more commonly used furin cleavage site like RARR rather than PRRAR. The Proceedings of the National Academy of Sciences article contradicts this argument and indicates that specialists knew that the RRAR'SVAS site was efficiently cleaved by furin," Etienne Decroly, director of virology research at the Aix-Marseille Université in France, wrote in an email to The Intercept.

Decroly added, "It is impossible to decide on the basis of the information currently available and it is urgent that the WHO Special Advisory Group for the Origins of Novel Pathogens investigate this question."

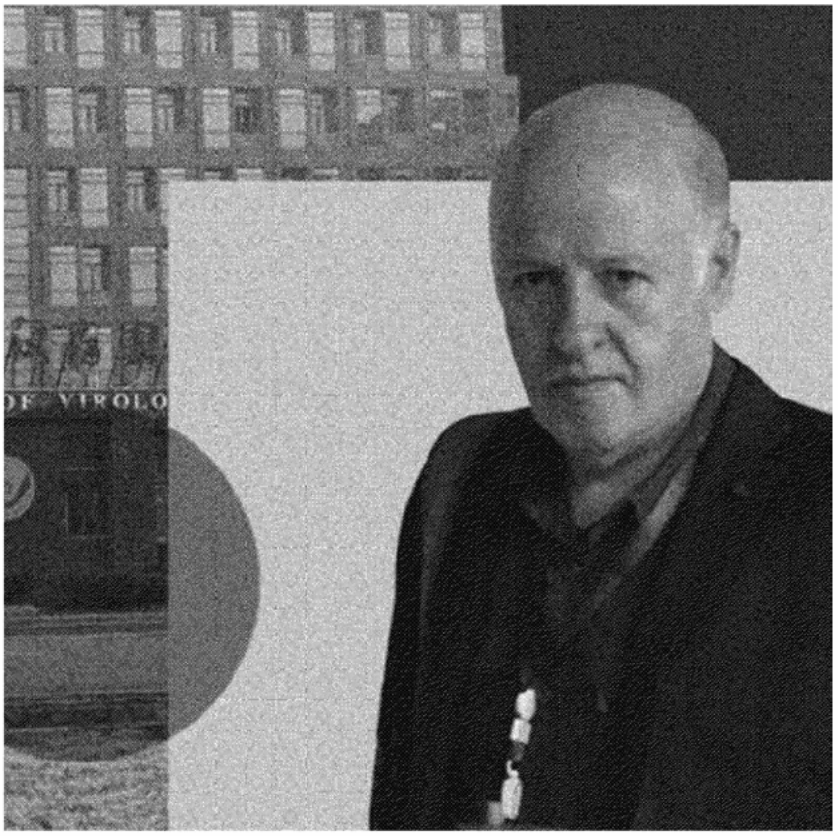
On the suggestion of an investigation, Nunberg is in agreement. "You can't argue with that," he told The Intercept. "Who's going to argue for burying one's head in the sand?"

For their part, Sachs and Harrison emphasize that they're not saying laboratory manipulation was involved in the emergence of the pandemic virus, only "that it could have been." They also give a nod to other possibilities, including that an airborne virus might have infected a laboratory worker. Rather than argue that any of these conceivable scenarios happened, they present the clues of the matching amino acid sequences to argue for an independent and transparent scientific investigation of the U.S.-based evidence related to the origins of the virus.

Among the institutions that Sachs and Harrison list as possibly having "knowledge of the detailed activities that were underway in Wuhan and in the United States" are the National Institutes of Health; the Defense Threat Reduction Agency, which has provided grant funding to EcoHealth Alliance; the Department of Homeland Security; DARPA; the U.S. Agency for International Development, which funded the $200 million PREDICT program that catalogued potential pandemic viruses; and the University of California, Davis, which participated in that program.

The authors suggest that EcoHealth Alliance and UNC may have particularly important untapped resources. "The exact

details of the fieldwork and laboratory work of the EHA-WIV-UNC partnership, and the engagement of other institutions in the US and China, has not been disclosed for independent analysis," they write. "The precise nature of the experiments that were conducted, including the full array of viruses collected from the field and the subsequent sequencing and manipulation of those viruses, remains unknown."



Peter Daszak, one of the members of the World Health Organization team investigating the origins of the Covid-19, on a balcony at a hotel in Wuhan, China, on Feb. 6, 2021.

A Reversal

The publication in the prestigious Proceedings of the National Academy of Sciences marks a reversal of sorts for Sachs, the chair of the Lancet Covid-19 Commission who, in November 2020, appointed Daszak, the EcoHealth Alliance president, to lead a task force to investigate the origins of the pandemic. Earlier that year, Daszak had signed on to a public st(b) (6)ent published in The Lancet on behalf of scientists who said they "condemn conspiracy theories suggesting that COVID-19 does not have a natural origin."

Related

Peter Daszak Answers Critics and Defends Coronavirus Research

Yet that early certainty about the pandemic's origins — and the sense of shared civic responsibility among members of the Lancet task force — soon disintegrated. In February 2021, emails revealed that Daszak coordinated the public statement in The Lancet tamping down suspicions of a lab leak. And by June

2021, Sachs was expressing his openness to the possibility of a lab origin, writing that NIH-funded research at the Wuhan Institute of Virology "deserves scrutiny under the hypothesis of a laboratory-related release of the virus." Three months later, he disbanded the task force that had been organized to "carefully scrutinize the origin of the SARS-CoV-2 virus" in the hopes of preventing future disease outbreaks, explaining that he had concerns that several members of the commission had conflicts of interest because of their ties to EcoHealth Alliance.

After leading the mainstream scientific inquiry into the origins of the pandemic, Sachs is now skewering it. "A steady trickle of disquieting information has cast a darkening cloud over the agency," he and Harrison write of the NIH, going on to accuse the entire federal government of not doing enough to explore the possible role of its grantees in the emergence of SARS-CoV-2 and investigate "overlooked details" such as the matching amino acid sequences.

Noting that the NIH has insisted that "the pandemic virus could not have resulted from the work sponsored by" the agency, Sachs and Harrison write that "blanket denials from the NIH are no longer good enough."

Cheers,

Peter

This is an utterly ridiculous set of BS. Jesse Bloom is the person driving it – he buys into the lab leak theory and found that some folks from WIV uploaded partial genomes early on, then added a bunch of more complete ones, and asked for the partial sequences to be removed. Absolutely normal, but he's trying to turn it into a 'mystery'.

Of course, NIH makes it all worse by not releasing emails, redacting critical parts of them, and failing to explain why they follow the wishes of the submitter re. Genbank. It's perfectly logical really – if NIH now starts releasing sequences you as a submitter asked them to remove for whatever reason, submitters will think twice about using Genbank. We already have China working with its own database and all this BS will make them twice-shy about submitting.

Even worse, Tabak now says that 'don't worry, we still have the data on back up tapes' so everyone now knows that NIH keeps the stuff you thought they agreed to delete, and no doubt has already handed it over to the FBI and the CIA.

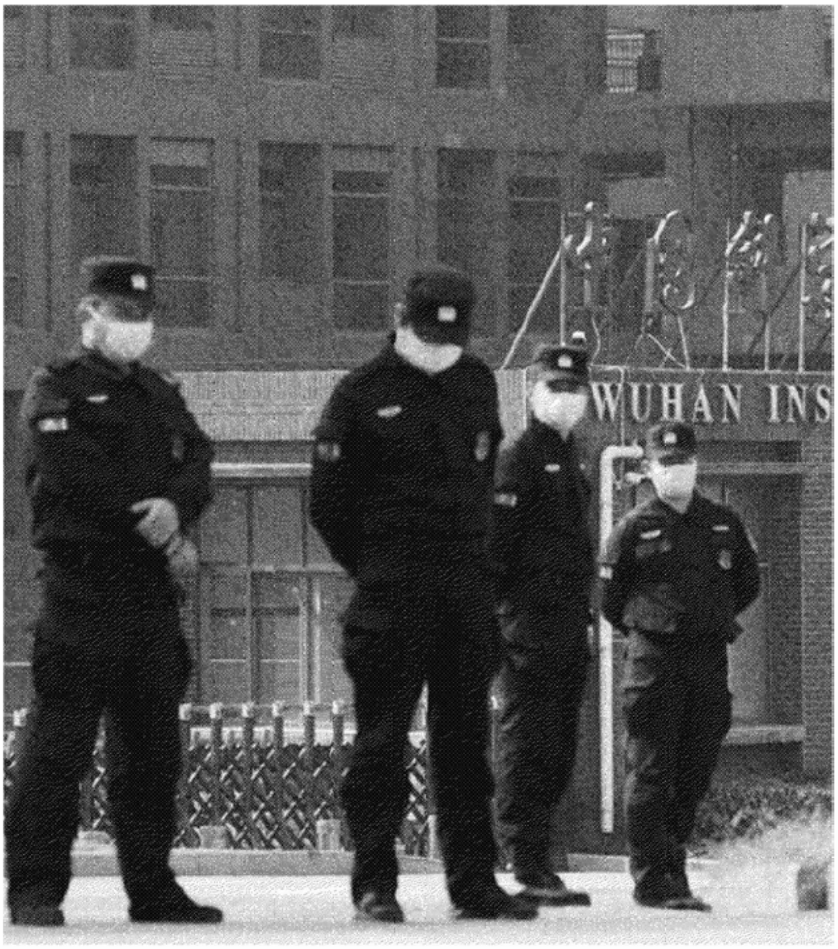
NIH director confirms agency hid early COVID genes at request of Chinese scientists

By
Steven Nelson
May 11, 2022 3:47pm



National Institutes of Health acting director Lawrence Tabak confirmed to lawmakers Wednesday that US health officials concealed early genomic sequences of COVID-19 at the request of

Chinese scientists — but insisted the data remains on file.
Tabak told a House Appropriations subcommittee that the NIH "eliminated from public view" the data from the pandemic epicenter in Wuhan, China, before adding that researchers can still access it via an archaic "tape drive."
Vanity Fair recently reported that the information was hidden in response to a request from Chinese scientists, despite potentially resolving whether the virus leaked from the Wuhan Institute of Virology or passed naturally from animals to humans.
Rep. Jaime Herrera Beutler (R-Wash.) asked Tabek to explain why US officials would comply with such a request.
"There's no question that the communication that we had about the sequence archive — Sequence Read Archive — could have been improved. I freely admit that," Tabek said. "If I may, the archive never deleted the sequence, it just did not make it available for interrogation."

Lawrence Tabak, acting director of the National Institutes of Health, testifies on May 11. Jacquelyn Martin/AP
"So wait, you have the information still?" Beutler followed up.
"We have the information … Anybody who submits to the Sequence Read Archive is allowed to ask for it to be removed," Tabak explained. "And that investigator did do that. But we never erase it."
"So you don't have the information anymore?" Beutler asked.
"We do. We never erase the information. We keep it," Tabak clarified.
"So they were able to withdraw public viewing of it?" the congresswoman followed up.
"That's correct," he said.
"OK, so researchers can apply to the NIH and get the information from you?" Beutler asked.
"In the way that it was originally eliminated from public view, it was withdrawn, and that's the most difficult for people to access," Tabak replied. "The error that was made, and we found this out after a review of all of our processes, was it should have been suppressed. The distinction being that if it's withdrawn, it is kept archivally on a

tape drive — old technology, but that's how it's done. But when it is withdrawn, it can still be accessed by accession number, and so researchers are able to access that information."

Security personnel keep watch outside Wuhan Institute of Virology during the visit by the World Health Organization on Feb. 3, 2021. Thomas Peter/REUTERS

"So the information is still there?" Beutler summed up.

"That's correct. The information was never lost," Tabak repeated.

In a March 31 article, Vanity Fair reported that evolutionary biologist Jesse Bloom discovered last year that early COVID-19 sequences had disappeared from a federally run data repository. When Bloom raised the issue, he was reportedly ganged up on by a group of researchers assembled by then-NIH Director Francis Collins and infectious disease institute head Dr. Anthony Fauci. Bloom shared a draft academic paper with Collins and Fauci, who allegedly objected on a June 2021 Zoom video conference to Bloom's description of Chinese scientists "surreptitiously" removing the sequences. Fauci said the word was "loaded" and implied a coverup, the report said.

Evolutionary biologist Kristian Andersen, who was selected to participate on the call by Collins, allegedly told Bloom that the Wuhan team had a right to claw back early pandemic information and that it was unethical for Bloom to question it.

MORENS_SUBPOENA_005199
MORENS_NIH_013129
REL0000478523

Tabak noted that while the request for information to be removed was honored, it was not erased fully.ECOHEALTH ALLIANCE Andersen allegedly went so far as to offer to delete Bloom's article from a "preprint" server "in a way that would leave no record that this had been done."

China's government has refused to cooperate with an international investigation of the origins of the pandemic. The COVID-19 virus has killed about 1 million Americans since March 2020 and caused massive social, economic and educational disruptions.

The US intelligence community said in an August report that it's possible the virus leaked from the Wuhan Institute of Virology, calling the theory one of two "plausible" explanations along with natural transmission from animals.

Lawrence Tabak confirmed Wednesday that early genomic sequences of COVID-19 were concealed at the request of Chinese specialists. Jacquelyn Martin/AP

President Biden rarely speaks publicly about wanting China to be transparent about the origins of the pandemic. Former President Donald Trump, by contrast, has demanded that China pay $10 trillion in reparations.

The Biden administration is considering undoing some of Trump's tariffs on Chinese goods "separately" from US pressure for coronavirus transparency, White House press secretary Jen Psaki told The Post on Monday.

Documents published in September by The Intercept revealed that US health officials indirectly funded so-called "gain of function" research at the Wuhan lab — including the modification three bat coronaviruses distinct from COVID-19 and the discovery that they became much more infectious among "humanized" mice when human-type receptors were added to them.

Really good to hear that David - it's another tough day, with the press baying for our blood again - Robert's holding them back as best he can.

I'm working on a diplomatic and careful response to Michael Lauer's letter that not only gives them the (pointless) information they seek, but also pushes back gently on what are misconceptions from Tabak about what our data showed, vs. what the requirements for reporting were, and also on the timing of this - we reported this back in 2018 and received no indication from NIH etc. etc. etc.

It would also be really good if you send Tabak an email Jerry.

Cheers,

Peter

Subject: Spoke with Tony

Peter, I had my regular meeting with Tony this morning. he immediately inquired about you and several times asked how you were doing, how you were holding up, and then said you and he were going through the same thing.

I mentioned the Tabak tweet and this morning's Collins release, and even said I suspected he had a hand in writing the Collins release, but he didn't confirm or deny.

he used alot of shall we say "colorful" language about the situation with attacks on EEcohealth and on him, then asked me what we should be doing scientifically to get on top of COVID-19, mentioning the great work of the phylogeneticists. I agreed but said that the phylogeneticists aren't going to solve the problems alone and that in country field work will be needed, reminding him that we have an ICIDR program as well as one-off program project grants that support multi-facet collaborative research between US and foreign scientists to fork at foreign sites.

I sense he hates what has been happening and feels a desire to get back to the science and away from the politics.

This paper's just out today online first after peer review in J. Virol. Normally wouldn't be of any global interest, but given the BS around Furin Cleavage Sites, it'll probably get some traction. It's a rodent alpha CoV w/ a cleavage site in the S protein so it adds another coin to the philosophical scales balancing 'natural' vs. lab leak – more evidence that these inserts are found naturally in a wide diversity of viruses, incl. alpha- and beta-CoVs, incl. SARSr-CoVs.

Please send a copy to Nicholas Wade and David Baltimore if you have their email addresses.

If the U.S. intelligence agencies adhered to the mandated schedule, and there's nothing magical about 90 days, the White House on Tuesday received spookdom's report on the origins of Covid 19.

MORENS_SUBPOENA_022014
MORENS_NIH_042904
REL0000478543

Leaks already indicate the 18 agencies couldn't settle an internal disagreement over whether a natural origin or a lab release was more likely. There is much else they might usefully say, though, in the declassified release the administration has talked about making public in the next few days.

With 100% confidence, the agencies could certainly tell us that China has engaged in a deliberate coverup. With some degree of confidence, they might tell us whether they believe China itself knows how Covid got started.

The agencies could estimate how committed Xi Jinping and his regime are to the propaganda claim that the virus originated outside the country, perhaps in the U.S. Army facility at Fort Detrick, Md. They might tell us about China's efforts to steal the secrets of the West's superior vaccines.

On a related question, they could estimate how long China will stick with its zero-Covid policy, which has required a deepening, Mao-like control over its population and China's re-isolation from the world.

If news reporting is correct, China is sitting on samples from early Covid infections and much other information it hasn't shared. A Bloomberg News investigation elaborates on a point made by this column: China's leadership would likely be covering up even a natural origin, "embarrassed that its citizens were still eating wild animals bought in wet markets—a well-known path for zoonotic disease transmission that China tried unsuccessfully to outlaw almost 20 years ago."

China's scientists would know with documentary certainty by now whether the virus is related to one held and possibly manipulated in a government-run lab. Thus it matters whether secret evidence shows they are still trying to find answers to Covid's origins.

The Economist magazine suggests that, following on the work of private researchers, U.S. intelligence supercomputers may have scoured the web for traces of deleted viral sequences once housed by the Wuhan Institute of Virology.

CNN, citing leaks, reports that the agencies may be in possession of Wuhan lab records that the Chinese mysteriously tried to take offline in September 2019, weeks before the Wuhan outbreak became publicly known.

The stakes are rising, geopolitically and politically. Once the story seemed to be that China, with its strange dietary fetishes and industrially primitive food markets, inflicted the virus on the world. The integrated, rules-based, freedom-based outside world saved the day with mRNA vaccines.

That story is less satisfying now that Delta has emerged. Our vaccines, however fabulous, are proving not a one-and-done fix. Everybody now seems to have a Delta breakthrough story. In my circle, multiple acquaintances talk about colleagues or family members who previously had Covid,

MORENS_SUBPOENA_022015
MORENS_NIH_042905
REL0000478543

were vaccinated, and now have tested positive for Covid again.

More than ever, coping with the virus seems likely to involve long-term adjustments. We might take with a couple of sacks of salt reports this week that China beat down its own Delta outbreak spread over 17 provinces by conducting 100 million tests in a matter of days, including testing every resident of one city 12 times.

Whether China can carry on this way is doubtful. In the meantime, it has effectively entered into a biological-cum-chemical standoff with the outside world. The global population's immune systems are being hardened by multiple exposures as well as by vaccination, and people are getting back to normal life after much loss and suffering.

China's increasingly virulent propaganda is aimed not at outsiders but at its own people, neutralizing what is bound to be a growing disgruntlement over recurrent iron-fisted lockdowns, over having to wait in lines repeatedly for mandatory testing, over the loss of tourism dollars, the loss of domestic and foreign travel and education opportunities, the loss of income and opportunities of every kind.

Three weeks ago I suggested the White House would likely prefer continued murk around Covid's origins for the purpose of rebuilding U.S.-China relations—that is, "unless the Biden administration's popularity is in free fall in three weeks and needs a foreign conflict to revive it." That caveat was offered in advance of the Afghanistan debacle, in advance of a now-avalanche of indicators suggesting the Delta surge is complicating what should be a shining recovery and renewing U.S. political fights over masks, vaccine mandates, schools and deteriorating hospital care in some locations.

The Biden administration has more reason now to treat the intelligence report on Covid's origins as a chance to lay down a tougher line on China's role in bringing this calamity on the world.

Cheers,

Peter

Subject: Washington Post: Biden receives inconclusive intel report on covid origins
Importance: High

Here's the 'nothing burger' from the US Intel Services.

https://www.washingtonpost.com/politics/2021/08/24/covid- origins-biden-intelligence-review/

Good quote from Bob Garry in here. Shameful disingenuous crap from David Relman, of course.

Hate to harp on about it, but we did have an active grant to work on "Understanding risk of emergence of bat-origin coronaviruses" in China that Trump/Francis Collins canceled, then suspended, and NIH is still refusing to release. We had active collaboration on the ground in the sites where the wildlife farms supplied Huanan and other markets, and I know that WIV is ready, willing and able to continue this work with us. Surely that's a better option than increasing the ranks of the CIA with people who "have significant scientific capacity relative to pathogens" that Biden is quoted as saying below.

This is beyond ironic at this point.

Cheers,

Peter

Biden receives inconclusive intelligence report on covid origins

The report falls short of concluding whether the coronavirus jumped from animal to human, or might have accidentally escaped from a lab in China

By
Ellen Nakashima
,
Yasmeen Abutaleb
and
Joel Achenbach

Today at 10:32 p.m. EDT
260

President Biden on Tuesday received a classified report from the intelligence community that was inconclusive about the origins of the novel coronavirus, including whether the pathogen jumped from an animal to a human as part of a natural process, or escaped from a lab in central China, according to two U.S. officials familiar with the matter.

The intelligence community will seek within days to declassify elements of the report for potential public release, officials said.

The assessment is the result of a 90-day sprint after Biden tasked his intelligence agencies in May to produce a report "that could bring us closer to a definitive conclusion" on the origins of a virus that has killed more than 4 million people globally and wrecked national economies. But despite analyzing a raft of existing intelligence and searching for new clues, intelligence officials fell short of a consensus, said the officials, who spoke on the condition of anonymity because the report is not yet public.

The debate over the virus's origins has become increasingly rancorous since former president Donald Trump said last year that the virus originated in a Chinese lab. Efforts to understand the virus's provenance have been complicated by Chinese authorities' steadfast refusal to allow a more intensive inquiry by international investigators.

Biden's directive came after he received a May report from the agencies saying that they had "coalesced around two likely scenarios" but had not reached a conclusion. He disclosed that two agencies leaned toward the hypothesis that the virus emerged from human contact with an infected animal, while a third leaned toward the lab accident scenario.

The leader of the intelligence community, Director of National Intelligence Avril Haines, cautioned in June that the agencies might not solve the mystery. "We're hoping to find a smoking gun," she told Yahoo News in an interview. But, she said, "it's challenging to do that," adding that "it might happen, but it might not."

The review involved dozens of analysts and intelligence officials across multiple agencies, Haines told Yahoo. She said she deployed "red cells," or groups to test analysts' assumptions and ensure the intelligence is scrutinized from every angle.

Another official said the intelligence community is "not necessarily best equipped to solve this problem," which is fundamentally an issue of science. Although spy services are "positioned to collect on a range of foreign actors," the official said, they are not necessarily poised to dive into global health data sets.

Biden himself, in his first visit to the Office of the Director of National Intelligence in July, voiced the need for a more robust group to track pathogens. "You're going to have to increase your ranks with people with significant scientific capacity relative to pathogens," he said at the time.

Officials in the Biden administration hammered China's lack of transparency ahead of a World Health Organization report on the origins of the coronavirus. (JM Rieger/The Washington Post)

Many scientists familiar with the origin debate have been skeptical that the 90-day review would settle it, and some have said the inquiry could require years of research.

"We should not even be thinking about closing the book or backing off, but rather ratcheting up the effort," David Relman, a Stanford University microbiologist who has pushed for a broad investigation of all origin hypotheses, said late Tuesday in an email.

The notion that the virus may have escaped from a lab got sharply increased interest this spring after 18 scientists wrote a letter to the journal Science in May saying that all possible origins needed to be investigated, including a laboratory accident.

Proponents of that theory point to classified information, first disclosed in the waning days of the Trump administration, that three unidentified workers from the Wuhan Institute of Virology — one of the

MORENS_SUBPOENA_022018
MORENS_NIH_042908
REL0000478543

world's preeminent research institutions studying coronaviruses — went to the hospital in November 2019 with flu-like symptoms. In China, people visit the hospital for routine and mild illnesses.
Throughout 2020, that hypothesis became enmeshed in election-year politics. Trump's assertion that the virus emanated from a lab came as he and other administration officials were blaming China for the global outbreak and trying to deflect attention from their botched handling of the virus at home.
Many scientists, however, noted that viruses have a long history of jumping from animals to humans. There are many plausible scenarios in which that might have occurred, including the possibility the virus spread from wild and domestically raised animals sold in crowded markets. Many early cases were clustered around a seafood market where traces of the virus were later detected on surfaces.
That zoonosis theory was bolstered by a June 7 report, published in the journal Nature, documenting 38 species of animals sold in 17 markets in Wuhan before the pandemic. The authors said many of the animals suffered from poor hygiene and were known to carry zoonotic diseases.
"We now know for sure that [coronavirus] susceptible animals were in fact sold at the markets in Wuhan, which changes the calculus tremendously," Robert Garry, a Tulane University microbiologist who strongly supports the zoonosis theory, said in an email.
Experts in viral genome evolution also determined that the novel coronavirus almost certainly was not engineered as a bioweapon because it has several naturally occurring features seen in many other coronaviruses. But even scientists favoring a natural origin have said that without definitive evidence of animal-to-human transmission, it is not possible to rule out the possibility that a laboratory accident led to the outbreak.
And many questions remain unanswered. The animal that carried this virus before it infected people has not been identified — a process that has taken years in previous disease outbreak investigations. Nor have the lab-leak advocates found any direct evidence that SARS-CoV-2 was inside a laboratory in Wuhan before the pandemic, although the lab has not released its records, which have been sought by scientists and governments around the world.
A delegation of investigators from the World Health Organization made a brief visit to the Wuhan laboratory in February and later declared that there were multiple possible origins, with a natural zoonosis most likely and a lab leak "extremely unlikely."
But the WHO director general, Tedros Adhanom Ghebreyesus, undercut that conclusion, saying it would be premature to rule out the lab-leak theory. The WHO effort was also criticized by some international scientists and researchers, who called for further investigation.
White House press secretary Jen Psaki on Monday said the public would be told the report's outcome. "I don't know what format that will take at this point in time," she said.

Cheers,

Peter

who one source describes it as “riddled with compromises and sloppiness”. Tedros Adhanom Ghebreyesus, the
who’s director-general, was uneasy about the way it was carried out. He pushed back at the marginalisation of the lab-leak hypothesis, particularly when the final report was released in March. He has since called for further investigations into it, as well as into other possibilities.

The further unravelling of the joint study matters because, more than a year and a half after the covid-19 outbreak in Wuhan, a city in Hubei, was first recognised as the work of a new pathogen, there has been nothing like a thorough international investigation of how that pathogen,
sars-cov-2, got into humans and spread round the world. The pandemic’s death toll stands at 9m-18m, according to a model which *The Economist* has built on the basis of excess-mortality reports and other indicators. The question of how it started matters both for the relatives of the dead and for those who wish to prevent such an outbreak happening again. China’s efforts to stop the world from answering it are both shabby and, to an extent, self-defeating. The more the truth seems hidden, the more it seems suspicious.

Earnest calls for an international investigation into the origins of covid-19 began in April 2020, voiced most clearly by Scott Morrison, the prime minister of Australia. The next month the World Health Assembly, the gathering of government representatives which serves as the
who’s decision-making body, passed a motion calling for a study into the origins of the pandemic. But in order to be acceptable to China—which had reacted furiously to Mr Morrison’s original suggestion—the work was set up as a joint research project between two teams of scientists, one Chinese, one international. And it was to be based on “scientific and collaborative field missions”, rather than a targeted and forensic inquiry into all the relevant circumstances.

The terms of reference, which were subsequently negotiated behind closed doors, allowed the Chinese hosts to frame the joint study’s work in the way which best suited them. The study was set up to build on pre-existing Chinese research, not to delve into unvetted data. Investigating the laboratories that had been working with coronaviruses like
sars-cov-2 in Wuhan was not part of its terms of reference.

After a lot of wrangling, the international team got to China in January this year. Data about the first reported covid-19 cases, those from December 2019, were one subject of friction with their hosts. The Chinese had reported 174 such cases, but would not share the underlying data on which those reports were based. Hearing that these vital data were not being made available worried Dr Tedros enough that he lobbied the Chinese government for access. The authorities declined, citing concerns over citizens’ privacy. It could have been anonymised.

Elsewhere the team appears to have been knowingly misled. Take, for example, the live-animal trade at the Huanan seafood and wildlife market, a site associated with a number of Wuhan’s earliest recorded cases of covid-19. In its final report, the study group took at face value claims there was no credible evidence that live mammals were sold there in 2019. A lot of eyewitness accounts gainsay that; so does a study published in *Scientific Reports*, a journal, this summer.

One report and no more

The *Scientific Reports* paper found that 18 species of mammal had been for sale in Wuhan between May 2017 and November 2019; gunshot wounds and trapping injuries suggested that almost a third of them were taken from the wild. Although the paper was published only recently, it was submitted to the journal in October 2020. Chinese law requires that all covid-19 research be reviewed by the government before it is sent to a journal. Some Chinese authorities would have known of its

contents before the team arrived.
The market is not the only way for animals and the pathogens they carry to get into Wuhan. The horseshoe bats in which the closest wild relatives to sars-cov-2 have been found do not live anywhere near the city, but the two laboratories there that were known to have engaged in coronavirus research received samples from bat caves around the country. The joint-study team was not allowed to investigate the procedures around, or documentation of, this research; when it visited the laboratories the team was shown presentations on safety procedures but no more.

When the researchers left Wuhan the
who
's Geneva headquarters told them that their report needed to be laid out scientifically and could express dissenting opinions; the international members and the Chinese members did not have to reach a consensus. However, according to sources within the
who
, the team felt committed to producing a joint report with their Chinese counterparts. Dr Tedros was so unhappy with what finally emerged from the processes that he nobbled the report as it left the starting blocks, rejecting its contention that the possibility of a lab leak needed no further investigation.
On May 26th President Joe Biden ordered America's intelligence services to report on the pandemic's origins in 90 days (time will be up on August 24th). When he and his fellow
g7
leaders met in June they joined in calling for a timely, transparent and science-based follow-up study. On July 16th Dr Tedros laid out the next steps which the
who
wants to see taken. They include further work on the Wuhan animal markets, studies of early cases and audits of local laboratories.
The Chinese government has reacted angrily to the idea of further studies on its territory. Zeng Yixin, the vice-minister of China's National Health Commission, said he was "shocked" by the plan to investigate a lab leak, saying it was "impossible" to accept. According to the *Global Times*, a tub-thumping tabloid run by the Communist Party, 55 countries have sent written complaints about the proposal for further investigations to the
who
. Dr Tedros, elected director-general with China's support in 2017 and derided by President Donald Trump as China's puppet, may now face a Chinese-backed candidate when he looks for reappointment later this year.
In the absence of any hope that China will co-operate, sources of data beyond its control have become increasingly important. One area of interest is genetic sequence data. Another is early cases exported from China.

See what you did there

An online open-source-intelligence group which calls itself
drastic
has been scouring sequencing data to get insight into activities at the Wuhan Institute of Virology (wiv). When researchers publish sequences they typically post the raw data from which those sequences are assembled to public databases such as the sequence-read archive at America's National Centre for Biotechnology Information. Contamination events in the laboratory, or within sequencing machines

themselves, mean these data sometimes contain sequences not meant to be there. In theory such evidence could reveal nefarious goings-on.

Such work, while promising, takes a lot of resources. If you have the sort of supercomputers available to America's national labs it gets easier. Gilles Demaneuf, a data scientist who works with
drastic
, says he has a hunch the American intelligence community's 90-day study is working the same angle. It is conceivable that the intelligence services might have been able to filch raw sequence reads directly from Chinese sequencing machines, thus picking up even more data.

Sequencing data only offers a way forward if the virus did indeed leak out of a lab, something which remains a possibility but which is far from proven. The study of early cases should be useful whatever route it took; the closer you get to understanding the when and where of the crossing-over from animal to human, the easier it should be to learn something of the how.

On the basis of information provided by China the joint study concluded it was unlikely for there to have been any substantial transmission in Wuhan before December 2019. That is unlikely to be true. For one thing the *South China Morning Post*, a newspaper based in Hong Kong, obtained government documents in 2020 which showed one to five new cases a day in Wuhan from November 17th 2019 onwards. Further evidence has strengthened the possibility that the virus could have been in circulation much earlier than the official story allows.

That circulation need not have been limited to China. There is increasing evidence suggesting early infections elsewhere. These cases would have been exported from China; no virologists doubt that Hubei was where the virus got going within humans. But if circulation in Hubei goes back further than thought and cannot be directly assessed through studies there, the presence of cases elsewhere offers an alternative way to get an idea of the timing. If a specific travel link were identified, that might help identify a group in Hubei which was infected early on.

A recent study of blood samples from 9,144 adults in 12 different regions of France found seven which contained antibodies against sars-cov-2, all of them taken in November 2019. An Italian lung-cancer screening trial has found samples taken in September 2019 which seem to contain anti-sars-cov-2 antibodies. Another antibody study suggests the virus was circulating at a low level in northern Italy at the same time, notably in Lombardy, a region which has close connections to Wuhan through the garment trade, and saw Europe's first major outbreak of covid-19 in March 2020.

Antibody tests can give false positives. In a preprint published on August 6th by the *Lancet*, researchers in Lombardy reported on looking instead for
sars-cov-2 gene sequences. Examining 289 swabs and urine tests taken from people who had presented with a rash as far back as the second half of 2019, they found
sars-cov-2 sequences in 13, the earliest of which was taken on September 12th.

Sudhir Kumar of Temple University in Philadelphia says the *Lancet* preprint is likely to inspire other investigators to go back and look at retrospective hospital samples. That should help his own research into the origins of the virus. A family tree Dr Kumar and his colleagues have built from vast numbers of published sars-cov-2 genomes allows them to predict the sequence of the progenitor virus from which they are all descended. This sequence differs in three places from that found in the earliest samples taken from patients in Wuhan, meaning there had been enough spread for a certain amount of viral mutation to take place before December. Dr Kumar says that an analysis of the Lombardy sequences suggests that the timeline for the origin of the virus in China might now extend back to the late summer.

More systematic international research into these early infections and their circumstances is needed. Maria Van Kerkhove, head of emerging diseases and zoonoses at the
who, suggests it may be possible to prioritise work in areas which saw the earliest outbreaks in America, France, Italy and Spain. “I think the floodgates will open one day,” says Dr Kumar.

A last line of light

An early origin would fit with the timeline that lab-leak proponents tend to favour. Early this August, the minority Republican staff on the House foreign-affairs committee released an 84-page report arguing this case. It makes much of a small but deadly disease outbreak which took place at an abandoned copper mine in Yunnan in 2012. As
drastic showed last year, a virus studied at
WIV which had been taken from that mine is the closest known relative to sars-cov-2. The report sees importance in the removal, on September 12th 2019, of a database containing details of sequences and samples from the
wiv
. This is read as the beginning of a cover-up, and thus as the point when the authorities first knew something had gone amiss, arguing for a leak in late August or early September. The
wiv
says it was a response to cyber-attacks.

A leak is not the only research-related possibility. The first person infected could have been someone employed by the
wiv
or another lab to collect bats and samples—the prospect to which Dr Ben Embarek pointed in his television interview. And it is important to remember that some other form of spillover outside the lab, either directly from a bat or by way of some other species, may well be to blame.

China clearly does not want lab-leaks investigated; but that does not mean it knows one happened. It is also being misleading about Huanan market, denying access to early-case data and obfuscating in various other non-lab-leak-specific ways. The most obvious explanation is that it does not really want any definitive answer to the question. An unsanitary market, a reckless bat-catcher or a hapless spelunker would not be as bad in terms of blame as a source in a government laboratory. But any definite answer to the origin question probably leaves China looking bad, unless it can find a way to blame someone else. To that end China has called for an investigation of Fort Detrick in Maryland, historically the home of American bioweapons research; state media regularly publish speculations about its involvement.

The possibility of spillover from wild bats does not have to be studied in China. Yunnan abuts onto Laos, Myanmar and Vietnam, and bats are not sticklers in matters of territory. Samples taken outside China could provide a good idea of viral diversity the other side of the border. A thorough evaluation of the existing farm-animal and wildlife trade in the region would also be useful.

Yet there is an inherent risk in such work that needs to be considered. Efforts to uncover the roots of covid-19 by seeking out a natural reservoir of something very like
sars-cov-2 would, by definition, expose people to the sort of risks that can seed pandemics. Ironically, the very possibility of a lab leak raises questions about how most safely to pursue investigations into other possibilities.

When he called for further inquiries in July, Dr Tedros also announced the formation

of a new permanent group of pathogen hunters, the International Scientific Advisory Group for Origins of Novel Pathogens (sago). He wants it to organise further studies of
sars-cov-2. But it will also need to look at more general questions for the future—such as how to be sure that, come what may, studies of pathogens involved in past disease outbreaks never create further outbreaks of their own.

MORENS_NIH_040684
REL0000478544

The origin of SARS-CoV-2, the virus that causes COVID-19, and the circumstances of the first cases of human infection, remain unknown. Science is our best tool to ascertain, or to understand to the extent possible, the origins of SARS-CoV-2 and COVID-19, which could help prevent future pandemics. However, misinformation, unsubstantiated claims, and personal attacks on scientists surrounding the different theories of how the virus emerged are unacceptable, and are sowing public confusion and risk undermining the public's trust in science and scientists, including those still leading efforts to bring the pandemic under control. We urge that investigations into the origins of SARS-CoV-2 and COVID-19 be guided by scientific principles, including reliance on verifiable data, reproducibility, objectivity, transparency, peer review, international collaboration, minimizing conflicts of interest, findings based on evidence, and clarity regarding uncertainties. In the case of SARS-CoV-2, there are multiple scenarios that could, in principle, explain its origin with varying degrees of plausibility based on our current understanding. These scenarios range from natural zoonotic spillover (when a virus spreads from non-human animals to humans) to those that are associated with laboratory work. Scientists need to be able to evaluate all of these scenarios, and all viable hypotheses, with credible data. Data accessibility, transparency, and full cooperation from China, of course, will be essential for a proper and thorough investigation.

Although much still needs to be done to stop the pandemic, particularly in developing nations, science has made remarkable headway, especially through the rapid development of effective vaccines. The same scientific robustness, rigor, and cooperation should be applied to examining important questions about how the pandemic began.

"The virus mystery" broadcast on August 12th, drew uncommonly wide attention for a Danish television documentary. That was because it featured Peter Ben Embarek, an expert on food security and zoonotic diseases, casting doubt on the conclusions of a "joint study" on the origins of the covid-19 pandemic carried out earlier this year under the auspices of the World Health Organisation (who). Dr Ben Embarek was the senior who figure who went to China as part of that study.

In March the joint study reported that it was "extremely unlikely" that the virus had been released in a laboratory accident. Dr Ben Embarek revealed that this conclusion did not come from a balanced assessment of all the relevant evidence but from a steadfast refusal by the Chinese members of the joint study to support anything stronger. Indeed they only allowed even that minimal assessment on the condition that the report did not call for further investigation into the question. He also pointed out that the idea that the point of spillover was someone collecting bat samples for research purposes belongs in the "likely" basket, along with other human interactions with wild bats.

Problems in the joint study had long been clear. Within the
who one source describes it as "riddled with compromises and sloppiness". Tedros Adhanom Ghebreyesus, the
who's director-general, was uneasy about the way it was carried out. He pushed back at the marginalisation of the lab-leak hypothesis, particularly when the final report was released in March. He has since called for further investigations into it, as well as into other possibilities.

Such work, while promising, takes a lot of resources. If you have the sort of supercomputers available to America's national labs it gets easier. Gilles Demaneuf, a data scientist who works with
drastic
, says he has a hunch the American intelligence community's 90-day study is working the same angle. It is conceivable that the intelligence services might have been able to filch raw sequence reads directly from Chinese sequencing machines, thus picking up even more data.
Sequencing data only offers a way forward if the virus did indeed leak out of a lab, something which remains a possibility but which is far from proven. The study of early cases should be useful whatever route it took; the closer you get to understanding the when and where of the crossing-over from animal to human, the easier it should be to learn something of the how.
On the basis of information provided by China the joint study concluded it was unlikely for there to have been any substantial transmission in Wuhan before December 2019. That is unlikely to be true. For one thing the *South China Morning Post*, a newspaper based in Hong Kong, obtained government documents in 2020 which showed one to five new cases a day in Wuhan from November 17th 2019 onwards. Further evidence has strengthened the possibility that the virus could have been in circulation much earlier than the official story allows.

That circulation need not have been limited to China. There is increasing evidence suggesting early infections elsewhere. These cases would have been exported from China; no virologists doubt that Hubei was where the virus got going within humans. But if circulation in Hubei goes back further than thought and cannot be directly assessed through studies there, the presence of cases elsewhere offers an alternative way to get an idea of the timing. If a specific travel link were identified, that might help identify a group in Hubei which was infected early on.
A recent study of blood samples from 9,144 adults in 12 different regions of France found seven which contained antibodies against sars-cov-2, all of them taken in November 2019. An Italian lung-cancer screening trial has found samples taken in September 2019 which seem to contain anti-sars-cov-2 antibodies. Another antibody study suggests the virus was

circulating at a low level in northern Italy at the same time, notably in Lombardy, a region which has close connections to Wuhan through the garment trade, and saw Europe's first major outbreak of covid-19 in March 2020.

Antibody tests can give false positives. In a preprint published on August 6th by the *Lancet*, researchers in Lombardy reported on looking instead for sars-cov-2 gene sequences. Examining 289 swabs and urine tests taken from people who had presented with a rash as far back as the second half of 2019, they found sars-cov-2 sequences in 13, the earliest of which was taken on September 12th.

Sudhir Kumar of Temple University in Philadelphia says the *Lancet* preprint is likely to inspire other investigators to go back and look at retrospective hospital samples. That should help his own research into the origins of the virus. A family tree Dr Kumar and his colleagues have built from vast numbers of published sars-cov-2 genomes allows them to predict the sequence of the progenitor virus from which they are all descended. This sequence differs in three places from that found in the earliest samples taken from patients in Wuhan, meaning there had been enough spread for a certain amount of viral mutation to take place before December. Dr Kumar says that an analysis of the Lombardy sequences suggests that the timeline for the origin of the virus in China might now extend back to the late summer.

More systematic international research into these early infections and their circumstances is needed. Maria Van Kerkhove, head of emerging diseases and zoonoses at the who, suggests it may be possible to prioritise work in areas which saw the earliest outbreaks in America, France, Italy and Spain. "I think the floodgates will open one day," says Dr Kumar.

A last line of light

An early origin would fit with the timeline that lab-leak proponents tend to favour. Early this August, the minority Republican staff on the House foreign-affairs committee released an 84-page report arguing this case. It makes much of a small but deadly disease outbreak which took place at an abandoned copper mine in Yunnan in 2012. As drastic showed last year, a virus studied at WIV which had been taken from that mine is the closest known relative to sars-cov-2.

The report sees importance in the removal, on September 12th 2019, of a database containing details of sequences and samples from the wiv. This is read as the beginning of a cover-up, and thus as the point when the authorities first knew something had gone amiss, arguing for a leak in late August or early September. The wiv says it was a response to cyber-attacks.

A leak is not the only research-related possibility. The first person infected could have been someone employed by the wiv or another lab to collect bats and samples—the prospect to which Dr Ben Embarek pointed in his television interview. And it is important to remember that some other form of spillover outside the lab, either directly from a bat or by way of some other species, may well be to blame.

China clearly does not want lab-leaks investigated; but that does not mean it knows one happened. It is also being misleading about Huanan market, denying access to early-case data and obfuscating in various other non-lab-leak-specific ways. The most obvious explanation is that it does not really want any definitive answer to the question. An unsanitary market, a reckless bat-catcher or a hapless spelunker would not be as bad in terms of blame as a source in a government laboratory. But any definite answer to the origin question probably leaves China looking bad, unless it can find a way to blame someone else. To that end China has called for an investigation of Fort Detrick in

Maryland, historically the home of American bioweapons research; state media regularly publish speculations about its involvement.
The possibility of spillover from wild bats does not have to be studied in China. Yunnan abuts onto Laos, Myanmar and Vietnam, and bats are not sticklers in matters of territory. Samples taken outside China could provide a good idea of viral diversity the other side of the border. A thorough evaluation of the existing farm-animal and wildlife trade in the region would also be useful.
Yet there is an inherent risk in such work that needs to be considered. Efforts to uncover the roots of covid-19 by seeking out a natural reservoir of something very like sars-cov-2 would, by definition, expose people to the sort of risks that can seed pandemics. Ironically, the very possibility of a lab leak raises questions about how most safely to pursue investigations into other possibilities.

When he called for further inquiries in July, Dr Tedros also announced the formation of a new permanent group of pathogen hunters, the International Scientific Advisory Group for Origins of Novel Pathogens (sago). He wants it to organise further studies of sars-cov-2. But it will also need to look at more general questions for the future—such as how to be sure that, come what may, studies of pathogens involved in past disease outbreaks never create further outbreaks of their own.

Here's a report in the Daily Caller that goes after the GoF argument that the chimeric bat viruses yielded more virus in humanized mice than the parental bat virus strain. https://dailycaller.com/2021/09/09/ecohealth-alliance-gain-of-function-higher-viral-load-anthony-fauci/

There's a good response from NIH: 'An NIH spokesperson told the DCNF the agency "never approved any research that would make a coronavirus more dangerous to humans." "The research we supported in China, where coronaviruses are prevalent, sought to understand the behavior of coronaviruses circulating in bats that have the potential to cause widespread disease," the spokesperson said. "The body of science produced by this research demonstrates that the bat coronavirus sequences published from that work NIH supported were not SARS-CoV-2. More importantly, because of similar research to understand coronaviruses, we were able to move swiftly to develop vaccines against SARS-CoV-2 and save lives."'

This story is particularly irritating because if you look at the P3CO rules, it's clear they are meant for pathogens that occur in humans and might be made more dangerous. These were bat viruses that have never been shown to occur in humans. Let's also not forget that the virus with a higher viral load in mice was actually because it had the spike protein of a bat virus being flown around every night by tens of thousands of bats in rural china – not something new created by us to enhance virulence - In fact, the opposite: the fact that we could do this work with a chimera means that we don't have to isolate and culture every single new bat cov we find. It reduces risk!

INVESTIGATIVE GROUP

Fauci-Funded Wuhan Lab Viruses Exhibited Over 10,000 Times Higher Viral Load Than Natural Strain, Documents Show

DAILY CALLER NEWS FOUNDATION

ANDREW KERR INVESTIGATIVE REPORTER
September 09, 2021 3:25 PM ET

- **U.S. and Chinese researchers funded by the National Institutes of Allergy and Infectious Diseases created viruses in a Wuhan lab that exhibited over 10,000 times higher viral load in humanized mice, records released by the agency show.**
- **Rutgers University professor Richard Ebright said the data was a "bona fide bombshell" that proves the NIAID, under Dr. Anthony Fauci's leadership, violated federal policies, endangered the public and lied to the public.**
- **Fauci testified before the Senate in June that his agency never funded gain-of-function research at the Wuhan Institute of Virology.**

U.S. and Chinese researchers funded by Dr. Anthony Fauci's National Institute of Allergy and Infectious Diseases (NIAID) created viruses in a Wuhan lab that exhibited over 10,000 times higher viral load in humanized mice than the natural virus they were based on, according to an infectious disease professor citing documents recently released by the agency.

The U.S. nonprofit group EcoHealth Alliance notified the NIAID in two reports that between June 2017 and May 2018 it had created three lab-generated chimeric SARS-related coronaviruses in China that exhibited "significantly higher" viral loads, documents first reported by The Intercept show, but the agency continued to fund the project with taxpayer dollars without flagging it for review by an independent federal committee created in late 2017 to oversee gain-of-function research.

Rutgers University professor Richard Ebright, a vocal opponent of gain-of-function research, said the data was a "bona fide bombshell" that proves the NIAID, under Fauci's leadership, violated federal policies, endangered the public and lied to the public.

"Three EcoHealth/[Wuhan Institute of Virology] lab-generated viruses exhibited >10x to >10,000x higher viral load than the starting bat virus in humanized mice," Ebright tweeted. "One EcoHealth/WIV lab-generated virus exhibited higher pathogenicity than the starting bat virus in infection studies with humanized mice."

"The results demonstrate–unequivocally–a gain in function," he said.

In comparison, the viral load for people infected with the delta variant is roughly 1,000 times higher than those infected with the original strain of the virus, according to Nature science journal.

Ebright added on Twitter that the gain-of-function research activity that NIAID allowed EcoHealth Alliance to conduct in China could have yielded the virus that causes COVID-19 or a progenitor of that virus.

EcoHealth Alliance first notified the NIAID it created the three lab-generated SARS-related coronaviruses in a progress report detailing its research activities between June 2017 and May 2018.

"Using the reverse genetic methods we previously developed, infectious clones with the WIV1 backbone and the spike protein of SHC014, WIV16 and Rs4231, respectively, were constructed and recombinant viruses were successfully rescued," the group said in its progress report. "2 and 4 days post infection, the viral load in lung tissues of mice challenged with rWIV1-SHC014S, rWIV1-WIV16S and rWIV1-Rs4231S … were significantly higher than that in rWIV1-infected mice."

"These results demonstrate varying pathogenicity of SARSr-CoVs with different spike proteins in humanized mice," the report added.

EcoHealth Alliance included a chart visualizing the increased viral load of their lab-created viruses. The chart is presented in a Log scale, meaning each tick of the chart represents a 100-fold increase in viral load in mice with humanized cells, Ebright explained to the Daily Caller News Foundation.

B.2 (Year 4 NIAID CoV Report_Final for eRA Commons.pdf)

REL0000478562

created virus strains. The viral load chart is presented in Log scale, meaning each tick of the graph represents a 100-fold increase in viral load, Rutgers University professor Richard Ebright explained to the DCNF. (Screenshot)

"Each tick in the chart on the right represents an increment of 100x," Ebright told the DCNF. "The day 4 data show greater-than-10,000x higher viral loads for the lab-generated viruses."

The viral load for humanized mice infected with the natural virus caught up with the lab-created strains by the end of the experiment, the chart shows, but Ebright said that viral loads in the early stages of an infection are important figures to consider when assessing a pathogen's transmissibility.

"In terms of assessing potential for transmissibility, the viral load at all time points, particularly at early time points, is relevant. (See Delta variant)," Ebright told the DCNF.

EcoHealth Alliance provided another chart in its progress report showing that humanized mice infected with EcoHealth's lab-created viruses lost more bodyweight than humanized mice infected with the natural WIV1 strain.

EcoHealth Alliance included the same two charts in a 2018 request to the NIAID requesting additional funding for its research in China, the document trove released by The Intercept shows.

Federal funding for gain-of-function experiments that increase the transmissibility or pathogenicity of potential pandemic pathogens was temporarily suspended in 2014 due to widespread scientific concerns it risked leaking supercharged viruses into the human population.

Funding for gain-of-function research was resumed in late 2017, but only for projects that went through the new Potential Pandemic Pathogens Control and Oversight (P3CO) Framework, which includes a review by an HHS review board tasked with critically evaluating whether grants that involve enhancing dangerous pathogens, such as coronaviruses, are worth the risks and that proper safeguards are in place.

The NIAID opted not to flag the EcoHealth Alliance grant for P3CO after determining on its own accord that the project "did not involve the enhancement of the pathogenicity or transmissibility of the viruses studied," a National Institutes of Health spokesperson previously told the DCNF. **(RELATED: US Grant To Wuhan Lab To Enhance Bat-Based Coronaviruses Was Never Scrutinized By HHS Review Board, NIH Says)**

Fauci said during a congressional hearing in May that the NIH and NIAID "categorically has not funded gain-of-function research to be conducted at the Wuhan Institute of Virology," a claim that led Republican Sen. Rand Paul of Kentucky in July to send a criminal referral to the Department of Justice to investigate whether Fauci lied before Congress.

The P3CO framework defines an "enhanced" potential pandemic pathogen as any lab-created virus that exhibits any level of boosted transmissibility and/or virulence. Funding agencies such as the NIAID are required to flag any research grant that is "reasonably anticipated to create, transfer, or use enhanced PPPs" for P3CO review.

Despite this, documents released by The Intercept suggest that the NIAID authorized EcoHealth Alliance to conduct gain-of-function experiments on bat coronaviruses up to a certain threshold.

The NIAID informed EcoHealth Alliance in a June 2018 award notice that it must notify the agency only if it creates a virus "with enhanced growth by more than [10 times] compared to wild type strains," according to documents released by The Intercept. The NIAID linked to the P3CO review process, which contains no such mention of a 10 times allowance, in the very next sentence, the document shows.

SECTION IV – AI Special Terms and Conditions – 5R01AI110964-05

Clinical Trial Indicator: No
This award does not support any NIH-defined Clinical Trials. See the NIH Grants Policy Statement Section 1.2 for NIH definition of Clinical Trial.

NIHGSA2 | Version: 1 - 01/16/2018 13:57:00 Generated on: 6/16/2021 11:07:55 AM

If any experiments proposed in this award result in a virus with enhanced growth by more than 1 log compared to wild type strains, you must notify your NIAID Program Officer and Grants Management Specialist immediately. Further research involving the resulting virus(es) may require review by the Department of Health and Human Services in accordance with the Framework for Guiding Funding Decisions about Proposed Research Involving Enhanced Potential Pandemic Pathogens (https://www.phe.gov/s3/dualuse/Documents/P3CO.pdf).

NIAID notice to EcoHealth Alliance in June 2018 saying it must notify the agency only if it produces a lab virus that exhibits more than 10 times enhancement over wild-type strains. (Screenshot)

Subject: RE: The Intercept report on coronavirus research at Chinese labs

That's interesting about Jesse Bloom– I wasn't aware of that work and hadn't really heard of him before this year to be honest. I suspect that like many people his view of his own research is that it's highly professionally managed and carefully controlled re. biosafety. He clearly has a different view of the work at WIV & by other leading Chinese scientists and seems suspicious of their motives in many of his public comments. This can't be based on their published work it's often excellent. It just seems like a difficulty people have teasing apart their viewpoint about the Chinese Govt from their opinion about individual scientists. Anyone who's been on the ground in China rapidly realizes that the two are not the same.

Cheers,

Peter

Sorry this is happening. The anti-science attacks are just getting more and more extreme.

Unfortunately, there exists a small vocal group of scientists that see virtually every experiment done by virologists as risky and potentially GoF. Many of those ppl are quoted in the Intercept article.

WRT Jesse Bloom it is rather ironic I must say. One need not look too hard at his influenza virus publications to identify quite a number that could be considered "risky" at least by a Relman/Ebright definition. Selecting drug resistant influenza virus mutants, and creating influenza virus SARS-CoV-2 recombinants to name two. Just saying…

External Sender. Be aware of links, attachments and requests.

Great to see your email Kristian – right on every point. The isolate vs. sequence vs. sample misnomer is something that really has plagued me with this stuff Zhengli's group repeatedly used 'isolate' for 'sample' on Genbank and I've made that mistake here also.

Re. the MERS work, you're dead right – we proposed it, explained that it would likely need review by the P3CO committee equivalent, and then pushed it to Yr4. In the end we didn't do this work – there was already a ton of other more interesting work directly on SARSr-CoVs to do.

The latest line of attack that will be coming out in a follow-up article in the *Intercept* tonight is that in the Y4 report, we show one of the chimeras having more than a log virus output than the parent strain (WIV-1). The NoA was updated in Y3 to say that if this happened we had to report to NIH and cease expts. Ironically, the way *Intercept* found this out is because they now have a copy of our "report to NIH" in which we show this, but of course that's not going to stop them saying we broke the rules on GoF.

The other line of attack is the one Jesse Bloom's pursuing -- that we didn't publish sequence data within 6 months of the "final version being received" as per our proposal. Jesse sneakily suggested this in an email to me last night in which he asked for the sequences so he can do SARS-CoV-2 origin analyses, while at the same time tweeting an accusation that we broke the rules in a chain with Alina Chan and the "Seeker". I'm not sure whether to respond at all, but I might just let him know that all SARSr-CoV sequences we had are already published in our 2020 paper in Nat. Comm. Again – the problem with these accusations is that just being accused of this by the press causes us seven levels of hell, and arguing back is even worse.

Subject: Re: Th research at Chinese

It's harassment, plain and simple - it has absolutely nothing to do with trying to find the truth of how SARS-CoV-2 emerged in the human population.

The way I see it though, we now have (a) the entire US IC having completed their investigation, (b) unredacted grants and annual reports from EcoHealth, and (c) old theses from the WIV.

This is *exactly* the type of information that Ebright, Metzl, Relman, Bloom, Chan, and the rest of the lot have been requesting. Now this work has been completed, what was unearthed? Nothing. Nada. Zilch. No evidence of the virus (or sequence) at the WIV (or anywhere else) prior to the pandemic. No gain-of-function work (despite what Ebright says). The same cloning system used again and again (WIV1). Vero cells used for virus isolation (SARS-CoV-2 loses the FCS in those cells), and no previously unreported viruses isolated (although I note the repeated use of "isolates" in one of the annual reports to describe 11 samples - I myself have made that mistake before). So again, there's nothing.

This absence of evidence is *in fact* evidence of absence in this particular case - there would have been *some* evidence for SARS-CoV-2 in *some* of these documents had it been at the WIV. Yet, nothing.

As for GOF work, again nothing. I note the mention of work with recombinant MERS in the year 3 report for work proposed in year 4 - depending on the nature of work, that could be considered GOF/DURC. However, when reading the year 4 report, I don't see any of that work mentioned - just work with pseudotyped viruses, which is clearly not GOF (or DURC).

Of course, people will take stuff out of context to make *anything* fit a particular narrative. However, there's an expiration date on bullshit and I suspect we're well past due.

To be honest, this whole process is beyond a joke. We're spending a huge amount of staff time dealing with the BS from these FoIA requests even though the grant's been terminated, suspended and funds are still unavailable.

The lab leakers are already stirring up bullshit lines of attack that will bring more negative publicity our way – which is what this is about a way to line up the GoF attack on Fauci, or the 'risky research' attack on all of us.

Jesse Bloom's now trying to claim we weren't following our proposed rules for data release (not true – all SARSr-CoV RdRp sequences on Genbank in summer 2020, despite the grant being terminated) – he's tagging Alina Chan and 'The Seeker' on Twitter. Ebright's trying to claim we were working on MERS as a 'shadow' line of work. There'll be more to come – just a free-for-all effort to find a few sentences that they can take out of context.

Totally - that the real story of the FOIAed grants - no SC2 or anything close that could have been converted to it.

Metzl, Chan and others wanted a "forensic investigation.' The grants that they thought would be private and written before the pandemic do not mention a new SARS-like virus. YOu can be sure that a new virus 76% similar to SC1 would have been front and center in the applications and progress reports.

My guess this is part of the info the IC used to conclude no bioweapon, likely no engineering - NO SC2 before the pandemic. This Gof debate now very clearly has nothing to do with the origin of SC2.

Going through it carefully as we speak (already wasted a few hours) - because that's how idiotic this has become.

Nicely detailed annual reports - makes it easy to show that there's in fact no SARS-CoV-2 in there...

People have lost their minds with this s***.

Yes I think it may be released as soon as next week, with press conferences I believe in NY around the time of UNGA (as originally planned). I was not invited to participate.

Two weeks ago, Richard Horton in a zoom agreed to address my concerns about Jeff's specific attacks on me, he was supposed to respond by last week. But nothing so far, so I'm not optimistic. Best Peter

Exclusive: Intel agencies scour reams of genetic data from Wuhan lab in Covid origins hunt

By Katie Bo Williams, Zachary Cohen and Natasha Bertrand, CNN
Updated 9:02 AM ET, Thu August 5, 2021

*Washington (CNN)*US intelligence agencies are digging through a treasure trove of genetic data that could be key to uncovering the origins of the coronavirus -- as soon as they can decipher it.

This giant catalog of information contains genetic blueprints drawn from virus samples studied at the lab in Wuhan, China which some officials believe may have been the source of the Covid-19 outbreak, multiple people familiar with the matter tell CNN.

It's unclear exactly how or when US intelligence agencies gained access to the information, but the machines involved in creating and processing this kind of genetic data from viruses are typically connected to external cloud-based servers -- leaving open the possibility they were hacked, sources said.

Still, translating this mountain of raw data into usable information -- which is only one part of the intelligence community's 90-day push to uncover the pandemic's origins -- presents a range of challenges, including harnessing enough computing power to process it all. To do that, intelligence agencies are relying on supercomputers at the Department of Energy's National Labs, a collection of 17 elite government research institutions.

There's also a manpower issue. Not only do intelligence agencies need government scientists skilled enough to interpret complex genetic sequencing data and who have the proper security clearance, they also need to speak Mandarin, since the information is written in Chinese with a specialized vocabulary.

"Obviously there are scientists who are (security) cleared," one source familiar with the intelligence told CNN. "But Mandarin-speaking ones who are cleared? That's a very small pool. And not just any scientists, but ones who specialize in bio? So you can see how this quickly becomes difficult."

Officials conducting the 90-day review hope this information will help answer the question of how the virus jumped from animals to humans. Unlocking that mystery is essential to ultimately determining whether Covid-19 leaked from the lab or was transmitted to humans from animals in the wild, multiple sources told CNN.

Investigators both inside and outside the government have long sought genetic data from 22,000 virus samples that were being studied at the Wuhan Institute of Virology. That data was removed from the internet by Chinese officials in September 2019, and China has since refused to turn over this and other raw data on early coronavirus cases to the World Health Organization and the US.

The question for investigators is whether the WIV or other labs in China possessed virus samples or other contextual information that could help them trace the coronavirus' evolutionary history.

Two scientists who study coronaviruses told CNN they are skeptical that there is any genetic data either in the tranche of 22,000 samples or any other database from the WIV that scientists don't already know about.

"Basically in [a 2020 research paper published in Nature], the WIV talked about all the sequences they had up until a certain point in time -- it's what most scientists virologists believe, that's pretty much what they had," said Dr. Robert Garry, a virologist at the Tulane University School of Medicine.

A source familiar with the US investigation would neither confirm nor deny that any of the data pertaining to those 22,000 samples is among what US intelligence agencies are currently analyzing.

MORENS_SUBPOENA_022889
MORENS_NIH_043895
REL0000478588

No 'smoking gun'

Sources familiar with the effort say filling in that missing genetic link won't be enough to definitively prove whether the virus originated in the lab at Wuhan or first emerged naturally. Officials will still need to piece together other contextual clues to determine the true origins of the pandemic.

But it is a critical puzzle piece that the Biden administration has been prioritizing.
"The most prized technical data in this context are genetic sequences, database entries and contextual information about the provenance of the samples and the time and context in which they were acquired -- information people would use to place them in a narrative of the origins of SARS, Covid," one source familiar with the investigation told CNN.

For now, senior intelligence officials still say that they are genuinely split between the two prevailing theories on the pandemic's origins, or some combination of both scenarios. CNN reported last month that senior Biden administration officials overseeing the 90-day review now believe the theory that the virus accidentally escaped from a lab in Wuhan is at least as credible as the possibility that it emerged naturally in the wild -- a dramatic shift from a year ago, when Democrats publicly downplayed the so-called lab leak theory.

Multiple sources told CNN that absent an unexpected windfall of new information, officials don't expect to uncover a "smoking gun" -- like intercepted communications, for example -- that would offer definitive proof for either theory. The Biden administration's 90-day push is predicated on the expectation that science, not intelligence will be the key.

Intelligence officials are tasked with addressing several "scientific knowledge gaps" about the virus' evolution, according to the collection guidance governing the 90-day push, distributed to more than a dozen agencies on June 11 by the Office of the Director of National Intelligence and obtained by CNN.

The memo instructs the intelligence community to "expand its collection" and consider data already in its possession to identify both the initial host of the coronavirus and any species that it may have passed through as it adapted to humans -- or to find as "any progenitor virus and/or virus that could serve as backbone for genetic engineering purposes."

But former Director of National Intelligence John Ratcliffe told CNN that the US intelligence community already had sufficient collection on the topic of Covid origins.

"Obviously the more, the better. But we've had extraordinary insight into this topic for many months, much more than has been declassified. Pretending we didn't is political theater and a classic example of a politician trying to buy time by using the IC as a scapegoat," he told CNN in a statement.

Digging into the science

That's where the genomic data from the Wuhan lab could come in.

The genetic code of a given virus is the signature that allows scientists to tell the difference between the Delta and Beta variants of the coronavirus, for example. It can also offer clues as to how the virus has adapted or mutated over time, including whether it shows signs of human manipulation -- a kind of genetic history.

Many scientists continue to believe that the most likely scenario is that the virus jumped from animals to humans naturally. But despite testing thousands of animals, researchers still haven't identified the intermediate host through which the virus passed as it adapted to humans.

But some researchers, intelligence officials and Republican lawmakers believe that researchers at the WIV might have genetically altered a virus in the lab, using a controversial kind of research known as "gain of function" that could have infected researchers who then spread it in their community.

It's also plausible that the initial infection took place naturally outside of the lab, perhaps while a scientist was collecting a sample from an animal in the wild, and that scientist then spread the virus unknowingly when he returned to the lab with the samples, multiple sources familiar with the intelligence explained.

"If it was the latter, it was likely brought into a lab to study because someone got sick ... which means there

were an unknowable number of other people who were already sick," the source familiar with the probe said.
Understanding exactly which viruses researchers at the WIV were working on could provide important evidence for any one of these theories. It's one of the reasons that investigators on Capitol Hill and elsewhere have been keenly focused on the database that was taken offline in 2019.

But it might not prove anything definitively, sources familiar with the intelligence say. Even if scientists in the intelligence community are able to use the data from the lab to stitch together a complete genetic history that shows how the virus mutated, they might not have enough information about how it was handled by the Chinese lab to determine with a high level of confidence that it leaked.

"Despite having that complete history of variants, [officials might] lack the contextual information to make sense of it in a narrative way," the source familiar with the investigation explained.
"Even a complete sequence history is difficult to obtain. And doesn't really tell us anything about the origins of the pandemic itself without the context," this person added.

Some Republicans on Capitol Hill have jumped into the uncertainty with their own report claiming that "the preponderance of evidence suggests" the coronavirus was "accidentally" released from a lab in Wuhan in 2019 -- an assertion that goes far beyond the intelligence community's current view of the matter.

90 days -- and then what?

It's possible that at the end of Biden's 90-day push, the intelligence community won't have reached what's known as a "high-confidence" assessment as to the pandemic's origins. Administration officials have previously suggested to CNN that it's possible a second review could be ordered at the end of the 90 days.

A bipartisan group of lawmakers on the Senate Intelligence and Foreign Relations Committees earlier this week sent a letter urging the administration to continue to prioritize the hunt until such a judgment can be made in order to prevent future pandemics.

But the lawmakers also zeroed in on a related focus for intelligence officials probing the pandemic's origins: China's "efforts to conceal the severity and scope of the outbreak of the SARS-CoV-2 virus that caused the COVID-19 pandemic."
"We also believe that the investigation should address PRC efforts to prevent international inquiries into the origins of SARS-CoV-2, and other actions PRC authorities have taken to obscure the nature of the virus and its transmission," the lawmakers said.

Republican lawmakers in the House, meanwhile, have latched onto the theory that the virus escaped from a lab. GOP lawmakers in a report released Monday by Rep. Michael McCaul of Texas have claimed that "the preponderance of evidence suggests" the coronavirus was "accidentally" released from a lab in Wuhan in 2019.

Intelligence officials say it's still far too soon to say.

Awful, but predicted and predictable: I explained to Jeff that his public position would cause unnecessary and unjustified harm to both science and scientists in the US. But in addition, it looks as though he invited public condemnation against himself by seeming to simultaneously support both the Russian and Chinese Governments.

My grandfather, Morris Goldberg a hard scrabble immigrant orphaned on the streets of Paris who got out before the Nazi's arrived and would chain smoke Phillip Morris cigarettes and used to take me to the Green Mountain race track in Vermont (when I was a kid) to bet on the horses, would call that "the Trifecta"

CAUTION: This email is not from a BCM Source. Only click links or open attachments you know are safe.

I don't think Jeff Sachs did a thoughtful reflection on what sort of damage he might end up doing by supporting the lab leak narrative and pointing the finger at US scientists. He's now dragged US science into the line of attack from China, Russia, and the US right wingers, all over again…

It's been a relatively quiet few weeks in the press for us at EHA, but I noticed some increased harassment by email etc last night. I've now found out that Tucker Carlson on Fox News decided to do a 'retrospective' on the lab leak narrative and demand investigation of US scientists including me and EcoHealth. The video's below – pretty miserable attack full of errors, innuendo and outright lies…of course… and with video of me and naming me as a person who likely started the pandemic.

https://www.youtube.com/watch?v=1MJrUew2Kyg

If you don't want to watch it (and it's extremely irritating) – just have a look at the comments on the website and you'll see where all this is going – with over a million views in one day, that's a million hard right US citizens putting US scientists on their hit lists for harrassment and worse…

Russia Jumps on Wild Claims COVID Was Created in U.S. Lab

By Ed Browne On 7/6/22 at 10:51 AM EDT

A Russian government official has demanded that Washington be "held accountable" for the COVID-19 pandemic after a pair of university professors said U.S. research organizations had more to answer for.

Since the early days of the pandemic in 2020 there has been much discussion over how SARS-CoV-2, the virus that causes COVID, came into existence.

World Health Organization (WHO) researchers sent to Wuhan, China, to investigate the first known outbreak concluded that although more research was needed, a natural spillover to humans from animals was the most likely outcome and considered a lab leak scenario to be "extremely unlikely."

At the time the lab leak scenario was perhaps more of a fringe idea and one that carried with it an air of conspiracy theory. Since then, calls for investigation into the origins of COVID, including a lab leak, have come from the U.S. president himself and the possibility has not been written off, though it's sparked animosity between scientists who disagree on the likelihood of the theory as well as between countries who are keen to off load blame.

Proponents of the lab leak theory argue that it is no coincidence that some labs—notably those in Wuhan—had been working on engineering coronaviruses in the years prior to the pandemic.

In May, two Columbia University professors published an opinion article in the U.S. journal *Proceedings of the National Academy of Sciences* (PNAS) in which they argue that animal spillover and a "research-related incident" are "the two main hypotheses" regarding the origin of COVID and that "there is much important information that can be gleaned from U.S.-based research institutions, information not yet made available for independent, transparent, and scientific scrutiny."

Jeffrey [redacted], an economics professor, and Neil Harrison, a professor of anesthesiology and pharmacology, went on to state that "much of the work on SARS-like coronaviruses performed in Wuhan [before the pandemic] was part of an active and highly collaborative U.S.–China scientific research program funded by the U.S. government" and that "it is still not clear whether the U.S. intelligence community (IC) investigated these U.S.-supported and U.S.-based activities. If it did, it has yet to make any of its findings available to the U.S. scientific community for independent and transparent analysis and assessment."

More recently, Sachs went further. Speaking in a discussion at the Gate Center research group in Madrid last month, Sachs said: "I'm pretty convinced it came out of a U.S. lab of biotechnology, not out of nature after two years of intensive work on this. So it's a blunder, in my view, of biotech, not an accident of a natural spillover. "We don't know for sure, I should be absolutely clear, but there's enough evidence that it should be looked into and it's not being investigated," he said, without elaborating on the nature or substance of said evidence.

MORENS_SUBPOENA_000987
MORENS_NIH_006680
REL0000478592

However, responding to a *Newsweek* request for comment, Sachs provided some additional insight into his thinking.

"The basic point is the US-backed and US-funded research in the US and partners in China was to perform the very kind of experiments that may have produced SARS-CoV-2," he wrote in an email.

"Indeed, in my view, that is the most likely inference from various pieces of evidence. SARS-CoV-2 is a SARS-like CoV (coronavirus) that has a Furin Cleavage Site (FCS). The US team backed by NIH was intent on introducing an FCS into a large number of previously unreported SARS-CoVs.

"My personal best guess is that SARS-CoV-2 was thereby created and that it accidentally escaped from a laboratory, perhaps the Wuhan Institute of Virology, or perhaps elsewhere.

"NIH has yet not told us what it knew when. The ongoing NIH secrecy and indeed misdirection is a huge and ongoing problem," he concluded.

However, as the U.S. Intelligence Council has previously noted, and past research has suggested, instances have been observed in which furin cleavage sites—a part of SARS-CoV-2 that enhances infection—have been identified in naturally-occurring coronaviruses in the past, and that a coronavirus that was 96.2 percent identical to SARS-CoV-2 was discovered in a bat in 2013.

While the research into and debate around this particular aspect of SARS-CoV-2 continues, it is neither a definitive indicator of lab origins of the virus, nor is it a new piece of information in the conversation about Covid origins, as some outlets and commentators have purported.

It is also worth noting that Sachs' own credibility and links to China, where he holds an advisory role at Beijing' Tsinghua University, have been questioned in the light of his efforts to find the origins of the virus, with some conservative outlets branding him "China's apologist in chief."

And regardless of his genuine or purported affiliations, it is worth emphasizing that Sachs' primary expertise lie in the fields of economics and policy, rather than virology.

Newsweek has contacted the U.S. Department of State for comment.

Shortly after videos of Sachs' comments spread online, Vyacheslav Volodin, Chairman of the State Duma in Russia, pounced on the claim to criticize the U.S. and demand compensation.

In a Telegram post on Wednesday this week, Volodin wrote, translated from Russian: "Millions of sick and dead people, the global economic crisis, a drop in people's living standards are the consequences of COVID-19 for which Washington needs to be held accountable.

"To all states affected by the pandemic, the United States is obliged to compensate for the losses incurred."

It should be noted that Russian officials and outlets have been spreading debunked claims and propaganda about supposed U.S. "biolabs" in Ukraine since invading its neighboring country.

It's also not the first time that COVID origins accusations have been levelled at Washington. China, which itself has been a target of such accusations, has in turn pushed its own theories.

Several times last year, Chinese foreign ministry spokesperson Zhao Lijian suggested that the Fort Detrick military base in the U.S. should be investigated as part of the WHO's COVID investigations. China's state-owned *Global Times* newspaper has also made similar claims.

Update 07/07/22, 5:16 a.m. ET: This article was updated with comment from Jeffrey Sachs.

That's exactly the problem David – the only person calling them out is me, and I'm just barraged by attacks because of it. It's logical because I was the only US member of the WHO team, and that's the political football at the moment, but it's making life extremely difficult and risky right now. I really need others to step up and talk out about what the reality is here.

Cheers,

Peter

Importance: High

Just read your email about being allowed to do interviews on the WHO report David. Interesting and disappointing. Clearly the issue of COVID origins is not the political problem – it's the WHO report that's the problem. It's quite telling really, that the Biden Admin decided the WHO report would be a political football and therefore NSC/White House agenda, not a scientific issue and therefore NIH/NIAID agenda.

This is a symptom of a bigger issues – over the last 2-4 weeks, all of the allies who would normally talk to reporters about the science have either been silenced/sidelined, or are following a political agenda, e.g. the White House, the WHO Director-General (who single-handedly threw the whole WHO expert team under the bus), the former CDC director, and now NIAID – all following the political line.

MORENS_SUBPOENA_012725
MORENS_NIH_024113
REL0000478595

The attacks reached a crescendo over this same period with daily op-eds in NY Post, WSJ, Daily Caller and other Right Wing papers bleeding over into CNN and even NPR. My Board are now beginning to get concerned and this puts me personally in a very difficult position – it's a risk to my job, my family's security, and my career. It's not a real problem yet – if the attacks die down a bit (which I believe they will), and if my Board continue to support me (I believe they will), the long game will win out.

But at this point I'm reaching out to call for help! Can we line up some allies who will help speak publicly about the science here on wildlife-to-human spillover vs. lab leak? Critically, there is still no evidence at all that a lab leak occurred, there is also no evidence at all that EcoHealth (or NIAID) funded or supported Gain-of-function work in China. Likewise, stories about EcoHealth 'hiding' DoD funding, being funded by China, not clearly indicating the source of funding on all public documents, etc. etc. are false and/or misleading. Still, the damage is being done and I'm worried that today the momentum is with the conspiracists.

Any and all ideas are welcome – ASTMH, NAM, NASEM, others?

Jerry – what about reaching out to Benjamin Corb and others?

Cheers,

Peter

Subject: Fwd: FW: (FYI only): Origin of COVID-19 - Possible Interview

Guys, see below..... The Biden admin apparently won't let any of us at NIH, including Tony, discuss the WHO report....

On the surface this sounds bad, but there is the possibility they just want one org to manage the message because they are trying to put out a fire. Or am I just Pollyanna? d

Hi Dr. Morens –

For your awareness (and in case she also reaches out to you directly), Mariana Lenharo followed up today on her request to speak with you or another NIAID expert about the WHO report, which as you know came out today. We've been asked to refer requests for comment about the report to the National Security Council, and we will be directing her there.

Best,
Hillary

Thanks for the background! Once we know what the WHO report says, we'll be better poised to make decisions about how to handle requests to discuss it… as you note, it is a bit of a hot issue.

That's fine, although I think she wants me because I spoke to her before, and because I published the major paper dealing with it, along with Breman at FIC and ex-FIC director Keusch, and other authors.

Also, just off the record, we may want to not give this to Tony as he has been unfairly criticized over some of the issues. It could be a hot subject for him….d

Hi Dr. Morens,

Thanks for sending. I'll write back to this reporter and ask her to send a fresh request to the press office once the WHO report is available – we can at that time better assess whether it makes sense for you or another NIAID expert to speak with the media about it.

Best,
Hillary

Dear Dr. Morens,

Thank you so much for getting back to me. I have a pretty open schedule in the next few days. These are the times I'll be available:

Wednesday: anytime after 8 am
Thursday: from 8 am to 9 am OR anytime after 1 pm
Friday: from 8 am to 3 pm

Please let me know if any of those work for you and how would you prefer to be contacted at that time.

Thank you.

Kind regards,

Mariana Lenharo

Subject: Possible interview - Dr. David M. Morens

Hello!

My name is Mariana Lenharo, I'm a science and health journalist and I'm working on a story about the work of scientists investigating the origin of the Covid-19 pandemic. This story will be published in Elemental (https://elemental.medium.com/), a Medium publication focused on science-backed health coverage.

As I was reading about this topic, I came across this very interesting article, "The Origin of COVID-19 and Why It Matters" and I'd love to interview one of the authors, Dr. David M. Morens. This would be a 20-30-minute interview by phone/skype/zoom preferably this week. Please let me know if you think this would be possible.

Thank you very much!

Kind regards,

Mariana Lenharo
Science and Health Journalist

Republicans Step Up Attacks on Scientist at Heart of Lab Leak Theory

A heated hearing produced no new evidence that Peter Daszak or his nonprofit, EcoHealth Alliance, were implicated in the Covid outbreak.

Peter Daszak, president of EcoHealth Alliance, testifying during a hearing on Capitol Hill on Wednesday.Credit...Ting Shen for The New York Times

By Benjamin Mueller
May 1, 2024, 6:54 p.m. ET

House Republicans demanded on Wednesday that the president of a virus-hunting nonprofit group be criminally investigated and barred from federal research funds, a sharp escalation in their campaign against scientists in the United States who Republicans have suggested either had links to the origin of the Covid-19 pandemic or obscured its true beginnings.

During a heated three-hour hearing of the Select Subcommittee on the Coronavirus Pandemic, Republican lawmakers at times raised their voices at the nonprofit's leader, Peter Daszak, and said that they believed that he would fare poorly as a defendant in criminal court.

The nonprofit, EcoHealth Alliance, which receives federal funding to study global threats from wild animal viruses, has faced suspicion over a proposal that it made in 2018 to team up with Chinese scientists on novel

MORENS_NIH_051364
REL0000478596

coronavirus experiments that Republicans believe could have led to the pandemic, despite that project's never receiving funding.

But in a report and in extensive questioning on Wednesday, the Republicans offered no new information suggesting that EcoHealth Alliance or Dr. Daszak were involved in the coronavirus outbreak. And they did not produce any evidence pointing directly to a coronavirus leak from a lab in China, with or without EcoHealth's involvement, a hitch in their yearslong effort to implicate Chinese and American scientists in the beginnings of the pandemic.

Democrats on the subcommittee seized on the dearth of new evidence, even as they echoed Republican concerns that Dr. Daszak had not been forthcoming about his collaborations with Chinese scientists.

The subcommittee, which is led by Republicans, has reviewed nearly a half-million pages of documents and conducted over 100 hours of private interviews in the course of investigating the origin of Covid, Representative Raul Ruiz of California, the panel's top Democrat, said on Wednesday.

But, Mr. Ruiz said, the subcommittee has found "no evidence" linking the pandemic to EcoHealth's research. And he added that the investigation had not "meaningfully advanced our understanding of the pandemic's origins." Rather, he said, the subcommittee's work now "appeared to be an effort to weaponize concerns about a lab-related origin to fuel sentiment against our nation's scientists and public health officials for partisan gain."

Republicans, for their part, pledged that their investigation would continue. They have called Dr. Anthony S. Fauci, the former director of the National Institute of Allergy and Infectious Diseases, to testify next month. A Republican member of the subcommittee pushed in January for Dr. Fauci to be jailed.

"I support work that will make the world safer," the chairman of the subcommittee, Representative Brad Wenstrup of Ohio, a Republican, said as he opened the hearing on Wednesday. "Our concern is that this research and research similar does the opposite," he said, referring to EcoHealth's collaborations with Chinese scientists. "It puts the world at the risk of a pandemic."

Republicans and Democrats alike hammered Dr. Daszak on Wednesday for what they described as a long list of misrepresentations and evasions. They suggested, among other things, that he was being untruthful about why he had been late to submit a required report to health officials before the pandemic and that he had cast research proposals in ways that helped his chances of receiving funding but misled reviewers. Dr. Daszak strongly denied those charges.

Much of the suspicion centered on an EcoHealth request made in 2018 for Defense Department funding to collect and experiment on coronaviruses with novel traits that would make them highly transmissible in humans.

EcoHealth's proposed partners included the Wuhan Institute of Virology, a premier site for coronavirus research in China. That institute's presence in the city where the Covid outbreak began was at the heart of theories that the virus had first infected people as a result of research activities.

Republicans said that notes on a draft of the proposal from 2018 suggested Dr. Daszak was trying to mislead American officials about the extent of Chinese involvement in the project. Dr. Daszak denied that, saying that he had sought — and received — approval from American defense officials for Chinese scientists to participate. Dr. Daszak said the research had never been carried out.

"It's utterly irrelevant to the origins of Covid," Dr. Daszak said of the proposal. He acknowledged that Wuhan scientists could have been conducting research independently that he was not aware of.

The Wuhan institute's biosafety practices have intensified concerns about the possibility of a lab leak. On Wednesday, Republicans doubled down on worries about its lab's protocols, citing private emails and comments in a closed-door congressional interview by Ralph Baric, a virologist at the University of North Carolina who has collaborated with EcoHealth and the Wuhan institute.

In an email to Dr. Daszak in 2021, Dr. Baric said the Wuhan institute had failed to conduct virus experiments under appropriately safe conditions, and called the idea that they were taking proper precautions a "load of BS." Still, Dr. Baric told Dr. Daszak in a separate email that year that the coronavirus had most likely jumped from animals to people outside of a lab. He cited the absence of any evidence that the Wuhan institute possessed a virus related closely enough to the one that caused the pandemic.

There remains no evidence that the Wuhan institute stored any virus that could have become the coronavirus and caused Covid, with or without scientific tinkering, researchers have said.

Scientists who specialize in tracing outbreaks have published analyses of early cases and viral genomes that they say point to the pandemic's starting at an illegal wild-animal market in Wuhan. The presence of the

coronavirus in samples from the market containing genetic material linked to raccoon dogs, they have said, is consistent with that scenario.

Dr. Daszak cited animal-borne disease threats on Wednesday in defending projects by EcoHealth, which works with collaborators around the world to identify and study dangerous viruses circulating in nature.

In April 2020, as EcoHealth came under attack from President Donald J. Trump, the group had a grant terminated by the National Institutes of Health. The grant was reinstated last year, but it does not provide funding for any research in China. The Biden administration has also taken steps to impose a 10-year ban on funding for the Wuhan Institute of Virology.

Republicans on Wednesday cited concerns about EcoHealth's compliance with grant reporting requirements in arguing that EcoHealth, too, should be barred from receiving federal funds. The N.I.H. faulted the group in 2021 for failing to promptly report findings from studies on how well bat coronaviruses grow in mice. An internal federal watchdog agency chided the N.I.H. last year for failing to demand a progress report from EcoHealth that was two years late.

In an interview after the hearing, Mr. Wenstrup, the Republican subcommittee chair, said that oversight by health agencies was too weak. He called for the creation of criminal penalties for violating health agency protocols — "anything from a misdemeanor to a felony," he said — as a way of better policing certain scientific research.

I'm not sure it's a wise thing to independently contact two journalists at the same publication about a scientific issue of importance that needs coverage for the general public. What is both start to put something together without knowing what the other is doing? If I were them I might be a bit upset by it.

I'm willing to contact Specter. I first go to know him just after I left NIH when he was doing a piece on the interference in NIH autonomy over its science, grants, and administrative independence by the George W Bush administration. As I recall he produced a very good investigative article about it.

On May 17, 2024, at 6:20 PM, Keusch, Gerald (b) (6) rote:

Maybe we should pick one and provide the background information Peter is putting together. The trouble with The New Yorker or the Atlantic is that it will take weeks for them to get something published and what is necessary now is to have the news journalists point out the written record to the contrary for claims like those the committee is making. Hiltzik is good at that. He has the attention of Ruiz's PR guy who is distressed Michael did not soften the criticism in his piece today. I think that has just made Michael more determined to tell it like it is and reveal the perfidy of Ruiz, his colleagues, HHS, and ultimately up to the White House.

By the way, I have found Michael Specter at The New Yorker to be a direct, scientifically driven, hard driving writer. I have dealt with him in the past and could try to interest him in following up. What say?

I have no problem highlighting the NIH's incompetence. But we need a serious science journalist to step up and detail what's going on to set the record straight. We need an Atlantic or New Yorker article to exonerate Peter Daszak and EcoHealth. Who would that be? Michael Hiltzik? Amy Maxmen? Molly Jong Fast? Mehdi Hassan?

That just builds on the dystopic presentation of what Tabak said, referring to the definition with or without "of concern." He was careful to give them what they needed to distort the truth while not exactly lying.

On the other hand his testimony about the requirement for EHA to produce WIV lab notebooks is an outright lie. I have pointed this out to Jocelyn Kaiser and to Michael Hiltzig. Maybe one of them will write about it.

Regarding Tabak's comments on GoF, this is what the text below shows.

Rep. Lesko: "Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?"

Dr. Tabak: "It depends on your definition of gain-of-function research. If you're speaking about the generic term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

So it is not what he said but how the SSCP spun it. That's a weakness that should be exploited in the press. It is deliberately spinning information into disinformation and that is both lying and dangerous. We need to point it out, find other examples where it is easy to refute what they are saying about Peter, EHA, and David, and make sure others will amplify that and delegitimize the committee. I'm going to point out that one to Hiltzik and Kaiser.

Jerry

Press ReleasePublished: May 17, 2024

Hearing Wrap Up: NIH Refutes EcoHealth's Testimony, Tabak Reveals Federal Grant Procedures in Need of Serious Reform

WASHINGTON — The Select Subcommittee on the Coronavirus Pandemic held a hearing titled "Overseeing the Overseers: A Hearing with NIH Deputy Director Lawrence Tabak" to examine the National Institutes of Health's (NIH) process for funding and overseeing scientific research as well as investigate NIH's relationship with EcoHealth Alliance, Inc. (EcoHealth). Members pressed

MORENS_NIH_045261
REL0000478597

former Acting NIH Director and current Principal Deputy Director, Dr. Lawrence Tabak, to explain numerous inconsistencies between the public and private testimonies of NIH employees and EcoHealth President, Dr. Peter Daszak. Dr. Tabak offered substantial evidence that Dr. Daszak purposefully misled both the NIH and the Select Subcommittee about EcoHealth's efforts to comply with grant procedures. In a shocking admission that directly contradicts Dr. Fauci's previous statements, Dr. Tabak

MORENS_NIH_045262
REL0000478597

testified that the NIH was funding gain-of-function research in Wuhan, China through a grant to EcoHealth. Members highlighted the dangers of continuing to fund gain-of-function research in foreign laboratories where NIH cannot ensure proper biosafety measures are implemented. Both Dr. Tabak and Select Subcommittee Members agreed that, in "hindsight," the NIH could have done more to protect the American taxpayer from EcoHealth.

Key Hearing Takeaways

- **NIH Deputy Director and former Acting NIH Director, Dr. Lawrence Tabak, acknowledged that NIH funded gain-of-function research in**

MORENS_NIH_045263
REL0000478597

Wuhan, China.

- Dr. Lawrence Tabak repeatedly refuted EcoHealth Alliance President Dr. Peter Daszak's public and private testimonies. It is now clear that Dr. Daszak misled both the Select Subcommittee and the NIH on numerous occasions.
- Serious shortcomings and failures in the NIH's grant awarding and grant oversight procedures enabled EcoHealth to facilitate gain-of-function research in Wuhan, China. These NIH deficiencies were exploited by Dr. Daszak and his team in an effort to avoid oversight and maintain funding.
- The U.S. Department of Health and Human Services' (HHS) decision to immediately suspend funding and commence debarment proceedings against EcoHealth is backed by substantial evidence and necessary to protect America's national security. The Select Subcommittee also recommends that HHS immediately begin debarment proceedings against Dr. Peter Daszak personally.
- The NIH often lacks the necessary subject matter and scientific expertise to ensure U.S. taxpayer funds are spent and overseen safely. Dr. Tabak testified to these gaps in NIH's system today, and former NIH Director Dr. Francis Collins recounted similar problems during his transcribed interview found here.
- The Select Subcommittee's investigation into EcoHealth's impropriety is far from over. Chairman Wenstrup appreciates Dr. Tabak's honesty today and intends to use his testimony to hold EcoHealth accountable for its facilitation of gain-of-function research and its blatant contempt for the American taxpayer.

Member Highlights Select Subcommittee on the Coronavirus Pandemic Chairman Brad Wenstrup (R-Ohio), D.P.M, pressed Dr. Tabak to address Dr. Daszak's testimony that EcoHealth was "locked out" of the NIH's grant reporting system. NIH conducted

MORENS_NIH_045264
REL0000478597

an internal forensic audit which proves EcoHealth was, in fact, not "locked out" from submitting its required NIH grant research update report on time. Notably, EcoHealth finally submitted its report nearly two years after the required deadline. According to the facts gathered by NIH, Dr. Daszak's sworn testimony appears to be false.
<image001.png >

Chairman Wenstrup: "

EcoHealth, like every other NIAID grantee, was

MORENS_NIH_045265
REL0000478597

required to submit a five-year progress report, as you know. This report was submitted nearly two years late. Dr. Daszak testified that EcoHealth had tried to submit the report on time but was locked out of the NIH system. Dr. Lauer testified that a forensic audit was conducted, and no such system error was detected. Is NIH now willing to share the findings of this forensic audit with the Select Subcommittee?
"

Dr. Tabak: "*We certainly will work together with you to obtain things that you*

MORENS_NIH_045266
REL0000478597

require, sir
."
Chairman Wenstrup: "*Does the audit indicate that EcoHealth could have submitted their report on time?*"
Dr. Tabak: "*That's what our audit indicates, yes.*"
Chairman Wenstrup: "*When EcoHealth eventually submitted its year-five report, Dr. Daszak testified it took 11 days to unlock the NIH system. Is this true?*"
Dr. Tabak: "*We have no evidence of that.*"
...
Dr. Tabak: "*All I can say to you is that our system did not lock them out and there was no impediment for them to*

MORENS_NIH_045267
REL0000478597

provide that report on time."

Committee on Oversight and Accountability Chairman James Comer (R-Ky.) questioned Dr. Tabak about the employment status of alleged federal records violator and top advisor to Dr. Anthony Fauci — Dr. David Morens — who was placed on administrative leave after the Select Subcommittee uncovered incriminating information. Dr. Morens used his personal email(s) to hide conversations about the origins of COVID-19 and undermine the operations of the NIH.

<image002.png

MORENS_NIH_045268
REL0000478597

>

Chairman Comer: "*What is Dr. Morens's current employment status?*"
Dr. Tabak: "*He is an employee of NIH.*"
Chairman Comer: "*Well, I think you see where my lines of questioning were leading. We have some serious concerns. We have fought in this Select Subcommittee, the Oversight committee, on obtaining information. And here you have an admission of deleting information, going to great lengths to not be transparent, in an apparent cover-up of something that I think*

MORENS_NIH_045269
REL0000478597

we would agree, in a bipartisan manner, is one of the most serious issues that our country has ever faced, the COVID 19 pandemic."

Rep. Debbie Lesko (R-Ariz.) elicited an admission from Dr. Tabak that the NIH funded gain-of-function research at the WIV through a grant to EcoHealth. This directly contradicts Dr. Fauci's U.S. Senate testimony in 2021 in which he claimed the NIH "has not ever and does not now fund gain-of-function research in the Wuhan Institute

of Virology." This type of research is known to be dangerous and even former NIH Director Francis Collins and Dr. Fauci were willing to admit that there are risks associated with this experimentation. <image003.png >

Rep. Lesko: "*Dr. Tabak, did NIH fund gain-of-function research at the Wuhan Institute of Virology through EcoHealth?* "

Dr. Tabak: "*It depends on your definition of gain-of-function research. If you're speaking about the generic*

MORENS_NIH_045271
REL0000478597

term, yes, we did…the generic term is research that goes on in many, many labs around the country. It is not regulated. And the reason it's not regulated is it poses no threat or harm to anybody."

Rep. Rich McCormick (R-Ga.), M.D., proved that EcoHealth violated the terms of its NIH grant when it failed to produce "laboratory notebooks" with information about the WIV's gain-of-function research. On May 1, Dr. Daszak falsely testified that he was not required

MORENS_NIH_045272
REL0000478597

to produce these notebooks as a condition of his grant.
<image004.png>

Rep. McCormick: "*When the National Institutes of Health requested the notebooks from EcoHealth, was EcoHealth required to produce them under its grant terms?*"
Dr. Tabak: "*Yes, they were.*"
Rep. McCormick: "*When NIH requested notebooks from EcoHealth should EcoHealth have been able to access them or already have access to them?*"
Dr. Tabak: "*That's correct.*"

MORENS_NIH_045273
REL0000478597

Rep. McCormick: "*Did EcoHealth ever produce the requested notebooks?* "

Dr. Tabak: "*They have not.*"

Rep. McCormick: "*Dr. Daszak testified two weeks ago that he was not required to produce the lab notebooks. Would NIH disagree with that testimony?* "

Dr. Tabak: "*Yes, we disagree with that testimony*."

Rep. McCormick: "*The testimony here today clarifies the inconsistency between Dr. Daszak's testimony and the testimony of numerous NIH officials*

MORENS_NIH_045274
REL0000478597

and NIAID officials, also, including yourself. Dr. Daszak continues to thwart congressional oversight through semantics and outright dishonesty, quite frankly. He has routinely failed to produce pertinent documents and made countless misleading statements to the Select Subcommittee right here."

Rep. Mariannette Miller-Meeks (R-Iowa), M.D., uncovered serious shortcomings in NIH's grant awarding and grant oversight procedures. Dr. Tabak testified that he would never again support a

MORENS_NIH_045275
REL0000478597

grant to EcoHealth Alliance to fund gain-of-function research in Wuhan and believes the NIH relied too heavily on Dr. Daszak attestations.

.

<image005.png>

Rep. Miller-Meeks: "*As I mentioned, the Understanding the Risk of Bat Coronavirus Emergence Grant was an almost $4 million grant that partially went to the Wuhan Institute of Virology and the Wuhan University of Public Health. Do you believe this grant was an effective use of taxpayer dollars,*

MORENS_NIH_045276
REL0000478597

and would you support issuing the same grant today?"
Dr. Tabak: "*Well, with the benefit of what we know today, no, of course not.*"
Rep. Miller-Meeks: "*There is great concern with Dr. Daszak interaction with NIH and NIAID pertaining to the one log growth term of the award. The NIH relied on Dr. Daszak to monitor and report virus growth after being a month late on his annual reporting requirements, which were outlined in the grant. Dr. Tabak, looking back, did the NIH rely too*

MORENS_NIH_045277
REL0000478597

much on Dr. Daszak's self-reporting information?"

Dr. Tabak: *"Again, with the benefit of hindsight, we did because we never received the information."*

Rep. Miller-Meeks: *"Well, as an ophthalmologist, hindsight is always 20/20."*

Rep. Nicole Malliotakis (R-N.Y.) revealed NIH's honest viewpoint regarding its funding of EcoHealth's risky research at the WIV. Dr. Tabak testified that NIH believed it was not funding any dangerous research

MORENS_NIH_045278
REL0000478597

prior to or during the COVID-19 pandemic.
<image006.png>

Rep. Malliotakis: *"We also know that at least 20 more EcoHealth research projects received funding since March of 2020, and they are conducting research Nipah, zoonotic viruses, bat coronaviruses, MERS. They are doing a lot of this research, mostly actually in third world countries. Subpar safety conditions. How do you ensure that our federal dollars are not going to do risky experiments in countries where there are*

MORENS_NIH_045279
REL0000478597

subpar safety regulations? And do you believe that should be a criteria that is put forth to ensure that the money doesn't?"
Dr. Tabak: "*Well, again, once we established special conditions for award on EcoHealth Alliance, we have monitored them very carefully with regard to expenditure and with regard to their various administrative processes. There was never a concern with the danger, if you will, of the experiments that NIH approved for EcoHealth Alliance to with under subaward*

MORENS_NIH_045280
REL0000478597

with WIV."

It feels a bit creepy to hear NIH boasting about the hard work it's doing to root out communist infiltration into our universities. Here's an article based on Michael Lauer's testimony at the Senate Committee on Foreign Relations, commenting that there's just too much work for them to keep on top of. I saw similar comments from him at last year's NIH Advisory Committee to the Director meeting where he presented something like 250 people they'd investigated in collab with the FBI, a handful who'd been charged and 60+ found not to have any concerns. I wonder if, like the McCarthy Era, they even knew they'd been investigated and their organizations contact about them?

After seeing that last year, I asked the FBI if I was under investigation. They actually checked and confirmed I was not. It sounds and smells like a witch hunt to me and unfortunately the Grand Inquisitor is the person(s) who are dealing with my R01 – Collins and Lauer…

Yes – I do know the journalist Peter Aldhous. I've found him to be persistent and generally balanced, but not averse to doing the usual journalistic strategy of always getting both sides of an issue and giving them appearance of equal weight. He did this in an article on the WHO mission's report last spring, but now this seems to be more balanced than some: https://www.buzzfeednews.com/article/peteraldhous/who- covid-origins-china-report-lab-accident

He did an earlier piece after Trump canceled our grant which tried to explain what the work was: https://www.buzzfeednews.com/article/peteraldhous/wuhan- lab-coronavirus-trump

I heard from him last week (email below). He says now that he's investigating what the political motivations were for the initial cancelation of our grant, which he believes were in-part driven by the awful pressure group White Coat Waste (he's correct). He might also be looking into their involvement in the attacks on Tony re. the alleged 'beagles with leishmaniasis'. Here's an email I got from him a few days ago:

From: Peter Aldhous (b) (6) >
Sent: Monday, April 1
To: Peter Daszak (b) (6)
Subject: Could we set up a conversation this week?

Dear Peter,

I hope all is well. I am now working on a piece based in part of the materials we've received from our FOIA to NIH surrounding the cancellation of your grant and subsequent developments.

My focus is a little different from previous coverage. I'm looking at the role of the animal group White Coat Waste in the events that led up to the cancellation of your grant and the subsequent "lab leak" and "gain-of-function" controversies, WCW's links to prominent Republican politicians, its subsequent involvement in attacks on Tony Fauci, and its current activities, which include (questionable) claims about research funded by NIH in Russia. There are some clear parallels this campaign and the way in which the group targeted your grant.

The piece will also discuss the big shift in the tone of internal NIH discussion of your grant before and after WCW's claims were published in the Daily Mail and elsewhere and pressure began to be exerted through WCW's links with politicians including Matt Gaetz and Marco Rubio. And it will go over NIH's missteps in the termination of your grant as the agency bent under this pressure.

I'd like to your input on the key developments as they affected the EcoHealth Alliance. I noticed that you've been quoted some of the stuff we discussed previously off the record, including in this piece in Science.

Can we set up a time for this? I'm due to file a draft early next week, so if we can speak in the next couple of days, I'd be very grateful.

Thanks,

Peter

Subject: Re: CIT Search Request: NIAID IOD FOIA Request 58170

Note that this foia is ostensibly about Leishmaniasis so hopefully not of concern to you, but we have had foia folks try to sneak in through the back door recently

In 5 years here i have never heard of a foia for Leishmaniasis so just want to be sure..... d

Importance: High

Good afternoon,

We have received a FOIA request from Dr. Aldhous, freelance journalist, on 4/13/22 (attached). I am reaching to you specifically for item 3 of his request:

- **communications among NIAID IOD/OCGR staff regarding this paper**: "Enhanced attraction of sand fly vectors of Leishmania infantum to dogs infected with zoonotic visceral leishmaniasis" https://journals.plos.org/plosntds/article?id=10.1371/journal.pntd.0009647
- date range: **July 21, 2021 and date of search**

I am seeking permission to request a CIT search of the following emails:

Anthony Fauci
Greg Folkers
Patricia Conrad
Kimberly Barasch
David Morens
Laurie Doepel

Please let me know if you have any questions.

Attached:

- Request

Thank you,
Beth

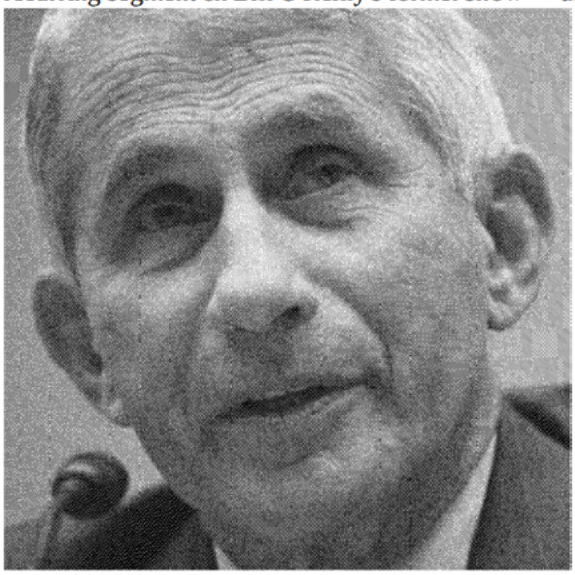
Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, has faced a barrage of conservative criticism and violent threats over the handling of the highly politicized coronavirus pandemic.
Greg Nash/Pool/Getty Images

Fox News host Jesse Watters is facing blowback for recent remarks he made at a conservative political conference, where he used violent rhetoric to explain how citizen journalists should confront Dr. Anthony Fauci with questions in the hopes of going viral.

Speaking at Turning Point USA's Americafest over the weekend, Watters urged young conservatives to "ambush" the nation's top infectious disease expert and "go in for the kill shot." He walked them through how to approach Fauci and how to phrase their



MORENS_SUBPOENA_015426
MORENS_NIH_032283
REL0000478605

questions, focusing on a conspiracy theory about the origins of the coronavirus pandemic.

"Now you go in for the kill shot. The kill shot with an ambush, deadly, because he doesn't see it coming," Watters said at one point, according to a transcript and a nearly six-minute video clip. "This is when you say, 'Dr. Fauci, you funded risky research at a sloppy Chinese lab, the same lab that sprung this pandemic on the world. You know why people don't trust you, don't you?' Boom, he is dead. He is dead. He's done."

Article continues after sponsor message

Watters — a regular commentator on the prime-time show *The Five* who made his name doing ambush-style interviews in a recurring segment on Bill O'Reilly's former show — also told audiences to be respectful and "just make sure it's legal."

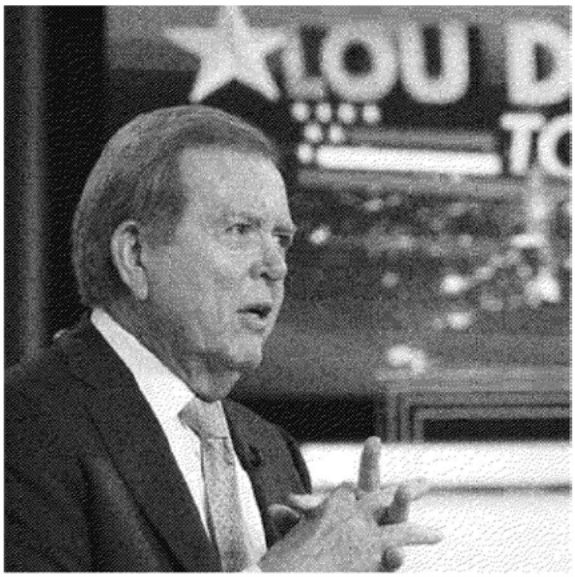
Coronavirus Live Updates

Fauci Reveals He Has Received Death Threats And His Daughters Have Been Harassed

While it is clear from the full context of Watters' remarks that he was not explicitly calling for violence, the viciousness of the chosen metaphor was striking, particularly given that Fauci has spoken publicly about receiving death threats. He is among the public figures who have faced a barrage of conservative criticism and violent threats over their handling of the highly politicized coronavirus pandemic.

In a Tuesday appearance on CNN's *New Day*, Fauci called Watters' remarks "a reflection of the craziness that goes on in society."

"The only thing that I have ever done throughout these two years is to encourage people to practice good public health practices: to get vaccinated, to be careful in public settings, to wear a mask," Fauci said. "And for that, you have some guy out there saying that people should be giving me a kill shot, to ambush me?"



He added that Watters "should be fired on the spot" but said the host was unlikely to be held accountable by his network.

Fox came to Watters' defense in a statement shared with NPR and other outlets.

"Based on watching the full clip and reading the entire transcript, it's more than clear that Jesse Watters was using a metaphor for asking hard-hitting questions to Dr. Fauci about gain-of-function research and his words have been twisted completely out of context," it reads.

Former government officials and public health authorities are among those slamming Watters' comments, which also follow recent revelations about how several prominent Fox News hosts figured into the Jan. 6 attack on the U.S. Capitol.

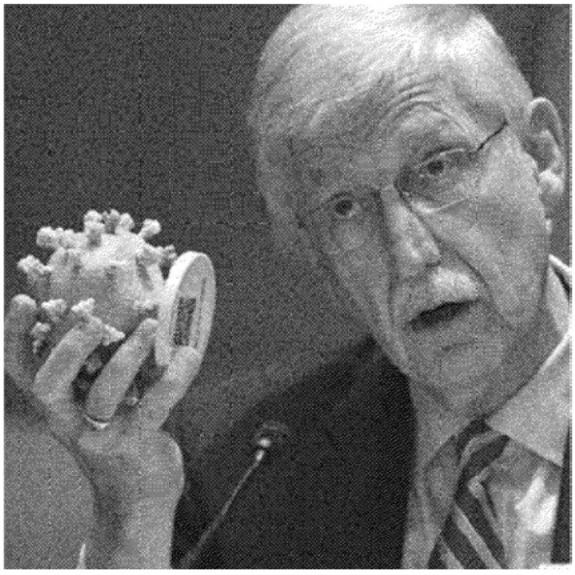
REL0000478605

Media

After Deadly Capitol Riot, Fox News Stays Silent On Stars' Incendiary Rhetoric

Text messages show that network personalities like Sean Hannity and Laura Ingraham privately pressured President Donald Trump to deescalate the day's events even though they downplayed his involvement on air in the months that followed.

Fox News hosts and guests also helped lay the groundwork for the insurrection by amplifying Trump's false claims of election fraud and by urging viewers to fight for their freedoms at the Jan. 6 protest that preceded the riot, as NPR's David Folkenflik and Tom Dreisbach have reported.



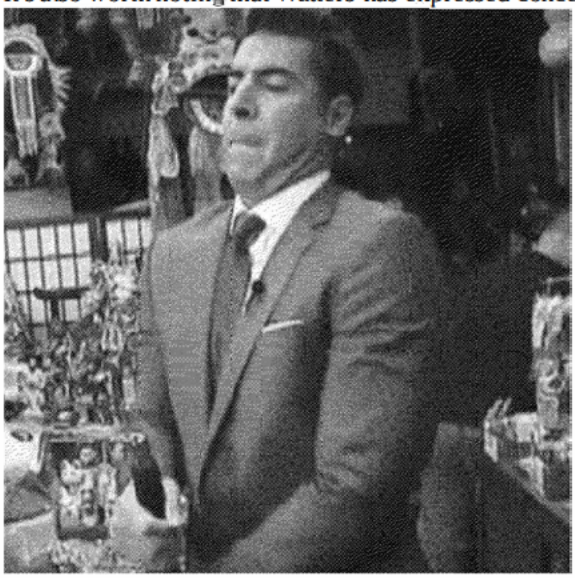
They also found that Ashli Babbitt, the U.S Air Force veteran who joined the protests and was shot and killed after storming the Capitol, was significantly influenced by Fox News coverage in addition to QAnon conspiracy theories.

How Watters urged his audience to confront Fauci

Watters opened his remarks by saying he was "sick and tired of conservatives always playing defense" and instructed the receptive crowd of students on how best to go on the offense.

He noted that politicians and other officials frequently speak at college campuses, and he encouraged students to "take advantage of that, make a name for yourselves." Then he proceeded to outline a series of tips for hypothetically engaging with Fauci, which escalated in intensity.

At one point, Watters told listeners to come equipped with a blank sheet of paper, refer to it as a research grant (again, related to the lab leak conspiracy regarding the National Institutes of Health's research in Wuhan) and "wave that in his face for the camera, for flair."



Coronavirus Updates

Outgoing NIH director implores Fox News viewers to stay focused on the real 'enemy'

As Watters described it, the goal is for students to capture the moment on their phone and send it out to any number of conservative media outlets for further reach.

"Imagine Tucker Carlson teases out of the A block, 'Coming up, brave college student confronts Lord Fauci at dinner. Exclusive footage, right back,' " he said. "Get us that! That's what we want. That changes the whole conversation of the country."

It's also worth noting that Watters has expressed concerns in the past about the vitriol people direct at public servants.

The Two-Way

Fox News Reporter: Sorry If 'Tongue-In-Cheek' Chinatown Segment Caused Offense

In 2018, for example, he railed against "the uncivil left" after staff at an upscale Lexington, Va., restaurant asked then-White House press secretary Sarah Sanders to leave.

"She's a public servant," he said to a commentator on the June 30 episode. "She has political beliefs that are different than yours and she is serving her country. Now, you may disagree with her policies, but that doesn't make her an evil person that deserves to be shunned and confronted."

People are technically allowed to "go up to someone on the street and yell nasty things in their face and surround their car," Watters acknowledged, but said that encouraging this type of behavior "is dangerous, and it's going to get out [of] control and something bad is going to happen."

Another Fox News personality recently compared Fauci to Josef Mengele

Late last month, Fox commentator Lara Logan faced fierce criticism for remarks she made on air comparing Fauci to Nazi doctor Josef Mengele.

During a segment accusing the Biden administration of overreacting to the new omicron variant, Logan said people tell her that to them, Fauci doesn't represent science but that he amounts to Mengele — who was known as the "Angel of Death" and conducted inhumane medical experiments on prisoners at the Auschwitz camp during the Holocaust.

Media

Fox anchor Neil Cavuto urged viewers to get vaccinated. Then came the death threats

"And I am talking about people all across the world are saying this, because the response from COVID, what it has done to countries everywhere, what it has done to civil liberties, the suicide rates, the poverty, it has obliterated economies," she said.
Her comments were swiftly condemned by the Auschwitz Museum and the Anti-Defamation League, among others.
Fauci told MSNBC days later that he was "astounded" that Fox had not taken any disciplinary action against Logan.
NPR has asked Fox whether that is still the case.
NPR's David Folkenflik contributed to this report.

I'm going through my unread emails from earliest to latest, so hadn't seen this – really glad you're planning this!

I really hope you're able to pull something together for the journal, most importantly on the broader impact that the continued circulation of the lab leak allegations will have on international collaboration across a wide range of scientific research.

Another thought – I've block-booked the ASTMH annual meeting into my calendar. Is there an opportunity to have a panel discussion on the importance of international collaboration on EID research, or how to manage politics and science in international research or some such? I'd be very happy to take part in something like that.

Cheers,

Peter

Hi David. I think that your plan is good. Don't try for a broad rebuttal; rather make specific points about research: a) data do not suggest release of SARS-CoV-2 from a Wuhan lab; b) research is inadequate to confirm this; c) shockingly, the very research that would help sort this out was abruptly cut by the NIH last year. I enjoy writing edgy editorials, so am happy to help if desired, but I am NOT the expert in this area. I suggest you (I recall that you were not on the last editorial), Joel, and other experts of your choosing. I would rather that this piece comes from others, but if you are interested I can work on a first draft, starting the week after next.
Cheers,
Phil

Phil, here are some thoughts.

I just discussed this with Joel on the phone and he asked I write down what I said in a few words.

As we are currently in a fact-free whirlwind of political and media hysteria, or as one science writer wrote today "we are witnessing the manufacturing of uncertainty", I think it is best to

NOT rebut the crazies point by point, because facts, logic and science hold little sway with these folks, and NOT attack the US or Chinese govt for bad behavior….

However, we could consider a commentary as follows:

An in house or mostly in house commentary or editorial making the following points, dispassionately. We are now 1 year into the termination of the major US grant that had until 2020 been investigating the origins and determinants of SARS and MERS, and later SARS-CoV-2 emergences; in our current situation there is no longer

MORENS_SUBPOENA_015902
MORENS_NIH_033644
REL0000478607

any similar major research going on China or the adjacent countries which constitute the bat reservoirs for these emerging viruses; such work is of critical importance since all evidence suggests that further coronaviruses are likely to occur; and that given the huge risks of doing nothing, American, Chinese, and other international scientists must once again come together and re-establish productive ties to conduct comprehensive research into coronaviruses which may emerging from hotspots around the globe, and particularly in Southwest/South China, Cambodia, Laos, Vietnam and contiguous areas.

Stephen and all,

While I would worry about getting into the middle of food fight going on in the political arena, at least as a Society, I would also remind us that this all began as an attack on science, the scientific process, and its integrity.

Let's remember that politicians, in violation of their own laws and regulations, reached into NIH and terminated a grant for no reason other than wild unsubstantiated charges unrelated to any scientific facts. And without any due process. No evidence, no chance to appeal, no fairness, in total violation of multiple NIH policies. This colleague is an ASTMH member and a member of the NAS, and he lost his grant and all of the people on it lost their jobs or funding. All because politicians wanted to play games and use him as a pawn on their chessboard. We didn't say that in the paper of course, but that was the subtext.

So, while ASTMH as a Society shouldn't want to get into the middle of this, we should continue to stand up for the integrity of the research process. How can we do that? I am not sure but there must be things we can do as scientists, together and individually. Maybe we can speak with some of our key leaders in our subgroups, for example. I have already done that and, I must say, many are very afraid that what happened to Peter D could happen to them. This is beginning to look too much like the McCarthy era.

I am all for being bold and out front, but, again, not lowering ourselves by attacking the wackos head on.

Subject: Re: FYI - COVID origins continues to gain steam

Hi all,

FWIW, I agree the current commotion is not really about science - at least science as we usually wish to think of it. I do think that it demonstrates the importance of fostering international collaboration and discussion, which I've always thought of as part of ASTMH's mission. And it highlights the importance of scientific diplomacy and communication - both of which are of course on the docket for the annual meeting

Best,
Stephen

On Thu, May 27, 2021 at 2:53 PM Karen Goraleski (b) (6) wrote:

> We are all right there with you, watching this with dismay and disgust. I'm at a loss of anything meaningful that ASTMH could do. As we know, there is no scientific response that will change these crazy statements, innuendos, and conspiracy theories. Made up craziness sells headlines and gets eyeballs to their websites.

MORENS_SUBPOENA_015906
MORENS_NIH_033648
REL0000478607

innuendo, false information, and strings of "what ifs". Also, the challenge of disproving negatives, such as: "Dr. Morens, can you PROVE beyond a reasonable shadow of a doubt that a cow didn't jump over the moon last night?????? Because if you can't prove it, then maybe it really happened"…. This is the type of sophistry we are dealing with.

No credible scientist I know, including the top scientists at NIH, think anything other than that SARS-C0V-2 emerged from nature, just as SARS did. But now we are seeing a few scientists, some credible, others not, most with no experience in experimental virology, lending their voices to calls for investigation, which will accomplish almost nothing except get these folks in the newspapers and on TV.

Regarding what to do, I am at a loss. We are at a point where telling the truth and outlining all the reasons and rebutting all the smooth falsehoods will bring on even more criticism, because this whole issue is no longer in the realm of science, but in the middle of the media-political scrum.

My approach to this last year, before the brown stuff really hit the fan, was to gather together 10 luminaries from science who understand these things and publish a paper designed to counter the craziness once and for all. You could argue that that paper was too subtle, but my sense is that this is neither about reality nor scientific arguments but rather, and I hate to quote the Witch in Chief, this is about a witch hunt.

If we, ASTMH, can agree on a scientific response, I am all in and will do all I can. But I am not sure what that will be. We could make a statement of position or principle, but do we have unanimity to do so? Are there some of our members who buy into this malarky? I would not be surprised…. We could write more papers. We could invite leading scientists to write on the subject.

I will also note that as the "story" progresses we are seeing a shift in the plot. Whereas last year the major accusation was that the Chinese created a Frankenstein virus, now that that has been so rigorously discredited, to the satisfaction of many critics, at least, the narrative has switched to "lab leak", the idea that the Chinese had and were secretly working with this virus in the lab, and it escaped, accidentally or not. Although this, too, is in the vicinity of impossible, it is much harder to take on because of the "prove a negative" challenge. Even if you acknowledge that nothing like SARS-CoV-2 or a possible precursor was ever recorded as being in the WIV, one could still posit that maybe someone brought the virus in secretly, or failed to log it in, and somehow let it loose. If that didn't happen, you can't prove it didn't happen. But if it might have happened, you don't have an obligation to explain why there is zero evidence of it.

MORENS_SUBPOENA_015907

REL0000478607

It's a lose-lose set-up. Could-of-might-up-I wonder-if now trumps facts and evidence. That's not the field in which science operates.

What to do?

Subject: FYI - COVID origins continues to gain steam

You are all seeing this pick up steam, in Wash Po, Tony Fauci being "quoted" as saying he's not sure, more in POLITICO, Biden's announcement, Tedros, and members of Congress.

David M - you said you welcome ideas on what ASTMH should/could say/do beyond what was written for AJMTH months ago? Dan? Christy? Joel? Thoughts? This isn't going away anytime soon.

Yes, i did read it and talked to him about it at length in the couple days afterward. His change of mind was occasioned by the article of his close buddy, Nick Wade

I pointed out to Don that Nick's article was cherry picked and biased, and tried to explain to him the mistake in David Baltimore's quotation. We had some very cordial and verl long discussions, and i left with him the hope that in the future he would retain a high degree of skepticism about supposed facts that have appeal by fitting into conspiracy theories

I think if there is a next time for him, he may take a more balanced approach

Thanks, Karen,

I am traveling at the moment and can't display this on my phone, but will hopefully see it later on ipad

I have been speaking off the record to many of the top reporters about this, including in depth discussions with Don McNeil, and have also been in touch with Daszak and several National Academy members and one prominent Nobel laureate, all of us working in the background to push back against the increasing misinfo

We should maybe think about doing more. I brought this up with Patty Aguilar and other acav folks a couple days ago

I would welcome ideas. Certain politicians are moving to try to shut down all bsl 3 and 4 research

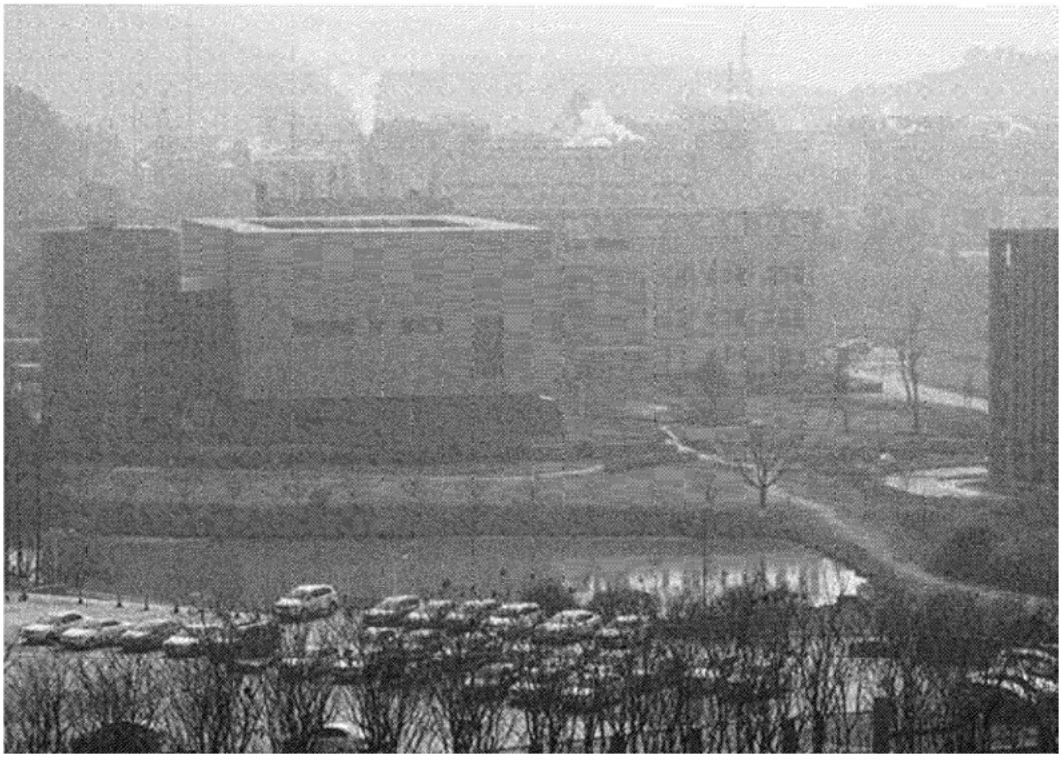
With help from Joanne Kenen

ORIGIN STORY — The hypothesis that Covid-19 was leaked from a Wuhan lab has leaped from its original host — Trump administration officials and people dismissed as conspiracy theorists — into the body of mainstream debate. Last week, 18 leading scientists published a letter in the academic journal Science calling for further investigation to determine the origin of the pandemic that has killed 3.4 million people worldwide. "Theories of accidental release from a lab and zoonotic

MORENS_SUBPOENA_015911
MORENS_NIH_033653
REL0000478607



spillover both remain viable," the scientists wrote.

The letter echoes a similar call from WHO Director General Tedros Adhanom Ghebreyesus. During a Senate hearing last week on the U.S. response to the pandemic, Anthony Fauci said he was "fully in favor of any further investigation of what went on in China" after sparring with Sen. Rand Paul (R-Ky.) about the origins of the virus. And this month, the former New York Times science reporters Nicholas Wade and Donald G. McNeil Jr. have written long essays on Medium outlining why they take the lab

MORENS_SUBPOENA_015912
MORENS_NIH_033654
REL0000478607

leak hypothesis seriously.

Nightly reached out to experts, two of whom signed the letter as well as others who have taken the opposite side in the public debate, to ask how credible they find the lab leak theory. Their edited responses are below.

A view of the P4 lab inside the Wuhan Institute of Virology is seen after a visit by the World Health Organization team in Wuhan in China's Hubei province on Wednesday, Feb. 3, 2021. | AP Photo/Ng Han Guan

IT'S POSSIBLE

"Much of the

MORENS_SUBPOENA_015913
MORENS_NIH_033655
REL0000478607

currently available information suggests that a lab-based origin of Covid-19 is plausible. **There remains no sign of an intermediate animal host that could have passed the virus to humans in 2019.** There is no evidence that live mammals were sold at the Wuhan seafood market in 2019, and none of hundreds of animal samples collected from that market had any trace of the virus. In other words, there is zero evidence that supports a zoonotic origin of the virus that excludes the involvement of research activity.

“There are copious precedents of pathogens

MORENS_SUBPOENA_015914
MORENS_NIH_033656
REL0000478607

leaking from labs — the original 2003 SARS virus leaked up to six times from labs across three countries. Consider that the SARS research and animal infection experiments at the Wuhan Institute of Virology, for more than 10 years, were all performed at relatively low biosafety levels. It is currently not possible to tell from the genetic evidence whether the virus ever passed through a laboratory or a lab personnel.

"The question is: How did a virus, whose lineage is found only in southern China, make its way into humans in the metropolitan city of Wuhan, more than a thousand miles away? We

MORENS_SUBPOENA_015915
MORENS_NIH_033657
REL0000478607

know that the Wuhan Institute of Virology had possibly the greatest collection of SARS viruses from numerous trips across China. We know that they were working with a batch of viruses very closely related to SARS-CoV-2. Details of these viruses and the experiments performed with them have not been shared in a timely manner."
— Alina Chan, molecular biologist at the Broad Institute of MIT and Harvard

"It is worthy of a careful, rigorous, unbiased, objective examination, based on relevant, verifiable data. There are a number of plausible

MORENS_SUBPOENA_015916
MORENS_NIH_033658
REL0000478607

scenarios embedded in this label, 'lab leak,' and importantly, they include an unrecognized infection of a well-intentioned lab worker attempting to recover or study new coronaviruses from bats. **It does not imply malice or even necessarily awareness (of the accident).** Lab accidents are much more common than any of us know, or would like to admit, and they occur worldwide and even in the most safe and secure labs. U.S. biosafety labs are by no means strangers to accidents; leaks of some of the most dangerous infectious agents have occurred at CDC and other U.S. government labs." **— David**

MORENS_SUBPOENA_015917
MORENS_NIH_033659
REL0000478607

A. Relman, microbiologist at Stanford University

"The following lines of circumstantial evidence are noteworthy:

"**The outbreak occurred in Wuhan, a city of 11 million people that does not contain horseshoe-bat colonies,** and that is tens of kilometers from, and outside the flight range of, the nearest known horseshoe-bat colonies. Furthermore, the outbreak occurred at a time of year when horseshoe bats are in hibernation.

"The outbreak occurred in Wuhan, on the doorstep of the laboratory that conducts the

MORENS_SUBPOENA_015918
MORENS_NIH_033660
REL0000478607

world's largest research project on horseshoe bat viruses and worked with the world's closest sequenced relative of the outbreak virus. The laboratory actively searched for new horseshoe-bat viruses in horseshoe-bat colonies in caves in remote rural areas in Yunnan province, brought those new horseshoe-bat viruses to Wuhan, and then mass-produced, manipulated, and studied those new horseshoe-bat viruses, year-round, inside Wuhan.

"Documentary evidence establishes that the bat-SARS-related-coronavirus projects at the Wuhan Institute of Virology used

MORENS_SUBPOENA_015919
MORENS_NIH_033661
REL0000478607

personal protective equipment (usually just gloves; sometimes not even gloves) and biosafety standards that would pose high risk of infection of field-collection, field-survey, or laboratory staff upon contact with a virus having the transmission properties of SARS-CoV-2."

— Richard Ebright, molecular biologist at Rutgers University

EXTERNAL SENDER

I love that idea Rich.

Truth is, our lawyers told us early on that the actions NIH took are likely illegal. They've looked at all prior cases of NIH terminated grants, suspending grants and appeals against them. There are precedents for winning these cases, e.g. Planned Parenthood and others. The only catch is that suing NIH would mean litigation that drags on for a few years, discovery actions that would demand all sorts of private correspondence, and ultimately a jury that might by now be contaminated with the lab leak narrative. They advised us that the best option is to push privately for the grant to be renegotiated, which I suppose is where we are now.

All of this is of course exacerbated by the other actions and attacks that add to a general narrative that EcoHealth must have been up to no good – this includes the NAM investigation that we're still waiting to hear about, and the OIG audit. There's also a lawsuit against us that we've tried not to talk publicly about, but it's real and we have to defend against it. A lawyer in Long Island who's sued EHA, myself and even my wife for a huge sum for causing COVID-19 that then infected him etc.

Cheers,

Peter

Importance: High

EXTERNAL SENDER

Thanks Rich - I've got to look at the positives in all of this and just carry on fighting, if only for my own health reasons. It's been a really horrible couple of years and I've found that the constant harassment can really get you down – it's been shocking to me how much of struggle this is with many days spent despairing over my own personal future and the future of EcoHealth. It's been tough on my family as well, and the other staff at EHA.

I'm determined not to give up though and will be going through all the options carefully. The other glimmer of hope is that any 'renegotiation' will be with NIAID staff, so I'll reach out to them ASAP. I think that if most of the funding is planned for the US, with just one subcontract to China, for a group that works on epidemiology, that might work. The other strategy would be to see if a shift to another country would work. I'm mindful that NIH (Lauer et al.) would be delighted if we just handed in the towel, and will probably be looking for excuses to consider our alternative plans out of scope.

On this issue of who is 'the pits' and who isn't at NIH, I think the list begins with Francis Collins, who committed the original sin of terminating our grant when he could have simply resisted. Second is his lackey Lauer who took it to another level of bumbling errors, illegal actions, and aggressive brinksmanship, but there are others also. Lawrence Tabak (now acting Director NIH) publicly stated that we were out of compliance and really threw us under the bus, and there are a group of legal advisors and Congressional staffers at the Office of the Director who have actively worked to publicly undermine us, sometimes with clear glee and delight.

For example, in one of the FoIA'd emails that Peter Aldhous at Buzzfeed unearthed, he spotted Michael Lauer sending details of our animal experiment oversight, which they then used to tighten the screw on us very publicly and unfairly. Lauer used the subject Header "A Gift" when he sent this to his legal and Congressional relations colleagues at NIH. That sort of gloating is pretty disgusting, and won't be forgotten by me. Peter Aldhous also dug up clear evidence that NIH requested an OIG audit as part of their efforts to tighten the screws on us, and get them off the hook. We're just negotiating the final results of that audit – a huge timesink that's been going on over a year now, has looked at grants to EHA over the last 8 years, and has only found $77,000 of mis-coded financial errors (including a $19 overpayment to a contractor, with $7 indirect costs; and a single $5 alcoholic beverage at a hotel mistakenly coded to our grant). Great use of taxpayer money and time and the total of these mis-coded finances is less than 1% of the grants they reviewed, and less than 0.01% of our budget over that period. Of course, when the report goes public in a few weeks, it'll be used by Republicans to demand we're de-funded and closed down (again).

Ironically, in the emails (below), Michael Lauer cc's Michelle Bulls, who's listed in his correspondence yesterday as the person we have to write to if we want to appeal their decision. Pretty sure she's not an objective overseer at this point.

Here's the article: https://www.buzzfeednews.com/article/peteraldhous/white- coat-waste-anthony-fauci-nih-ecohealth-al liance-lab

And here's the section (and you can click on the links to see the FoIA'd emails):

A heavily redacted series of emails from May 2021 centers on the July 2016 letter from the NIAID that had given EcoHealth permission to resume the chimera work. Accepting a suggestion made by Daszak himself, it stated that if any of the chimeric viruses showed unexpectedly rapid growth, he would "immediately stop all experiments with these viruses" and provide NIAID officials with information about the unexpected outcomes. Shortly after receiving the letter, Lauer sent it on to a senior attorney with the Department of Health and Human Services, assigned to the NIH, changing the subject line on the email thread to "Gift."

Daszak's problem was that the NIH determined that an experiment described in annual progress reports for the grant indicated that one of these viruses had made mice engineered to carry the human receptor targeted by SARS-like viruses sicker than expected and showed signs of rapid growth. "EcoHealth failed to report this finding right away," NIH deputy director Tabak later wrote in an October 2021 letter to James Comer, the ranking Republican member on the House of Representatives Committee on Oversight and Reform.

MORENS_SUBPOENA_003846
MORENS_NIH_010772
REL0000478608

None of this amounts to a smoking gun linking EcoHealth and the Wuhan institute to the origins of COVID, as the viruses involved were very different to SARS-CoV-2. And in a letter to Lauer and Tabak after the latter's communication with Comer, Daszak contested the conclusion that the experiment did show rapid viral growth and argued that EcoHealth had complied with its reporting requirements.

But it gave Lauer evidence that he was looking for. EcoHealth is now under audit from the Office of Inspector General for the Department of Health and Human Services, an independent watchdog that monitors fraud, waste, and other problems, as part of a review of the NIH and "selected grantees" initiated on June 11, 2021. Documents received by BuzzFeed News through its FOIA lawsuit, including a timeline of events put together by Lauer dated June 13, 2021, indicate that the suggestion for an OIG audit of EcoHealth came from the NIH, just days after Lauer sent his "Gift" email.

The NIH declined to discuss Lauer's email and timeline, saying in a statement: "NIH doesn't comment on internal deliberation of grant awards."

Cheers,

Peter

EXTERNAL SENDER

I found a copy on Twitter of Lauer's letter to Rep Comer yesterday – word doc attached, recreated using screenshot jpegs, so hope it works.

It's good that they're publicly stating we've cooperated with NIH – this is related to their continued series of letters about our other grants – making us jump through all sorts of hoops just to continue our work. At the same time, they're clearly trying to show the aggressive Republicans in Congress that NIH is going to crack down on miscreants such as us. Apparently, for at least the next 3 years we'll have to double up our reporting requirements, have no automatic carry over of unspent funds, and have to conduct 6 monthly onsite assessments of subcontractees. We've not been told all that yet by NIH, but no doubt there'll be another letter from Lauer on its way soon.

Cheers,

Peter

Here's the latest from NIH – as usual we received a Friday afternoon pdf letter from Michael Lauer that's full of legalistic language (attached). And as also 'usual', Lauer only sent this the same day he informed Republicans on an oversight committee, and either him or the Republicans then instantly made it public. There's already an article in the Washington Examiner about it (below)

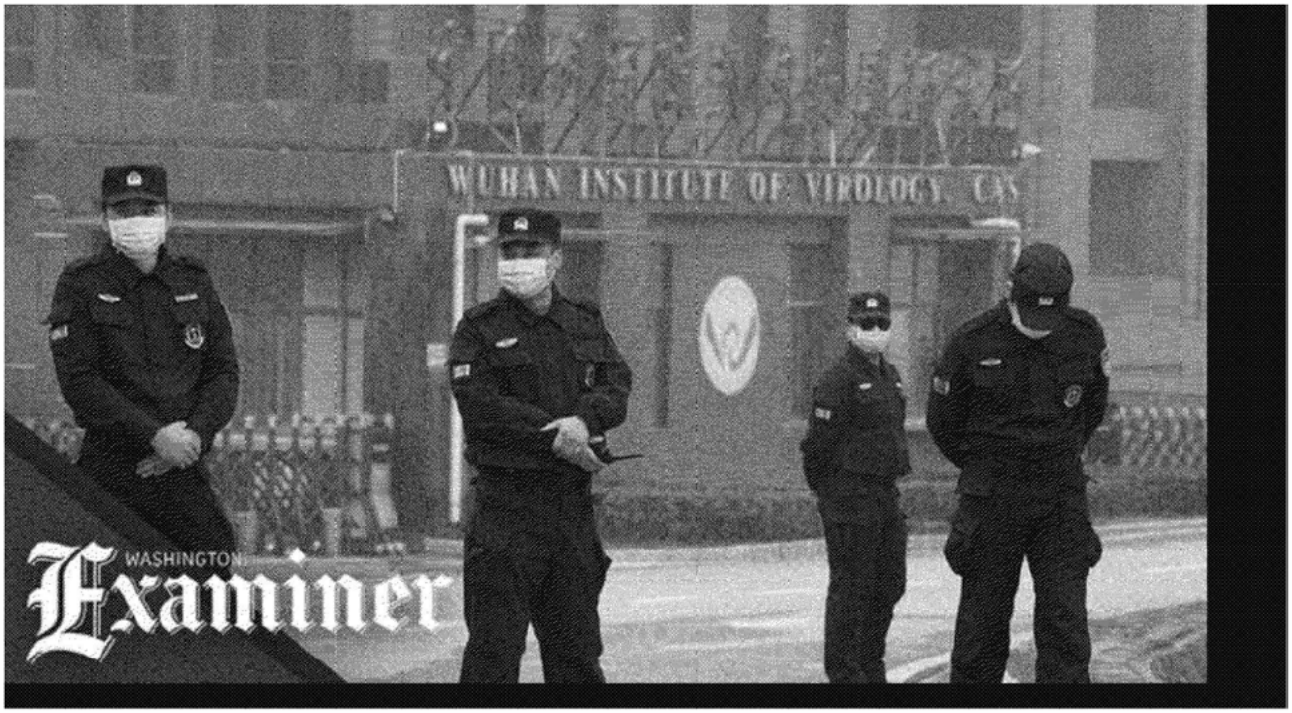
They're basically terminating our subcontract to WIV because we were unable to get the lab notebooks they demanded (no surprise there, given the politics). They're also offering us the chance to renegotiate the grant. Sounds great, but by now of course the chances of any institution in China wanting to work with an organization targeted in this way are pretty slim. There's also the buried proviso that we have to arrange for 6-monthly inspections of our subcontractee's labs.

If we don't want to renegotiate, we have to bilaterally terminate.

After 2 and a half years of pressure from NIH, we're now back to where we were in April of 2020, when NIH informed us to suspend all work with WIV, but that we could carry on with the grant. This was then followed a few days later with full termination, then suspension with conditions, then more conditions, now this. Pretty depressing, awful, and utterly unnecessary.

Not sure what we'll do, but my gut feeling is we should continue and try to find a way forwards with other groups in China. It'll be a hard path, considering WIV are the premier bat virus group in China and our preferred partners, and the politics has made all of this completely toxic. But it's the honorable path, as a scientist, and I think we should at least try.

Here's the Washington Examiner article: https://www.washingtonexaminer.com/policy/healthcare/nih-ends-subaward-wuhan-lab-stonewalling



WUHAN LAB

NIH ends subaward to Wuhan lab after continued stonewalling

by Jerry Dunleavy, Justice Department Reporter |

August 19, 2022 08:21 PM

Ad ends in 9s

The National Institutes of Health announced it was finally cutting off a subaward to the Wuhan Institute of Virology after it continued to refuse to hand over key information about the coronavirus research it conducted with U.S. tax dollars.

NIH Deputy Director Michael Lauer made the revelation in a letter Friday to House Oversight Committee Republicans, in which he said the Wuhan lab had refused to turn over lab notebooks and electronic files connected to its research funded through an NIH subaward given to it by the U.S.-based EcoHealth Alliance.

But Lauer indicated the NIH may continue funding EcoHealth's controversial bat coronavirus research despite the group's documented noncompliance issues, its close links to the Wuhan virology institute, and its history of funneling hundreds of thousands of U.S. tax dollars to the Chinese lab.

"NIH … identified one non-compliance under the ... award that cannot be remedied with specific award conditions," Lauer said Friday. "NIH has requested on two occasions that EHA [EcoHealth Alliance] provide NIH the laboratory notebooks and original electronic files from the research conducted at the WIV [Wuhan Institute of Virology]. To date, WIV has not provided these records."

Lauer added: "Today, NIH informed EHA that since WIV is unable to fulfill its duties for the subaward

MORENS_SUBPOENA_003851
MORENS_NIH_010777
REL0000478608

grant under R01AI110964, the WIV subaward is terminated for failure to meet award terms and conditions requiring provision of records to NIH upon request."

FBI INVESTIGATED NIH AWARD TO ECOHEALTH AND WUHAN LAB

The Office of the Director of National Intelligence released an assessment in 2021 stating that one U.S. intelligence agency assessed with "moderate confidence" that COVID-19 most likely emerged from the Chinese government lab in Wuhan, while four U.S. spy agencies and the National Intelligence Council believe with "low confidence" COVID-19 most likely has a natural origin.

The NIH's Lauer also said Friday that the National Institute of Allergy and Infectious Diseases, which has been led by Dr. Anthony Fauci for decades, "will begin to engage with EHA to renegotiate the specific aims and objectives of the R01 grant without the involvement of WIV … in light of the cooperation from EHA and the substantial subsequent improvements in administrative processes that EHA demonstrated."

Rep. James Comer (R-KY), the ranking member on House Oversight, hammered the NIH over this.

"Terminating EcoHealth Alliance's partnership with the Wuhan Lab is the bare minimum," Comer said Friday. "It's unacceptable that the NIH continues to allow EcoHealth Alliance to receive taxpayer dollars even though it is confirmed EcoHealth violated the terms of its grant contract. EcoHealth conducted gain of function research on bat coronaviruses in Wuhan, knew about the Chinese Communist Party's coverup, and failed to inform the U.S. government."

Comer added: "EcoHealth's dangerous experiments in Wuhan and possible efforts to cover up any evidence may have started the pandemic. EcoHealth should not receive a penny of American taxpayer dollars for their gross mismanagement of Americans' hard-earned money."

The NIH had awarded EcoHealth with a grant dubbed "R01AI110964" years ago, and EcoHealth then doled out three research subawards, including one to the Wuhan lab.

"The research approved under this grant sought to understand how bat coronaviruses evolve naturally in the environment to become more transmissible to the human population," the NIH said Friday in defending t

Hi David – have a look at the Bloomberg report below – we've been tracking this, and wondered if NIAID is aware that they are going to vote on canceling all federal funding to WIV. Obviously, the bigger issue is whether Congress should be meddling in NIH's decision process at this level of detail, and I wondered if your lobbyists were aware, and if they're doing anything about it.

Obviously, I believe it's a mistake to specifically cancel the possibility of working with WIV in the future – they're the best virology lab in China, and if we want to work with China on viruses that emerge from there, we're at a disadvantage, but the bigger issue is Congressional micromanagement of NIH's work.

Peter, attached some edits for consideration. In general I think it makes the right points and presents a strong case. My comments are mostlly minor word-smithing, plus clarifying and simplifying as much as possible, since this will probably be read by Lauer but will perhaps be leaked and read by many others. david

Ranking Member Ruiz Statement on Suspension and Proposed Debarment of EcoHealth Alliance

May 15, 2024

Press Release

Announcement Follows Democrats Pressing EcoHealth Alliance President on Professional Misconduct at Select Subcommittee Hearing Earlier This Month

Washington, D.C. (May 15, 2024)—Today, Rep. Raul Ruiz, M.D., Ranking Member of the Select Subcommittee on the Coronavirus Pandemic, issued the following statement regarding the suspension and proposed debarment of EcoHealth Alliance (EHA) by the Department of Health and Human Services (HHS):

"I welcome the Administration's announcement that it has suspended and initiated the termination of federal funding for EcoHealth Alliance. Every recipient of federal taxpayer funding has an obligation to meet the utmost standards of transparency and accountability to the American public. EcoHealth Alliance's failure to do so is a departure from the longstanding legacy of good faith partnerships between NIH and federal grantees to advance science and the public interest, which remains essential for the continued work of preventing and preparing for future threats to our nation's public health."

On May 1, 2024, Dr. Peter Daszak, President of EHA, testified at a hearing before the Select Subcommittee. Ahead of that hearing, Select Subcommittee Democrats released a **staff report** revealing findings from the Select Subcommittee's investigation into EHA's conduct as a federal grantee, including Dr. Daszak's **transcribed interview** on November 14, 2023.

Although there is no evidence that EHA played a role in creating the COVID-19 pandemic, Select Subcommittee Democrats' report found that EHA engaged in other conduct that raises questions about their professional integrity—including failing to adequately monitor compliance with their own grant terms and conditions, potentially misleading NIH regarding the reason for its untimely submission of its Year 5 report, and potentially misleading NIAID regarding the location of its previously collected samples.

Ranking Member Ruiz and Select Subcommittee Democrats **pressed** Dr. Daszak regarding these and other issues at during his public testimony that day.

BREAKING: HHS Suspends Funding and Proposes

MORENS_NIH_049797
REL0000478623

Formal Debarment of EcoHealth Alliance, Cites Evidence from COVID Select Report

WASHINGTON — Today, Select Subcommittee on the Coronavirus Pandemic Chairman Brad Wenstrup (R-Ohio) issued the following statement after the U.S. Department of Health and Human Services (HHS) accepted the Select Subcommittee's recommendation to formally debar EcoHealth Alliance, Inc. (EcoHealth). HHS will immediately commence official debarment proceedings and implement a government-wide suspension of U.S. taxpayer funds to EcoHealth — including a hold on all active grants.

"EcoHealth Alliance and Dr. Peter Daszak should never again receive a single penny from the U.S. taxpayer. Only two weeks after the Select Subcommittee released an extensive report detailing EcoHealth's wrongdoing and recommending the formal debarment of EcoHealth and its president, HHS has begun efforts to cut off all U.S. funding to this corrupt organization. EcoHealth facilitated gain-of-function research in Wuhan, China without proper oversight, willingly violated multiple requirements of its multimillion-dollar National Institutes of Health grant, and apparently made false statements to the NIH. These actions are wholly abhorrent, indefensible, and must be addressed with swift action. EcoHealth's immediate funding suspension and future debarment is not only a victory for the U.S. taxpayer, but also for American national security and the safety of citizens worldwide.

"The Select Subcommittee's investigation into EcoHealth and the origins of COVID-19 is far from over. Dr. Daszak and his team are still required to produce all outstanding documents and answer the Select Subcommittee's questions, specifically related to Dr. Daszak's potential dishonesty under oath. We will hold EcoHealth accountable for any waste, fraud, and abuse and are committed to uncovering any illegal activity, including lying to Congress, NIH, or the Inspector General," **said Chairman Wenstrup.**

Read the Select Subcommittee's report titled "*An Evaluation of the Evidence Surrounding EcoHealth Alliance, Inc.'s Research Activities*" here.

Read today's letter from HHS to EcoHealth Alliance, Inc. here.

Read HHS's Action Referral Memorandum here.

Pure baloney – asking Biden to act tough to "take possession of the truth about the origins". It'll involve actually doing work to analyze the origins, not just banging on China's door and asking for the lab notes! It took us 5 yrs to find 99%+ similar viruses to SARS-CoV in bats. In fact, doing this will require the opposite of banging on the door – it will involve inviting our Chinese colleagues for a cup of tea to design strategies for surveillance in their country. Collaboration will win the day.

Two questions have dominated politics throughout the coronavirus pandemic. Democrats and public-health experts have asked: What should we do? Former President Donald Trump, for his part, minimized the need to act. He instead spoke incessantly about a very different question: Whom should we blame?

"In recent months, our nation and the world has been hit by the once-in-a-century pandemic that China allowed to spread around the globe. They could have stopped it, but they allowed it to come out," Trump said as he accepted the Republican Party's nomination in August 2020.

"It's China's fault. It should have never happened," he said at a presidential debate with Joe Biden in September 2020.

"We built the greatest economy in the world; it was horribly interrupted by something that should have never happened, came in from China—the plague. The plague from China," he said on *Fox & Friends* on the morning of Election Day 2020. There are hundreds of similar examples from the president and his inner circle.

In November 2020, a solid majority of American voters decided that the first of the two questions—What should we do?—was more urgent, and that Biden and his party offered the better answer.

•

But now that Biden's administration is succeeding at bringing the pandemic under control within the United States, Trump's preferred alternative question—Whom should we blame?—is reclaiming attention.

Trump's question was of course, from the beginning, politically motivated. He and his supporters hoped that if enough Americans blamed China for creating the problem, that blame would somehow exonerate Trump from so callously mismanaging it. More than that: Trump and his supporters hoped that if enough Americans blamed China for creating the problem, they would agree that he ranked as its most pitiable victim. As Gabriel Sherman reported for *Vanity Fair* in May 2020:

As he headed into Memorial Day weekend … "He was just in a fucking rage," said a person who spoke with Trump late last week. "He was saying, 'This is so unfair to me! Everything was going great. We were cruising to reelection!"

The public's rejection of Trump's attempt to deploy blame as an excuse does not, however, make the question go away.

Early on, it became clear that Chinese authorities were lying about the disease's human toll. Nick Paton of CNN in December 2020 reported on 117 pages of internal Chinese government documents suggesting that the local authorities in Wuhan had massively underreported COVID-19 infections in the early weeks of the outbreak. In January 2021, HBO aired a documentary by the director Nanfu Wang minutely detailing the Chinese undercount.

From the beginning, though, many have suspected the Chinese authorities of concealing an even darker secret about the outbreak than China's count of the sick and the dead. Those doubters suspected that the Chinese were also lying about how the outbreak *started*. They suspected that the official story of a spread from bats to humans was an excuse to conceal the fact that the virus had originated in a Chinese lab.

If you read the responsible American press, you likely first heard of those suspicions only from the reports denouncing and rebutting them. On January 29, 2020, *The Washington Post* ran a story headlined: "Experts Debunk Fringe Theory Linking

China's Coronavirus to Weapons Research." When Senator Tom Cotton voiced suspicions in February, *The New York Times* headlined its report: "Senator Tom Cotton Repeats Fringe Theory of Coronavirus Origins."

Over time, the suspicious modulated their accusation a little. In the spring of 2020, Trump world was also arguing that the virus was no big deal, no reason to shut down the U.S. economy. The president and his supporters wanted to argue that masking was stupid and that public-heath officials were hysterical. You couldn't argue *both* that the virus was absurdly exaggerated *and* that it had begun its existence as a Chinese superweapon. By the time Secretary of State Mike Pompeo endorsed a lab-origin theory of the virus in May 2020, the suspicion about the virus's origin had been downgraded from "superweapon" to "medical experiment gone wrong."

Despite this softening, the scientific community for the most part continued to emphatically reject the lab-origin theory. Past pandemics had started when a virus leaped from animals or birds to people, so why should this new coronavirus be any different? U.S. scientists were perhaps also influenced by their respect for their Chinese counterparts. While Chinese *officials* had tried to stifle the flow of information to the rest of the world, Chinese *scientists* had generally proved highly cooperative with their Western counterparts. When Chinese scientists cracked the virus's genetic code early in January 2020, they promptly posted full results for all to read. That did not seem to most Western scientists to be the behavior of conspirators.

When the Trump administration ended in January, even Pompeo's State Department had to admit uncertainty in its final official statement about the coronavirus pandemic:

The U.S. government does not know exactly where, when, or how the COVID-19 virus—known as SARS-CoV-2—was transmitted initially to humans. We have not determined whether the outbreak began through contact with infected animals or was the result of an accident at a laboratory in Wuhan, China.

The virus could have emerged naturally from human contact with infected animals, spreading in a pattern consistent with a natural epidemic. Alternatively, a laboratory accident could resemble a natural outbreak if the initial exposure included only a few individuals and was compounded by asymptomatic infection. Scientists in China have researched animal-derived coronaviruses under conditions that increased the risk for accidental and potentially unwitting exposure.

Scientists can live with uncertainty. Politics abhors it.

Through 2021, advocates of the lab-escape theory have become more emphatic and explicit.

Trump's former director of the CDC endorsed the lab-accident theory in March. "I am of the point of view that I still think the most likely etiology of this pathogen in Wuhan was from a laboratory, escaped," Robert Redfield said in an interview on CNN. Refield acknowledged, however, that "other people don't believe that. That's fine. Science will eventually figure it out."

Through the spring, journalistic interest in the lab-escape theory jumped the barrier from the Fox News universe to more centrist media.

Then, earlier this month, the veteran science reporter Nicholas Wade published an argument for taking the laboratory-origin hypothesis seriously. Wade's case was fortified by thick scientific detail and the prestige of his byline: He was for many years an eminent science reporter at *Nature* and *The New York Times*. And the article was spiced with an extra-exciting ingredient: It accused not only the Chinese state but also the U.S. scientific community of complicity in a cover-up.

If the case that SARS2 originated in a lab is so substantial, why isn't this more widely known? As may now be obvious, there are many people who have reason not to talk about it. The list is led, of course, by the Chinese authorities. But virologists in the United States and Europe have no great interest in igniting a public debate about the gain-of-function experiments that their community has been pursuing for years ...

The US government shares a strange common interest with the Chinese authorities: Neither is keen on drawing attention to the fact that Shi's coronavirus work was funded by the US National Institutes of Health. One can imagine the behind-the-scenes conversation in which the Chinese government says, "If this research was so dangerous, why did you fund it, and on our territory too?" To which the US side might reply, "Looks like it was you who let it escape. But do we really need to have this discussion in public?"
